22,125. And no other Department of the Government is to have any say on the safety or anything else with regard to the mines?—No; it is entirely a matter for the Mining Council, subject to Clause 19 (2), which provides: "The Mining Council, before making or altering any regulations or conditions of employment, including wages, as affect workmen engaged in the mining industry, shall consult with the association known as the Miners' Federation of Great Britain, and, in the event of such representatives and the Mining Council failing to agree, the matter in dispute may be referred to arbitration on such terms as may be mutually agreed." That to some extent deals with the question of the conditions of labour.

22,126. Does that mean that the question of wages will be subject to the Mining Council?—And the Miners' Federation, and by arbitration if there is a dispute.

22,127. This contemplates that as long as this Act continues in force the Miners' Federation, however large or small in proportion to the number of men it represents, is the body to remain in power?—It takes the position as it is to-day, the Miners' Federation being representative of the miners, and for that reason you will see the same argument to a certain extent applies to the Coal Owners' Association.

22,128. I will not argue; I only want to know what you mean. You appreciate that the Miners' Federation is the one and only body which is to be concerned?—Yes. It is always open later on to amend the Bill if necessary. I was going to say that the Coal Owners' Association is similarly recognised in the clause dealing with valuation, as the appropriate body to represent the coal owners.

22,129. With all respect, it scarcely represents the coal owners.

22,130. *Mr. R. W. Cooper:* With regard to clause 21, am I correct in interpreting that clause as in effect preventing the railway companies or the railway department if the railways become State railways from raising the existing rates on mineral traffic?—Yes, I think that is correct.

22,131. Would you look at clause 11 (3). Am I right in supposing that that clause enables the Mining Council to carry on business as shipowners?—It gives them the power like you often have in the case of the Memorandum of Association of a limited company, to use a number of expedients for carrying out their duties. I take it that nothing there gives them power to use the powers or expedients for any purpose greater than the duties which are cast upon them under the Act. That is, they would be allowed to use ships for certain purposes, such as handling coal, but not as shipowners in the sense of running a competing passenger service to New York.

22,132. I follow. But they can use their ships for the purpose of taking coals out and bringing other commodities home?—There are certain powers given them in the earlier sub-section. If you look at clause 11 (1) you will see it says: "It shall be lawful for the Mining Council to open and work mines and search for" coals and other mineral. Then the powers are defined, and in addition to that under (a) they may work railways, tramways, and so forth.

22,133. And ships?—Yes, for the purpose of supplying and delivering coal or other products.

22,134. I agree. Am I right in saying that they may own ships and work ships for carrying coal to various ports and use those ships for cargo back to England from those foreign ports?—That depends upon the words, "or other products," and whether they are to be used *ejusdem generis* with "coal."

22,135. But you would not expect the ships to come back in ballast?—My idea is that this whole reference to working ships is only really substantially working lighters and local ships.

22,136. Not shipping generally?—No, I do not think so. This is only a power, and I think a legitimate power, which is given to the conduct of that

23 May, 1919.]

MR. HENRY H. SLESSER.

[Continued.]

industry, but it is limited by the general duties to winning and distributing coal.

22,137. I will not argue the point. I am merely asking you as to the interpretation of the clause. It struck me as giving power to work ships and own ships, and to deliver coal to foreign ports, and, of course, *ex necessitate* to bring back cargoes from the foreign ports to the English ports?—I think these particular words are in a New Zealand Act dealing with State mines, and I think they are to be used in some limited sense.

22,138. Supposing they had power to run ships, and supposing they lost money in carrying on the ships, I gather the money would come out of funds provided by Parliament?—Yes, it would come out of the general funds.

22,139. Provided by clause 17 (1)?—Yes, that depends on whether there is not a total profit with the running of ships pooled in with the other matters, and that rather depends upon the result of the industry.

22,140. Now would you look at clause 11 (1). That clause appears to prohibit the Mining Council disposing of any mines that it might acquire in any way. Is that so?—Yes.

22,141. Now let me ask you a question on clause 5. I have not yet seen in the draft Bill any appointed day mentioned. You referred to the appointed day. What clause provides for fixing the appointed day?—Clause 22. It is "the first day of the second year after the coming into operation of the Act."

22,142. Do you intend by that clause to transfer to the Mining Council tin mines, lead mines and china clay mines?—This is the position if I may put it shortly. By clause 5 (1) all the minerals are transferred other than those which are set out in the first schedule and in the first schedule I think you will find among other things building clay but not china clay.

22,143. There is not china clay or tin or lead?—That is so.

22,144. Nor tin, nor lead?—Therefore the answer is that those minerals not being mentioned in the schedule would be transferred subject to 5 (3) which gives power to disclaim and presumably I think you may have disclaimer for classes as well as individual mines and minerals. You may disclaim a whole group.

22,145. With regard to the expression associated properties, I gather from your answer to the Chairman you intended if as is the case some of the large steel making companies in this country should also happen to be owners and workers of collieries that subject to the disclaimer clause all their steel works as well as their collieries will vest in the Mining Council?—The phrase used is: "All associated properties in the opinion of the Mining Council belonging to mining undertakings or connected with any colliery."

22,146. What do you mean by those words? They are subject to the opinion of the Mining Council?—Yes.

22,147. You probably know the names of some of the large steel working concerns in this country. Have you heard of Bolckow, Vaughan & Co. in the county of Durham?—Yes.

22,148. They have, as you probably know, large blast furnaces and steel furnaces at Middlesbrough and a large group of collieries some miles away from Middlesbrough?—Yes.

22,149. They have also ironstone mines in Cleveland further away again to the south. Is it possible under that clause of yours, subject to the disclaimer clause, that, if the Mining Council thought fit, the whole of these properties of Bolckow, Vaughan & Co. would become vested in the Mining Council?—I do not think you could say those were works belonging to the mining undertaking. It might be the mining undertaking and steel works were both owned by the same company. I should think it would be stretching language to say they belonged to the mining undertaking.

22,150. How do you define the expression "mining undertaking" in the case I take?—It is a case for the Mining Council to decide in the first place.

22,151. Do you intend, in such case as I put now, which is not an isolated case, that the question should depend entirely upon the *ipse dixit* of the Mining Council?—I think somebody must decide whether the matter belongs to the mining undertaking or not.

22,152. If the Mining Council decided it, rightly or wrongly, that the Bolckow, Vaughan steel works belonged to their colliery undertaking, the steel works would pass to the Mining Council?—Not necessarily. I take it there are legal remedies to decide if the Mining Council acted properly or were within the meaning of the words.

22,153. That is a very ticklish horse to ride?—Somebody has to decide which works belong to the mining undertaking and which do not.

22,154. I will take your answer with regard to disclaimer apparently either your associated properties, such as steel works on the one hand or collieries on the other, should be disclaimed for any length of time at the option of the Mining Council?—Yes.

22,155. If that option is exercised, rightly or wrongly, that steel works are, they clearly could not be worked by the owner?—I do not think, with respect, that is so, because it cannot be worked without the permission of the owner.

22,156. I see that?—I attach importance to that protection.

22,157. It leaves the steel works and the mining owner to the judgment of the Mining Council?—On the assumption that the particular individual steel works belong to the mining undertaking.

22,158. That turns on the slender ground of the meaning of the words "mining undertaking"?—The difficulty would arise apart from nationalisation in any scheme dealing with these works as well as to mines.

22,159. I am discussing the language of your drafting?—I suggest whatever scheme you have you must invest some authority with the power of deciding at what point a property is said to be ancillary to an undertaking.

22,160. I shall be curious to hear what the steel works have to say upon the subject. Will you show me the clause which fixes the price of the associated properties?—You will find in clause 10 (1), "The purchase price, any mine and such of its associated properties as have been purchased."

22,161. That provides for payment I see. I want to find the clause which fixes how the value of the associated properties is to be ascertained?—That is 8 (1): "The Commissioners shall as soon as may be after the passing of this Act cause a valuation to be made of all mines other than those disclaimed, whether or not developed or working or abandoned or exhausted, in Great Britain, showing what on August 4th, 1914, and what at the date of the passing of this Act was respectively the total ascertained value of each mine and its associated properties." The question of the basis on which the associated properties are to be valued is not laid down in the Bill. There is a general instruction to value.

22,162. They cause a valuation to be made?—Yes. Then they are paid for under clause 10 (1).

22,163. With regard to the things that are not to be paid for, I gather, although, if I may respectfully say so, I do not quite gather it from the language of the draft, that what you really mean is the thing that has not to be paid for is simply—I adopt the phraseology of the Finance Act, 1909-10—the rental value of the mineral rights?—Yes.

22,165. And you intend everything, except the rental value interest, to be paid for?—If it is a part of the mine, subject to the provisions as to the maximum price.

22,166. I suppose under that a colliery undertaking which was working its own freehold property—you know what I mean?—Yes.

22,167. And therefore, strictly speaking, no rental value subject to the maximum proposed would receive the selling value of its interest?—Subject to the maximum.

23 May, 1913.]

MR. HENRY H. SLESSER.

[Continued.]

22,168. The maximum, I suppose, has been inserted by you simply upon the instructions of your clients?—That is so.

22,169. I do not propose to ask you any question as to the propriety or otherwise of the maximum. With regard to sub-clause 2 of clause 20, I gather you agree the effect of that clause is practically to wipe out the Home Office under the existing Coal Mines Regulation Acts and to substitute for the Home Office the Mining Council?—Yes, that is right.

22,170. The position then would be this, that the Mining Council will be the owners and workers of the collieries and would also be the persons responsible for seeing that they perform the regulations imposed by the Acts of Parliament?—Yes, there will be nothing to prevent any individual aggrieved persons prosecuting them.

22,171. You mean as members of the public?—Yes.

22,172. I suppose on the principle, subject to the terms of the Act, every member of the public can prosecute for an infringement of the law?—I was thinking of the coal miners acting through the Miners' Federation.

22,173. With regard to the Mining Council, I gather that is to be what I may call a body corporate?—Yes.

22,174. With perpetual succession and capacity to hold land and to sue and be sued?—Yes.

22,175. Supposing I was a contractor contracting with the Mining Council and I recovered judgment against them in an action, could I levy on any of the assets for the time being vested in the Mining Council under sub-clause 3 of Clause 4?—I think the same position has come up in connection with properties owned by the Postmaster-General as to the position of a Corporation, sole or otherwise, under the Crown—I speak subject to correction. I think when the petition of right has originally been granted or specific rights of suit for breach of contract provided they proceed under that and you have the rights of any other plaintiff in an action.

22,176. Do you expect that the proceedings under sub-clause 3 of clause 4 of any person contracting in the way of business with the Mining Council would have to be by way of the procedure known as Petition of Right?—I think the position is just the same as in the case of the Postmaster-General.

22,177. I see in sub-clause 4 of clause 3 there are two provisos that any person employed under the Act is to be at liberty to participate in any civil or political action, and a further proviso: "That no such person shall suffer dismissal or any deprivation of any kind as a consequence of any political or industrial action, not directly forbidden by the terms of his employment, or as a consequence of participation in a strike or trade dispute." Can you tell me what are the disabilities that Civil Servants are at present under? Are they not precluded from taking political action?—I think they are.

22,178. And you intend that although miners may become under the Mining Council they are not to be deprived of their rights to exercise full political action?—That is the intention.

22,179. However, as regards payment, the great feature appears to be this, that the individual interest in all mines of all rights, plant and machinery connected therewith that may be vested in the Mining Council is to be paid for subject to a maximum, and paid for, I suppose, at the fair selling value, except that the rental interest or rental value is not to be paid for?—Yes, that is broadly the position, as I understand it.

22,180. *Mr. Arthur Balfour*: In clause 1 (3) I see the Miners' Federation are to form 10 out of 20 of the Mining Council. What would happen if this was passed as an Act of Parliament and the Miners' Federation for some reason lost its power and only represented, say, 100,000 of the workers instead of the number they represent to-day. They would still have 10 on the Mining Council?—In that case, I think it is clear the Act would have to be altered.

The object is to give a fair representation to the workers in the industry. Clearly if a particular Association failed to adequately represent the miners the Act must be altered.

22,181. Would it not be better to say so at once?—That is a question that ought more fairly to be put to the persons instructing me. My instructions were to put it in that form that contemplates the Miners' Federation as the miners' representatives.

22,182. Now go to section 3 (4). Under that I take it if there was a dispute at any moment the 10 Miners' Federation people on the Council for the time being who are practically owners and miners of the concern could go on strike, if they wished?—I do not follow that. They are not employed by the Mining Council.

22,183. They are the body who is going to run it?—"All or some of whose members are wholly or partly employed in or about mines, or in any other manner employed by the Minister of Mines, or the Mining Council." I do not think the Mining Council themselves are employed by the Mining Council.

22,184. So that any 10 members could take part in strikes and lock-outs or in terminating strikes and lock-outs?—That clause does not seem to touch the members of the Mining Council.

22,185. Is there anything in your Bill to make it quite safe that the 10 members on the Mining Council shall not go on strike and ferment disputes?—The matter is not dealt with one way or the other.

22,186. You do not answer the question. Is there anything in the Bill to prevent it?—No, I do not think there is anything to prevent it, anything more than there is to prevent the 10 members of the Government going on strike, or the President.

22,187. Clause 5 (1) (c) is plain confiscation of the unrelieved property; that is what is referred to in that clause?—The persons instructing me consider there would be no compensation for the rights and easements there stated, and the clause carries out that intention.

22,188. As regards wages, if these powers were delegated to the Pit Councils they could settle wages?—Subject to the provision that the wage question shall be settled in consultation with the workers.

22,189. The Act really settles wages to the detriment of the consumers?—I can only answer in this way. The Bill does not say which subjects are, if I may use the phrase, reserved subjects, and whether to be reserved to the Mining Council or reserved to the District Mining Council, or reserved to the Pit Council. It gives a discretion to delegate such powers as can be exercised locally. I should say the wage question is not a question that could be conveniently exercised locally. Even if it were delegated, it would probably go to the District Mining Council and not the Pit Council. I think it says in terms the delegation is to the District Council: "A District Mines Council shall, in the first place, subject to the approval of the Mining Council, have power within their area to appoint Pit Councils for each mine or group of mines," and so on, "and the District Mining Council may delegate to such Pit Council such of their powers concerning the immediate working or management of a particular mine or group of mines as the District Mining Council may, subject to the approval of the Mining Council, think fit." I do not think that would extend to the question of wages. The intention is the question of wages would rest with the District Council, that is, by districts, as under the present Minimum Wage Act, if not with the Mining Council it will not rest with the Pit Council.

22,190. It is certainly the management of the pit; the word is "immediate"?—The matter is entirely elastic. One cannot dogmatise. I think that means something more immediately connected with the winning than a general wage question.

22,191. In Clause 13 (1) you provide for a Fuel Consumers Council, but it has no powers; it is an advisory body?—Yes.

22,192. It has no power to discuss the wage question or the controlling of expenditure?—I take it

23 May, 1919.]

MR. HENRY H. SLESSER.

[Continued.]

the general powers of the Mining Council to make regulations under the Act provided for in Clause 19 would enable the Mining Council to make regulations, among other things, as to the manner in which the Fuel Consumers' Council should be convoked and what it has to do.

22,193. The Fuel Consumers Council is subsidiary to the Mining Council?—It would be like the Food Controller's Council that did such valuable work during the war.

22,194. Under Clause 21 you refer to a sufficient supply of fuel at reasonable prices. Who is going to settle the reasonable price—the Mining Council?—I think those words are practically the same words as in the New Transport Bill with regard to electricity; they are really declaratory.

22,195. It means the whole of the consumers of the country are in the hands of the Mining Council as to reasonable price?—I think there is this advantage under the Bill. At present, except for war emergency legislation, there is no necessity on any owner or seller of coal to sell coal at a reasonable price. He can sell it at the price he can get. Under the Bill there is an obligation on the Mining Council to sell it at reasonable prices, whatever they may be.

22,196. If a man sells it too high he has to keep it, because people will go and get it somewhere else?—There is a duty on the Mining Council to supply coal at reasonable prices.

22,197. They decide the reasonable prices?—It may be a matter of mandamus; I cannot say.

22,198. *Mr. R. W. Cooper:* There is one question I forgot to ask you. Take clause 16 sub-clause 1. You say there: "There shall be transferred to the Mining Council all the existing assets and liabilities of mine undertakings and associated properties, as and when they are transferred to and vested in the Mining Council other than liabilities for" rents and so on. No doubt you will readily imagine, and you probably know, that many of these mining undertakings have a large amount of invested reserve funds which represent the profits of past years. Am I right in supposing that under that clause as you have framed it, those vested reserve funds would pass to the Mining Council. Under clause 16 (3) they are provided for?—Hardly.

Chairman: Supposing the company had £50,000 of war loan.

22,199. *Mr. R. W. Cooper:* That was the case I was thinking of.—Those are moneys due to the company.

22,200. *Mr. R. W. Cooper:* Put it another way. Let us assume that the company held £50,000 of Canadian Pacific Debenture Stock, or better still £50,000 of ordinary stock of a British railway. You would hardly suggest that was money due to the company as holders of the stock, would you?—The intention is that assets which are transferred shall be paid for.

22,201. What I ask is this. What object have you in seeking to transfer to the Mining Council such assets of an undertaking as its invested reserve fund which cannot be of any use to the Mining Council in carrying on the mine itself as an undertaking?—I say quite frankly it may be this clause wants some little re-drafting. The intention is when you have existing liabilities or have credits that that shall be carried on as a going concern.

22,202. All that you intended by this clause was that the balance of debts owing on the one hand to the concern or moneys owing by the concern in the ordinary course of business shall be paid for as the case may require?—Yes.

22,203. The assets outside the fixed mining assets have not to pass to the Mining Council?—No—"As at the date due" suggests that.

22,204. I respectfully submit your clause wants some amendment?—That is very likely.

Chairman: We are very much obliged to you for explaining it to us so lucidly.

(The following Draft Bill was placed by witness before the Commission.)

THE NATIONALISATION OF MINES AND MINERALS BILL,
1919.

A Bill to Nationalise the Mines and Minerals of Great Britain and to provide for the National Winning, Distribution, and Sale of Coal and other Minerals.

Whereas it is expedient that mines and minerals should be taken into the possession of the State.

Be it enacted by the King's Most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal and Commons in this present Parliament assembled, and by the authority of the same, as follows:—

Establishment of Mining Council.

1. (1) For the purpose of winning, distributing, selling, and searching for coal and other minerals, there shall be established by His Majesty by Warrant under the sign manual, a Mining Council, consisting of a President and 20 members, ten of whom shall be appointed by His Majesty and ten by the Association known as the Miners' Federation of Great Britain.

(2) It shall be lawful for His Majesty, from time to time, to appoint any member of the Privy Council to be President of the Mining Council, under the name of the Minister of Mines, to hold office during His Majesty's pleasure.

(3) The Members of the Mining Council, other than the President, shall be appointed for five years, but shall be eligible for reappointment. Provided that His Majesty or the Association known as the Miners' Federation of Great Britain respectively shall have power to remove any person appointed by them and appoint some other person in his place. On a casual vacancy occurring by reason of the death, resignation, or otherwise of any of such members or otherwise, His Majesty or the Miners' Federation of Great Britain, as the case may be, shall appoint some other person to fill the vacancy, who shall continue in office until the member in whose place he was appointed should have retired, and shall then retire. The members of the Mining Council shall devote the whole of their time to the business of the Mining Council.

Minister of Mines and Parliamentary Secretary.

2. (1) The Minister of Mines and one of the Secretaries of the Mining Council (to be known as the Parliamentary Secretary and to be appointed by His Majesty) shall at the same time be capable of being elected to and of sitting in the Commons House of Parliament.

(2) The Minister of Mines shall take the oath of allegiance and official oath, and shall be deemed to be included in the First Part of the Schedule to the Promissory Oaths Act, 1868.

(3) There shall be paid out of money provided by Parliament to the Minister of Mines a salary at the rate of £2,000 a year, and to the Parliamentary Secretary a salary at the rate of £1,500 a year.

(4) The Minister of Mines and the Parliamentary Secretary shall be responsible to Parliament for the acts of the Mining Council.

Officers, etc.

3. (1) The Mining Council shall appoint a Secretary (to be known as the Permanent Secretary), and such assistant secretaries and officers and servants as the Mining Council may, with the sanction of the Treasury, determine.

(2) Subject to the provisions of Section 11 (2) of this Act, there shall be paid to the Permanent Secretary, Assistant Secretaries and other officers and servants such salaries or remuneration as the Treasury shall from time to time determine.

(3) There shall be transferred and attached to the Mining Council such of the persons employed under any Government Department or local authority in

23 May, 1919.]

MR. HENRY H. SLESSER.

[Continued.]

or about the execution of the powers and duties transferred by or in pursuance of this Act to the Mining Council as the Mining Council and the Government Department or local authority may with the sanction of the Treasury determine.

(4) Notwithstanding anything in any Act, order, or regulation, any society of workers, all or some of whose members are wholly or partly employed in or about mines, or in any other manner employed by the Minister of Mines, or the Mining Council, or a District Mining Council, or Pit Council, or otherwise under this Act, may be registered or constitute themselves to be a Trade Union, and may do anything individually or in combination which the members of a Trade Union or a Trade Union may lawfully do. Provided further that notwithstanding any Act, order, or regulation to the contrary, it shall be lawful for any person employed under this Act to participate in any civil or political action in like manner as if such person were not employed by His Majesty, or by any authority on his behalf.

Provided, further, that no such person shall suffer dismissal or any deprivation of any kind as a consequence of any political or industrial action, not directly forbidden by the terms of his employment, or as a consequence of participation in a strike or trade dispute.

Constitution of Mining Council.

4. (1) The Mining Council shall be a Corporation to be known by the name of the Mining Council and by that name shall have perpetual succession, and may acquire and hold land without licence in mortmain.

(2) The Mining Council shall have an official seal, which shall be officially and publicly noticed, and such seal shall be authenticated by the Mining Council or a secretary or one of the assistant secretaries, or some person authorised to act on their behalf.

(3) The Mining Council may sue and be sued without further description under that title.

(4) Every document purporting to be an order, licence, or other instrument issued by the Mining Council, and to be sealed with their seal, authenticated in manner provided by this Act, or to be signed by a secretary or by one of the assistant secretaries, or any person authorised to act, shall be received in evidence and be deemed to be such order, licence, or other instrument without further proof unless the contrary is shown.

(5) Any person having authority in that behalf, either general or special, under the seal of the Mining Council may, on behalf of the Mining Council, give any notice or make any claim, demand, entry, or distress, which the Mining Council in its corporate capacity or otherwise might give or make, and every such notice, claim, demand, entry, and distress shall be deemed to have been given and made by the Mining Council.

(6) Every deed, instrument, bill, cheque, receipt, or other document, made or executed for the purpose of the Mining Council by, to, or with the Mining Council, or any officer of the Mining Council, shall be exempt from any stamp duty imposed by any Act, past or future, except where that duty is declared by the document, or by some memorandum endorsed thereon, to be payable by some person other than the Mining Council, and except so far as any future Act specifically charges the duty.

Transference of Mines and Minerals to Mining Council.

5. (1) On and after the appointed day, save as in Sub-Section 3 of this Section, provided—

(a) Every colliery and mine (including all mines, quarries and open workings of ironstone, shale, fireclay and limestone, and every other mine regulated under the Metalliferous Mines Regulation Acts, 1872 and 1875, but not including mines, quarries,

or open workings of minerals specified in the First Schedule to this Act), whether in actual work, or discontinued, or exhausted, or abandoned, and every shaft, pit, borehole, level, or inclined plane, whether in course of being made or driven for commencing or opening any such colliery or mine, or otherwise, and all associated properties (including vessels, lighters, railway rolling stock, and all works, including works for the manufacture of bye-products, in the opinion of the Mining Council belonging to any mine undertaking or connected with any colliery or mine, and every house belonging to the owners of any such colliery or mine, which, in the opinion of the Mining Council, is usually occupied by workmen employed at such colliery or mine), (all of which are herein included in the expression "mine"); and

(b) all coal, anthracite, lignite, ironstone, shale, fireclay, limestone, or other mineral, excepting the minerals specified in the First Schedule to this Act, whether at present being worked or not worked, or connected or not connected with any mine, beneath the surface of the ground (all of which are herein included in the expression "minerals"); and

(c) all rights and easements arising out of or necessary to the working of any mine or the winning of any mineral, including all mineral wayleaves, whether air-leaves or water-leaves, or rights to use a shaft, or ventilation or drainage or other royalties, lordships, or rights in connection therewith, whether above or below the ground (all of which are herein included in the expression "rights")

shall be transferred to, vested in and held by the Mining Council in their corporate capacity in perpetuity, and shall for all purposes be deemed to be royal mines, and the minerals and rights thereof respectively.

(2) The Acts contained in the Second Schedule to this Act are hereby repealed.

(3) Provided that the Mining Council may at any time before the appointed day give notice in writing to the owner of, or person interested in, any mine or minerals or rights, disclaiming, during the period of such disclaimer, all or part of the property in such mine or minerals or rights to the extent specified in the notice, and thereafter such mine or minerals or rights shall, until such time as the Mining Council shall otherwise determine, to the extent specified in such notice, not vest in the Mining Council as provided by Sub-Section (1) of this section. Provided that in such case it shall not be lawful for any person other than the Mining Council, without the permission of the Mining Council, to work such mine or minerals in any way. Provided further that on the termination of such disclaimer by the Mining Council, such mine or minerals or rights shall, to the extent of such notice, as from such date as the notice may prescribe, vest in the Mining Council as if such notice of disclaimer had not been given.

Purchase of Mines.

6. The Mining Council shall purchase the mines of Great Britain in them vested by this Act (other than those which are the property of the Crown at the time of the passing of this Act or which have been disclaimed in whole or in part in accordance with Section 5 (3) of this Act) at the price and in the manner provided by this Act. Provided always that the value of any rights as defined by Section 5 (1) (c) of this Act shall not be taken into account in computing such price, for all of which no compensation shall be paid.

23 May, 1919.]

MR. HENRY H. SLESSER.

[Continued.]

Mines Commissioners.

7. (1) For the purpose of assessing the purchase price of mines it shall be lawful for His Majesty, by warrants under the sign manual, to appoint ten Commissioners, to be styled the Mines Purchase Commissioners (herein called the Commissioners) of whom one, appointed by His Majesty, shall be Chairman.

(2) Three of the said Commissioners shall be nominated by the Association known as the Miners' Federation of Great Britain, and three by the Association known as the Mining Association of Great Britain.

(3) At the expiration of twelve months from the passing of this Act, in the event of a majority of the Commissioners failing to agree as to the purchase price of a particular mine or of its associated properties, it shall be lawful for the Chairman himself to fix the purchase price of such mine, which price shall then be deemed to be the price fixed by the Commissioners, but, save as herein expressly provided, the finding of a majority of the Commissioners voting on any question or as to the purchase price of mines shall be final and conclusive and binding on all parties.

(4) It shall be lawful for His Majesty to remove any Commissioner for inability or misbehaviour. Every order of removal shall state the reasons for which it is made, and no such order shall come into operation until it has lain before the Houses of Parliament for not less than thirty days while Parliament is sitting.

(5) The Commissioners may appoint and employ such assessors, accountants, surveyors, valuers, clerks, messengers, and other persons required for the due performance of their duties as the Treasury on the recommendation of the Commissioners may sanction.

(6) There shall be paid to the Commissioners and to each of the persons appointed or employed under this section such salary or remuneration as the Treasury may sanction; and all such salaries and remuneration and the expenses of the Commission incurred in the execution of their duties, to such amount as may be sanctioned by the Treasury, shall be paid out of moneys provided by Parliament.

Valuation of Mines.

8. (1) The Commissioners shall, as soon as may be after the passing of this Act, cause a valuation to be made of all mines other than those disclaimed, whether or not developed or working or abandoned or exhausted, in Great Britain, showing what on August 4th, 1914, and what at the date of the passing of this Act was respectively the total ascertained value of each mine and its associated properties and the rights, as defined by Section 5 (1) (c) of this Act, therein, and the total ascertained value of such mine and its associated properties respectively exclusive of such rights; and the owner of every mine and any person receiving any rents, interest, or profit from any mine or possessed of any rights therein or connected therewith, on being required by notice by the Commissioners, shall furnish to the Commissioners a return containing such particulars as the Commissioners may require as to his property, rent, interest, profits, or rights in such mine.

(2) The Commissioners may likewise cause any mine to be inspected, require the production of documents, or do any other thing which may, in their opinion, be necessary to fix the purchase price of the mine or its associated properties.

(3) The Commissioners in making such valuation shall have regard to returns made under any statute imposing duties or taxes or other obligations in respect of mines, or minerals or rights, and to any information given before or to any Commission or Government Department, including the Coal Industry Commission constituted under the Coal Industry Commission Act, 1919.

Ascertainment of Purchase Price.

9. (1) The purchase price of mines exclusive of associated properties (other than mines in the

possession of the Crown at the time of the passing of this Act) shall be computed subject to the provisions of sub-sections (2) and (3) of this section by ascertaining the average annual number of tons of minerals actually raised during the five years preceding August 4th, 1914:

Provided that as regards coal mines in no case shall the maximum purchase price, exclusive of associated properties, be taken to be more than the following:—

	s. d.
When 100,000 tons or less have been raised per annum on the average during such five preceding years, a capital sum equal to one such year's output at	12 0 per ton.
When more than 100,000 tons have been raised per annum on the average during such five preceding years, a capital sum equal to one such year's output at	10 0 per ton.

(2) The Commissioners in arriving at such computation shall also have regard to the actual gross and net profits which have been made in the mine during such years or thereafter and to the amounts which may have been set aside from time to time for depreciation, renewals, or development, and to the probable duration of the life of the mine, and to the nature and condition of such mine, and to the state of repairs thereof, and to the assets and liabilities of any mine undertaking existing at the time of purchase which are transferable to the Mining Council under Section 16 of this Act.

(3) Provided further that where a coal mine, in the opinion of the Commissioners, has not been fully developed, the amount which would be raised under full development without any increase of capital expenditure shall be taken as the average annual number of tons raised, and the maximum purchase price in such case shall be taken to be a capital sum equal to the product of such number of tons and 12s. or 10s. per ton respectively, for the purpose of ascertaining the maximum value per ton under sub-section (1) of this Section.

Issue of State Mines Stock.

10. (1) The purchase price of any mine and such of its associated properties as have been purchased, as ascertained under the provisions of this Act, shall be paid by the Mining Council in Mines Purchase Stock to the persons who, in the opinion of the Mining Council, have established their title to such stock. Provided that an appeal shall lie to the High Court under rules to be framed by the High Court from the decision of the Mining Council as to the title of any such persons, but for no other purpose.

(2) For the purpose of paying such purchase price the Treasury shall, on the request of the Mining Council, by warrant addressed to the Bank of England, direct the creation of a new capital stock (to be called "Guaranteed State Mines Stock"), and in this Act referred to as "the stock," yielding interest at the rate on the nominal amount of capital equal to that payable at the date on which this Act received Royal Assent on what, in the opinion of the Treasury, is the nearest equivalent Government Loan Stock.

(3) Interest shall be payable by equal half-yearly or quarterly dividends at such times in each year as may be fixed by the warrant first creating the stock.

(4) The stock shall be redeemed at the rate of one hundred pounds sterling for every one hundred pounds of stock at such times and by such drawings as the Treasury, on the recommendation of the Mining Council, may think fit.

(5) The stock may be issued at such times and in such amounts and subject to such conditions as the Treasury may direct, and may be issued as bearer bonds with quarterly or half-yearly interest coupons attached.

(6) The stock shall be transferable in the books of the Bank of England in like manner as other stock is transferable under the National Debt Act, 1870.

23 May, 1919.]

MR. HENRY H. SLESSER.

[Continued.]

Powers of Mining Council.

11. (1) Subject to the provisions of this Act, it shall be lawful for the Mining Council to open and work mines and search for, dig, bore, win and deal with minerals and generally to carry on the industry of mining, distributing, vending and exporting, together with all other industries carried on in connection therewith. Provided that it shall not be lawful for the Mining Council to lease or sell any mine or minerals or rights to any person, association, or corporation.

(2) The Mining Council may, from time to time, in such manner and on such terms as they think fit—

- (a) subject to the general consent of the Treasury, appoint or continue in employment or dismiss managers, engineers, agents, clerks, workmen, servants and other persons; and
- (b) construct, erect or purchase, lease, or otherwise acquire buildings, plant, machinery, railways, tramways, hulks, ships and other fixed or movable appliances or works of any description, and sell or otherwise dispose of the same when no longer required; and
- (c) sell, supply and deliver fuel, coal and other products, the result of mining operations, either within or without the realm; and
- (d) enter into and enforce contracts and engagements; and
- (e) generally do anything that the owner of a mine might lawfully do in the working of the mine, or that is authorised by regulations under this Act or by this Act; and
- (f) employ local authorities for any purpose they may think necessary to carry out their duties under this Act, on such terms as may be mutually agreed.

(3) In addition to the powers conferred on the Mining Council by the last preceding sub-section, the Mining Council may, in such manner as they think fit, work any railway, tramway, hulk, ship, or other appliance for the purpose of winning, supplying and delivering coal or other products.

(4) The Mining Council may compulsorily purchase land or acquire such rights over land as they may require for the purpose of this Act, and shall have, with regard to the compulsory purchase of land, all the powers of purchasers acting under the Land Clauses Act, 1845, and the Land Clauses Consolidation (Scotland) Act, 1845, or any other Act giving power to acquire land compulsorily for public purposes which may hereafter be enacted.

(5) With respect to any such purchase of land under the Land Clauses Acts in Great Britain the following provisions shall have effect (that is to say):—

- (a) The Land Clauses Acts shall be incorporated with this Act, except the provisions relating to access to the special Act, and in construing those Acts for the purposes of this section "the special Act" shall be construed to mean this Act, and "the promoters of the undertaking" shall be construed to mean the Mining Council, and "land" shall be construed to have the meaning given to it by this Act.
- (b) The bond required by Section 85 of the Land Clauses Consolidation Act, 1845, and by Section 84 of the Land Clauses Consolidation (Scotland) Act, 1845, shall be under the seal of the Mining Council, and shall be sufficient without sureties.

District Mining Councils and Pit Councils.

12. (1) The Mining Council shall, for the purpose of the carrying on and development of the mining industry, divide Great Britain into districts, and shall in each district constitute a District Mining Council of ten members, half of which shall be

appointed by the Miners' Federation of Great Britain.

(2) The Mining Council may delegate to any District Mining Council or Pit Council, such of their powers under this Act as may conveniently be exercised locally, and the District Mining Council shall upon such delegation have and exercise within their district all the powers and duties of the Mining Council as may be delegated to them.

(3) A District Mining Council shall, subject to the approval of the Mining Council, have power within their area to appoint Pit Councils for each mine or group of mines, composed of ten members, half of which shall be members of the Miners' Federation of Great Britain, and nominated by the workers of the mine or groups of mines aforesaid, and the District Mining Council may delegate to such Pit Council such of their powers concerning the immediate working or management of a particular mine or group of mines as the District Mining Council may, subject to the approval of the Mining Council, think fit.

(4) The members of District Mining Councils shall be appointed for three years, but shall be eligible for reappointment, and the members of Pit Councils shall be appointed for one year, but shall be eligible for reappointment.

Fuel Consumers' Council and Advisory Conference.

13. (1) For the purpose of advising the Mining Council it shall be lawful for His Majesty to appoint persons to represent the interests of consumers, to be known as the Fuel Consumers' Council.

(2) The Mining Council shall have power to convoke at such times as they think fit and under such regulations and conditions as they may prescribe advisory conferences of representatives of District Mining Councils, and the District Mining Councils shall have power in like manner to convoke advisory conferences of Pit Councils within their area.

(3) The expenses of the Fuel Consumers' Council, National and District Mining Conferences shall, subject to the approval of the Treasury, be paid by the Mining Council.

Payment of Mining Council and District Mining Committees and Pit Councils.

14. There shall be paid to each of the members of the Mining Council, other than the President, such salary as the Treasury may determine, and to the members of the District Mining Councils, and to the Pit Councils, such salaries and emoluments as the Mining Council, with the consent of the Treasury, may determine.

Accounts.

15. (1) The Mining Council shall cause full and faithful accounts to be kept of all moneys received and expended under this Act, and of all assets and liabilities and of all profits and losses, and shall annually lay such accounts before Parliament.

(2) The Mining Council shall annually cause a balance sheet of accounts to be made, including a capital account and a profit and loss account for each mine worked under this Act.

(3) Such balance sheet and statement shall be so prepared as to show fully and faithfully the financial position of each such mine, and the financial result of its operations for the year.

(4) All moneys raised under the authority of this Act shall, as and when raised, and all other moneys received hereunder shall, as and when received, be paid into a separate account called "The National Mines Account."

(5) All moneys withdrawn from the National Mines Account constituted under this Act shall be withdrawn only by the order of the Mining Council or such other person as the Mining Council may from time to time appoint.

(6) All moneys in the National Mines Account, or payable into that account by any person whomsoever,

23 May, 1919.]

MR. HENRY H. SLESSER.

[Continued.]

and also all moneys owing by any person under this Act, are hereby declared to be the property of the Crown, and recoverable accordingly as from debtors to the Crown.

Transference of Existing Assets and Liabilities.

16. (1) There shall be transferred to the Mining Council all the existing assets and liabilities of mine undertakings and associated properties, as and when they are transferred to and vested in the Mining Council, other than liabilities for rights including royalty rents, wayleave rents, or any other underground rents or charges, payable or due at the time of the passing of this Act to any person, all of which shall cease to be payable on and after the appointed day.

(2) On the passing of this Act, there shall be ascertained by the Commissioners the amount of all moneys due to or from all mine undertakings, and the findings of the Commissioners as to the amount of such moneys shall be binding and conclusive on all parties.

(3) The net amount of all moneys due to any mine undertaking, after all debts due from any such undertaking have been deducted, as ascertained under Sub-section (2) of this section, shall be paid by the Mining Council to the persons to whom in the opinion of the Commissioners such debts are due, and shall be deemed to be expenses incurred under this Act. Provided that an appeal shall lie to the High Court, under rules to be framed by the High Court, from the decision of the Commissioners as to the title of any such person, but for no other purpose.

Payments out of Moneys Provided by Parliament.

17. (1) All sums expended or payable under this Act in carrying out the provisions of this Act for expenses, or for salaries or wages payable under this Act, or in the construction, erection, or acquisition of buildings, plant, machinery, railways, tramways, hulks, ships, or other appliances or works, or otherwise, shall be payable out of moneys provided by Parliament.

(2) Provided that moneys received under this Act in respect of the sale or export or supply of coal or other minerals (including the moneys received from the Government Departments) may be directly expended in or towards carrying out the purposes of this Act.

Payment out of Consolidated Fund.

18. After full provision has been made for all outgoings, losses, and liabilities for the year (including interest on securities created and issued in respect of moneys raised as aforesaid, and on moneys paid out of the Consolidated Fund), the net surplus profits then remaining shall be applied in establishing a sinking fund and, subject thereto, in establishing a depreciation fund in respect of capital expended.

Regulations.

19. (1) The Mining Council may, from time to time, make such regulations as they think necessary for any of the following purposes:—

- (a) The management of mines under this Act;
- (b) the functions, duties, and powers of the District Mining Councils, Pit Councils, and other bodies or persons acting in the management and working of mines or distribution and sale of fuel under this Act;
- (c) the form of the accounts to be kept and the balance sheets to be prepared in respect of mines under this Act;
- (d) the mode in which the sinking funds and other funds connected with mines under this Act shall be held and administered;
- (e) generally any other purpose for which, in the opinion of the Mining Council, regulations are contemplated or required.

(2) The Mining Council, before making or altering any regulations or conditions of employment, including wages, as affect workmen engaged in the mining

industry, shall consult with the association known as the Miners' Federation of Great Britain, and, in the event of such representatives and the Mining Council failing to agree, the matter in dispute may be referred to arbitration on such terms as may be mutually agreed.

(3) Provided that nothing in this section shall be deemed to interfere with the right of any employed person, subject to his contractual obligations, to dispose of his labour as he wills.

Statutory Regulations.

20. (1) Every mine worked under this Act shall be managed and worked subject to the provisions of the Metalliferous Mines Regulations Acts, 1872 and 1875, the Coal Mines Regulation Act, 1908, the Coal Mines Act, 1911, and any other Act regulating the hours, wages, or conditions of labour in mines.

(2) There shall be transferred to and be vested in the Mining Council all the powers and duties of the Secretary of State and of any other Government Department imposed upon them by the Metalliferous Mines Regulations Acts, 1872 and 1875, the Coal Mines Regulation Act, 1908, the Coal Mines Act, 1911, or any other Act regulating or affecting mines or the hours or conditions of labour therein.

Duty of Mining Council to Supply Coal.

21. (1) It shall be the duty of the Mining Council to ensure that there is a sufficient supply of fuel at reasonable prices throughout Great Britain, and for this purpose it shall be lawful for the Mining Council, or for any local authority or Government Department acting on their behalf, to establish stores and depots and to employ vehicles and to use all other necessary means for the selling of fuel and to sell fuel within the area of every local authority, and, further, for this purpose it shall be the duty of the railway companies or authorities of Great Britain to provide such facilities for the conveyance of fuel as the Mining Council may deem necessary to enable them to carry out the duties imposed upon them by this section at rates not greater than such railway companies or authorities are now entitled to charge for the conveyance of fuel.

(2) Where the Mining Council delegates to any local authority all or any of their powers under this section, it shall be lawful for such local authority to exercise all or any of the powers of the Mining Council so delegated to them.

(3) All moneys had and received or expended by a local authority under this section shall be deemed to be had and received or expended on behalf of the Mining Council.

Title and Commencement.

22. This Act may be cited as the Nationalisation of Mines and Minerals Act, 1919, and this Act and the Metalliferous Mines Regulations Acts, 1872 and 1875, and the Coal Mines Regulation Act, 1887 and 1908, and the Coal Mines Act, 1911, may be cited together as the Mines Acts, 1872-1919, and shall come into operation on the first day of the second month, which shall be the appointed day, after the passing of this Act, and, save in the case of disclaimer, all valuations, purchase, and transference of mines and minerals to the Mining Council, and all other arrangements for the carrying out of this Act shall be concluded on or before the first day of the second year after the coming into operation of this Act.

23. This Act shall not apply to Ireland.

FIRST SCHEDULE.

Minerals excluded from this Act:—

Sandstone.	Slate.	Building Clay.
Granite.	Chalk.	Gravel and Sand.
Cherts.	Flints.	Igneous Rocks

(The Witness withdrew.)

CAPTAIN WILLIAM STEPHEN SANDERS, SWORN and Examined.

22,205. *Chairman*: I think you are the Secretary of the Fabian Society?—I am.

22,206. You are going to be good enough to tell us something about the condition of affairs in Germany?—I will try.

22,207. Have you been in Germany yourself very often?—I have resided there for special purposes to study for 18 months, and I have been there every year since 1900 until the outbreak of war.

22,208. *Chairman*: I will ask the Secretary to read your *précis*.

Secretary:

"I have had a fairly wide experience in the administration of both private and public enterprises (in connection with the latter mainly through membership of the London County Council) and have made a special study of working class social, industrial and political conditions in Germany.

The system of State ownership of coal mines in Germany did not arise out of any well considered scheme of Nationalisation, as nationalisation is understood to-day in Great Britain. The mines were pieces of State property which were used for the object of raising revenue, any other purpose being purely incidental. The output was mainly absorbed by the State railways, the Navy, the Army and other national institutions. The management was purely bureaucratic, the workers having no voice whatever in the control and management of the mines. The various Mines Departments in the various States possessing State coal mines were, of course, subject to the criticism of the State Parliaments, but, owing to the undemocratic franchises, democratic opinion had no opportunity of bringing direct pressure upon the administration, which may be justly described as a form of State capitalism, a term which may also be applied equally correctly to all the State productive undertakings of Germany. The State Governments almost universally refused to recognise trade unionism, and this accounts largely for the weakness of the German miners' organisations. It is true that by law the Prussian Government instituted Workers' Committees in all mines in Prussia, both private and State owned, but these Committees were purely advisory, and being without the support of strong trade union organisations were without much influence.

Nevertheless, in spite of the bureaucratic and entirely undemocratic system of administration, the effect of State ownership on the conditions of life and work of the miners was, in some respects, undoubtedly good. The State did not pay higher wages than the private employer, in fact State wages were lower than in some of the privately owned mines. But in pursuance of its policy of social reform as a counter measure to Social Democratic propaganda and as a means of checking physical deterioration in

human industrial and war material, the Prussian Government (which owns the bulk of the State mines in Germany) provided amenities in connection with its mines which were superior to those instituted by private enterprise in the same industry. It was more generous in giving holidays in cases of ill-health; in erecting miners' cottages and advancing loans to miners to build their own houses; and in the establishment of baths and washhouses. Some of the miners' cottages in the Ruhr district are quite admirable and considerably above the general standard of German working-class housing accommodation. It should be mentioned, however, that there was a strong feeling among the miners against owning their own houses on the ground that it tied the workers too closely to the place of their employment and limited freedom of movement. The equipment of some—not all—of the State mines was claimed to be of a high order, and large sums were spent in attempts to minimise the risks to the workers. This policy, coupled with the legislative enactments concerning all mines, also affected the conditions prevailing in privately owned mines.

The results of the working of the State mines in comparison with private enterprise mines, is a matter of dispute. The output of the State mines was, during the few years before the war, from 13 to 15 per cent. of the total coal output of Germany. The Prussian Mining Law of 1907 gives the State the exclusive right to search for minerals and to take over and work any discovered at a fixed valuation. It is, therefore, to be expected that the well-organised private coal-mine interests, opposed as they were to State enterprise and wishing to prevent its extension, should endeavour to prove that the State was not so efficient in its management as the private owner. To obtain a correct judgment on the matter it would be necessary to have all the facts—many of which are not at present obtainable—submitted to an impartial financial mining expert—if there is such a person. In 1913 there was a net surplus or profit on the Prussian State mines of 14½ million marks, and in 1914 it was estimated that the surplus would reach 17 millions. It is contended by private mine-owning interests that certain charges which ought to have been brought into the accounts were met out of taxation; on the other hand, a mining workers' journal* alleges that the whole cost of the Mines Department, which administers the Acts relating to all mines, private and State, and the cost of the Academy of Mines and of the National Geological Museum, are all included, unfairly, in the statement of expenditure of the State-owned mines. With regard to output it would appear that, on the whole, the production per miner in the State mines is less than in those privately exploited. But it is not clear whether the production per miner per day worked is less. In the Saar District the State mines show a larger output per miner

* *Bergarbeiter*, March 14, 1914.

23 May, 1919.]

CAPTAIN WILLIAM STEPHEN SANDERS.

[Continued.]

than the privately-owned mines in Lorraine. Dr. Ernst Jungst declared in 1913 that it was impossible to solve the question of comparative output with the data available. As to the State administration, it is alleged by the German supporters of private enterprise that it was costly and unenterprising, and, at the same time, that it was too much concerned in providing amenities for and considering the welfare of the miners and not sufficiently bent upon getting the full value out of the mines. The workmen also complained that the bureaucratic State management was sometimes wasteful in its methods. It would appear that although the State mines yielded a considerable revenue, the administration was not as competent, nor had it evolved such elasticity in its system, as that of the State railways. But in this connection, two facts should be borne in mind. First, that the State mines form only a comparatively small part of the whole mining industry while the State owns and works practically the whole of the railways; and, second, that, as already mentioned, private enterprise in the German coal industry was exceedingly well organised, and in its fight against the extension of State ownership or control was not over scrupulous in its method of attack nor in the kind of evidence it adduced. How powerful private enterprise was, and how ingenious in protecting its interests, may be seen in its defeat of the attempt of the Prussian Government to obtain a controlling interest in the Hibernia Coal Company.*

As to opinion in Germany on the question of State ownership of the mines, it may be stated that the orthodox political economists as represented by Adolf Wagner, Gustav Schmoller and other well-known professors, on the one hand, and the Social Democrats on the other, were both in agreement as to the necessity, in the public interest, of nationalising the whole of the industry. They differed, of course, as to the method of control. The economists were averse to democracy in industry as understood in Great Britain; the Social Democrats, while opposed to syndicalism, were desirous of securing more political power and industrial rights for the workers before increasing the area of State ownership. The political conditions in Germany, especially in Prussia, were of a kind that gave justification to this attitude on the part of a party standing for democracy.

It is not possible to state what was the attitude of the majority of the miners themselves on the question

* Elmer Roberts. Monarchical Socialism in Germany.

as they were not only badly organised, but the various workers' organisations that existed were on anything but friendly terms with each other. This weakness was due partly to the antagonism of both the State and the private employers to trade unionism and partly to the religious, political and national differences between Germans themselves and the Poles and Germans employed at the mines. In 1913 there were 765,000 mine workers in Germany. Of these only 104,113 were members of Miners' Central (i.e., Social Democratic) Union, the only organisation in the industry which was similar in structure and aim to those unions of this country connected with the Miners' Federation of Great Britain. A smaller number belonged to the so-called Christian Trade Union and still fewer to the Hirsch-Duncker organisation. There were also several thousands in what were known as "Yellow" unions (Free Labour Associations) founded by the employers to combat the Central Union. The members of the Central Union would, as Social Democrats, be in favour of complete nationalisation, providing that the administration was subject to the control of a popularly elected Government. As to the others, they would probably have been divided in opinion.

No doubt the Social Democrats, before the Revolution of November, 1918, would have been satisfied with nationalisation under a democratic form of government, but the actual workers in the industry would almost certainly have claimed a voice in the management and in the regulation of disciplinary conditions. The Social Democrats had not worked out any plan to deal with these problems, being immersed in the task of acquiring political power. But in other countries the problems have been dealt with, and in several cases with satisfaction to the workers, notably in the French State Railway administration, the New South Wales Railway Service, the Swiss Railway Service, the Municipality of Lyons, the Canton of the City of Basle and elsewhere.**

Chairman: Gentlemen, Mr. Sanders has given us a very valuable *précis* of what happened in Germany, but, of course, he is not expressing any individual opinion; therefore it is not necessary to cross-examine him on his individual opinion. Unless you think anything he has said is inaccurate, I do not know that it is necessary to ask him anything. Does any gentleman on my left wish to ask Mr. Sanders any questions? (*No reply.*) Does any gentleman on my right wish to ask any questions? (*No reply.*) Thank you, Mr. Sanders.

** See State and Municipal Enterprise. Fabian Research Department.

(The Witness withdrew.)

(Adjourned to Tuesday next at 10.30.)

SECOND STAGE—NINETEENTH DAY.

TUESDAY, 27TH MAY, 1919.

PRESENT :

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.
MR. R. W. COOPER.
SIR ARTHUR DUCKHAM.
MR. FRANK HODGES.
SIR LEO CHIOZZA MONEY.
SIR ADAM NIMMO.

MR. ROBERT SMILLIE.
SIR ALLAN M. SMITH.
MR. HERBERT SMITH.
MR. R. H. TAWNEY.
MR SIDNEY WEBB.
MR. EVAN WILLIAMS.

SIR ARTHUR LOWES DICKINSON,
SIR RICHARD A. S. REDMAYNE, } (*Assessors*).

MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

Sir L. Chiozza Money: Sir, I am very sorry to interrupt, but I wish to direct attention to a matter which has occurred. You will remember that Mr. Harold Cox recently gave evidence before this Commission. He has since reprinted his evidence, or some one has done it for him, and it appears in a pamphlet entitled "The Coal Industry: Dangers of Nationalisation," in which there is the following foreword: "The following pages are based upon the evidence given by me before the Coal Commission, with further material added and necessary corrections." There is nothing in the reprint to show what has been added, but amongst the things added there appears this at page 9: "The Post Office is a favourite example for State Socialists. They are apparently unaware that, except as regards the conveyance of letters, the Post Office has for many years been virtually a bankrupt concern. In 1916 the Committee on Public Retrenchment, of which Sir Leo Chiozza Money and Mr. J. H. Thomas were members, reported unanimously with regard to the Post Office: 'We have, however, been impressed by the fact that of all the numerous services managed by the Post Office, hardly one shows any profit, except the Letter Post.'" Mr. Harold Cox was a member of this Committee, and so was I, and he and I know that in signing that report it was a report made in time of war. In making that report, we deliberately put in those words: "We have decided, after discussion, to adopt the procedure of

Select Committees and not to publish any Minority Reports or individual reservations." Among the individual reservations which were made was one made by myself, in which I think Mr. Thomas also agreed, that we did not agree with the paragraph as to the Post Office. There are many other similar things in the report also. It seems to me very unfair to publish evidence given before this Commission and to add things taken from another Committee's Report, and to represent that one of the Commissioners agreed with that form of report when as a matter of fact the Report as a whole was only signed by the members because it was in time of war, and we felt we had to get on with practical things, and therefore we would not worry about making individual reports. I wish to point out that this attack on the Post Office, which is continuous, seems to be exceedingly unfair.

Chairman: Thank you, Sir Leo. With regard to the evidence this morning, the first witness will be Mr. Hughes, who will place the case of the Surveyors before the Commission. Then we shall have Mr. Gibson, who submits a proof on behalf of the Scottish Mine Managers' Association. There will be two other witnesses with regard to mine managers tomorrow. After we have heard Mr. Hughes and Mr. Gibson, Mr. Straker, the Secretary of the Northumberland Miners' Association and a member of the Executive Council of the Miners' Federation of Great Britain, will go into the witness chair.

MR. AUSTIN OWEN HUGHES, Sworn and Examined.

22,209. *Chairman:* I think you are the Head Surveyor of the Powell Duffryn Steam Coal Company, Limited?—Yes.

22,210. I believe you speak as to the surveying subject?—Yes.

22,211. *Chairman:* I will ask the Secretary to read your proof.

Secretary:

"The standard of education, training and experience required to produce an efficient Mine Surveyor:—

Preparatory to being a pupil in mine surveying a secondary education at least is necessary, consisting of a thorough knowledge of Higher Mathematics, including Trigonometry, the use of

Logarithms, Mensuration, Theoretical and Applied Geometry, English Grammar, Composition and Phraseology. I consider a training of 5 years necessary to a pupil, the last 2 years being made to be the requisite period in the practical experience in the surveying of mines for qualifying to sit for a Mine Surveyor's certificate. The knowledge to be acquired in this qualifying period must include the construction and uses of the theodolite, Mine Surveyor's dial, levelling instruments and the other manifold accessories appertaining to field and mine surveying, together also with the practical use of the various appliances for the transfer of all survey and levelling work on paper in the shape of accurate plans and sections of the surface boundaries of

27 May, 1919.]

MR. AUSTIN OWEN HUGHES.

[Continued.]

mineral takings and the relative positions of mine workings in the seam or seams of coal being worked. Having attained the foregoing knowledge and experience, the pupil obtains by a written and oral examination a certificate of competency as a Surveyor of Mines, granted by the Secretary of State of Home Office.

2. His duties, as demanded by the Coal Mines Act, must be to provide:—

- (1) An accurate plan of the workings of the mine up to a date not more than 3 months previously, showing the boundaries of the mine, relative positions of mine workings with surface and variations of ordnance basis levels of the mine roadways, all faults, disturbances and washouts, depths of shafts and sections of strata sunk through.
- (2) A separate plan showing the system of ventilation of each seam in the mine, direction of air currents, points of air measurements, devices for regulation and distribution of air, &c.
- (3) Plans of abandoned mines within 3 months after abandonment showing all particulars of the plan of the mine as described under paragraph (1).
- (4) Plans of the workings of the mine for rescue brigades to be kept up to a date not more than 3 months previously showing detailed particulars as to mode of ventilation, &c.
- (5) A sketch plan for each pit-head showing the means of egress from each part of the mine, &c.
- (6) A proper plan showing all fixed electrical apparatus in the mine, &c.

In addition to the above Home Office requirements, duplicate plans are made and respectively kept up to date for the General Manager, Agent and Manager of the Mines, totalling three distinct duplicate plans of each individual seam. As the seams are often 10 in variety, this means 30 plans or tracings to be posted up every 3 months. Other plans are also prepared and kept up to date on reduced scales for the use of Directors and General Managers of a similar nature to the above larger scale plans.

In many cases throughout the country, to minimise the cost to the Coalowner, the Surveyor designs and draws up the plans of winding, hauling and other class engines and the requisite houses to accommodate same. The importance and responsibilities are also embraced in the designing and making plans and sections of surface arrangements for a colliery, including the correct laying out of railways, sidings, tramways and mechanical haulages; a thorough knowledge of mining for the safest and most economical way of laying out the workings of a mine, including expensive drivages of hard headings from seam to seam in directions and to gradients given by Surveyors. Owing to mineral takings being subdivided into as many as 12 to 30 different Royalty Owners, strict attention has always to be observed in the avoidance of roadways passing through expensive wayleave estates without unduly affecting the best working methods of the colliery. Also the Surveyor has to, either by calculation or allocation, ascertain the due proportions of coal payable as royalty and wayleave to the respective Property Owners. The accuracy of the Surveyors' work under all conditions is the greatest safeguard to the lives of all employed in a mine; illustrating, for instance, the immense dangers of new workings approaching old and disused workings, which latter often contain accumulations of great weight of water or of inflammable or other poisonous gases and would, if accidentally released, result in great loss of life. In all cases of fatal accidents or accidents which may probably prove fatal, the Surveyor has to prepare sketches to scale and produce same as a sworn-in witness at the Inquiry or Inquest, as the case may be.

3. I beg to include with this *précis* a diagram picture showing comparisons of wages of the educated,

trained, experienced and Home Office Certificated Mine Surveyor—"

22,212. *Chairman*: Have you that diagram?—Yes.

(*The diagram was produced.*)

22,213. On the right hand side the diagram says: "Colliery labourer also assisting surveyor in the mine, average weekly wage, £4 0d. 6d." Then the next gentleman is "Certificated Mine Surveyor (other than head) (educated, highly trained, experienced and executing work of vital importance), average weekly wage throughout Great Britain, £4 5s. 8d." Then this shows the average weekly wage of the Head Certificated Mine Surveyor is £5 10s. The next is: "Colliery labourer (unskilled) also assisting surveyor in the mine." There is a note that the colliery labourer needs no education whatever, and it gives the average weekly wage throughout Great Britain as £4 0s. 6d. Then comes the fireman assisting the surveyor in the mine. The note says that the fireman is not an educated man and is subservient in his ordinary duties to the uncertificated colliery overman. The average weekly wage throughout the kingdom is £5 7s. 3d. That is a very interesting table, and we are very much obliged to you for it, because it puts it very clearly.

Secretary:

"3. I beg to include with this *Précis* a diagram picture showing comparisons of wages of the educated, trained, experienced and Home Office Certificated Mine Surveyor, with the fireman and labourers assisting him on a survey underground, in addition to the accompanying diagram the following statement will indicate the comparisons of Surveyors' wages and wages paid to unskilled labour. The latter are based from Mr. Finlay Gibson's figures which have already been before the Coal Industry Commission, whilst the Surveyors' wages are averages from personally signed statements of Surveyors. In both cases the recent award of 2s. per day has been added.

COMPARISONS OF WAGES PAID TO CERTIFICATED MINE SURVEYORS AND MORE OR LESS UNSKILLED AND PURELY UNSKILLED COLLIERY LABOUR.

Weekly Wage (Average) Paid on May 10, 1919.

	£	s.	d.
*Head Certificated Mine Surveyor	5	10	0
*Certificated Mine Surveyor (other than Head)	4	5	8
* (Educated, highly trained, experienced and executing work of vital importance.) Unlimited hours of employment.			
Fireman, examiner or deputy, assisting Surveyor in the mine	5	7	3
(Not an educated class of man and subservient in his ordinary duties to the colliery overman.)			
(Mr. Finlay Gibson's statistical evidence, Form 5-5, with addition of recent advance and multiplied 6½ days per week.)			
Colliery labourer (unskilled) also assisting Surveyor in the mine	4	0	6
(No education, even of an elementary kind necessary for his duties.)			
(Mr. Finlay Gibson's Form 5-6, recent advance allowed for 6 days per week.)			

4. The comparisons obviously show the present inadequate remuneration of a Certificated Mine Surveyor and on behalf of the Mine Surveyors of Great Britain.

5. The following scale of salaries are requested for immediate adoption:—

£300 first year's certificated service, afterwards £26 annual increment until a maximum of £600 be reached.

A minimum salary of £600 per year for Head Surveyors with free house, coal, firewood and light to every married man holding a Home Office Mine Surveyors certificate.

27 May, 1919.]

MR. AUSTIN OWEN HUGHES.

[Continued.]

When these salaries are reduced by more than half to ascertain the pre-war values of same, the figures will appear to be reasonable.

I beg to submit also the unwarranted condition of the present remuneration as noted out to the Surveyors of Metalliferous Mines and to Land Surveyors of Mineral Estates."

22,214. *Chairman: (To the Witness.)* I am going to ask Mr. Frank Hodges, who comes from the South Wales district, and Mr. Evan Williams, who is also familiar with that district, to ask you questions; but before they do so, do you wish to add anything to your proof?—I wish to dilate somewhat upon these different points which are before you in an abridged form.

22,215. Which point do you wish to dilate on first?—On the preparation of accurate plans.

22,216. Then will you kindly dilate upon the preparation of accurate plans?—Section 20 (i) of the Coal Mines Regulations Act, 1911, says: "An accurate plan of the workings of the mine up to a date not more than three months previously" shall be kept. How much lies in those words, "an accurate plan," only the skilled surveyor of to-day fully realises, with the constant experience of present workings to be carefully watched against the unexpected striking of the workings of former years, frequently filled with water and deadly gases. How often do we hear of the piercing prematurely of those old workings inaccurately recorded by unskilled men with a superficial knowledge of surveying, which inaccuracies have cost the country many valuable lives of the workers underground, and involved colliery companies in the loss of thousands of pounds? The curse of past years has been the employment of incompetent and careless surveyors who gave temporary service for a small salary, and whose inaccurate records are the distraction and incubus of the competent surveyor of to-day whose responsibilities are greatly increased thereby. The post of a mine surveyor was up to a few years ago looked upon merely as a stepping stone to a colliery manager's post, and it is chiefly the work of these men, who have looked upon it and used it as such, that has been the undoing of the mine surveyor by the inaccurate records left behind them. I do not wish to infer that this was so in every case, for I know of several very excellent mine surveyors who are now mine managers; but, generally speaking, it cannot be disputed that mine surveyors of the past, using their post temporarily as a stepping stone to another position, carried out their work in anything but an efficient manner. His Majesty's Inspectors of Mines recognised the arduous task of the mine surveyor and the skill and technical knowledge necessary to provide reliable

plans of a mine, and it is due to their efforts chiefly that of late years the mine surveyor has been recognised by the Home Office as a person upon whom rests a large amount of responsibility, and whose knowledge and skill must be tested before a Board of Examiners. This Act of 1911 has effectually stopped the quacks who have done so much to degrade the profession, but it does not prevent mining students swotting to get through an examination and then to hold the position of mine surveyor with the ultimate object of attaining to the position of the little better paid mine manager, and thereby stultifying by neglect the surveying knowledge gained and preventing him from taking that whole-hearted interest in his survey work that is absolutely necessary for accuracy. The higher standard of education of late years has produced young men of higher ambitions generally, and others who are attracted to the work of mine surveying feel they need only the incentive of adequate pay to perfect themselves in the profession and raise it to a standard of excellence that will be a credit to the coalfields of our country, whose greatest asset is its coal industry.

22,217. Have you sufficiently dilated upon the first point?—I have a little more I should like to say.

22,218. Lots of people have a lot to say, but what is the next point you have?—I just wanted to prove that the work of a colliery surveyor has to be done by a skilled man.

22,219. I think you may take it that all the members of the Commission would entirely agree with you there, that the colliery surveyor's work requires a skilled man. You need not trouble about that point. Speaking for myself, and, I think, speaking for all the Commissioners, we are quite in agreement without question that for a colliery surveyor's work you must have a skilled man, so that you need not labour that point?—If you please.

22,220. What is the next point?—I was going to take the whole of these points.

22,221. Well, you have finished with that one. What is the next point? Do you wish to say anything with regard to earnings and what they ought to be?—I should like to bring before your notice some of the work done by a mine surveyor, and I shall be pleased if I may be permitted to put before the Commission a glass model of the pit bottom of a shaft recently sunk, and which was made under the supervision of Mr. Vaillant, the head surveyor of the Great Western Colliery Company.

22,222. Very well; we will call Mr. Vaillant now and have the model produced.

(A glass model was produced.)

Mr. JOHN IGNATIUS VAILLANT, Sworn and Examined

22,223. *Chairman:* What does this model represent?—This represents the opening development of a new colliery, the Cwm Colliery, at Llantwit Fadre.

22,224. Is that near Pontypridd in South Wales?—Yes. Five miles from Pontypridd. This is a section which shows two shafts from the surface, the one 743 yards and the other 765 yards. The lines that you see represent a series of drivages underground. I should like to point out first of all that before anything is done underground a plan is drawn to show exactly how we are to do the work, and directly the shafts are down, the coal proved then the landings are marked out. It is the work of the surveyor to lay out the roads as intended.

22,225. I think I understand this. You must remember that some of the members of the Commission have been engaged in coal mining for forty years and they have just begun to know something about it. Does this model accurately represent the work of the surveyor?—Absolutely.

22,226. It shows the difficulties the surveyor has?—Yes.

22,227. And it shows the skill he must have in order to lay out a proper plan of the mine?—That is the case.

22,228. I do not think we need trouble you any more.

(The Witness withdrew.)

22,229. *Chairman: (To Mr. Hughes.)* Will you continue?—I think we understand the model.

Witness: I should like also to show a small plan of the section of the sinking of a shaft as to which details of the sinking have to be kept by the surveyor and recorded upon the plan. (Plan produced.)

22,230. This is the same sinking what the Cwm sinking. Will you tell us briefly what the plan is, does

it show the various strata through which you have to sink to reach the seams of coal?—That is so, from the surface.

22,231. And the surveyor is responsible for a plan like that?—Yes.

22,232. That again proves your point and shows what a skilled man he must be?—I think so, especially when he has to be up against the sinker, who is a very sharp man indeed.

27 May, 1919.]

MR. AUSTIN OWEN HUGHES.

[Continued.]

22,233. What is the next point?—The next point is that I should like to show another small plan which shows the difficulty of the surveyor in preparing the work.

22,234. But I do not think you need trouble about that, because we all agree with you: you must be a man of great skill?—But the work would be rather interesting if you saw it before you.

22,235. Very well, we will just see the plan?—(*Producing plan.*) This is a plan by Mr. Leston of the Powell Duffryn Company, showing the contouring of a seam of coal down the pit the difficulties of mining and the difficulty of the work the surveyor has to carry out.

22,236. I am afraid we cannot go into a great number of plans, but we appreciate your point. What does this next plan show?—(*Producing plan.*) This shows the working of the seam with the big faults running through the valley at right angles to the strike of the seam with the contouring of the seam clearly demonstrating the amount of the throw and the increase of the throw of the big fault as it travels in one direction or the other.

22,237. That plan, again, shows that you must have a man of great skill to do work of that sort?—Yes.

22,238. Now, what is the next plan?—(*Producing plan.*) The next plan is one showing the peculiarity that is met with underground by great washouts occurring in the seam which may, or may not, affect the seam above or below, and those washouts have to be carefully put down by the surveyor when they have been proved either by trial pits, or bore holes, and they have to be accurately recorded so that the managers of mines may not drive in any direction an expensive road which may go into that barren ground.

22,239. Yes, that is most important. Then I suppose you would say that £5 10s. a week is not sufficient for a gentleman who has to possess all this knowledge?—Not at the present day.

22,240. You have quite demonstrated that to us. I will ask you two questions now, because I quite appreciate the result of your evidence. First of all, are you in favour of the nationalisation of the coal royalties?—It is a matter that we have not given great attention to.

22,241. If you have not given attention to it, your opinion will not be very valuable. Now with regard to the coal industry, what is your view with regard to the nationalisation of that? Have you given attention to that?—Yes.

22,242. What is your view? Do you think it is a good thing or a bad thing?—It will be a good thing in one way.

22,243. What are your reasons for saying it will be a good thing?—We look upon our coalfields or coal as a very valuable asset of the country, and at present with the irregularity of the boundaries with each mine taking there is a considerable loss of this valuable asset of the country. Hundreds of thousands of tons of coal are left in useless barriers through these irregularities. If they were under the State these irregularities would be very largely laid out in straight lines, limiting the amount of barrier that would have to be left to protect one colliery's workings against the other.

22,244. *Mr. Frank Hodges:* Do you regard your present employers as men who have appreciated your education and intelligence up to now?—Unfortunately I do not. If they had we should not have troubled to ask to appear before this Commission for redress.

22,245. So that it is not true to say, as has been said, that the present system of ownership is one that readily appreciates intelligence and pays for it, and pushes it forward?—Far from it.

22,246. When you make this comparison between your wages and the wages of a labourer and make the distinction as you do between your education and the education of a fireman, is it because you feel that the latter class are not being properly paid, or being paid too much?—Oh no, it is not that at all. I do not think that the miners are paid too much for their

work, but the mine surveyor is paid far too little for the skilled work which he carries out.

22,247. Do you think that if the industry were owned by the nation you would, as a class of workmen, give the same valuable services, with the same amount of zeal, to the nation as you now give to these people who apparently do not appreciate the standard of your education?—Certainly. That is one of the failings of the present-day colliery surveyor; he does his work too conscientiously for the pay which is given him.

22,248. *Mr. Evan Williams:* Do you come here representing any organised body of surveyors?—Yes.

22,249. What body is that?—The Institute of Mine Surveyors recently formed.

22,250. How recently?—March of this year.

22,251. Was it formed for the purpose of bringing the grievances of surveyors before this Commission?—Yes, that is one of the objects.

22,252. I gather from your reply to Mr. Hodges that your sole purpose in coming here is to try and get higher salaries for surveyors?

Mr. Frank Hodges: I did not put that question. I never asked the witness the question whether it was his sole purpose to come here for an advance in wage. I did not ask a question about his wage but the character of the work he was performing under a different system.

Mr. Evan Williams: I am not referring to Mr. Hodges' question but his reply.

Mr. Frank Hodges: He did not give that reply.

22,253. *Mr. Evan Williams:* I think he gave a reply which bears that construction. (*To the Witness.*) What is your object in coming to give evidence before this Commission?—My main object in the first instance is this. The Institute of Mine Surveyors has not originated or been brought to birth by the present industrial unrest in the country, but has been growing for many years, and has come out at this particular time when they have seen an opportunity of putting before the Coal Commission some wrongs which they think need redressing. It is also the object of this Institute to educate their members and to impress upon the Commission the necessity of having skilled and experienced mine surveyors upon their Board of Examiners so that whenever a colliery company employs a surveyor having that certificate there is the assurance that the man is a skilled man and able to carry out and make reliable plans of the mine.

22,254. Do you mean to cast any reflection upon the competency of the present Board of Examiners?—I would rather you did not ask me that question.

22,255. But it is a question which I think arises out of your reply. However, you come here representing that body?—Yes, I come here representing that body. We have branches in Scotland, Yorkshire, Lancashire, North Wales, Derbyshire, Nottinghamshire, Somersetshire, and South Wales.

22,256. Have you taken any opportunity at all of putting these views before the coal owners?—No, we have not.

22,257. You have come to this Commission without asking the coal owners to meet you or discuss any of these matters with you at all?—Yes. We have tried too many times, individually but not collectively. We find without some move is made collectively no movement on the part of the coal owners takes place.

22,258. And you have taken a lesson from the workmen and organised for the purpose?—There is a jolly good organisation and an example which could be followed.

22,259. You have given figures as to the wages of the head certificated mine surveyors and other surveyors. What are those compiled from?—They are compiled from information sent in to our Secretary from the different centres, which are signed by the head surveyor of each colliery, giving the wages of each individual member of his staff.

22,260. Have you returns from the whole country?—Yes.

27 May, 1919.]

MR. AUSTIN OWEN HUGHES.

[Continued.]

22,261. And these are the averages of the whole country?—Yes.

22,262. Do you say this £5 10s. a week represents the wages of a head surveyor of your standing?—It is less than that. Those figures were prepared up to May 13th. Since then we have had other figures in which have reduced that amount.

22,263. Will you tell the Commission what is your own salary?—£335 a year.

22,264. Are there any privileges?—House, coal, fire-wood and light.

22,265. In addition to the £335?—Yes. That is a recent increase I had within this last month.

22,266. What were you getting before the war?—Before the war, £200.

22,267. I suppose you are aware that the Controller has exercised a good deal of control over the salaries of officials of collieries?—Yes, but unfortunately it is not applied in all cases to the mine surveyor.

22,268. But the colliery owner has frequently had great difficulty in getting consent from the Coal Controller to increase his officials' salaries?—Well, it is time the Coal Controller knew something more about the work of some of the colliery officials.

22,269. Are you aware what salaries men of your capacity are getting in the Army? What is the pay of an Engineer officer?—About eight members of my staff joined the Forces and became Lieutenants in the Tunnelling Company of the Royal Engineers, and I have heard them say that their salaries have run up to something like £1 or 25s. a day.

22,270. That is during the war and on war service?—Yes.

22,271. Do you know what a Sub-inspector of Mines gets in the way of salary?—Yes.

22,272. Are they better paid than you?—Oh, yes, in some cases.

22,273. Are you aware that their maximum is £200 per annum?—The maximum of an Inspector of Mines?

22,274. No, of a Sub-inspector?—I misunderstood you; I thought you said Inspector. I was not aware it was quite as low as that; if it is, it is a shame.

22,275. Do you anticipate that you would get higher wages under Government service than in private service?—Yes, I feel pretty sure I should.

22,276. Although Sub-inspectors of Mines, who, I think you would say, are quite as well qualified as surveyors of mines, are paid less than you?—I do not think they are to be compared with surveyors of mines. They do not do half the arduous work that a mine surveyor carries out or put in the time the mine surveyor does.

22,277. They may have a different opinion?—Yes, but I should like to argue the point with them.

22,278. Perhaps you will have the opportunity some time. You said you favoured the nationalisation of the coal industry because of the waste of coal in barriers. Is that so?—Yes.

22,279. Are you quite clear you did not refer to the nationalisation of minerals, but you meant the nationalisation of the working of the collieries?—Well, I intended that reply to be under the nationalisation of mines.

22,280. And the reason you gave was that at present a large amount of coal is wasted in barriers?—Yes.

22,281. Do you say that is your experience in South Wales?—Yes.

22,282. With the Powell Duffryn Company do you find a lot of coal wasted in barriers?—Yes.

22,283. Do you know Mr. Hann, who gave evidence here?—Yes.

22,284. That was not his opinion?—Well, of course, it differs from mine, that is all.

22,285. Your experience is that in the Powell Duffryn Collieries a large amount of coal is at present wasted in barriers?—At the present time I must say on behalf of the Powell Duffryn Company—otherwise

I might be misunderstood—that it is their great endeavour, and always has been, to straighten the barriers, and it is not any fault of theirs that the barriers of their workings are not straight ones.

22,286. How much does the Powell Duffryn Company leave as a barrier?—About 50 yards.

22,287. That is to protect them?—Yes, from the adjoining workings.

22,288. Do you suggest it is not necessary to leave any barrier at all?—I do not; I think it is necessary.

22,289. Necessary for the working of the collier?—Yes.

22,290. So that if the mines were nationalised and were all mines in the same ownership, you still think it would be necessary to leave barriers between them?—Yes.

22,291. To what extent do you suggest there is any saving?—In the straightening of the barriers.

22,292. And for that purpose you think it is necessary to nationalise coal mines?—One of the reasons—not the only reason.

22,293. For that purpose to straighten the barriers, it is your opinion that the coal mines should be nationalised?—It is one of the purposes, at any rate; I do not say it is all.

22,294. Assuming that should be done, do you suggest it cannot be done by any other means?—Well, we have tried, speaking again of the Powell Duffryn Company, for several years to get an agreement with owners of adjoining mines for the straightening of boundaries, but have failed to do so.

22,295. What do you attribute that to?—To the stupidity of the other coalowners.

22,296. Have the landowners interfered at all?—No.

22,297. It is the difficulty of arranging between one coalowner and another?—Yes.

22,298. Given that the boundaries are irregular, as they undoubtedly are, do you know of any barriers left needlessly at present in South Wales?—Hardly needlessly, but left in excess of what is necessary.

22,299. You say that no barrier is left which is not required to be left at the present time?—No.

22,300. None at all?—Except in the irregularity of the boundaries. Do not trip me up in that. I want to be clear on the point.

22,301. Then the hundreds of thousands of tons of coal you speak of are left only because of the irregularity of the barriers?—The irregularity of boundaries and excessive barriers.

22,302. What do you mean by excessive barriers?—In the case of a dispute in mine ownership, the result is, usually after coming to arbitration, that the disputed area should be left as a barrier.

22,303. Could you give me an instance of that?—Yes; if you compel me to do so, I will.

22,304. *Chairman:* Will you tell us that?—There was a dispute between the late Lord Merthyr and Lord Aberdare, where there is a large barrier left between the Powell Duffryn workings and the Fendal Colliery workings, and I consider it excessive, and a lot of very valuable coal has been left which would not otherwise have been done.

22,305. *Mr. Evan Williams:* What was the ostensible purpose of leaving that barrier?—It was really because they could not definitely agree as to what was the correct boundary line.

22,306. And so you say a larger barrier was left than was necessary?—Yes.

22,307. And it was left as the result of arbitration?—As a result of the dispute.

22,308. But you said it went to arbitration, do you not?—Yes.

22,309. And the arbitrator decided that this barrier should be left?—It was decided, or, as I take it, they agreed to that.

22,310. It is a difference of opinion between you and the arbitrator?—Well it may be so.

Mr. R. H. Tawney: Sir, might we ask this witness to give the figures of which he spoke as to the wages of the surveyors?

22,311. *Chairman:* (To the Witness.) Have you got the figures?—Yes.

27 May, 1919.]

MR. JOHN GIBSON.

[Continued.]

22,312. Will you let Mr. Tawney have them?—Yes; our Secretary has them here. They are given in confidence by the surveyors.

22,313. *Mr. R. H. Tawney*: You have no objection to those going in?—They are given in confidence.

22,314. *Mr. Robert Smillie*: The amounts might be given without the names.

Witness: Yes; the amounts might be given without the names.

22,315. *Mr. Arthur Balfour*: Could you give us numbers with the salaries opposite the numbers?—Yes.

22,316. *Chairman*: Is there any objection to our seeing them, but not publishing the names?—No, that is so.

Chairman: Then I will hand them round.

Sir L. Chiozza Money: Could the witness prepare a table summarising it without names?

22,317. *Chairman*: Yes, I think that will be the best. (*To the Witness*.) Will your secretary, in the course of the day, prepare for us a table showing the gross weekly salary? This table which I have is headed "Strictly private and confidential," and then it says: "Institute of Mine Surveyors. Returns of salaries paid to the Surveyors at such-and-such a mine." Then the head surveyor gives his number of years' service, and I will read the first line so that you will see what is there. It says: "Head Surveyor. He had 25 years' service before the granting of certificate, and 8 years' certificated service, net salary, without deduction or extras, £3 10s.; percentage, 7s.; bonus, 10s.; war wage, 18s.; Sankey Award, 12s.; gross weekly salary, £5 17s." Then

the next are the certificated surveyors, and they are £4 10s., £4 8s. 6d. and £4 7s. I think that is a Welsh colliery.

Mr. R. W. Cooper: Could we have the district in each case and the number of pits over which the surveyor has charge?

22,318. *Chairman*: Yes, we will get that. This is Cheshire, £4 2s., and Lancashire, £5 16s. Then there come some Scottish mines which seem to be much less, £3 17s., and so on. (*To the Witness*.) Could you make a list and analyse all these, putting the gross weekly salary and the size of the colliery?—That is already prepared. I think our Secretary has that statement there now.

22,319. *Sir L. Chiozza Money*: How many collieries have you returns from?—The figures are there, but I cannot remember them.

Chairman: Very well; we will call the Secretary as a witness later when we have seen the papers.

22,320. *Mr. Robert Smillie*: Would you ask the pre-war and the present time figures?

Chairman: Can we get the pre-war ones and the present figures, Mr. Bray?

Mr. Bray: The standardised wago is practically pre-war.

22,321. *Chairman*: What do you want to know, Mr. Cooper?

Mr. R. W. Cooper: I think we should have it classified into districts, and we should know the pits that each surveyor has charge of. He may have charge of one small pit, or he may have charge of several pits, and one wants the output.

Chairman: Very well.

(The Witness withdrew.)

Mr. JOHN GIBSON, Sworn and Examined.

22,322. *Chairman*: You have not been good enough to tell us anything about yourself except that you are a certified colliery manager. Do you live at Kilmarnock?—Yes.

22,323. What colliery are you managing there?—I am the manager of the Aunandalo and Windy Edge Collieries.

22,324. You are presenting a *précis* of evidence on behalf of the Scottish Mine Managers' Association?—Yes.

22,325. How many gentlemen are there in that Association?—About 300 managers.

22,326. You deal with the points of joint control, nationalisation, the status of the manager and housing. How long have you been a district colliery manager?—19 years.

22,327. Now, if you will turn to the first page of the evidence, when I have read it I am going to ask Mr. Smillie to ask you questions on my left, and Sir Adam Nimmo on my right. I am not going to read the whole of it, but the various important points. I do not say it is not all important, but I am going to read what appear to me to be the salient parts:—

"SCOTTISH MINE MANAGERS' ASSOCIATION.

I. Regarding Joint Control.

So far as the Association understand this proposal it means, in effect, multiple management. If this implies multiple responsibility they consider it possible in practice, but economically impracticable. If it means that the managers will be saddled with responsibility for matters over which they have little or no control, they will not touch it. If it means advisory, but not executive control, they welcome the proposal."

That is what you say with regard to joint control. Now with regard to nationalisation:—

"The Association believe that certain national advantages may be gained by this proposal, for example:—

- (1) Central pumping stations for draining great areas.
- (2) Standardisation of a great many of the simpler appliances such as trams, rail gauges, tippers, greasers, turn plates, etc.

(3) Central power stations worked in connection with central washing plants, and so making use of the slurry or duff.

(4) Central power stations worked in connection with coke oven and by-products plant.

(5) Some little advantage might be gained on boundary coal between different royalties, but in the troubled fields of Scotland large faults or whin intrusions usually form natural boundaries.

The Association see various other minor advantages of nationalisation, as, for example, a higher status for the manager. They firmly believe that it would do all these things, and might do many others; but so far as the nation is concerned it would *not* pay. A very difficult question crops up at the first step towards nationalisation, that is valuation. A coal pit is unlike other concerns, such as factories or workshops. Its valuation does not depend entirely on the value of the fixed plant, nor the average profit for the past ten, twenty, or thirty years, but largely on the quantity and *quality* of the *unworked* coal. How an equitable valuation could be made, giving the proper respective powers to these and other factors, they are unable to imagine."

I will not trouble you with a thing you cannot imagine, but I will go on to your scheme: "Gibson's Scheme." When you say "Gibson's Scheme," does that mean a scheme that you bring forward on your own responsibility, or does it mean a scheme that you are authorised to put forward on behalf of the Scottish Mine Managers' Association?—My scheme authorised by the Scottish Mine Managers' Association.

22,328. It is your idea which they have approved. Now I am going to read that, because that is the sort of thing we want.

"The easiest and safest policy probably is for the Government to follow the example of the Co-operative movement and tackle the distribution problem before attempting the nationalisation of the productive process. The railways being in their hands, they can at once get delivery of every pound of coal immediately it reaches the pit bank, and distribute it as they

27 May, 1919.]

MR. JOHN GIBSON.

[Continued.]

think fit. The price given would be the highest that the country could afford, and would vary with the national and international economic exigencies of the time, but the price of pit bank would be the same all over the country, and a low grade coal from Ayrshire would be paid for at the same rate as anthracite from Glamorgan. Each colliery would be a separate economic entity, and the scheme would be as follows:—

- (1) Standard national rates for every class of labour, from the managing director to the youngest boy, would be set up, but the present system of paying by piecework would be continued.
- (2) A standard rate of interest on capital would be set up, based, not on any valuation, but on wages paid.
- (3) 50 per cent. of the profits, after paying all charges, would be divided in direct proportion to their receipts between the employers and employees, and 50 per cent. would go to the pool.
- (4) The pool would, with Government sanction, guarantee the standard wages in the poor mines.

Should the pool in any bad year be unable to pay the standard wages the Government would advance the necessary money, and they would get the surplus in any good year.

(5) Cost of new plant to be taken out of revenue. Some of the results of this arrangement would be:—

- (1) It would not be in the interest of the owner to keep down wages, but the reverse, as his profit would be in direct ratio to the wages of the workmen, hence:—(a) The wages of the director and manager should, to a larger extent than in the case of the workmen, depend on dividends; (b) The capitalised value of the colliery, if taken over by another coalowner or if nationalised, should be estimated on, say, 10 years' interest on capital plus 20 years' dividend."

What do you mean by 10 years' interest on capital?—I have set up a certain arbitrary figure as interest on capital, a figure based on wages paid. Then, after paying the sum due to the pool, the remainder, which goes to the men and the employers, is called the dividend.

22,329. Is the pool to pay taxes?—Oh no, the pool is the surplus from the rich collieries.

22,330. Will any taxes be paid at all—only by the recipients, I suppose, of the pool?—I do not quite follow you on taxes. We call local rates taxes.

22,331. Then I will not trouble you.

"It would be directly in the interests of workmen that the colliery was efficiently managed and that labour-saving appliances were introduced to reduce the cost of production, but, as the cost of the machinery will be borne largely by them, the country would be safeguarded from costly experiments. In the case of an allegation of inefficient management, simple, practical machinery could easily be devised to try the case.

While it would be in the interests of the workmen to have high wage rates, it would not be in the interests of the workmen generally in any colliery that any particular section should have excessively high rates, as these could only be got either out of dividends or out of the pool, hence applications for sectional increases would be dealt with by the Pit Committee assisted by the management in the first instance.

The manager's time would be much devoted to considerations of safety, as wages disputes would hardly concern him, and every one of his men would be an eager economist and a hustler for output. His powers for disciplinary purposes should be clearly defined and should, within certain limits, be absolute."

What limits do you suggest?—The Legislature has always put the limit on us. I am perfectly willing to suggest limits.

22,332. But you must have had something in your mind when you wrote this. What had you in your mind when you said, "His powers for disciplinary purposes should be clearly defined and should within certain limits be absolute"?—For example, the manager should have the power of instant dismissal or any other punishment which he should think fit for disobedience to orders or what he might think inefficiency.

22,333. What is to happen outside? Who is to deal with cases outside the limits?—So far as wages and wages disputes are concerned, they would be dealt with by the Pit Committee on the Whitley Council as set forth in the supplementary *précis*.

22,334. Do you think wages come within the disciplinary purposes?—No.

22,335. Your sentence has nothing with regard to wages. You say: "His powers for disciplinary purposes should be clearly defined and should within certain limits be absolute." I may be wrong, but I gather you mean by that that there are certain disciplinary cases where his powers are not absolute, and I wanted to know what they were?—I can answer that. In the case of a breach of the regulations regarding safety his powers should be absolute to deal with that, and his powers for the moment—it may be subject to any higher or wider authority—but his powers for the moment regarding what he considers inefficiency should be for the purposes of immediate action absolute.

22,336. Have you thought what should happen after immediate action?—In which way?

22,337. Is there anything in the nature of an appeal to some other body?—Yes; that is set forth in my supplementary *précis*.

22,338. We shall come to that, but you can tell me what it is now?—If you could state a case.

22,339. I will not trouble you if you have not thought it out.

"The Whitley National Mining Council, having control of the pool, should have power to make a special grant to the director, managers, and officials of any particular colliery or any workman for good individual work, practical suggestions for improved working, or a high standard of general efficiency."

Then you give us a very interesting table of examples of working, but I will not go through that, because the gentlemen of the Commission can see it. Now I go on to page 6, the Status of the Manager.

"Great differences of status exist at the various collieries in Scotland. At one colliery the certificated manager may receive only general instructions regarding what may be called technical policy from his superior, and is allowed a large measure of liberty of choice as to the methods and plant that are to be used for attaining the desired end, and is judged by his results, the whole operation being under his control and supervision. At another colliery he may exercise only supervision, the control being in the hands of a resident general manager or agent. Between these extremes there is an infinite variety of intermediate classes. At one colliery, the manager may enjoy the personal intimacy and friendship of the owner or managing director. At another his name may be unknown to the directors.

When the great increases in wage rates of miners took place during the war, the anomaly arose frequently of the workman being paid more money than the manager. This caused a little estrangement in some cases, as the owners looked upon salaries as being outside the rules that regulated wages. They looked on inflated salaries as permanencies, while inflated wages are only seasonal.

Government control complicated the situation, and the general consensus of opinion among managers was in the direction of combining on quasi trade union lines to get some of the spoil during the scramble. Impetus was given to this movement by fear of harsh and unsympathetic administration of the Mines Act resulting in legal prosecution. The Scottish Mine Managers' Association was formed on these lines, and recognised by the Coalowners' Asso-

27 May, 1919.]

MR. JOHN GIBSON.

[Continued.]

ciation. The questions at issue presently are claims by the managers for—

- (1) A minimum salary of £500.
- (2) A superannuation scheme.
- (3) An increase of £100 on the present war wage of £125.'

I want to know something on this superannuation scheme. Is it your view that superannuation should only be paid after a number of years' service?—The discussions between our Association and the Coal-owners' Association have never taken concrete shape. We have had sympathetic reception.

22,340. I do not know what the discussions have been or what the sympathetic reception has been. I want to have your view. I am asking you this for a purpose. Is it your view that superannuation should only be paid after a certain number of years' service?—With a particular firm?

22,341. Yes?—Oh, no.

22,342. Then what is your idea? If a man serves a year, may he be superannuated?—He might serve a year as a manager from 69 to 70 or from his 46th to his 50th years or at whatever period superannuation was fixed, but before he did so he would be an under-manager or other official all his life.

22,343. Then, would superannuation mean this, that when a man gets to a certain age he is entitled to superannuation?—Yes.

22,344. Now, assume, for the sake of argument, a manager at the age of 55 becomes so incompetent that it is not worth while employing him any longer, but he has been for ten years a manager and has served probably for 30 years; how would you deal with that case? If you keep him on for the sake of his superannuation, you are keeping on an incompetent man for 10 years; if you turn him off it is rather hard on him, because he has got three-quarters of his way towards his pension?—It would be rather difficult.

22,345. That is what I find, and I want to see if you can help me?—It would be rather difficult.

22,346. It is. I have been trying to do it, and I want to see how you can help me. What is your remedy?—There is no remedy for inefficiency.

22,347. I am going to try and find one, but I was hoping to have your assistance.

"These questions are likely to be amicably settled. In the event, however, of the adoption of Gibson's Scheme, nationalisation, or other method of reconstruction, the managers are likely to accept salaries rising and falling with miners' wages, and as the manager is legally responsible for seven days per week and twenty-four hours per day, a reasonable minimum wage would be fourteen miners' standard shifts per week."

Now housing: "Our Association are of opinion that this is not the business of the coalowners any more than it is the business of the Postal Authorities to house the postmen." We do not want the colliery owners to house the postmen. I suppose what you mean is the coalowners to house the miners. Obviously, that is it.

"The coalowner's primary business is to produce coal, and if, in the process, he launches into the subsidiary business of housing, he usually does it badly because he does not understand it. In towns, the unwashed, the feckless, and those criminally inclined gravitate to the slums, but in miners' villages no discrimination is possible between the sheep and the goats, and the wives and children of the best class of the miners are thrown into the closest contact with the dirt, the vermin, and the many disgusting concomitants of slumdom introduced by any low-ruffian whom the colliery manager employs, and who thereby becomes tenant of a company's house.

The owner naturally objects to a man occupying one of his houses while in the employment of a rival firm. The process of ejection raises bitterness. Cheap, bad housing has a detrimental effect both on the physical vigour of the occupant and on his self-respect, and this reacts on output; consequently on wages and the standard of life. Again, the low rental has a detrimental effect in the following way: Sir Leo Money, in the "Nation's Wealth," fixes the

poverty line at 45s. per week (pre-war), and 7s. 6d. or 16.6 per cent. as the economic rent. I can point personally to cases where the rent of a miner's house is as low as 1/200th or .5 per cent. of the household income. With the standard of life so low, the family have some difficulty in finding what to do with their money. I see no prospect of raising the standard until the housewife finds herself demanding the amenities compatible with life in a good house.

Money is the great problem. Quite a large sum is spent yearly in Scotland repairing the damage caused by subsidence and by bad tenants. By standardising the plumber's work a fairly good house might be built (working on a large scale) for £400. If 20,000 such houses are necessary, £8,000,000 is the sum required. Good taste would prevent uniformity of architecture, although we think sensitive people attach more importance to this matter than it really deserves. Although land is cheap we do not think that rent and rates of such a house would be less than 12s. per week. This raises another point. The Scottish miners have lived so long in houses with low rents that they will take very unkindly to high rents. Even with inflated war prices and wages the 12s. rent would be looked upon by the vast majority as prodigious. In our opinion, the process of building good houses and educating the people to the better environment is both a financial and psychological problem, and can only be solved by time and patient effort."

I am very much obliged to you for that paper.

22,348. Mr. Robert Smillie: Could you give us any idea of the average salaries of colliery managers in Scotland at the present time?—I am sorry I could not put authentic figures before you. We have got no returns from our Association.

22,349. Do you know anything about what the salaries were prior to 1914?—I think before the war about £170 to £200 plus the allowances would be about the average figure.

22,350. An average of from £3 10s. to £4 a week with allowances, you say?—I think so.

22,351. Would that apply to Ayrshire?—I would not like to go beyond the book. Of course I could not speak for beyond what I was getting myself.

22,352. You do not mean to say that you have no general knowledge outside of your own colliery. Do you mean to say that you have an Association of 300 members, which you represent here, and have no general knowledge of what their salaries were prior to the war?—Yes, we have general knowledge, but no accurate information.

22,353. Have you known any men holding a first class certificate and in charge of a colliery being paid at any time prior to the war under £3 a week?—Yes. I think I remember one or two cases.

22,354. If you do not know I will not press you on the matter, but I thought you would have some information as representing your Association?—We have no precise information.

22,355. May we take it that your Association is not satisfied that the present system of working the mines of this country by private ownership ought to continue as at present conducted?—I do not think that could be taken as their finding. As loyal citizens they have accepted the finding of the Coal Industry Commission.

22,356. Have they any views on what the Commission has found? I should like to get your own view on this matter. Is it your opinion that the mining industry should be continued on the lines that it has been continued on up to the beginning of the war?—It is my opinion that it is useless to speculate when a postulate has already been laid down. We have to start with that postulate, which is that the present system is condemned.

22,357. Do you consider that the present system is not satisfactory?—Really, my opinion is not worth anything. We must postulate from that. We must start reasoning from that, not work back from it.

22,358. I take it that you are here to give your opinion and the opinion of your Association?—That is perfectly right.

27 May, 1919.]

MR. JOHN GIBSON.

[Continued.]

22,359. The colliery managers, I feel sure, must have been discussing the question whether or not the present system of working the mines of this country should continue or whether there should be another system? I think I might express the general feeling if I were to say that if a better one could be got we would very readily adopt it and uphold it.

22,360. I should like to press you for an answer to my question, which is whether you and your Association are satisfied with the present system of working the coal mines of this country under private ownership?—You may take it very readily that as human beings we are not content.

22,361. *Chairman:* We can only speak as human beings?—That is so.

22,362. You are not content?—No.

22,363. *Mr. Robert Smillie:* The colliery managers employed at the coal mines of Great Britain are responsible from day to day practically for the lives of a million men and boys who are employed?—Yes; and we object very strongly to the position we are put in.

22,364. Do you not wish to be held responsible for the men that you manage?—Yes, I am perfectly willing to take responsibility, but the Coal Mines Act and Regulations have put far too much for any individual man to deal with.

22,365. Is it a fact that they are responsible under the law at the present time for the safety of the mine workers?—Yes.

22,366. That body, so far as you are represented, are not satisfied with the system under which the mining industry has been conducted down to the present time? That was your previous answer—they are not satisfied?—No, not satisfied generally—not with the system. We are not satisfied as human beings; we want something better.

22,367. I want you to put yourself and your managers, as far as their financial position is concerned, outside of this for the moment altogether. I will come to that afterwards. I want to put your own conditions outside of it, and I want to know whether the mining industry as at present carried on, or as it has been carried on up to the beginning of the war, was satisfactorily carried on. Do you think the method in which it was carried on under private ownership was in the nation's best interest?—As far as the production of coal is concerned I think it was efficiently carried on.

22,368. Do you feel that the State, if they owned the mines, could not improve on that?—Yes, if they worked them on my scheme.

22,369. If they would accept the Gibson scheme?—Quite so.

22,370. But if there is not nationalisation of the mines, would that not still leave the mines in the hands of the private owner?—Not necessarily.

22,371. Does the Gibson scheme propose to take over on behalf of the nation the mines?—Yes, that may be eventually adopted.

22,372. Eventually adopted?—Yes, eventually adopted.

22,373. I understood that this Gibson scheme, so far as I could follow you through it, did not propose to take on behalf of the State the mines?—If you will turn to the bottom of page 3 you will see what I suggest is the easiest and safest policy and so forth that should be followed before attempting the nationalisation of the productive process.

22,374. I take it that the Gibson scheme must be tried before attempting the nationalisation of the mines. Is that so?—It might be used as preparatory.

22,375. Your scheme does not nationalise the mines?—No.

22,376. Do you think it would be possible to carry on the coal mines of Great Britain under State ownership, provided we have the assistance of, say, the present staff of managers, under-managers and general managers? Do you think the State could carry it on?—Yes, they could carry it on if they could make it pay—if they could produce coal economically.

22,377. I see you say if the nation took it over they could not produce coal so cheaply as it is produced at the present time?—No.

22,378. Will you give us some reason for that?—You must have studied the question before you make that statement?—Yes. We find if you consider a social body, drawing an analogy between that and a physical body, the bigger the physical body the greater the inertia, and if you have more inertia it takes more force to move it and it takes more force to alter its direction. You cannot stop it and you cannot guide it, and that does not lead to efficiency.

22,379. Would you say that that argument should be applied to your own organisation that you represent here, for instance?—That is not an analogy; that is a metaphor.

22,380. Do you think that your argument would apply to your own organisation—that is to say, the smaller it is the better?—Of course, I could organise another person and myself better than I could organise 199 persons.

22,381. I took it that one of your objections to nationalisation was that you could not produce coal so cheaply, and when I asked you why you said that your answer was because the larger an organisation of this kind becomes the less able it is to be carried on as efficiently as would be the case of the small one?—Yes.

22,382. Then I ask you, does that apply to your own organisation?—My organisation does not produce coal.

22,383. Would it apply to a colliery company that the smaller pits or collieries are better organised and more productive than the large ones?—Yes, I think one could take that as generally true.

22,384. Are the smaller collieries, generally speaking, in a position to apply the mechanical appliances which we have at the present time in the same way as a larger colliery would be?—I should put it in this way, that the smaller pit is more efficiently managed personally, although the plant may be less efficient. The total net efficiency is greater in a small colliery than it is in a large one.

22,385. Then are we to take it that the smaller the pit the better it is?—You must not take that.

22,386. Where do you draw the line?—Hard and fast lines cannot be drawn. You cannot work a small pit at a great depth. A small pit, 10 fathoms deep, is a totally different thing from a small pit 500 fathoms deep.

22,387. I can hardly imagine a small pit 500 fathoms deep?—It may be comparatively small. "Small" is a comparative term in any case.

22,388. At least it would cost a considerable amount of money to put it down?—Yes, but it may be comparatively small—compared with another at 500 fathoms deep.

22,389. Do you think any company would be foolish enough to put down a pit 500 fathoms deep unless it was going to be a large concern? You would not put down a pit of 500 fathoms to work 20 to 30 acres of coal?—Quite so.

22,390. You must ultimately expect it to be a big concern to go down 500 fathoms?—Yes; but I mean comparatively small compared with another.

22,391. May I take it that the very large companies which have amalgamated a number of collieries in Scotland are not the best paying colliery companies?—I do not think you should take it.

22,392. I am merely taking it from your argument that the State would be too big to conduct efficiently the coal mining industry of this country. Imagine for a moment that it was nationalised: I take it that each colliery would still be under the management of an efficient manager?—Yes.

22,393. I suppose we may take it that he would do his duty as he does now to make his own particular part of the work successful?—Yes.

22,394. May we take it that you think that coal could not be produced as cheaply if the mines were nationalised as it is being produced now?—No, I think not.

22,395. Do you know any districts in Scotland in which there are several collieries sunk very close to each other?—I think examples might be got, perhaps, near Hamilton, but I cannot remember for the moment.

22,396. Do you know the Hamilton district and round there?—Yes.

27 May, 1919.]

MR. JOHN GIBSON.

[Continued.]

22,397. I suppose you know of some cases round there where three, four or five collieries may be found within probably a quarter or half a mile of each other?—Yes, I think that is likely.

22,398. Is it not possible that there may be collieries in different parts of Great Britain at the present time in which there is pumping gear in each of the collieries, and that if they were associated the pumping might all be done from one?—Yes.

22,399. Do you think it would be a saving if you could drain a coal area to one centre, always providing that the pumping gear is not engaged its full time? Would it be more economical, where it could be done, to drain it all to one area?—It might or might not. If the centre from which the water was pumped was rather deep you would lose money pumping all the water from a great depth. You would dissipate more than by pumping it from a less depth.

22,400. Generally speaking, it has been suggested that that might be one method of saving expense. I want to put it to you that while you might conjure up circumstances in which it might cost more money, that, generally speaking, it would cost less to pump from one centre than from half a dozen places?—I think you might take it that there is a fair chance of economy.

22,401. I think you are very cautious. However, if you cannot give an answer to the question, we will allow it to drop?—I am trying to answer you as fairly as possible.

22,402. I am trying to put it to you whether it is not possible to cut down expenses by pumping from one central station rather than working in rivalry with one another. You cannot help me on the question of pumping?—I think I have.

22,403. I do not know whether you are trying to or not, but you have not?—You may take it that I am trying.

22,404. In the case of barriers left between several collieries in close vicinity to each other, if it were possible to work co-operatively all over the collieries and take out those barriers, that would be a great saving of the nation's wealth? If the barriers could have been taken out without danger, that would have been a great saving?—Yes.

22,405. If four collieries are sunk close to each other and barriers are left between them for the purpose of preventing the water going from one to another, you would say that is the only purpose of the barriers—that national wealth might have been saved if the pumping could have been done at one centre?—Yes, you may take it.

22,406. I want to put it to you that not only is it a loss of national wealth, but it makes the mine managers' position more difficult in the working of the barriers?—I never personally found a barrier trouble me.

22,407. Barriers sometimes require to be left in in order to conduct the ventilation?—Yes.

22,408. But if the coalfield that is being worked by four different collieries is not too large to be worked from one centre then it would not be necessary to leave those barriers in for that purpose?—No.

22,409. If the coalfield was not too large for the pumping to be done it would not be necessary in that case to leave the barriers in to prevent the water going from one colliery to the other?—Yes, that is so.

22,410. That would be a saving. I want to put it to you that the manager who had to set up his colliery to work a field from one shaft ought to be more successful than if he had barriers to leave in here and there, if he was going to exhaust it from the two instead of four. He would have less difficulty in working the field than if the barriers had to be left in by the four owners. Supposing you yourself found that right in the middle of a field which you are setting out to work you had to leave in, say, a pillar for some purpose of 400 or 800 yards square, it is more difficult working round about there than it would be supposing you went straight forward?—Yes, it is difficult to work round a pillar.

22,411. That is exactly what I have been trying to arrive at for the last ten minutes; and it ought not to be difficult for two men who understand mining to

arrive at a conclusion?—You did not ask me that question.

22,412. I did ask you a similar question with regard to barriers that have to be left between various takings, and you said you had never had any difficulty with barriers. I want to put it to you that wherever you have to go along and leave a piece of solid coal in it always increases the difficulties of miners' work and the manager's work?—No, I do not follow you there. I do not think it is a fair inference.

Mr. Robert Smillie: Then I will leave it there.

22,413. Chairman: Two minutes ago an addendum to the proof was handed to me. I had better read it out. When did you send the addendum in?—I only got it yesterday to bring here.

22,414. I will read it:

“*Re GIBSON SCHEME.*”

Supplementary *précis* of Evidence giving certain suggestions regarding the Constitution, Powers, and Duties of the Whitloy Pit Committees, and District and National Councils. By JOHN GIBSON, Colliery Manager, Kilmarnock.

Constitution.

1. Pit Committees might be composed of the director, manager, and under-manager, and not less than three persons elected by the workmen. This Committee would deal with many of the matters now handled by the owner, agent, or manager. For example, complaints as varied as those as to the presence of foreign material in the coal, from the miners as to the quality of the oil supplied for the safety lamps, or from the drawers as to the condition of the drawing roads. Applications for increased rates would come before them, but their decisions would be subject in this case to the approval or otherwise of the District Council, who would have the advice of their experts. The Committee would direct the policy of the pit, but their general policy would be checked by the Government Inspectors, in order that, for example, “A” seam was worked in such a way that “B,” “C,” and “D” seams were not lost or made unnecessarily difficult to work.

2. The method of electing the members of District and National Councils would require to be carefully thought out and laid down. It would be almost immaterial whether these were composed of workmen or officials, or owners entirely, provided the necessary business ability was present.”

Are you prepared then to see the National Council composed entirely of workmen?—Certainly.

22,415. “For the National Council perhaps 36 members would be a fair number, and to begin with probably 12 each of owners, officials, and workmen representatives would be a good arrangement, as their experience of economics would be from different view points—exchange, technical, and ethical.”

Which are the “exchange”? Are those the owners?—Yes.

22,416. What exactly do you mean by “exchange”?—It is Marshall's definition.

22,417. I dare say it is Marshall's definition, but I want to know what you mean. Everybody in this room does not know Marshall, or his definition. You tell us?—For example, the exchange of coal for gold.

22,418. I know, but everybody has perhaps not had the advantage of knowing. What else?—That illustrates the general principle.

22,419. What do you mean by “technical”?—The trained skill of the manager.

22,420. And “ethical”?—The skill that Mr. Smillie possesses regarding the health, and so forth, and the wage rates of the miners.

22,421. “*Duties and Powers.*—1. The National Council would act as trustees of the pool, keep in touch with the responsible Government Department, and see fair play for the industry.

2. As the health and safety of the miners is of the greatest importance, the Council would—

- (a) Become the Approved Society for Miners' Health Insurance.
- (b) Become the Assurance Corporation for Accident Insurance.
- (c) Institute Unemployment Insurance for Minors.

27 May, 1919.]

MR. JOHN GIBSON.

[Continued.]

To carry out the above, the Council would retain the services of Medical Officers, also Safety Inspectors, who would investigate all serious accidents. Many of the present Coalowners' Officials could be usefully employed in those capacities. It would be a logical step to hand over the responsibility for the safe working of the mines to the Council and its Officers. The present staff of Inspectors employed by the Home Office could be retained for seeing after the country's interests as Economic Inspectors by the responsible department." Does that mean that the present staff of the Safety Inspectors would become Economic Inspectors?—Yes.

22,422. What about safety?—That would be handed over to the National Council.

22,423. "The National Council should set up in business as universal providers of colliery stores and appliances." Does that mean that they are to be merchants or manufacturers?—Certainly merchants, and possibly manufacturers.

22,424. Manufacturers of what?—Colliery stores and appliances.

22,425. Have you any particular sort in your mind?—No.

22,426. "A most interesting development would ensue, as for example:—The Committee of 'X' Colliery propose trying a coal cutter in a certain seam. The District Council expert is consulted, and gives advice free of charge. The machine is installed at a cost of £1,000. If it succeeds 'X' Colliery pays five £200 yearly instalments in discharge of the debt. If it fails it is returned to the district stores, where the depreciation is estimated at £200, which is the only charge that 'X' Colliery has to meet. Or suppose that a quantity of old machinery or scrap is lying about 'Z' Pit. This is sent to the stores and valued at £500. Then 'Z' Colliery gets five yearly instalments of £100.

Very large economies would be eventually realised by the standardisation of the underground rail gauge and tram. The natural corollary would be the establishment of District Tram Exchanges.

4. Another activity of the National Council would be Mining Development, which I suggest should be done in this way:—Any person or company could intimate to the Council that they propose to prove the minerals and open a mine at a certain place. The Council, on behalf of the Government, should have the option of investing up to 90 per cent. in the venture. When the development had reached a certain stage the mine would be admitted to membership of the pool.

5. Education should become an important duty for the National Council, and they should set up a National College or Colleges for the training of all Colliery and Council Officials.

6. In all matters of internal dispute the decision of the Council should be final.

Note.—It is obvious that all the various activities of the Council would require to be kept in separate watertight financial compartments.

Correction.

Page 5 of *Précis*, example number 3, A Colliery—Workmen's Dividend should read £4,000, not £3,760.

Owners' Total Interest and Dividend should read £3,760, not £4,000."

Where is the National Council to meet? Have you thought of that?—Yes, I have thought.

22,427. What are your thoughts?—My thought is that it is none of my business where it should meet.

22,428. We want you to help us. I am not at all saying that your scheme does not contain valuable suggestions, but if you cannot give us your views, it is no use my asking you. Is it your suggestion that the National Council should meet, say, once in London, once in Edinburgh, and once in Wales?—I would have a fixed centre.

22,429. What centre would you suggest?—London.

22,430. How often would they meet?—They would require to meet in practically permanent session.

22,431. Would they be paid?—Certainly.

22,432. How much?—As much as the constituents would permit them to get, within reason.

22,433. Sir L. Chiozza Money: You mean well paid?—Yes, well paid.

22,434. Chairman: What does that mean?—It means different things at different times, of course.

22,435. What does it mean at this time? If you are not prepared to assist us, I will not trouble to ask you any further questions. Your scheme is valuable to me, but if you are not prepared to give proper answers to proper questions I shall not be able to consider it. Have you thought about it?—Yes.

22,436. What do you say it ought to be?—Anything from £1,500 to £2,000.

22,437. How many are there to be?—Thirty-six.

22,438. Thirty-six at £2,000 each?—Yes.

22,439. Mr. Robert Smillie: On page 5 in Clause 4, one or two things were put to you by the Chairman with regard to the powers of the manager. You said his powers for disciplinary purposes should be clearly defined and should be absolute. He would not have the power of life and death in his hands. Did you mean he would have the power to dismiss a person for disobeying a rule?—Yes.

22,440. I put it there would be a colliery manager who would order men or a man under his charge to do something which seemed to them or him unsafe to do, such as removing a prop which would be fatal to do, and, if they have disobeyed the order, do you still give them power to punish them for disobeying an order of that kind?—I would have the Pit Council or Pit Committee review his decision.

22,441. Chairman: Do you mean to say you would give the manager power to suspend until the case came before the Pit Committee?—Yes.

22,442. Mr. Robert Smillie: Suspension is different from dismissal. In a case of that kind the manager ought to be in a position to carry out this safety provision and to have power to suspend a person for breach of rules or for refusing to carry out orders?—Yes; but the committee or council, or whatever it was, who had the revision of the decision of the colliery manager must back him generally or very shortly dismiss him.

22,443. I take it, if he suspends a man for a fault, for disobeying an order, or for a breach of rules, it must be remembered the law is still in force, and for a breach of the rules a prosecution can take place, that is to say, for a breach of the Mines Regulations at the present time. Supposing a mine manager suspends a worker for refusing to obey an order he has given, would you allow the Joint Committee or the Pit Committee, or whoever it may be, to review the decision and to reinstate the man if they were satisfied the man was right in the action he took?—No; I hardly think you could go that length.

22,444. You think that would weaken the manager's power for discipline?—Yes, I am afraid of it.

22,445. Is that your only fear?—Yes.

22,446. When a man is suspended, what takes place? If you say the manager has the right to suspend pending an inquiry, what really takes place, or what would take place, under your scheme?—Supposing that a manager finds a man—putting the legal question aside, because the law can deal with the man for a breach of the regulations—is guilty of gross inefficiency, and the manager suspends the man, if the Committee reverses the decision of the manager 60 times out of the first 100 times—if the committee which revises the decisions of the manager reverses them 60 times out of 100, the manager, I should say, would be inefficient and should go.

22,447. Chairman: What was that you said; please repeat it?—If out of the first 100 cases 60 were reviewed in favour of the workmen and against the manager, the manager should be dismissed or the Committee.

22,448. Mr. Robert Smillie: I take it you would expect that under a new scheme that you should hope for greater harmony amongst the different elements than exists at the present time?—Yes.

22,449. But I think that your mind is running in view of the position as it is to-day perhaps rather

27 May, 1919.]

MR. JOHN GIBSON.

[Continued.]

than the position you would like to create of all the elements working for the common cause of increased production?—Yes.

22,450. You would hope that would arise under your scheme?—I am sure it would.

22,451. I put it to you that you yourself may have found sometimes an under-manager or an oversman has made a mistake in the orders he gave the men, orders that were refused, very likely?—Yes, I think so.

22,452. Would you believe me when I say it has not been an uncommon experience of my own, when I have seen the manager of the mine to complain of the dismissal of a man, that we both came to the conclusion the man had been unfairly dealt with?—Yes.

22,453. You know we have again and again found the oversman who dismissed the man has admitted after thinking the whole thing out that he was wrong and the man was right?—Yes.

22,454. In a case of that kind would it tend to discipline if there were cases where men were dismissed without any hope of review?—Perhaps I could answer it better by telling you what I would do and how I feel about the matter. May I do so?

22,455. *Chairman*: Yes?—No matter what a man says to me, even although he threatened physical violence, if he was a good workman, and I do not care what he was to do, I would dismiss him if I thought fit; but provided he promised not to repeat the offence or to stop the system of bluster in my presence I would take him back to-morrow. I think the relations between the manager as representing the employer and the employee should be perfectly passionless; there should be no temper shown and a man should be taken and dealt with sympathetically in order that the best efforts may be got out of him.

22,456. *Mr. Robert Smillie*: You are very desirous, I think, that in view of the fact that the colliery manager is still to be the colliery manager and in charge of the safety of the mine, that nothing should take place which would interfere with discipline?—That is so.

22,457. You are willing that there should be a new method which would bring the manager's side, or the employer's side, and the workman's side in touch with each other?—Yes.

22,458. In order that the workmen's side should have a greater interest in the carrying on of the colliery than at present?—Yes.

22,459. If that machinery is set up, your hope is that perhaps much of the bitterness that has existed in the past would be got rid of?—Yes.

22,460. I suppose the position generally speaking of a colliery manager to-day is not a very happy one; he is between the devil and the deep sea. I do not know which side you call the devil, the employers or ours. That is the position the manager is in generally at the present time?—Not quite crucified betwixt two thieves.

22,461. His position is a difficult one?—Yes.

22,462. Has it been your experience that you and your colleagues in the management of the mines are left with a free hand as far as the owners are concerned to manage the mine as you think fit?—In my particular case, yes; it varies greatly though.

22,463. I do not think there would be any use in your being here as a witness if you only came to speak of your own particular case. You come here to speak on behalf of 300 organised mine managers?—Yes.

22,464. Have there been complaints amongst the managers of the collieries in Scotland that they are unnecessarily interfered with from the head office?—I have heard that said frequently.

22,465. Have you any reason to believe it or to doubt it?—Oh! I would readily believe it.

22,466. You could not yourself definitely say, because it has not occurred to you personally, as to the truth or otherwise of them?—Yes, I have been interfered with personally on occasions, but that is an honest difference of opinion between the managing director and myself, in which, after all, he is entitled to have the last word.

22,467. I do not mean cases of that kind. I suppose there is always a very natural desire to keep down the cost of production?—Yes, very.

22,468. Do you know whether or not it is a common thing for the pay sheets to be returned from the head office with certain red or blue marks upon them calling the manager's attention to a reduction that must take place in cost?—I think it is possible it exists, though it has not come within my personal knowledge. I never heard that reported either.

22,469. You do not know of your personal knowledge of any such thing?—No.

22,470. Then we may take it you cannot say anything on that particular part?—No.

22,471. Under your scheme there is a minimum salary of £500 a year for the colliery manager?—Yes.

22,472. I take it that is a man holding a first-class certificate and having full charge of the mine?—Yes.

22,473. Would there be any limit to the size of the mine or the responsibility?—Yes, I think 700 men is a big enough colliery for any one man to manage.

22,474. I want to get to the other end. There are collieries where men are holding a first-class certificate where there are only 40 men employed?—Yes.

22,475. Would that minimum salary of £500 a year apply in a case of that kind?—Under my scheme it would not pay the men to employ a first-class certificated manager at their collieries, and they would co-operate with their other small neighbours and engage a manager, placing an under-manager at each colliery.

22,476. Would you say there should be one manager, say, for two or three small mines?—Yes.

22,477. In that case the manager would be responsible for the management of two, three, or, it may be, four small concerns in the vicinity?—Yes.

22,478. And could still carry out under the law his duty?—Yes.

22,479. You desire to have a superannuation scheme. Is that to apply to managers only?—Unless I am confusing you that is not an integral part of my scheme. That has nothing to do with the present system, or should any form of it remain.

22,480. The question at issue are claims by the managers—I am not dealing with your scheme—the colliery managers claim a minimum of £500 a year at the present time?—Yes.

22,481. And a superannuation scheme?—Yes.

22,482. Do you wish that to apply only to colliery managers?—Yes.

22,483. To first-class men holding first-class certificates?—Yes.

22,484. If there is to be a superannuation scheme, ought it not, in justice, to apply to under-managers?—I think so.

22,485. If there is this superannuation scheme, ought it not to apply to every other official of the mine? Why single out the colliery manager and under-manager from the other officials?—It is every association in the world fighting for their own hand.

22,486. Do not you think the colliery fireman is as important in his sphere as the manager?—Yes.

22,487. Do not you think the man who produces the coal is as important in his own sphere?—We are all needed; none of us are indispensable.

22,488. The only reason you should have a claim for superannuation for managers is really that they have given a part of their lives in the carrying on of the mine?—Yes.

22,489. And in return for that they ought to be superannuated?—Yes.

22,490. Now, dealing with the housing question. I want to put it to you that it will be taken from what you have said here that the Scottish miners live in very bad houses and very low rented houses because they choose. I suppose you know Ayrshire very well?—Yes.

22,491. And Lanarkshire pretty well, I think?—Yes.

22,492. Do you know whether or not there is any possibility of the miners who are living in very low rented, miserable houses shifting to better houses. Are there better houses?—Housing is very scarce.

22,493. Could you express an opinion as to whether or not there might be thousands of mining families at the present time very desirous of shifting to better houses if there were better houses?—I think so.

27 May, 1919.]

MR. JOHN GIBSON.

[Continued.]

22,494. Even supposing the rent is considerably higher than they have ever paid before?—Yes, there are quite a considerable number.

22,495. Are there not conditions in which the miners if they wished to be outside the colliery houses, that is to say, houses owned by the mine owners, they would have to travel a very considerable distance?—Yes.

22,496. If they wish to be removed from the colliery owners' houses?—Yes.

22,497. Your own position is, it is of immense importance in raising the standard of life of the miner and family that they should have better houses?—Yes, good houses.

22,498. Do you think there is any hope of raising them to the standard you would like to see them attain so long as they live under the housing conditions as you yourself know?—None at all.

22,499. *Sir Adam Nimmo*: You speak on behalf of the Scottish Mine Managers' Association?—Yes.

22,500. What is the membership of that Association?—About 300.

22,501. There are a large number of managers in Scotland that remain outside your Association?—The total number of managers in Scotland is 420. Deduct 50 for innagers who own or have an interest in little mines, and you bring down the possible number we could have to 370; that is to say, I represent three-fourths of the possible managers of Scotland.

22,502. You stated in reply to Mr. Smillie the pre-war salary of the managers in Scotland was £170 to £200. Was that intended to be an average figure?—Yes, I think so.

22,503. I understood you said you did not know what the figure was?—I really could not put a figure upon it.

22,504. You know the district of Ayrshire very well?—Yes, I hope so.

22,505. What size pits have you generally speaking in Ayrshire?—From 100 tons up to 500 or 600.

22,506. That is output per day?—Yes.

22,507. Have you not a very large number of very small pits. Supposing you take the figure of 100 tons, have you not a large number of pits in Ayrshire that are roundabout that figure?—Yes, quite a number.

22,508. Would you say in these circumstances the mine manager had a large amount of responsibility to discharge?—Compared with the larger ones, no.

22,509. Do you suggest in these cases in a district like Ayrshire the salary of the mine manager should be fixed at £500?—Personally no, but my Association thinks otherwise.

22,510. What is your own view then?—That a graded scale should be made which would be fair and not unreasonable.

22,511. I take it in other words the salary should be in proportion to the responsibility?—Not in direct proportion.

22,512. In some close approximation to responsibility?—No, not in close approximation. A direct salary according to responsibility would mean that a colliery with 100 men employed in it, if you paid the manager of that colliery £500 a year, it would follow that a colliery with 600 men the manager should get £3,000 a year.

22,513. You are now suggesting very heavy financial responsibilities for the industry. How do you assume the industry could carry such responsibility?—I was speaking of your premises, not mine.

22,514. *Mr. Robert Smillie*: Would you clear that up. I want it made quite clear that this witness is speaking for himself when he says that the manager ought to have £3,000 under those circumstances?—I was showing the fallacy of assuming a man should be paid in direct proportion to responsibility.

22,515. *Sir Adam Nimmo*: You do not suggest that a reasonable salary for a mine manager would be £3,000 a year?—Not at all.

22,516. Generally speaking, your view is the amount of money paid to the manager should be in some reasonable relation to the working and responsibility?—That is so.

22,517. Does that mean you want to supply a stimulus to bring out the best that is in the different men?—Yes, that would be one object.

22,518. Do you think you would get the best men to come into the industry unless you had such a stimulus?—No, it needs stimulus to bring men in.

22,519. It needs stimulus to bring out the best that is in men?—Yes.

22,520. Mr. Smillie asked you some questions about the pre-war system of control and management and you rather assumed the question was disposed of by the judgment of this Commission but, assuming the Commission had not met and had furnished no judgment on the situation at all, would it have been your personal view that the industry stood condemned?—Not so far as the productive part is concerned.

22,521. You think your technical management was good?—Yes.

22,522. Take it on another side. What would you say about the relations between you and the workmen: were they good or bad?—Well, I will put it this way, that the relations between the manager and the men generally are very good; there is always a kindly feeling, but the method of adjusting wages was a constant source of irritation.

22,523. Was not that due to the fact that in a coal field there are naturally a great many variations in conditions?—No, I think it sprang from the fact that wages were based on selling price.

22,524. Would you say the relations between you and your men in the past could be regarded as so unsatisfactory as to require a change of system?—I do not think between mine manager and men there is anything wrong at all.

22,525. You got on well with your men?—Yes.

22,526. You think the relations between you and your men were, generally speaking, the relations between the other managers and their men?—No, I do not think that. Of course, the Ayrshire men are exceptional men.

22,527. And exceptional managers, too?—They do not send their worst to London.

22,528. Sometimes it is suggested the industry in respect of the relations between the employers and workmen was a distracted industry. Would you say that applied to Scotland generally?—Yes, I take it that there is a good deal of irritation in Lanarkshire—Lanarkshire especially, more so than Ayrshire.

22,529. What would you say was the cause of that?—The causes are seldom simple, most complex. I take it to be one of the chief reasons, the method of paying wages on selling prices.

22,530. Would you say that the action of the Miners' Union had nothing whatever to do with it?—I think it had. There is always two to make a quarrel.

22,531. That is to say, there might be faults on both sides?—There certainly would be.

22,532. On the question of joint control, Mr. Smillie asked you certain questions as to the relationship between the manager and the Pit Committee, and you did not seem to be very clear, I think, as to the position you desire to take up, if I may say so. What I understood you to say was the Committee must back the manager or dismiss him?—Or themselves.

22,533. Do you really think the manager could leave the question of discipline in the hands of a Pit Committee?—So far as safety is concerned, do you mean?

22,534. Any question of discipline?—And question?

22,535. Any question of discipline. Do you think the manager could leave any question of discipline in the hands of a Committee?—There is a wide difference between legal faults and faults of efficiency. Legal faults could be dealt with by the management and the faults of efficiency by the Committee.

22,536. *Chairman*: Would you kindly answer the question? It is a question of vital importance. The question was, do you think any question of discipline could be taken out of the hands of the manager and left over to a Committee? It is a question of supreme importance, and I should like to know your view?—The manager must have the last word.

22,537. Is the answer to the question, No?

22,538. *Sir Adam Nimmo*: Is the answer to the question the manager must have the last word on any question of discipline?—Yes.

27 May, 1919.]

MR. JOHN GIBSON.

[Continued.]

22,539. Is that your view?—Yes. The manager must have the last word.

22,540. Can you see how an authority can be maintained over the mine unless he had the last word?—No, no.

22,541. Would you say the manager of a mine is in the same position as the captain of a ship?—Yes.

20,542. He is responsible for the control of the ship?—Yes.

22,543. And do you say that the manager in the same way must be responsible for the executive control of the mine?—Yes.

22,544. Would it be workable otherwise?—No; the manager must have the last word.

22,545. He could not afford in these matters to put himself in the hands of a Pit Committee?—To a certain extent yes, because the man who is sure of his job does not need to care who reviews his work.

22,546. We are dealing with the question of discipline that has arisen. I take it your view is quite clear that he could not afford to submit a question of that kind to the decision of a Pit Committee?—He could not do it and remain in the pit.

22,547. I think you are aware, are you not, of the proposals of the Miners' Federation of Great Britain in regard to joint control?—No, I do not understand it.

Chairman: You ought to have a copy of those. (Handing same to the Witness.)

Sir Adam Nimmo: It is on the point I am dealing with. I wish to make special reference to the machinery that is proposed to be set up. It is first of all the appointment of a Mining Council consisting of a Minister of Mines as President and 20 members. You notice half of these 20 members are to be appointed by the Miners' Federation of Great Britain. Then there is to be what is called a District Mining Council.

Sir L. Chiozza Money: Have you noticed the other half is not appointed by the Miners' Federation but in quite a different way?

22,548. *Sir Adam Nimmo:* I am leading up to the point. First there is the Mining Council; then District Mining Council, consisting of ten members, half of which is to be appointed by the Mining Federation of Great Britain. That would be appointed by the Mining Council, and it would have such powers conferred upon it as the Mining Council thought fit within the powers which the Mining Council has. The District Mining Council would appoint Pit Councils or Pit Committees which would consist of ten members, half of which would be nominated by the workers in the mine and by members of the Miners' Federation of Great Britain. I want to put this position to you. Supposing a Pit Council had in its hands the appointment of the manager of a mine would it be your view that that position would be a workable position, in other words if the Pit Committee had the power to appoint or dismiss a manager?—No.

22,549. Would a manager's position be tenable in those circumstances?—No.

22,550. You think it would be quite unworkable?—Yes.

22,551. Would it make any difference in your view if a District Mining Council appointed a manager having regard to the constitution of the District Mining Council?—Yes, it would help.

22,552. Having regard to the constitution of that body. You have half of the membership of that body appointed by the Miners' Federation of Great Britain. Do you think that would make any difference in the situation? I do not catch the condition. Is this nationalisation?

22,553. This is the system of joint control that is suggested by the Miners' Federation of Great Britain?—Under present ownership?

22,554. Under nationalisation of the mines. I ask you whether, from the point of view of a colliery manager, you think these provisions would be workable?—The Pit Committee, of course, could not make a workable arrangement for appointing the manager.

Mr. R. H. Tawney: Is it proposed they should?

Sir Adam Nimmo: It is proposed they shall have power conferred upon them by the District Mining Council.

Mr. R. H. Tawney: I submit if the witness is asked about the scheme he should be asked correctly.

Chairman: The submission is quite correct.

Sir Adam Nimmo: This is the possibility.

Mr. R. H. Tawney: You did not put it merely as a remote possibility.

Sir Adam Nimmo: What is the effect of the machinery upon the position of the manager? What is the effect of the fact that these Councils would be composed as to one half by the members of the Miners' Federation of Great Britain?

Mr. Sidney Webb: The Supreme Mining Council is not to be one-half but only 10/21sts.

Sir Adam Nimmo: The District Mining Council is one-half.

Mr. Sidney Webb: You said Councils.

22,555. *Sir Adam Nimmo:* The District Mining Council. Take the District Mining Council that is composed of one-half of members of the Miners' Federation of Great Britain. What would be likely to be the influence exercised upon this Committee under those circumstances by the Miners' Federation of Great Britain?—I do not grasp what the general conditions would be at all.

22,556. You know what the effect of the Miners' Union upon the working of the collieries would be?—Yes.

22,557. You know they exercise a very considerable influence at the present time?—Yes.

22,558. Assume that upon these District Councils you have a representation of the Miners' Federation of Great Britain to the extent of one-half, would their influence upon that Committee be likely to be very great?—I take it it would be 50 per cent.

22,559. Would it not be a great deal more than 50 per cent. having regard to the big organisation of the Miners' Federation of Great Britain that stood behind it?—I really do not think I can give you an opinion that would be of any value. I do not grasp the thing at all.

22,560. Supposing Mr. Smillie was the Minister of Mines, would it make a great difference in the situation? That would be quite a possible position, would it not?

Sir L. Chiozza Money: You would welcome that, would you not?

22,561. *Sir Adam Nimmo:* What you would have on the Mining Council would be this: You would have ten members appointed from the Miners' Federation of Great Britain with Mr. Smillie as Minister of Mines. Would your position as manager in those circumstances be a reasonable one at all? As the witness is not following the position I will not press it. There are one or two questions I wish to ask you upon your *précis* with regard to the advantages of nationalisation. You say one of the advantages might be that you could secure central pumping stations?—Yes.

22,562. Do you think from your practical experience that can be carried very far?—I think there are possible economies in it—possible economies.

22,563. Do you know of cases in your own district where it could be carried out?—Yes.

22,564. Do you mean any material cases?—Yes.

22,565. You mean where water could be pumped at the dip of your coalfield with advantage; that is to say to pump water as it is pumped now?—Not quite that position, but pumping from a big area.

22,566. You agree you require to take each individual case by itself. The whole situation in a coalfield requires to be dealt with exhaustively by itself?—Yes.

22,567. You cannot say theoretically what can be done in a matter of that kind?—No.

22,568. Do you know from your own practical experience in respect to barriers the barriers have been uselessly left in?—I have not seen a barrier for 17 years.

22,569. Is it your view that the question of barriers is a good deal exaggerated?—So far as Ayrshire is concerned it is non-existent.

27 May, 1919.]

MR. JOHN GIBSON,

[Continued.]

22,570. All available coal possible is being worked out?—Yes.

22,571. With regard to standardisation of plant. You mention certain kinds of plant. Do you think there is very much in that?—Yes.

22,572. You think there is a good deal in it?—Yes.

22,573. Is there not a great deal of standardisation going on now?—No.

22,574. Do not you think one colliery copies another to a large extent?—That is not standardisation.

22,575. It is very largely standardisation, is it not?—No.

22,576. Are you a member of the Mining Institute of Scotland?—Yes, I am indeed.

22,577. Do you attend all the discussions?—As many as I can find time for.

22,578. Is there not a great deal of freemasonry between you with regard to dissemination of knowledge?—Yes.

22,579. You tell one another pretty much all you know?—Yes, we have no secrets about the things at all.

22,580. You pass on new methods to one another?—Yes.

22,581. I take it, in connection with the erection of a colliery plant you would endeavour to copy the best methods as far as you could?—Yes.

22,582. I think you very largely come here, do you not, to secure a better status for the managers?—Yes, you can take it fairly that is one of my objects here.

22,583. Is that based very largely simply upon the question of salary?—No, not entirely.

22,584. In what way do you think you would get a higher status under nationalisation than what you have got now?—We think we might have a higher status; it depends on forcing it out of the nationalisation standard.

22,585. You would keep a close association and bring as much pressure to bear as you could upon the State?—Yes.

22,586. You indicated that you have been interfered with to some extent in the management of the mine. Did you refer in that connection to questions of safety?—No.

22,587. You have never been interfered with in any question of safety?—No.

22,588. Have you been always supported by your proprietors, the owners of the colliery, in doing everything for the sake of safety?—Oh yes. I might even go further and say I am less an alarmist than my employers.

22,589. It is difficult to follow all the details of your scheme, but may I ask you this. Do you seriously suggest that the consumer of coal should pay the same price for all grades of coal?—No; the Government will.

22,590. The Government will?—Yes.

22,591. Where is the Government to get the money to pay, to meet the cost of carrying out such an arrangement?—They will sell the coal.

22,592. You say a low grade coal from Ayrshire would be paid for at the same rate as anthracite?—Yes.

22,593. Is there a differentiation between the two customers, as far as their power is concerned—does the Government make up the deficiency?—That is so.

22,594. I do not think one would understand that from the statement contained on page 4 of your *précis*?—I am sorry for my English then; I think I state it sufficiently clearly. The railways being in their hands, they can at once get delivery of every pound directly it reaches the pit bank, and distribute it as they think best.

22,595. Do you mean the Government would take the coal at the pit bank and fix the price of coal at one price?—To the producer.

22,596. Not to the consumer?—Not to the consumer.

22,597. That is to say, what would happen is this. Under your scheme the Government would purchase the whole of the coal simply at one price?—That is so.

22,598. Would it proceed to sell the coal in the ordinary way in the market?—I do not know that. I could not express an opinion on the distribution of the coal.

22,599. Is not the existing system of open competition that prevailed before the war the most likely to determine the real value of the commodity between the producer and the consumer?—Yes, I think there is a great deal to be said for it.

22,600. Under your scheme is each colliery to be taken by itself?—Yes.

22,601. And the Government fixes the price of coal at each colliery?—A common price for the whole country.

22,602. And new plant is to be charged at cost?—Out of revenue.

22,603. Is the price always to be kept up sufficiently high to carry the whole financial burden?—Not necessarily.

22,604. Then how can you make your scheme self-supporting?—Supposing the price given for this next year was 15s., and the cost of production over the country was 15s. 1d., the Government would need to find the penny.

22,605. The trade is to be subsidised in respect of any loss that arises?—No. The price could be raised the following year to try and recover that, and if any balance is recoverable the Government could try and recover it.

22,606. Would not in the long run the price rise to an enormous extent?—No.

22,607. Your scheme provides for the payment of high wages, does it not?—No.

22,608. One rather gathered from it you do not suggest a limit to wages?—The wages would be set forth by the responsible department periodically.

22,609. Who would adjust the wages—who would determine the wages to be paid?—The responsible department.

22,610. Do you mean by negotiation with the workmen?—No, by the economic position of the country.

22,611. Would not the natural effect be the wages would constantly rise, and the owners under your scheme have no interest in keeping down wages if their profits are based upon wages?—The owner would be interested in keeping up wages.

22,612. If he kept pressing them up knowing his profit was based on wages, what would the consumer's position be in the country?—He would not force them up. It would be in the interest of the miners generally that the cost of production was kept down.

22,613. It is very difficult to see that if they are interested in having high wages?—The miners?

22,614. Yes; and if the employer is interested also in having high wages. With regard to the expenses of working on page 5, are those intended to be actual figures or are they merely illustrations?—Illustrative figures.

22,615. Do you mean they bear no relation to the figures you would require to put in if dealing with actual valuation?—If I were dealing with the valuation I should require a great deal of data.

22,616. You do not mean to suggest the figures put down there in respect of capitalist value bear any relation to the facts?—No.

22,617. They are merely given as assumptions?—Exactly.

22,618. *Chairman*: You say in paragraph 2 of your *précis* that the method of electing the members of the District and National Councils will require to be carefully thought out and laid down. I should be obliged, if you have thought it out yourself, if you would send me on a piece of paper the result of your thinking?—Yes.

Chairman: Send it to the Chairman of the Coal Industry Commission. I should like to know what you think of it. We are much obliged to you for the assistance you have given us. As long as you send it by this day week that will do.

(The Witness withdrew.)

27 May, 1919.]

MR. WILLIAM STRAKER.

[Continued.]

Mr. WILLIAM STRAKER, Sworn and Examined.

22,619. *Chairman:* This is the *précis* of the evidence of Mr. William Straker, Secretary of the Northumberland Miners' Association; Member of the Executive Committee of the Miners' Federation of Great Britain. Mr. Straker, I need not introduce you either to the Members of the Commission or the Press. Will you kindly read your proof.

Witness:—"When I was before this Commission on a previous occasion, I broadly outlined my suggested scheme of control when Mines and Minerals are Nationalised.

Since that time the Miners' Federation executive have gone very carefully into the whole question, so that the scheme as proposed in the draft Parliamentary Bill prepared and laid before the Commission by Henry H. Slessor, Barrister-at-Law, embodies my previous proposals, added to and extended in detail by the Federation Committee, with all of which extensions and details I am in complete agreement.

I have endeavoured to fully appreciate all the arguments and statements—there being many more of the latter than the former—which have been placed before you. I have also endeavoured to compare and contrast the proposed scheme of the Mining Association of Great Britain for the working of the mines with that of the Miners' Federation of Great Britain, in order to form the most reasonable and unbiased opinion as to which of these will be best, judged from the point of view of national welfare rather than from personal interest. Whether it is this difference in view point which is responsible for the difference in attitude between the Federation of Mine Owners and the Federation of Mine Workers, the public will have to decide.

Fundamental Difference.

"It is well," says one great thinker, "that the beaten ways of the world get trodden into mud; we are thus forced to seek new paths." Notwithstanding the mud, any section of mankind which has done well for itself along the old ways will always be reluctant to leave these ways.

During the first stage of this Commission the old ways of mine management and control were shown to be so beaten into mud that the Report, known as the "Sankey Report," and accepted by the Government, declared that "the present system stands condemned." This being so, we must have a new system; not a mere patching up of the old, such as is suggested by the scheme of the mine owners.

It is well that we should narrow down to a clear issue the fundamental difference between those for and those against nationalisation. Those against nationalisation evidently hold that competition is the very soul of all progress. Life, to them, is an antagonism, each individual struggling for supremacy; and out of this struggle the fittest will survive. This means that out of selfishness, scientifically applied, will come the greatest good to the greatest number. This seems to me to be a primitive idea belonging rather to an early form of society than to twentieth century civilisation.

On the other hand, those in favour of nationalisation hold just as strongly that life is not necessarily an antagonism, and that mutual aid, applied scientifically, must give the best results. This is a conception which mankind arrives at after getting away a considerable distance from the primitive. Selfishness is the root-cause of all wrong-doing; therefore any system which is an outgrowth of selfishness must be wrong. That which is morally wrong cannot be economically right. Systems based upon this great truth ought to be encouraged, as such must produce a better citizen. Systems based on the desire for selfish gain ought to be discouraged, as making for all that is worst in individual and corporate life. That which draws men together in co-operative activities makes for progress and human welfare; that which keeps men in a hostile attitude one to another wars against welfare and progress.

Industrial Stability and National Welfare.

Any scheme which will not secure industrial stability is not worth a moment's consideration, as on that

the future welfare of the nation depends. In my previous *précis* I stated what, in my opinion, is the root of all labour unrest. I will here emphasise, if possible, that no stability in the mining industry can be secured by any scheme which does not recognise that the man who gives his labour to the industry has, at least, an equal right to executive powers in every department of the industry with the man who puts his capital into it. The scheme of the mine owners explicitly states that miners shall have in no way such executive power. That being so, it is foredoomed to failure.

Advisory Committees.

It is proposed to allow mine workers advisory powers so as to satisfy their desire for joint control. I want to say that the miners have had more than enough of Advisory Committees. If the Coal Controller's Committee had had executive power the present condition of things in the industry would not have existed. Whether it be a national or a local Advisory Committee, the advice of which may be absolutely set aside, nothing but dissatisfaction and unrest can be the outcome. "A little knowledge is a dangerous thing," as men will never rest content with the "little." Better keep working men in ignorance than educate them, if they are to be kept in their present servile position.

Profit Sharing.

It is also proposed to allow mine workers to share in profits after a standard wage and a standard profit have been secured, the purpose of this proposal being to induce the mine workers to produce more. This, clear of all camouflage, simply means that if the mine worker will increase his production for the mine owner, the mine owner will allow the mine worker to retain a share of the extra he, the mine worker, has produced.

This proposal is based on the assumption that the mine worker produces less than he ought to do. This is altogether a false assumption. I know of no class of men who work harder and give greater service for the wages they receive. Even the working man, wage slave though he is, is entitled to a higher life than merely eating, sleeping and working in order to make profit for a few others of his fellow men. He claims to be more than a mere wealth-producing machine, and must have opportunities to cultivate the higher possibilities of his being. I will admit that some men are absent from work when they would be better at it; but this absenteeism affects the position only little.

The miner's standard wage is to be fixed by machinery set up in conformity with the proposals of the National Industrial Council. May I say that the Miners' Federation has already refused to be associated with that Council, so that no such proposal can possibly secure that peace in the industry which we ought to aim at.

The miner's share of the extra profit is to be in such proportion as agreed on. In all the mining districts at the present time standard wages obtain, and on to these wages a percentage increase is added. Wages disputes, resulting in strikes, are generally because of failure to agree as to what these percentage increases are to be. Can anyone imagine that by substituting a share in extra profit for percentage increases that there will be less room for disputes? In my opinion, the very fact that part of their wage depends on profit, and that profit depends to a considerable extent on the executive management of the mine, in which the miners are to have no part, will beget greater dissatisfaction among miners than there has existed at any time in the past. Success does not lie that road.

Nationalisation.

No industry ought to be carried on only for the benefit of those engaged in it; it ought to be for the benefit of the whole community. This is a truism which very few will dispute. Under private ownership of industry the primary object is private gain, the

27 May, 1919.]

MR. WILLIAM STRAKER.

[Continued.]

welfare of the community being a secondary consideration. In the development of human society private industrial enterprise has played a valuable part. But so soon as the community can manage an industry, necessary to its own welfare, it should no longer be owned and controlled privately. Private ownership, then, having served its day should cease to be. This applies with equal force to other industries than mining; but for the time being, and sufficient for the time, we are dealing with the latter industry.

Mining can be more economically carried on by the executive power of mining being in the hands of those engaged in it, and who, as a matter of course, must know most about it, instead of, as at present, by so many people such as shareholders and directors with no practical knowledge, who so largely dominate mining policy at the present time.

Not only this, but the huge drain upon the industry by royalty, rents and wayleaves would disappear, and the large private profit would, in one form or another, go to or remain with the people generally.

The Results.

The inevitable result of nationalisation would be:—

- (1) A decrease in cost of production decreasing the price of coal (a) to the consumer at home, (b) for export.
- (2) As a result of the decreased price at home many other national industries dependent upon a cheap supply would be largely benefited.
- (3) The decreased cost for export would lead to an increase in the quantity exported.
- (4) This would tremendously benefit the shipping trade. This increase in export coal shipments would prevent any ships having to sail outward with, possibly, only ballast, with the consequence that the homeward freight would be reduced, as it would not have to cover both the homeward and the outward voyage.
- (5) Decreased freights would in turn produce a decreased cost of the commodities imported, and in particular of the country's raw materials and food.
- (6) In addition to these benefits the State would own its own mines and minerals, and would have the results accruing from such ownership, instead of, as at present, only receiving a part in the shape of Income Tax and Mineral Rights Duty.

In the above I have freely used the formula of Baron Gainford, but in an opposite sense. He assumed that under nationalisation quantities would fall and costs would rise. I have assumed, and given my reasons for the assumption, that costs will fall and quantities will rise; consequently the opposite results to those feared by him will follow.

Incentive to Enterprise.

It must be admitted that competition has been a great incentive to enterprise; but it must also be admitted that it has been a prolific cause of dishonesty and nearly every other evil that has afflicted humanity. The relationship of human beings one to another has been so placed that one part of the family of man can exist only at the will of another part. The possession or non-possession of wealth determines that a Lanarkshire miner's cottage, such as has been described before this Commission, is fit to be the dwelling place of the wealth producer, and that the Hamilton Palace is necessary for the home of a Duke, who is only a wealth consumer. The fact is that by the competitive struggle the moral nature of man has been so depraved that those who have come to the top set up their personal interest as their standard of what is best. In place of this evil-producing thing, the Miners' scheme would give a cleaner and higher incentive to enterprise in the Mining Industry, which would combine the moral and economic laws, instead of these being mutually antagonistic.

Under the Miners' scheme there will be a National Mining Council which shall establish District Mining Councils and Pit Councils. The National Council shall have power to delegate part of its duties to those other Councils.

There will also be an annual National Conference of the National Council with representatives from each of the District Councils. Also an annual District Conference of the District Council with representatives of the Pit Councils.

Thus the whole industry will be so co-ordinated that the very best possible results will be secured.

Pit will be compared with pit, district with district, system with system, method with method, manager with manager, cost with cost, in such a way that every part will be tested, and neither inefficient men nor unsuitable systems will be retained. Every member of the managerial staff and every workman knowing their mutual responsibility to the whole industry will always be striving after the best results, not merely for the sake of gain but, to put it as Baron Gainford so well put it, because of a sense of achievement.

Managers will be remunerated according to the character of the mine of which they have charge, and the responsibility they are under. The larger positions will always be open to the men of greater efficiency. Positions on the expert staff of the Mining Ministry, and even seats on the National Council, will be open to the greatest ability. No such incentive to real worth has ever been, or can be, offered under private ownership.

Discipline.

The fear of a loss of discipline under what has been erroneously called divided authority has been much in evidence among those who are opposed to Nationalisation, and even representatives of the Home Office have expressed their fears of this and the added danger to workmen. Surely these representatives, knowing the Miners' leaders as they do, who are urging Nationalisation, cannot really believe that officials of the Home Office care more for the safety of miners than those miners' leaders do?

The assumption that the mine manager is supreme now in the management of the mine is just as untrue as that his authority, so far as discipline is concerned, will be weakened under the Miners' scheme of joint control.

His disciplinary power under the Councils to be set up will be the same as it is now under a Board of Directors and a managing agent. His advantage will be that in cases of doubt he will be able to secure the assistance of men who understand the business they have either to decide or advise upon.

Although the manager will be under the direction in many things of the Mining Councils, as he is now under his directors and agent, yet under the Mines Act he will still have his responsibilities which no one can share. In the same way other officials in the mine, although under the direction of the manager, have responsibilities which they cannot share with the manager. Mutual confidence between managers and workmen and mutual interest will be a far better guarantee of necessary discipline than any external force. To talk of divided authority in the way that some have done is to talk the most sheer nonsense.

I do not want to suggest that the objection to joint control is the outcome of a distrust of working men; rather would I say that it is but a form of conceit on the part of managing directors, who believe that they are the only men who can do things as they ought to be done.

Bureaucratic Control.

If the miners had proposed to nationalise the mines and set up a system of bureaucratic State management, I could have understood all the criticism of State control. I want to say that the miners are just as strongly opposed to such bureaucracy as the mine owners are. In justice, however, to State control which we have had during the war, I want to ask, what would have been the condition of things had we

27 May, 1919.]

MR. WILLIAM STRAKER.

[Continued.]

had no control? I want also to ask the consumer at home what price he would have had to pay had there been no control. It would not have been only consumers in neutral countries who would have been paying £3 and £4 per ton to the British coal owner.

I desire also to point out that there is a considerable difference between private ownership with State control (such as we have had during the war) and State ownership with industrial joint control such as is proposed by the miners under their scheme of Nationalisation.

Danger of Sudden Transition.

The danger of a sudden transition from one form of ownership and control to another, resulting in such an upheaval in the industry that the welfare of the nation would be seriously affected, is a real danger. To avoid this, Section 5 of the Bill has been intro-

duced. Under this section the Mining Council will have power to disclaim the taking over of any mine, &c., until such time as it can do it safely and without interfering with the orderly continuation of any mine or other industry connected with mining. Its delegation of powers to District and Pit Councils will be exercised how and when it is advantageous to do so. This being so, for some time at least, the management and control of the industry would largely remain in the hands of the present staff, changes being made as it is found advisable to make them. The Mining Council will be comprised of men who know the exigencies of the industry and the stage of education of the worker, technically and otherwise, and the amount of responsibility they will be able to discharge at any given time. From these provisions it may be seen how groundless are all the fears expressed by the opponents of Nationalisation."

(Adjourned for a short time.)

Chairman: I understand Mr. Straker's proof was only placed in the hands of the Commission this morning, and some of the Commissioners would like to have an opportunity of considering it and thereby possibly restricting the number of questions which would be put to Mr. Straker. We will get on as far as we can with Mr. Straker, but if anyone would rather postpone his questions with a view to shortening them to-morrow, let that be so. I will do what I did in the case of the owners' witnesses: I will ask an owner to begin cross-examining, and then a miners' representative to follow, so that they get the last word, as it were.

22,620. *Mr. Arthur Balfour:* (To the Witness.) Do I clearly understand from you that you adopt entirely

clause 5 (1) (c) of the Bill as put forward by Mr. Slesser?—Yes. I think that that clause makes ample provision for not taking over any industry or part of an industry that the Council might think inadvisable at the time to take over.

22,621. I think we are not quite on the same subject. Clause 5 (1) (c) refers to mineral rights?—Yes, certainly.

22,622. You clearly understand that you are in favour of confiscation of everything included in 5 (1) (c) without any compensation whatever?—Yes.

Chairman: Mr. James Winstone is assisting Mr. Straker. He had better be sworn, and then we can have his evidence, if it is wanted. If Mr. Straker wants assistance, he is clearly entitled to it.

MR. JAMES WINSTONE, Sworn and Examined.

22,623. *Chairman:* (To Mr. Winstone.) I think you are President of the South Wales Miners' Federation, and also a member of the Executive Council of the Miners' Federation of Great Britain?—Yes.

22,624. *Mr. Arthur Balfour:* (To Mr. Straker.) You are clear 5 (1) (c) means complete confiscation without any compensation whatever?—Yes, of wayleaves and royalties.

22,625. And of everything mentioned in that clause?—Yes.

22,626. Do you think that is fair?—That is obvious, or else it would not be in.

22,627. Do you think it is to the interest of this country to confiscate property without compensation?—I think it is to the interest of this country for the people to take back from the present owners that which always ought to have belonged to the people.

22,628. There is a difference between "ought to have belonged" and "does belong"?—I am quite sure of that.

22,629. Do you claim if a thing legally belongs to a person that you ought to take it away from him simply because you think it ought to belong to someone else?—When I remember that the people who made the law are the people who took these things from the people, then I am not prepared to accept it that because something is legal therefore it is right.

22,630. You do not face the point I ask you. If something legally belongs to someone in this country, is it reasonable, because you think it ought to belong to someone else, for you to confiscate it?—Are you referring to wayleaves?

22,631. I am referring to everything in clause 5 (1) (c), minerals, royalties, wayleaves, and everything?—Let me take minerals. I certainly think that is a property belonging to people who never ought to have possessed it.

22,632. Supposing last week you had purchased a mineral property and paid cash for it, would you claim that did not belong to you?—Would I what?

22,633. Supposing last week you purchased mineral property and paid cash for it, would you claim that now it is not your property?—I would be in the position of a man who buys stolen goods.

22,634. I do not think you can say that exactly when it is legally the property of the person who conveyed it to you?—I think no sacrifice is too much to give the people back their own. It is a choice between two evils. The worse evil is to allow the present possessors to retain that which does not belong to them.

22,635. In other words, you are drawing no distinction between some one who has inherited property and some one who purchased it last week?—I do not think length of time affects the principle.

22,636. You do not think the fact that it was paid for last week by money taken out of hard-earned savings has anything to do with it at all?—No.

22,637. In fact you simply say quite plainly that it should be confiscated, never mind how it was purchased or obtained?—That is so.

22,638. Do you think that a jump such as you propose by this Bill is a feasible thing to do in one step?—A jump, do you say?

22,639. Yes?—Do you mean from one system to the other?

22,640. Yes?—I think I give my views upon that under the last heading of my *précis*.

22,641. Yes; that is what I want to call attention to. Are we to understand from that that it is the object of the Miners' Federation of Great Britain to purchase mines gradually and work them: that is to say, take a dozen first, if you like, and test the scheme?—I think that there would probably be mines which could not be taken over at once without interfering with the continuous working of the mines. There will be a preparatory period after this measure passes during which the present system of working will have to continue. There will also be industries associated with mining, some closely and some more distantly, and the Mining Council itself will have to decide from time to time what to take over and what not to take over. I think that is altogether a detail or a power which will be exercised by the Mining Council and be determined on by them.

22,642. Do you convey by that that your idea is that they should take over the good mines first and leave the poor ones?—No, I do not suggest that at all, but I do suggest when you ask me my opinion—

27 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

22,643. I want your opinion?—Yes, I know. I do not think any one man (and that is why we differ on the point of a Minister of Mines) is capable of deciding these matters. We therefore substitute a Council and out of the wisdom of a council these things would be done, so that I do not feel at all competent to answer all these questions.

22,644. You really want to leave it to experiment afterwards?—A good deal of it will have to be left to experiment. There are no two ways about it.

22,645. There is no evidence in the past upon which to base such a change?—Well, we have not had in this country nationalisation of mines before.

22,646. Or in any other country?—I am not quite sure.

22,647. Where else is it?—I believe they have had some State mines in Germany.

22,648. State mines, and just a few?—Yes; I say they have had some.

22,649. The result of those mines has not been very satisfactory, has it? They are condemned by the Germans themselves in the last investigation?—That was because of the system of management, and I am not sure that they were the best mines or anything like the best mines.

22,650. Do you anticipate we should be able to arrange for a better system of State management than in Germany where they had an autocratic system?—I think our present system is far superior to what I understand the German system was.

22,651. I take it you agree this question of nationalisation or otherwise is not a question as between coal owners and the coal workers?—No, it is a much bigger question for the nation.

22,652. You agree it is a question for the State and the consumer as a whole?—Most decidedly.

22,653. Do you think the scheme which has been put forward by Mr. Slesser protects the State and the consumer as a whole?—I think it does.

22,654. Let us take the Fuel Consumers' Council. Does that help to protect the consumer at all?—I think it would do.

22,655. In what way?—If it was a question of wages which affected the cost and probably the price, the Mining Council in negotiating with the miners' unions would, as representing the nation, take into consideration the whole of the people and the whole of the industries that would be affected by it, and in order intelligently to be able to do that, you would call in the assistance of the Consumers' Council or the representatives of the Consumers' Council, so that they could measure the all-round effects that such would have, and that would largely determine whether or not an advance in wages or reduction in wages was justifiable. The Mining Council, representing the miners themselves and representing the community, having been appointed by His Majesty would do nothing without fully considering all the other interests affected.

22,656. Would not that Council, to get down to real bed rock, really represent the workers—the Miners' Federation or whoever it might be—and, secondly, largely political influence?—I do not see that political influence would play an undue part. His Majesty would appoint the first half of that Council to commence with.

22,657. That is the Government and that is politics, after all. The Miners' Federation would represent the other half of the Council, would it not?—But these would be appointed because of their fitness for the position and not because of any political influence they might hold.

22,658. But surely there would not be anyone there who was very much interested in protecting the consumer?—I think when His Majesty appointed his side of the Council he would most certainly have full regard to the interests of the consumer. I cannot conceive anything else.

22,659. Would it not appeal to you on consideration that a council of that kind should be divided into thirds: a third Government officials, if you like; a third representing the consumer, and a third the workers. Would that not be a more equitable division?—What one wants in a council of that kind

is to have men who understand their business. We must not assume that the miners in making their appointments are going to appoint all miners. I think our idea when we increased the number, as you have noticed from ten, which I suggested on the last occasion, to 20 on this, was that there must be sufficient room for the appointment of other than miners—experts, say mining engineers, experts in overseas trade—I am merely illustrating—experts in transit, experts in the distribution of coal at home. We want to make room for all these people so that we will have really a representative council representing all interests.

22,660. Would it not be better to say so at once and not leave it to a combination of half and half?—In making appointments of this kind your safeguard is to have people who understand the business to be done by those to be appointed. I am not sure that the community know sufficient of mining and its intricacies, if the appointment was left to them, to appoint wisely.

22,661. But you do agree there are a number of people in this country outside Government officials and mine workers who do know sufficient about the mining industry to be capable and competent to sit on such a board?—To manage mining I should say so far as ever possible, there should be men who have been closely associated with mining in all its departments—the mining industry, I mean.

22,662. Supposing a ballot is taken by the Miners' Federation or any other federation representing any other industry, and they demand nationalisation; if Parliament considers that is not in the best interests of the State, do you take it they should give way to that opinion?—Do you mean that Parliament would give way?

22,663. No, the Miners' Federation should give way, Parliament representing the whole of the country?—I am afraid I could not answer that question. I can only say that the miners feel strongly on this question of nationalisation and that Parliament will do a foolish thing if it does not agree to it. It may be refusing to pass it for a time prevent it; but you may be sure that evolution is moving in that direction and you can only stop it for a time.

22,664. Then it boils down to this, that if any section of the community wants a thing, even although they represent only 5 per cent. or less of the total population, Parliament should agree with it, even when they think it is not in the interests of the country?—No, I do not mean that at all. I mean this: that not only the mining community, but the people generally are moving in the direction of nationalisation, especially of mining, after what they have learned from this Commission and from the revelations before this Commission.

22,665. Does it not strike you that to rush into a thing of this sort is very unwise, surely. As we have done in this country before, ought there not to be a compromise as a stepping stone to such a big movement as this?—In order not to rush it, but at the same time to get into it, we introduced clause 5 under which we think all safeguards can be made.

22,666. But you agree after all it is the country which must decide this question. This Commission can make recommendations on the evidence before it, but in this big question Parliament must decide as representing the country?—Yes, most decidedly.

22,667. And everyone concerned will have to abide by their decision?—Yes. I have two hopes: first of all, that the Commission will recommend, and then that Parliament will adopt the recommendation. I can see no other way of securing stability, satisfaction and rest in the mining industry.

22,668. You see that if the argument you and I have carried on is carried to its logical conclusion, any section of the country might take a stand and hold up the whole of the country. You believe in nationalisation, but if the whole country does not, surely it is advisable to find some intermediate step to test these questions?—I think I have already said that wherever the community finds it can take any industry into its own hands it should do so. For the moment we are only dealing with mining.

27 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

22,669. But mining, of course, is fundamental to all industries of the country?—Yes, and I think for the benefit of the country, the community can take mining into their own hands.

22,670. Now take clause 21 of the Bill: according to that you can never raise the railway rates on coal in this country?—Yes.

22,671. So that if the railway workers determine that they must have more wages, it could never be put on to the price of coal, for instance?—I do not quite follow you.

22,672. If there is an increase in the cost of working the railways at any time in the future, you can never put up the railway rate on coal to meet the increased cost?—I dare say in the past that railway wages have been regulated independently of the mining industry.

22,673. That is not the point. The point is that according to your Bill, whatever it may cost to carry coal in the future, the coal is not to bear that cost, but that cost is to be thrown on the community in some other form?—I assume that the cost of carrying coal and distributing coal will be—

22,674. This is carrying only. Let us keep carrying on the railway separate from distribution?—I am not quite following your question.

22,675. I am referring to the railway carriage of coal only?—That is fixed now. The community has that to pay now in the price they pay for coal.

22,676. Yes. According to your Bill that can never be raised. Never mind what the cost in future of actually carrying on the railways may be, the cost of carrying can never be raised?—Why? I think all these things will be managed. Every question of this kind belonging to the Council will be settled by the Council.

22,677. No, it goes further than that?—Will you read the part you refer to?

22,678. It is the whole of the clause: "And, further, it shall be the duty of the railway companies or authorities of Great Britain to provide such facilities for the conveyance of fuel as the Mining Council may deem necessary to enable them to carry out the duties imposed upon them by this section at rates not greater than such railway companies or authorities are now entitled to charge for the conveyance of fuel." Do you agree that my statement is correct?—I think that is a useful limit because of the price now for railway carriage; but I do not think for a moment that the necessity will ever arise. I think all the profits made out of carrying coal and of handling coal—

22,679. There is already an enormous loss on running the railways as it is under the Railway Executive, so that the necessity has arisen already for increasing the rates on coal. It is not a question of supposition, but already it is a question of fact.

Sir L. Chiozza Money: That is rather problematical. That has not been shown.

Mr. Arthur Balfour: The loss is there.

Sir L. Chiozza Money: No, it is not.

Witness: I must say I do not know sufficient about the railways either to agree or disagree with you on that, but I do not think that the present railway system in this country is conducive to economy. I think that would probably be the next industry that ought to be nationalised and co-ordinated.

22,680. If that is what you are going to do and you are going to restrict each unit and not increasing its rates when its costs increase, surely you will find you are running the country on the taxpayers' money?—No, we are going to supply the community with much cheaper coal so that any disadvantage they may have in one direction they will far more than gain in another. It is not a new principle for a limit to be put upon the charges made by railway companies; I mean railway directors never had a free hand as to what they should charge even with regard to passengers.

22,681. Yes, but they have maximum rates?—Quite so.

22,682. And they can go to the Railway and Canal Commissioners, and on proof that these rates do not pay, they can get consent to increase these rates?—I know that.

22,683. There is no arrangement for consent here; it is a hard and fast thing. It really means that the

taxpayers of the country will have to make up the deficit?—No, the taxpayers of the country are gaining largely and benefiting.

22,684. Take the present position: the taxpayers of the country are making up the difference in the cost of the wages of the miner at the present time?—No, nothing of the kind.

22,685. But, excuse me, they are?—No, excuse me, they are not.

22,686. Surely the Coal Controller is now paying out money for the miners' wages which comes out of the taxpayers' pocket?

Mr. Sidney Webb: Much less than he has received. *Witness*: After the Government and the coalowners have taken the cream away, but there ought never to have been a deficit.

22,687. *Mr. Arthur Balfour*: The fact remains that something which has been collected in this country as taxation has been paid back as wages?—No; money that has been taken out of the industry has to be paid back in wages.

22,688. Which has been taken out in taxation and which has to be paid back in wages?—Taken out of the industry.

22,689. Yes?—Largely taken out of the industry.

22,690. But largely taken out of the public?—No. It is all taken out. The mining industry has been far more than self-supporting during this war.

22,691. As a matter of fact, the difference between the profit which has been taken by the Government is not sufficient to meet the increase of wages, and mere money is being paid by the taxpayers in this country to supplement those wages?—I think if you combined that which the Government has got and the extra which the mine-owners have been allowed, this would never have happened.

22,692. The position as I put it to-day, I think you must agree, is that money is being paid back by the Government to pay wages?—But you must take it out of the industry.

22,693. Not all out of the industry, but partly out of the taxpayer. Do you not think it would be a prudent thing, before we leap to nationalisation, for the Miners' Federation to buy a group of mines and run them and test some of its theories?—I do not.

22,694. Would it be a prudent thing for the State to buy a group of mines and attempt to run them on the basis of the Miners' Federation proposal and see what the effect is?—I think it is a prudent thing for the State to do it at the discretion of the Mining Council which we propose to set up.

22,695. I do not want to take you back to the same point. Surely in that case the consumer ought to have some control of the situation and mere influence upon it than is provided for in your scheme?—I think the consumer will be fully represented through the Industrial Council and on the Council itself. The consumer must be considered in making the appointments.

22,696. On the question of delegation of authority, authority can be delegated right up to the Pit Council and from the Mining Council to the Pit Council?—Yes.

22,697. Would it not be very dangerous to delegate the question of wages, for instance, to the Pit Council?—I do not think that it is likely that the Mining Council would delegate the question of wages to the Pit Council.

22,698. But they have authority to do it?—Oh! yes. A lot of people have authority to do that which they never would do. I mean directors of colliery companies, at the present time, could leave exclusively the power to pay wages to the manager, but they do not do it.

22,699. But then you see, half the Mining Council consists of representatives of the mine workers, whose interest it is to increase wages?—I think, if I may respectfully suggest it, that you are labouring under a misapprehension that the two sides of the Council are always going to be in antagonism one with the other. That is a mistake. Neither the Mining Council, the District Council, nor the Pit Council will be in that attitude one side to the other. They will work as a whole for the good of the whole.

22,700. You have a very grave situation arising when you come to the question of a national advance

27 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

of wage which might be demanded by the Miners' Federation if 10 of their representatives were on the Council and had to decide that question. I can understand if a third were there, but when half the Council consists of the very people asking for an increase of wages and who are the responsible officials of the Miners' Federation, the question is rather different?—If we might assume that which I do not think is correct, that the party is always going to divide, there will always be the Chairman to decide upon a casting vote.

22,701. You give the Chairman a casting vote?—Yes.

22,702. And the Miners' Federation would abide by his decision?—Yes, I have no doubt about that whatever. I am sorry Mr. Cooper is not here, or else he might have told you some of the experiences that we have had in Durham and in Northumberland, where we have had mining questions and pit wage questions—not general questions—always submitted to what we call our Joint Committee: that is to say, so many owners' representatives and so many workmen's representatives with an independent chairman. The independent chairman gives his decision frequently and it is more often that way than any other way. I can scarcely remember a case—and I have had well over 30 years' experience in connection with that Board—where the men have not loyally carried out the Chairman's decision.

22,703. Supposing a ballot became necessary or desirable at any time on any of these questions of wages or hours, do you not think that it ought to be taken by the State when it affects every other human being in the country?—I think the best way the State could deal with it is through the Mining Council.

22,704. You think that the State through the Mining Council could take a ballot and control the ballot?—I am not assuming that the Mining Council is going to, but if the miners take a ballot on the wages question and the granting of that request was to affect everyone else, then the best way the State could deal with it would be through the Mining Council.

22,705. What would the Mining Council do then? Do you mean that the State should deal with it through the Mining Council?—The State, I take it, is the people.

22,706. Only a small section of the people, you know?—No. I will admit that the franchise might well be further extended, but I do not look at the State as something separate from the people; so far as it is, it needs to be altered.

22,707. You do agree that if we are going to run this country on democratic lines, if the majority think that a thing is not for their good they have a right to prevent it?—Most decidedly.

22,708. *Mr. Robert Smillie*: Mr. Balfour put it to you, did you not think it wrong that people who are legally possessed of property should have it taken from them without compensation. I suppose you are acquainted with the state of matters in South America, that there were people there at one time possessed of property in slaves?—Yes.

22,709. It was legalised, and they bought and sold these slaves. Then came a time when North America thought they would have to stop. Do you remember whether they were paid compensation for the loss of those slaves?—No, I do not think they were.

22,710. Would you conceive that the fact that those people owned slaves and bought and sold slaves made that property of theirs such that the people should not take it away from them?—Not even if they bought it the day before.

22,711. You say if people wrongly held property now, though they legally held it, if it is wrongly held, and not in the interests of the nation, that it should be held, the nation is entitled to take that property from them without compensation?—That is the attitude. I think, if I may say so, that the time was when miners were bought and sold with the mines in Scotland at least, but yet that was not right because a company might have bought the mine the week before. I do not remember ever having

read that they were compensated for the loss of that slave-holding power.

22,712. Mr. Balfour's idea would be that if miners in Scotland, or anywhere else, were at one time property that was bought and sold or swapped, that if Government by law prevented miners still being the property of the owners they ought to compensate the owners for the loss of their property. Mr. Balfour's idea evidently on this question is that everything that is legally held as property should be compensated for?—I do not admit that that which is legal is always right.

22,713. I suppose your opinion and the opinion of the majority of the miners is that the coal and the minerals under the surface never ought to have been privately owned. Do not the miners feel that it was at one time held by the King on behalf of the people, and that the King if he gave it away had no right to give it away?—I quite agree, neither King nor anybody else would have any right to give away that which naturally belonged to the whole people, such as minerals within the earth.

22,714. If Parliament ultimately agrees to nationalise the mines and the minerals—to take over the minerals without paying compensation—do you propose to ask these who have held the minerals up to the present time to pay compensation for what they have taken out of the mines?—I think they could well afford to do so; but I would not propose to ask them.

22,715. You would let bye-gones be bye-gones?—I think they have got more than enough.

22,716. On the question of Clause 21, was that clause not put in rather as a protecting clause, a clause with regard to the railways—was it not put in as a protecting clause to insure that the Authorities carrying on the mines would not be charged an unreasonable charge for carrying coal?—That is so. That was quite seen by the miners when they went over this matter—that railway owners might make mine nationalisation a complete failure if they had unlimited powers.

22,717. But supposing that was read as Mr Balfour has read it—that the rates were not to be greater than such railway companies or Authorities are now entitled to charge for conveyance of fuel, and the time came when it was necessary to charge higher charges than they charge now, could not Parliament in a short time alter this law to enable them?—Parliament doubtless could do that, just as they authorised an increase when the railwaymen's wages were raised a few years ago.

22,718. Parliament often alters Acts of Parliament; it often changes existing laws; and they could do it again, I suppose?—As the necessities of the country require it.

22,719. Is it your opinion that the mine workers of the country are more concerned in the question of nationalisation than any other class of people in the country?—I think they are more concerned. They have a greater interest. They have a common interest with the community so far as the profit from the industry and the minerals belonging to the people, but they have an additional interest, because their lives are at stake while following their occupation.

22,720. I suppose we may take it that the miners you represent feel that the men and boys who work in and at the pit ought to have far more interest in it than those who have merely invested their money in it?—I think that they have and must have more interest in it, because after all no money can compensate for the loss of life.

22,721. I suppose we may take it that the consumers of coal, whether for domestic or manufacturing purposes, are not entitled to expect that they would get the coal for consumption till in the first place provision is made for fair and reasonable wages and for the conditions of the men and boys who produce the coal?—I think fair and reasonable wages ought to be a first charge in any industry.

22,722. Is it your opinion that State ownership of the mines would tend in the direction of preventing much of the loss of time that now takes place at collieries through strikes and lock-outs?—I think that it would prevent nearly the whole of it, if not the

27 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

whole of it, because decisions affecting the conditions under which the men give those services would be governed largely by their own representatives; consequently we would not have these strikes and stoppages such as we have now.

22,723. Do you think it is unreasonable that on any Board for the regulation of the mining industry for the production of coal for the common use of all the people that the miners should have half of the membership of the Committee to represent them?—I think the miners' interests are so much larger than any other particular section that they ought to have the appointment of at least one half.

22,724. Do you think the miners, if they were asked to do so, would combine with the colliery owners in any trust for the purpose of raising the price against the consumer merely to secure higher wages and higher profits?—I think the working classes of this country that comprise the great mass of the people are so recognising each other's interests and well-being that miners will not join with any coalowner or private trust for the purpose of exploiting the rest of the community. I feel quite sure that they will never do so.

22,725. Do you know that the Government felt that it was necessary, even before they took over the control of the mines, to appoint a committee called the Coal Association Committee to look after the coal trade?—I think it did.

22,726. You know that that was so?—That was so.

22,727. Do you know what the composition of it was?—I am not sure that I could correctly say, but I think the miners had half of it, and I believe the chairman himself was closely associated with the mining industry. If I remember rightly, the chairman was Sir Richard Redmayne.

22,728. There were three miners' agents who were represented with three mineowners?—Yes.

22,729. With the Chief Inspector of Mines as chairman?—Yes.

22,730. Do you know whether that Committee did very useful work in the interests of the community?—I feel quite sure that it did.

22,731. Did you ever hear any grumbling with the work of that Committee, either from the public, from the mineowners or from the miners?—No. I think

everyone who ever read the reports of that Committee was highly satisfied with the work that it did.

22,732. Are you aware that it settled many disputes remitted to it from the mining districts?—I know that it did suggest useful machinery for the settlement of disputes which were really settled and also settled a large number of disputes.

22,733. Do you know that the general wages of the mine workers in the several districts forming the Miners' Federation of Great Britain have been regulated for years by what are called Conciliation Boards?—That is so.

22,734. Do you know that they were composed equally of minors' and mineowners' representatives?—I think that was so.

22,735. Do you know that they have settled many questions without going before a third party?—I think it is usually held by these Boards that if the final decision of such a large question has always to go to an Arbitrator that the Board itself would fail, so that they have mostly settled without referring to an Arbitrator.

22,736. You are aware that in many of the districts neutral chairmen have been called in again and again?—That is so.

22,737. Even outside Durham and Northumberland they have been called in in many other places, such as South Wales and Scotland?—In every district, I think.

22,738. Do you know of a single case in which the miners have refused to carry out the finding of an Arbitrator?—I know of cases where they have not been satisfied, and they have used the machinery that has been agreed upon for an alteration or an improvement in the decision, but I have never known of a case where they have refused to carry the decision out.

22,739. Do you know that in some of the districts and on several occasions they have protested against the injustice, in their opinion, of the award, but they have always carried it out?—They have always carried it out.

22,740. Have you any fear that in any committee that might be set up if the mines be nationalised the miners would refuse to carry out the findings of the Committee?—I think, if anything, if it was possible, the men would more loyally carry out any decision if the mines were nationalised than they would have done in the past.

(The Witnesses withdrew.)

Mr. WILLIAM BLANE, Sworn and Examined.

22,741. *Chairman*: "Précis of Evidence proposed to be given by Mr. William Blane, C.B.E., M.I.Ming.E., M.I.Mech.E., trained in mining engineering in Scotland; has worked as miner, chief engineer, mine manager and consulting engineer; has been a large employer of labour; founder of the firm Blane & Co., Ltd., Mining Engineers and Contractors; employed in 1900-1 by the Queensland Government to inspect all the mines in Queensland and report on the possibilities of improvements and methods of working; was in the War Office 1915-19 as senior Technical Assistant and Assistant Director of Army Contracts; immediately previous to the war was Special Commissioner for the "Engineer" and, as such, travelled through many countries and inspected and wrote on railways, docks, mines and technical education.

My evidence will be more on subjects subsidiary to the Principle of Nationalisation of Mines and Minerals than the Principle itself.

I am in favour of the principle itself, subject to safeguards being established which will ensure:—

- (a) Freedom from political influence.
- (b) Fairness in the national interest in all disputes regarding wages and working conditions.
- (c) Industrial and commercial efficiency in control and management.

It may be worth considering whether nationalisation of mines and minerals should not be taken as separate subjects. State ownership of minerals is so general as to require little argument in its favour. It would, of course, involve the cancellation or acquisition by purchase of existing royalties.

Where minerals are State owned there are various systems of leasing rights, and these imply a consideration to the Government.

The owning of minerals by the State gives the State an initial advantage in all mining operations and a decisive voice as to where and how mining operations should be carried out.

The parallel sometimes drawn between State mines and State railways does not carry far.

State railways may be profitably run at an apparent financial loss. They may be used to develop fresh country and foster new industries. Competition with other similar undertakings is not necessary, and direct foreign competition is non-existent.

Coal must be produced on an economical basis which will permit of its utilisation in the building up of other industries, and in the case of the United Kingdom it is necessary that a considerable amount of coal be exported at competitive prices in order to balance the transport cost of necessary imports, and also to balance exchange.

The magnitude of the undertaking is apparent, especially as it is proposed to nationalise the sale of coal as well as the getting of coal. It is, therefore, suggested that at first it might be well to confine nationalisation to the actual getting of coal. It is, therefore, suggested that at first it might be well to confine nationalisation to the actual getting of coal and, should this be successful, extend it to the sale of coal and possibly also to coal products, such as coke, gas and tar.

With reference to (a), namely, Political Influence—Various efforts have been made to get away from

27 May, 1919.]

MR. WILLIAM BLANE.

[Continued]

this evil, the most successful being the appointment of independent Commissioners. But even where these have been appointed there is a consensus of opinion that the evil has only been partially overcome.

Germany and Hungary suffered little from this owing to the fact that the heads of the State railways were appointed by the Emperor and were not subject to Parliament.

Commissioners are, naturally, influenced to some extent by the body which appoints them. It is, therefore, suggested that the appointment of Coal Commissioners or a Board of Control, or whatever it is decided to appoint, be made by such Authority and under such conditions as will effectually free them from political influence, and that the whole executive functions be abandoned to them. Parliament would, of course, indicate the policy to be pursued and protect the Commissioners in the pursuance of that policy within the limits laid down.

(b) In an industry so vital to the State some statutory regulations with regard to the settlement of disputes are indicated. In this connection it will be necessary to establish such safeguards as will protect the worker and the consumer alike. A wise enactment on this subject might make strikes unnecessary and practically impossible. Great contingencies, such as a sympathetic strike of national workmen in favour of workers engaged in private enterprise, might be anticipated.

(c) There is a well-founded fear that State officials will not work an industry so economically as the employees of a private concern.

After four years' experience as a responsible Government official I must agree that, if the coal industry is to be run by a Government Department on lines similar to those on which existing Departments are run, it must, commercially, be a failure.

The principal cause of inefficiency is excessive centralisation, and this is inherent in the present system.

Perhaps the greatest evil is the control exercised by the Treasury over expenditure, appointments and promotions in all Departments. This fosters inefficiency, delay and financial loss, any one of which would be fatal in a large industrial undertaking such as that contemplated. The institution of a separate Fund and the abandonment of that and all executive functions to the Commissioners would probably go far to mitigate this evil.

Efficiency in the management and in the workers down to the labourer is an essential quality which would naturally be insisted on by the Commissioners.

Delay in a commercial concern cannot be tolerated. Advantage must be taken of every opportunity to improve trade, and such advantages will be lost by delay. This would have special application in the case of export trade, without which the coal industry could not survive.

To avoid financial loss the management must be prepared to act promptly without having to secure the agreement by minute of every person concerned, from the mine manager up to the Treasury.

In view of these considerations devolution should be as complete as possible. As a first step in that direction it is suggested that the working of areas, districts or "fields" might be leased to individual companies on the same principle as the Indian Government leases its railways.

These companies might be composed of the mine workers or of the general public; the amount of capital to be subscribed would be indicated by the Government and would be small, not more than, say, 10 or 20 per cent. of the total capital represented in the undertaking involved, and interest on that would be guaranteed by the Government. The leasing companies would manage the areas for the Government, under the Commissioners, taking their proportionate amount of the profits as dividends, say one-fifth if the representation was 20 per cent. The other four-fifths would go to the Coal Commission Fund.

Such leasing companies would be in competition with each other as far as efficiency is concerned, and this would set up a healthy condition tending to profitable working. They would also act as buffers

between the workers and the Commissioners, and the workers would not necessarily rank as civil servants.

Competition might be accentuated by the application of the premium bonus or other bonus system.

General.—The first object of the Commissioners should be to make mining an attractive employment. In all my experience I have never met a mother who wished her son to be a collier, and I have met few fathers who did not wish their sons never to enter the coal pits. There is no reason why this state of things should exist. Coal mining carried out under the best conditions should be an attractive occupation, and the better the conditions the more profitable the undertaking.

Apprenticeship should be recognised in the coal trade, and means adopted for training youths to the scientific use of pick, hammer, shovel and machinery. Schools for youths should be instituted, where they would be encouraged to compete, both in theory and practice. I would even go so far as to make every person pass such an examination before he takes charge of a working face as would ensure his being a potential manager.

It has been predicted that nationalisation will kill expert trade. With this I disagree. State ownership should foster improvements rather than hinder them. The suggested working of areas would make centralisation of service equipment practicable, and with mechanical haulage over long distances the coal could be brought to central sorting and distributing plants.

Similar advantages underground might be realised. The inauguration or extension of mechanical haulage and belt conveyers, and the more general application of machine cutting and drilling would result in a substantial reduction of the cost of production.

The utilisation of the coal produced could be taken in hand by the Government. The average efficiency of the steam engine and all connected with it results in not more than 6 or 7 per cent. of the B.T.U. (British Thermal Units) in the coal being brought out in effective work.

On the other hand, the internal combustion engine has reached the stage at which 25 to 30 per cent. thermal efficiency can be relied on.

The average steam engine, therefore, may be classed as a coal destructor, and should be scrapped as soon as possible.

The waste of coal in the ordinary fire grate is a matter of common knowledge. Most of the heat goes up the chimney or is dissipated against an outside wall.

As a curative measure I would suggest the passing of an Act of Parliament making it illegal to have a fire in any room within 2 feet of a wall. This would drive consumers to the internal combustion stove, which would utilise most of the heat in the room and make it impossible to consume anything like the amount of coal consumed now.

In like manner the maximum amount of consumption of fuel per horsepower by any prime mover ought to be fixed by Act of Parliament. The coal waster could be eliminated gradually by fixing a minimum of thermal efficiency to be permitted in one year after the passing of the Act and raising the minimum each succeeding year until a satisfactory efficiency is obtained. This would ultimately scrap the steam engine, or induce a miracle on it. Steel and iron furnaces could be treated in the same way.

The carrying out of these suggestions would, incidentally, provide work for many thousands of people and create a boom in the staple trades of the country where coal is the principal raw material used. There would be no hardship, because many enterprising firms would be willing to take contracts both for internal combustion stoves and internal combustion engines on terms of payment to be represented by the cash saving to be effected.

By this means, the whole of our houses and all our prime movers would be placed on a footing of economy which would save, at least, one-half of the fuel at present consumed and cheapen living and production to the same extent. The coal saved would go to

27 May, 1919.]

MR. WILLIAM BLANE.

[Continued.]

increasing export and so enrich the country; and the trade created, without outlay, would raise the whole status of the people.

There is also the question of central generation of gas and electricity, as well as the electrification of railways. These in themselves are very important, but I think it would be better to tackle those I have mentioned first.

Reverting to the main subject, I see no reason why the principle of nationalisation of mines and minerals should not be adopted, but there are so many dangers to be guarded against—some of which I have indicated—that it would be well, after adopting the principle, for a Commission to go into the whole subject and to advise regarding the safeguards to be instituted.

The following Governments work State coal mines, and it is suggested that the actual results be investigated on the spot by men of wide experience and unbiased judgment:—

Germany—about 20,000,000 tons per annum equal to about 15 per cent of the whole production.

Holland—about 500,000 tons, equal to about 30 per cent of total production.

Victoria—about 500,000 tons, equal to about 70 per cent of total production.

New Zealand—about 200,000 tons, equal to about 10 per cent of total production.

New South Wales—about 400,000 tons, equal to about 15 per cent of total production.

The above figures are approximate only.

Other Governments have reserved areas of coal beds to be mined in case of necessity, notably the United States reserves in Alaska and the South Africa reserves in Cape Colony."

22,742. *Mr. Arthur Balfour*: Do you agree that if nationalisation were adopted the control must not rest in the hands of any one section, it must be real control by the nation?—Certainly.

22,743. I take it that you also agree it is absolutely essential that we should have cheap coal to carry on the export trade of this country?—It is essential that we should have coal at competitive prices to compete with other nations.

22,744. Do you think that we should unless we can get all the safeguards to which you have referred? Do you think if the coal mines were run like any Government Department at present that we should get cheap coal?—No, I do not think so, but at the same time I do not think it is impossible to regenerate the bureaucracy, or have a new bureaucracy with an idea of incentive in it that would do it.

22,745. Do you believe in co-operation?—No, I think that co-operation is a very dangerous thing, because while on the one hand we are at the mercy of the worker, and on the other hand at the mercy of the employer to-day, we should be at the mercy of a co-operation from which there would be no retreat.

22,746. *Mr. Sidney Webb*: I see you suggest that possibly each field or district might be leased as the Indian Government does its railways?—Yes.

22,747. But then you go on to suggest that the amount of capital at stake by the lessees would be very small?—Yes.

22,748. You even go on to say that the interest on that capital might be guaranteed by the Government?—It is so as a matter of fact.

22,749. Would that leave very much incentive to the lessee?—There is the incentive of the profit made over the guaranteed amount.

22,750. Then practically it is using them as subcontractors for labour?—No, I do not think so.

22,751. Would you contemplate that there should be a very strict schedule of wages below which they could not go?—Yes, there might be a fixed minimum wage.

22,752. Are you suggesting that the price should remain a competitive price?—Competitive internationally.

22,753. Yes, but not internally. I am only anxious to get your suggestion. Would you suggest that the price of coal inland should be left to be settled among the lessees by competition?—No, I do not

think so. The competition among the lessees would be more in the nature of economies and improvements.

22,754. If they all have to pay a fixed minimum wage and they are selling at a fixed price and the capital is, one way or another, practically supplied by the Government, there will be very little possible savings, because the savings, surely, of the administration would be due to the introduction of machinery or anything of that kind?—There would be all the savings that are possible in an honestly run industry from their brain work, improvements, and so on.

22,755. Surely in an honestly run industry at the present time the saving is the saving from the wages of labour?—No, very largely the opposite—it is very largely the saving of ingenuity.

22,756. At any rate I understand from you that you would not suggest that these leasing companies should be able to fix the price and you would not suggest that they should be able to vary the wage?—No.

22,757. With regard to the export trade, you do not see any serious difficulty in a nationalised industry carrying on the export trade?—No, I do not see any serious difficulty.

22,758. *Mr. R. H. Tawney*: I see on the second page of your proof that you mention various possible economies in the production of coal?—Yes.

22,759. Is it your opinion that there is considerable scope for improvement in production?—Yes.

22,760. That is to say there are economies which we have not yet used and which we might use in the future?—Yes.

22,761. Do you connect that at all with any change in the system of organising or working the industry?—I mean unification or nationalisation—or do you think it would come as a matter of course?—I think unification would help.

22,762. You think there are possible improvements from which the consumers might benefit?—Yes.

22,763. And that the condition of obtaining them is unification?—I should say it would help.

22,764. That is the argument of this Paper?—Yes.

22,765. *Sir Adam Nimmo*: I think you seem to have little difficulty in accepting the principle of nationalisation of the mines?—Yes.

22,766. Your difficulty is in regard to the application of the principle in detail?—Yes.

22,767. Do you think in a matter of this kind that you can adopt a principle without knowing how it is going to work out in detail?—Yes.

22,768. How would you explain that?—The principle may be forced upon you, or you may arrive at the adoption of a principle by broad arguments; but, having arrived there, you want to find out conditions under which it will work.

22,769. Have you not a special problem here in connection with the mining industry which you have to apply your principle to and consider the application of that principle in detail?—Will you please repeat your question?

22,770. Is the mere assenting to a principle of any use in connection with such a problem as the nationalisation of mines?—It is only of value as far as the value of my opinion goes here.

22,771. The whole question turns upon whether you can apply that principle to the problem in detail. I suggest there is little to be gained by merely expressing a pious opinion upon the principle in connection with such a problem as this?—Ask me upon it then.

22,772. I observe you think it necessary to apply certain safeguards. In applying the principle, and the first one I observe is there should be freedom from political influence. Do you think the appointment of a Minister of Mines would secure freedom from political influence?—Not quite.

22,773. Then you say there should be fairness in the national interests in all disputes regarding wages and working conditions?—I suggest how I think it could be freed from political influence.

22,774. You suggest there should be fairness in the national interest in all disputes regarding wages and working conditions?—Yes.

22,775. Would you consider that fairness could be secured by having every wage question referred to

27 May, 1919.]

MR. WILLIAM BLANE.

[Continued.]

the Miners' Federation of Great Britain?—If the mines are to be nationalised and become the property of the nation it must, I think, in fairness be referred to the nation.

22,776. That is to say, they are not to be put into the hands of the Miners' Federation of Great Britain to deal with the question of wages assuming the mines to be nationalised?—In the proportion to which they are part of the nation, yes.

22,777. Your demand is there should be fairness in the national interest in all disputes regarding the wages and working conditions?—That is if the mines are nationalised they should be nationalised by the nation for the nation and run for the nation.

22,778. If the Miners' Federation was to create a preponderating influence, would that fairness be secured?—I should not like to prejudge the case.

22,779. With regard to industrial and commercial efficiency in your control and management, would you say it was necessary to secure from that point of view the largest possible output of coal?—It depends upon the demand.

22,780. Consistent with the demand?—Yes.

22,781. Would you say it was desirable to secure that production at the lowest possible cost?—No, I would not say that.

22,782. Would you say the lowest reasonable cost so as to maintain the whole industrial position?—No, I would not say that.

22,783. What is it you have in mind when you speak of industrial and commercial efficiency?—You mean the production of coal should be at a price which would be consistent with fair working conditions. I mean to say the coal should be produced at a price not controlled by anything except the working conditions and the demand for the coal, and generally the question of a low price is not a vital question.

22,784. Would you not say efficiency generally was more likely to be secured by the initiative of private enterprise than by the application of nationalism?—I do not think so.

22,785. Taking the question of exports, I observe you do not agree that nationalism will kill the export trade. It may not kill the export trade, but would you be disposed to say it may not seriously affect it prejudicially?—In my opinion, it would seriously affect it for good, because if the nation controlled the mines and controlled the product, half the coal that is used in this country could probably be saved—saved by our industries which make steel, iron and everything else—and thereby the price of such production is brought down; the coal that is saved would go to increase the quantity of export at the ordinary price.

22,786. How would you bring about such a saving in consumption in this country?—I have hinted at it here. In the first place, by standardising the consumption of all coal consumers.

22,787. Would not that really mean, for example, in connection with the industry a great reconstruction of the whole of the industries of the country?—Yes, very greatly.

22,788. Do you consider that a practical scheme just now?—Yes, I consider it a profitable scheme as well.

22,789. Would it not take an enormous amount of time to carry it out?—Five years.

22,790. It would take five years to reduce the consumption by 50 per cent.?—Yes.

22,791. Do you really put that forward?—I do.

22,792. Referring to exports, you propose to deal with the export trade through a centralised authority?—I should rather not touch upon that.

22,793. You remember you say here in your *précis* that you do not agree with the statement that nationalisation will kill the export trade. If you manage the export trade through central organisation are you not likely to hold it up?—I do not know much about that end of it. I know there will be much more to export.

22,794. You do not know whether we could secure thereby the same competitive conditions to hold our own?—I do not know that there would be any difficulty.

22,795. Would not the whole organisation be slow moving under nationalisation? Would you be able

to change the price to take advantage of changed conditions in foreign markets?—I suggest that should be ensured.

22,796. Is it not very much safer for the export trade to rest that upon competitive conditions as it does just now with the freedom of movement?—I do not know. I do not know much about trading in coal; I am an engineer.

22,797. *Mr. Evan Williams*: I see you suggest as a mitigation of Treasury control the institution of a separate fund. Do you contemplate that fund in connection with the scheme you outline following on the leasing of the coal properties to be worked by private persons, or do you contemplate a fund in connection with the complete ownership of the mines?—In connection with complete ownership.

22,798. Would that be a fund into which all the proceeds would go and out of which all the outgoings of the trade would be made?—I should think so.

22,799. Your object would be in that way to make the coal trade self-supporting and under no financial control except its own?—Yes.

22,800. How far would you advocate devolution of authority in connection with finance?—I think only as far as the Commissioners may have to arrange what should be done.

22,801. You would still retain financial control in the hands of the Commissioners?—Yes.

22,802. Central?—Yes.

22,803. Do not you think that is rather preserving the evils of Treasury control?—No, because with the present system you would have the Treasury over your Commissioners.

22,804. You would have the Commissioners ever every mine manager in the same way?—For the Commission to devolve as they thought advisable.

22,805. Do you think it is possible to run an industry when every expenditure or single matter has to be referred to headquarters?—In the Indian Railways it is not so. Everybody runs their own finance, but the central finance is controlled by Commissioners.

22,806. I thought you had no devolution of finance following the central authority of the Commissioner?—I do not mean that.

22,807. You would have devolution in regard to financial matters to each unit?—Yes, to each unit.

22,808. You would give units the power of spending money without reference to the central body?—They would have to get their votes, so to speak, or their portion of their capital apportioned to them. After that they would probably control it themselves.

22,809. Do you think that would still reduce the evils of Government financial control?—It would reduce it to a minimum.

22,810. You think so?—Yes.

22,811. That would give all the local councils power to spend other people's money without running any risks of their own?—I do not think that applies at all. With regard to the handling of money they would be receiving money, paying out money in the ordinary trade, and it is not a question of giving them authority to spend other people's money at all. It is giving them authority to carry on a business.

22,812. With other people's money?—With other people's money as is done every day in companies.

22,813. By whom?—All directors' boards do it. Every limited company does it.

22,814. And they are responsible to their shareholders and they are themselves shareholders?—They are shareholders and they represent the shareholders.

22,815. And they are generally the largest shareholders?—Sometimes with a very nominal qualification.

22,816. There are other qualities, I suppose, in those cases?—Perhaps.

22,817. *Mr. R. W. Cooper*: I see towards the end of your proof you give us information about State owned mines in other parts of the world. I see you state that in New South Wales there is about 400,000 tons per annum produced by State owned mines?—Yes.

22,818. What is your authority for that statement?—My authority for that statement is the Report of the Commission that sat in 1916-17 in South Africa on the same subject as this Commission is handling now.

27 May, 1919.]

MR. WILLIAM BLANE.

[Continued.]

22,819. Have you that Report with you now?—I have not got it. I can send it to you.

22,820. We had here a statement days ago by the Agent-General of New South Wales. He told us the State was not working any colliery in New South Wales.

22,821. *Sir Leo Chiozza Money*: He was, I fancy, wrong about one or two things?—I will send you the Report.

Mr. R. H. Tawney: Which Report was that?

22,822. *Mr. R. W. Cooper*: This is the question asked the Agent-General:—"Are there any State owned mines in New South Wales?—(A) The nearest approach to it is the mine that is partly sunk for the use of the Railway Commissioners. I refer to that in my evidence, and I have heard in the last few days that they have got as far as sinking the down-east shaft, completing that, and they have got part of the way with the upcast, and the Government have given instructions to cease it, and nothing has been done." What I was referring to was in the evidence of the Hon. Sir Charles Wade on page 814, question 19,380. Then at question 19,381 he is asked:—"But no coal has been as yet worked?—(A) No." Now let me refer you to the Annual Report of the Department of Mines of New South Wales for the year 1917. It is published by the Government publishers in Sydney in 1918: "*State Coal Mine, Lithgow*.—Operations in connection with the establishment of a State coal mine at Lithgow continued until 10th July, when, as the result of the decision of the Cabinet, all work ceased. At this time, the upcast shaft had been sunk to a depth of 85 feet, and a commencement had been made to put in the brick lining. Owing to the treacherous nature of the surface alluvial deposits, containing considerable quantities of water, special timbering was required for about 40 feet from the surface. At the time when work was abandoned, the down-east shaft headgear, &c., was erected and the necessary arrangements for sinking were nearly complete." Then it says: "Before operations are resumed, it would be advisable to construct the railway, as this would much facilitate the work of development and effect a great saving in the carriage of materials." I suppose after hearing what the Agent-General said and hearing the Government Report you do not adhere to the statement?—I shall send you my authority. While I am here, may I mention that was a very important Commission on the State working of mines in South Africa?

22,823. The question is not the importance of the Commission, but the accuracy of the statements.

Mr. R. H. Tawney: Would you ask which is the Commission? I should like to see it.

22,824. *Mr. R. W. Cooper*: The witness is going to send the Report. Have you any personal knowledge of the carrying on of mines in New Zealand or in Germany?—No.

22,825. In particular parts of the British coalfields have you had any experience?—Scotland.

22,826. When was that?—When I was a young man.

22,827. How long is that ago?—A considerable time now.

22,828. How many years ago?—Nearly forty years ago.

22,829. Is that the only coalmining experience you have had?—No.

22,830. Where else have you had experience?—South Africa.

22,831. How long ago is that?—About 10 years ago.

22,832. Anywhere else?—Queensland.

22,833. I observe apparently in Queensland there are no State worked mines at all?—No.

22,834. Have you had any experience except Scotland in the British coalfield?—Nothing except by examination.

22,835. You mean you have been employed professionally as a mining engineer to examine collieries?—All my life.

22,836. Are you acquainted with the Durham coalfield?—No.

22,837. Or the Northumberland coalfield?—No. I am not acquainted with the English coalfields.

22,838. I observe you make a statement in your *précis* that in all your experience—of course, it is qualified by those words—that you never met a mother who wished her son to be a collier. Do you know that in Durham and Northumberland it is almost a general rule for the sons to go into the pits as soon as they are 14 years of age?—Yes, I know that. I also know if the mothers could make them anything else they would usually do it.

22,839. How do you know that?—I have lived amongst them.

22,840. Do not you think the mother's influence is strong enough to prevent it if she cared to do it?—Yes, but not her purse.

22,841. I suppose you mean by that the boys get good wages?—They get better wages than by serving apprenticeship to a trade.

22,842. I think probably that is the case. Do you suggest nationalisation of royalties is a thing apart from what I may call the complete nationalisation of all mines and minerals?—I do not suggest it. I suggest it might be treated as a separate subject. It is a separate subject really.

22,843. You speak also of confining nationalisation to the actual getting of the coal. Do you mean the State should carry on the collieries but not sell the coal?—What I meant by that was the thing could be taken in stages; it is a very big thing.

22,844. Do you mean the State should produce the coal, but not sell the coal?—It would produce it at first and then take the selling of it afterwards.

22,845. That is what you mean by your suggestion?—Yes.

22,846. I see you absolutely condemn what I may call bureaucratic management?—Yes, it exists to-day.

22,847. On every ground, both as regards delay and efficiency?—Yes; but I do not think it is impossible to fit up a bureaucracy which would avoid these things.

22,848. You mean to reform the present system of Civil Service?—Yes, instil new elements into it; put incentive there. The Civil Servant has to-day no balance sheet; he has nothing but the side of a page on which his faults are written. Give him a balance sheet like another man, and give him an incentive, make blunders if you like, then it will be much better.

22,849. You cannot succeed without making blunders. There is another question I want to put to you. You talk about devolution, about leasing areas to companies on the same principle that the Indian Government leases its railways. Do you mean by that that the State should acquire these areas and lease them to private companies to work?—I mean the State, having nationalised all the coalfields, might lease them to companies representing a very small sum of interest. For instance, some of the Indian railway companies have, I believe, only a five per cent. interest in the thing. It sets up initiative for competition in various ways which should take the thing out of the ruck of officialism.

22,850. You do attach importance to the influence of personal enterprise?—Yes.

22,851. And personal initiative?—Certainly.

22,852. And competition?—And competition.

(The Witness withdrew.)

(Adjourned to to-morrow at 2 o'clock.)

28 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued

SECOND STAGE—TWENTIETH DAY.

WEDNESDAY, 28TH MAY, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. ROBERT SMILLIE.

MR. R. W. COOPER.

SIR ALLAN M. SMITH.

SIR ARTHUR DUCKHAM.

MR. HERBERT SMITH.

MR. FRANK HODGES.

MR. R. H. TAWNEY.

SIR LEO CHIOZZA MONEY.

MR. SIDNEY WEBB.

SIR ADAM NIMMO.

MR. EVAN WILLIAMS

SIR ARTHUR LOWES DICKINSON,	} (<i>Assessors</i>)
SIR RICHARD A. S. REDMAYNE,	

MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

MR. WILLIAM STRAKER and MR. JAMES WINSTONE, Recalled.

22,853. *Mr. R. W. Cooper*: As I had the pleasure of asking you some questions on the 14th March, I shall endeavour, as far as I can, to avoid the deadly sin of repetition. You refer first in your proof to the draft Parliamentary Bill which was laid before us last Friday afternoon by Mr. Slessor. I am asking you some questions which to a certain extent I refrained from asking him. Would you mind telling me, was he the draftsman of your Bill? When I say your Bill, your Federation's Bill of 1912?—Yes, he was acting under our instructions then.

22,854. I said draftsman?—Yes.

22,855. I quite understand whatever is in the Bill was put in under your instructions. He merely puts it in the proper language for you?—Yes.

22,856. I suppose he would be the writer of a little tract I hold in my hand called "Fabian Tract, No. 171." I will show it to you; you may have seen it?—Yes, I think I have.

22,857. Is he the same gentleman?—Yes, I think so.

22,858. You say that the draft Bill embodies the proposals you outlined to us in March with some extensions or additions in detail?—That is so.

22,859. I gather as regards the suggested Mining Council the difference between the proposal in the draft Bill and the proposals outlined by you last March simply is that the Council consists of 20 members instead of 10?—I think that is the principal difference. There are the replacing, I think, of some of the clauses.

22,860. Quite. That is neither here nor there. I notice in the Bill you propose not only to pay no compensation for what I will call royalty rights for the sake of simplicity and wayleaves, but you also propose to put a limit on the amount of compensation to which the colliery owners are entitled?—That is so; not to what he would be entitled.

22,861. A limit, I meant, on the sum to be paid to him?—Yes, that is so.

22,862. When you and I were discussing the matter in March you said nothing then about that proposed maximum limit. Let me read you the question I asked you in March?—I would suggest I did not put in any Bill in March.

22,863. I asked you a question and I am going to ask you the reason why your Bill does not agree with the answer you gave me in March. On page 325 of the shorthand notes, at question 8,082, I asked this question: "I gather that your intention is that the

present owners should receive the fair selling value of their property from the Government?" Your answer was: "Quite so"?—Yes.

22,864. Assume that the fair selling value of a man's colliery works out at more than 10s. per ton of output, why is it to be limited to the 10s. per ton?—Of course, it all turns on what we may consider the fair selling value.

22,865. Let me ask you this. Can the fair selling value have any meaning except one meaning? (*After a pause.*) Now, Mr. Straker, will you answer my question?—I am quite ready.

22,866. Had you better not give me the answer no; it can only have one meaning?—What you would consider a fair selling value might differ from what I might consider a fair selling value.

22,867. I am not talking of what you or I might think to be the fair selling value. I ask you the meaning of "fair selling value"?—I can assure you, when you refer to my previous answer, that answer was governed by what I consider the fair selling value.

22,868. I will give you your previous answer; I do not wish to be unfair to you at all. I will go back to the questions, so that you can see the whole of the context: "You and I happen to come from the same part of the world, and we shall be able to understand each other. The effect, I suppose, would be this, that all the Northumberland collieries would be transferred, we will say, to the State?—(A) Quite so—all the collieries in the country that were worth taking over. (Q) Will you tell us how do you propose that those collieries should be paid for?—(A) I have suggested, I think, in the case already read by the Chairman that they should be paid for by the Government Stock. The form of that stock I do not think is germane to the present question. (Q) I quite agree with you?—(A) I dare say ultimately that would rest with the Government, acting on the advice of the Treasury, as to the form that stock should take." Then comes the question I commenced by reading to you: "I gather that your intention is that the present owners should receive the fair selling value of their property from the Government?—(A) Quite so." Then, I go on in the next question to ask you: "Assuming that the collieries have been bought and paid for by the State, there would then be, I suppose, a Northumberland Council of Management?—(A) If Northumberland was formed into one district that would be so"?—That is so. What question have you asked?

22,869. My question is this: can there be any meaning except one attached to the expression "fair selling

28 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

value."?—I can only say what I said was governed by what I considered to be the fair selling value; that is, the repayment of the capital in the form of Government Stock bearing a certain interest would be the fair selling value.

22,870. That is not my point. I am not discussing the method of payment. I ask you why, if you told me in March the colliery owners should have the fair selling value of their property, you now propose to give a man who has a fair selling value of more than 10s. a ton output only 10s. a ton output? Assume the man's property is, in the eyes of all commercial people, worth more than 10s. a ton output, why do you limit that man to 10s. a ton output?—We allow a maximum of 12s.

22,871. That is the maximum only for very small collieries. Keep to the general case, if you do not mind?—The maximum, in my opinion, will cover any real capital.

22,872. That is rather begging the question. I ask you to assume a case where it does not, and I want you to tell me why, in such a case as that, the man should be cut down to 10s. a ton output?—I would assume, in such a case as you name, there has been over-capitalisation.

22,873. You must not assume that; you must assume fair selling value only?—I assume if you get the capital out that you have put in, you have a fair selling value.

22,874. I will take that for the moment as your answer. If the owner of a colliery, or, rather, his executors when he dies, has to pay duty to the State upon the full amount of the fair selling value of his property, why should not the State if it buys that property pay the full amount of the fair selling value?—That is a question beyond me. I am afraid I am not well acquainted with death duties at all.

22,875. I will leave it at that for the moment. I appreciate very well what you say about much that has taken place here being argument on both sides, therefore I will endeavour as far as possible to avoid argument. You make a statement in the second paragraph of your *précis* headed: "Fundamental Difference," in which you say: "During the first stage of this Commission the old ways of mine management and control were shown to be so beaten into mud that the Report, known as the 'Sankey Report,' and accepted by the Government, declared that the present system stands condemned." Have you not made a slip in writing that paragraph?—I think it is a correct quotation.

22,876. Let me show you where it is not. Look at what I will, with respect, call the Sankey Report. It says: "The present system of ownership and working," not "management"?—I think if that Report has any meaning at all, and I think it has a lot of meaning, it is that that declaration certainly, above all things, includes management and mine policy.

22,877. You read no doubt the evidence given by Mr. Sidney Webb?—I did not.

22,878. You do not agree with what Mr. Sidney Webb told us?—Not necessarily.

22,879. Let me read what he said to us in the second paragraph of his *précis*. "It is desirable to make plain that the relative inefficiency of the British coal supply is not to be ascribed to personal shortcomings of those who direct the various branches of the industry. There seems no ground for accusing the mining engineers or the directors or managers of collieries or the merchants or dealers in coal of any technical inefficiency."

Mr. Sidney Webb: Read the next sentence.

Mr. R. W. Cooper: It goes on to the theory of profit.

Mr. Sidney Webb: You get the explanation of the statement.

22,880. Mr. R. W. Cooper: "Indeed it is not suggested there is among them for the most part any inefficiency in getting profits; even those who suppose profit making an indispensable motive will realise the making of private profit is no test of efficiency." If I have misinterpreted what I conceive to be your magnanimity I am sorry?—I will suggest you recall Mr. Sidney Webb.

22,881. We have had two days of him?—I cannot be responsible for what he said.

22,882. I simply say you do not agree with him?—Not necessarily.

22,883. Now I am talking of production. Is it not a fact that there has been a gradual decline in production per person employed in the coal mines over a considerable series of years?—I think that is so.

22,884. I do not know whether you have seen an article in the "Times" newspaper of Thursday last giving certain figures beginning in 1903 and going to July, 1918, and also giving the first three months of 1919. Did you see that article?—No, I did not.

Sir L. Chiozza Money: Was that the allegation that since what we call the Sankey Report was made there has been a great further decline?

Mr. R. W. Cooper: Yes.

Sir L. Chiozza Money: I thought that a very unfair letter, and it was an anonymous letter too.

22,885. Mr. R. W. Cooper: This is not a letter. This is an article by the "Times" Labour Correspondent. I should imagine from the appearance of the article it was inspired from some official source. It shows this, that on the basis of the first three months of this year the production for 1919 will only be about 224,000,000 tons.

Sir L. Chiozza Money: It is true this article appeared in the "Times," and appeared to convey the information which, if authentic, ought to be in our possession.

Mr. R. W. Cooper: I am going to ask for it.

Sir L. Chiozza Money: It is not in our possession officially, yet it appears in the "Times" newspaper through their Labour Correspondent, which seems curious.

Mr. Evan Williams: I ask that we may have the return of the output for the years which were mentioned some time ago.

Mr. R. W. Cooper: If they are agreed figures, and if they are in possession of any department of the Government, I agree with Sir Leo that we ought to see them.

Chairman: So many things have been circulated that it is not surprising that some members of the Commission forget what has been circulated. We have had circulated the output for every week this year down to April 26th. I will hand Mr. Cooper a copy. It gives the output for every week in every district up to April 26th. For the week ending April 29th you have to add one-third on because of Easter. You cannot compare the output of that Easter week.

22,886. Mr. R. W. Cooper: The figures do not quite correspond with the "Times" figures, but they do very nearly. I take the figures from the official paper. The total for the 12 weeks ending 29th March, 1919, in millions, was 56 millions. Multiply that by four, that gives you for the whole year 224,000,000 tons. If that be further reduced during the second half of the year the probability is the output in the year would be less than 224,000,000 tons. With your practical knowledge is not that so?—That it will be reduced?

22,887. Yes?—I do not think so.

22,888. Do you think there will be no reduction, at all in consequence of the reduction of hours beginning on the 1st July?—I think that the figures you have given now for the first quarter of this year are the result of a peculiar set of circumstances that will be largely absent during the second half of the year.

22,889. What do you mean by that?—If you had been a mine manager I believe you would know.

22,890. I am not a mine manager, as you know?—I know. The pits have been largely overcrowded owing to the soldiers returning to the mines. You know mine owners have been under a pledge to reinstate all the men who come back.

22,891. Certainly?—The miners, on the other hand, object strongly to the displacement of men who have served the country well and who have been in the mines during the war. In addition, too, the natural development that under ordinary circumstances goes on all the time has been prevented by the Coal Control, consequently the room in every pit almost is

28 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

so restricted that these men, even if they were all fit for hard arduous labour in the mine at once when they come back, which they are not, owing to the lack of pit room and the crowding of these men into the mines, you cannot possibly expect the same result.

22,892. I do not suggest that?—I suggest that is the cause of this fall per person employed during the first quarter of this year.

22,893. I am not talking of that, but the total output of the 12 weeks which I gave you as 56,000,000 for the whole country?—This has affected the whole country equally.

22,894. It may have affected per person employed. Do you suggest it has the effect of reducing the output, the putting of mere men into the mine—surely not?—The only other thing I can conceive is that in some cases I know of the miners have been losing time owing to the difficulty of being supplied with trucks.

22,895. During the first quarter of 1919 was there any loss of time worth speaking of in the mines of this country?—I think there was some. I could not say how much. I know some pits which lost some time.

22,896. What do you mean by some time?—I do not mean them all.

22,897. Do not you think that, generally speaking, the pits were working well during the first quarter of this year?—I think they did work fairly well, but they may have worked better.

22,898. My point is this. On these figures are we not bound to assume the output of coal in this country this year will be less than 224,000,000 tons?—It does not follow that that will be further reduced.

22,899. I am not suggesting a further reduction. For the moment I am assuming this rate is being maintained at 56,000,000 tons a quarter. I say, do not these figures show, especially having regard to the fact of the impending reduction of working hours, that we could not pursue a bigger output for this year than 224,000,000 tons, that means, four times, or thereabouts, this 56,000,000 tons?—Even if we do not know for the moment, without an enquiry, as to the real cause of that, I do not see where that affects the question of nationalisation.

22,900. It affects what you tell me about the amount of work that is not got out of the pit. I will take you on another subject. I gather that your political views, or your ethical views, are this, that industrial enterprise carried on for profit is altogether a depraved occupation?—I do not think I said that.

22,901. Let me see. Do not you say that in effect? You say that competition is a purely selfish matter. "This seems to me to be a primitive idea belonging rather to an early form of society than to twentieth century civilisation." I suppose you know the earliest idea of all. You remember the early community of goods, do you not?—I do not remember that.

22,902. Do not you remember the system which brought Ananias into trouble?—I must confess I was not there.

22,903. I gather that your view is that all industries ought sooner or later to be nationalised?—I think all industry will be nationalised some time.

22,904. You speak about the huge drain on the industry of royalties and wayleaves?—Yes.

22,905-6. About how much a ton do you consider the average mine royalty in Great Britain to amount to?—I think the figure given before this Commission was right, over 6d.

22,907. I will take it at that. Have you any idea what the percentage of the selling value of coal at the pit head that represents?—Over what period?

22,908. I take the year 1913, and then I take September, 1918?—If you will tell me what the average selling price for 1913 was.

22,909. The figures show that in 1913 the selling value of coal at the pithead was 10s. 1½d. Is not 6d. a ton about 5 per cent. of that?—5 per cent., a 20th part.

22,910. In another paper it is shown the selling value of coal for the quarter ending September, 1918, it was when the prices were high, was practically 25s. and the royalties were 7d?—Yes.

22,911. How much per cent. do you imagine those royalties were of that selling value?—It is a question of figures.

22,912. Take it from me, it is about 2½?—Yes.

22,913. Do you agree with my calculation?—I am not disagreeing with it at all. I do not know why you examine me in arithmetic.

22,914. Because you use the expression "huge drain." "Huge" compelled me to exercise my arithmetical faculties as well as yours. You talk about the result of nationalisation being a decrease in the cost of production. Do you expect the workers' wages will be reduced if the mines are nationalised?—That will largely depend on all other circumstances at any given time.

22,915. That is hardly an answer to my question. Do you imagine under nationalisation there is a greater likelihood of the workers' wages being reduced under any circumstances than under private ownership?—I think the wages cost, owing to greater economy in management and application of improved machinery, will be less per ton.

22,916. You mean you may get more coal for the same amount of wages?—That may be.

22,917. I do not know what you mean when you refer to export. You say the increase in the export coal shipment will prevent any ships having to sail outwards with, possibly, only ballast. Have you heard of ships leaving an English coal port in ballast?—No, I have not.

22,918. Take Blyth. You know Blyth. Did you ever hear of a vessel going from Blyth in ballast?—You might address that question to Lord Gainford, who is present.

22,919. He is not in the box. He did not make that statement?—He suggested it.

22,920. I see you say later on: "It must be admitted that competition has been a great incentive to enterprise; but it must also be admitted that it has been a prolific cause of dishonesty and nearly every other evil that has afflicted humanity"?—Yes, I think you will agree with me.

22,921. I do not, indeed. I will come to the end of your *précis*. I am anxious to avoid travelling over the ground you and I thrashed out in March. You talk of section 5 of your Bill. I think you are referring to the particular part of sub-clause 3 of clause 5, by which the Mining Council has the option of electing not to take over any colliery or any particular works connected with any colliery undertaking until they otherwise determine. You say: "The danger of sudden transition from one form of ownership and control to another, resulting in such an upheaval in the industry that the welfare of the nation would be seriously affected, is a real danger. To avoid this, section 5 of the Bill has been introduced." Then you say: "Under this section the Mining Council will have power to disclaim the taking over of any mine, &c., until such time as it can do it safely and without interfering with the orderly continuation of any mine or other industry connected with mining." Are you aware as your Bill stands that if your Mining Council elects not to take over a colliery, the owner of the colliery is prohibited from working it without the consent of the Mining Council?—Quite, but he is allowed to take it with the consent of the Council.

22,922. What would his position be supposing the Council did not give their consent?—The Council would take it over and work it.

22,923. But supposing for some reasons known to themselves they said they would not take it over and work it and would not allow the man to work it, what is the position of that man to be?—He would then, I take it, be paid the capital value of his mine.

22,924. No. You see your clause provides that in the case you and I are discussing the Council are not to pay for the mine?—They are to pay the capital of the mine.

22,925. No. The case you and I are discussing is not so. We take a case where they elect not to take over the mine and pay for the mine?—Quite.

22,926. I put it to you in that event your Council have the power to absolutely sterilise the mine?—While it is necessary that it should be worked under

28 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

the jurisdiction of the Council, as I may put it, yet there is no likelihood of a condition of things arising like that if the mine is worth working.

22,927. Do not you see that as your Bill stands your council might elect not to take over the mine? The owner could not then work it and then after a long or a short delay the Council might elect to take it over. What is to become of the mine meanwhile?—The present owner would continue working the mine.

22,928. Only if he had the consent of the Council?—Quite. I cannot imagine a case where that can be refused.

22,929. Supposing you are advised by some very astute lawyer who saw his way by letting that mine remain dormant for four or five years to greatly reduce the selling value of the mine and so reduce the amount you have to pay for it?—I think that is not contemplated when the mine is taken out of the hands of the present owner of the mine.

22,930. This clause of yours assumes that the mine is not taken out of the hands of the present owner of the mine. It remains in his hands?—But when his mine is stopped, I take it, it is taken out of his hands.

22,931. It is not that it remains his property, but he cannot work it. You might either say you shall not work or must work under conditions which the man cannot comply with?—That may be a fair point for lawyers to argue in the House, but if there was any difficulty in that it could probably be put right before it got through Committee.

22,932. Am I to take it from you you agree that such a power would be altogether unfair to the owner of the mine?—No, I do not.

22,933. Then why is it a matter for reasonable debate in the House?—I do not think there is any probability of it being applied as you suggest.

22,934. It is the power I object to. Why should you have such a power as that given to you?—In order that as far as ever possible the Mining Council may know exactly what is being done in the whole coalfield and in the whole coal market.

22,935. If that is the only answer you can give me I leave it at that?—Even the continuation of a mine under present ownership must be under the control or subject to the control of the Council.

22,936. *Mr. Sidney Webb*: In your Miners' Federation Bill there is a provision for taking over the associated properties in connection with the mine. That would probably mean coke works, for instance, by-product works?—It does mean all that.

22,937. Where there is an iron and steel works run in the same ownership as a colliery or a tin plate works run in the same ownership as a colliery, is it the intention of the Bill that the iron and steel works or the tin plate works should be taken over with the colliery or not?—If it is worked in conjunction with the colliery and closely adjacent to the colliery I think any works in that position would be taken over.

22,938. If it can be separated and the accounts are separated and the premises are separated would it then be necessary to take it over?—I can imagine works of that kind being so distantly connected or associated with the colliery that the Mining Council in their wisdom would not take them over. I can understand again their being so closely associated and so closely connected with the colliery that they would take them over.

22,939. *Mr. Evan Williams*: In the case such as *Mr. Webb* was putting to you, say steel works or tin plate works being contiguous to a colliery, you say that they would be taken over?—If it was works in connection with a pit.

22,940. After being taken over it would be subject to the Central Mining Council?—We do not mean, certainly, to take any works over simply because it appears to belong to the same ownership. We only contemplate taking over works that happen to be worked in conjunction with the mine.

22,941. And such works, if taken over, would be owned and managed by the Mining Council?—Any works taken over would be owned and managed by the Mining Council.

22,942. You do contemplate that steel works, tin plate works and other works might be managed by

the Mining Council?—I certainly have not said that. I said any works that were taken over.

22,943. Do you contemplate that such works may be taken over?—I do not contemplate taking tin works over and taking steel works over. I really do not. I do not think that has been contemplated.

22,944. Then you wish to amend your first answer?—No, I do not.

22,945. Then I do not know what you do mean?—You had better ask it again.

22,946. You say there is the power to take them over and if closely associated you say they would be taken over?—Yes.

22,947. Assume they are taken over, does the Mining Council propose to manage steel works and tin plate works that would be taken over?—If taken over, they would be managed by them. I have not said they would be taken over.

22,948. If taken over, they would manage them?—Yes, manage anything taken over.

22,949. Do you think such a body as the Mining Council is capable of managing such an undertaking as a tin and steel plate works?—I have not said they would take them over. You must not lead me there.

22,950. I see you are getting into difficulties. Substantially it is for sentimental reasons that the miners wish for the nationalisation of mines?—You think it is for sentimental reasons?

22,951. No; you wish to convey that in your proof?—No, the opposite to that.

22,952. Is it not they wish to have a greater share in the control?—Yes.

22,953. And a better system without any competition?—Quite.

22,954. And those two very largely are the reasons for which they wish nationalisation?—Largely, yes.

22,955. Do you think that the industry can be carried on at all if competition is entirely eliminated?—I think that it can under one authority.

22,956. An industry which, as you admit, has been built up under a competitive system which you say has proved useful and valuable in the past?—It has only proved useful and valuable so long as the community through their representatives could not manage it themselves.

22,957. You think the community can manage it themselves?—So far as mining is concerned.

22,958. What proof have you of that?—The general knowledge which miners have of the industry.

22,959. Has it ever been tested?—Not in this country that I am aware of. It has been tested in other countries.

22,960. You know a man may have any amount of knowledge, but without a certain amount of practice he cannot become a coal manager?—Yes; but no one can imagine the State taking over such an industry and not also employing these men of experience who are now in it, and I cannot imagine these men refusing their services if you pay them for it.

22,961. When you say the State is to manage, you mean the present manager is going to continue?—Just as when I say the community, I substitute the community for the present shareholders.

22,962. Do you think there will be no competition at all if the industry is taken over in that way?—Not in the selling market.

22,963. Is there not going to be competition between individuals in the industry in the same way as in the past?—Not in getting less prices. The price will be regulated by the Councils under the Nationalisation Act.

22,964. Then it was only commercial competition you objected to in the past?—Most decidedly.

22,965. It is the competition between one owner and another in the sale of his coal?—I think the competition between one manager of a mine and another will be there still. Each manager will vie with the other in doing their best.

22,966. I gather from your proof you wish to stimulate that competition?—Yes.

22,967. Make competitors between one pit and another?—Yes.

22,968. And stimulate that competition between them?—There will be set up a system of comparison that will result in, I think, an improved and more economical management.

28 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

22,969. You say that will not be a system based on selfish gain of the individual wanting advancement?—Nothing like what competition in the selling market is.

22,970. It is commercial competition you object to?—Yes.

22,971. With regard to sharing control, you say there must be a right to executive power. Explain what you mean by that. The miners shall have such executive powers, you say?—I mean the opposite to what the mine-owners mean when they say the miners shall not have executive power.

22,972. You mean the miners shall have power to the full extent?—I think we have drafted the scheme of management.

22,973. It is somewhat contradictory if that is what you do mean. You say, on the second page, that to talk of divided authority is the most sheer nonsense; and you say, in another place, responsibility cannot be shared. I am at a loss to know what you mean?—I think you are separating that from its context.

22,974. It is not in the same place, it is true, but it bears on the same point. It is important we should know to what extent the miners are to have executive power. Are the men to have control over the manager in his technical management and the management with regard to safety at the colliery?—The Pit Council would deal very much with managers as they are now dealt with by managing directors.

22,975. Without any mere power than the managing director has got?—I do not know any limit to the power of the managing director or the agent.

22,976. There is the limit imposed by the Act of Parliament?—Quite. That would be the limit of the Pit Council.

22,977. The division of responsibility and this executive power stops short of the Act of Parliament?—The manager would have the same responsibility under the Act of Parliament which cannot now be shared with an agent or managing director.

22,978. Would you give the manager the last word in the case of a difference between him and the Pit Council?—I do not think he has the last word now.

22,979. In matters of safety?—Might I quote from Mr. Gibson, who is himself a certificated colliery manager, who gave evidence yesterday? He declared that the agent must have the last word, after explaining in his *precis* the limitations of the power of the colliery manager, in his evidence he made the statement, using almost his own words, that "the agent must have the last word."

22,980. And the agent before he can interfere in the management must be a qualified manager?—I am not sure that is so.

22,981. That is so under the Act of Parliament?—I do not think so.

22,982. It says he must be?—No; you must point that out in the Act.

22,983. It is in the Act?—No.

22,984. It is?—I feel fairly confident it is not.

22,985. No owner or agent can interfere in the management unless he is himself a first class certificated man?—I think the Act requires that any owner or agent must appoint a certificated manager; that is all it requires.

22,986. I think there is the provision. You would give to your Pit Council all the power the agent has at the present time?—Yes, I would.

22,987. Although they would not be qualified under the Act. I have the Act. It is section 2, sub-section 4. "The owner or agent of a mine required to be under the control of the manager shall not take any part in the technical management of the mine unless he is qualified to be a manager." You expect greater agreement and efficiency under nationalisation than at the present time?—I do.

22,988. You expect a decreased cost?—Yes.

22,989. And a greater production?—Yes.

22,990. How do you suggest those are to take place?—Any one who has had any experience of working in the mine can see almost day by day economies that might be made in the working. I think the coal owners in the past have made a huge blunder in not getting the assistance of the practical men in many things down the pit. All the experience

that the man has would be at the service of the management, and there is so much to be learned by experience in a mine that cannot possibly be found in books.

22,991. I quite agree with you?—I think you will agree that that would be almost invaluable if it could be available for service. All that would be given with the greatest freedom because the men would then feel they were giving it in the interest of the whole community rather than for the benefit of a few private people.

22,992. Or even then giving it for their own benefit?—They would share as members of the community in the benefit.

22,993. Simply as members of the community?—More than as members of the community in the shape of greater safety for themselves and security for their wives and children that depend upon their freedom from accident.

22,994. You are aware it is proposed by the owners that the experience of the men shall be utilised in that way?—Yes. I think I pointed out how that is to be purchased.

22,995. And that from any economy or increased efficiency that may result the men will share?—They will get a share. What that share is to be I do not know, but the men then would feel they were giving their services in this direction for the benefit largely of coal owners—private people.

22,996. You assume the division would be in favour of the owner as against the men, that he would take a larger share?—I should think the miners will have to fight for the size of their share just as they have had to fight for increases in percentage of wages.

22,997. I have no doubt. Would it not be true to say the miners would benefit from the efforts of the managers and of the owner in providing and putting up new machinery as well? Is not the benefit mutual?—I question whether it would be mutual or not. I see no reason why, and I do not think you will induce the men to co-operate with the management under a system of that kind, in the way they would do, if they knew the value of their services and initiative and experience was going to the community generally.

22,998. And they prefer it to go to the community generally than be shared between themselves in equal proportions with the owners of the colliery?—I do not think miners—I think I knew them fairly well—are going to agree with colliery owners to combine for the purpose of benefiting themselves only. That would largely mean exploiting the community.

22,999. Although they would be benefiting as much by the increased method of the manager and expenditure of capital as by their own efforts?—I do not think they would benefit so largely if, out of the result, the colliery owner had to come in and take a share, probably a large share.

23,000. Assume a reduction of 1s. a ton in cost is obtained by the introduction of some machinery under the owners' scheme, the men would benefit as much by the 1s. reduction as by a shilling reduction from efforts made by themselves?—I do not know how much they would benefit in that case for the same reason, as you said, they would have to fight for their share.

23,001. You said that?—And you agreed with it.

23,002. Your view is that however much the miners might benefit, although they might benefit even more under the owners' scheme than under nationalisation, they would still prefer nationalisation?—I think they prefer nationalisation. They have reached that stage now when they are against a few private people coming into the industry to make money out of it. They also, I think, have their own safety to look after, and that is one of the most important considerations. They know an increased share of profits such as you suggest might result even in an increased number of accidents, because after all they will still be human, and the love of immediate gain might overcome their desire for safety. The time will come when even piecework itself will be abolished because of that.

23,003. You contemplate the abolition of piecework under nationalisation?—I am merely expressing my own views. The time will come when men will

28 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

be wiser; the competing one against another for wages and possibly risking the whole future well-being of their wives and families, as they do by piecework, will be abolished.

23,004. It is not by increasing the wages they themselves earn they do not increase their neighbours'; under the owners' scheme, each man would benefit by the exertion of his neighbour. It is not a competition between them?—I was speaking rather of piecework. I say combining with the owners in the way suggested is for the purpose that both the owners and workers might get more out of the community.

23,005. It is they may get more out of the industry possibly, and certainly give the community the article at a lower price than now. Is not that the object of your scheme?—Yes, and we do all you suggest by our scheme without having to hand that extra result over to the present colliery owners.

23,006. In order to get a lessening in the case of production you must have lower wages or employ fewer men?—Not necessarily.

23,007. How would the cost of production go down?—By increased output.

23,008. How is the cost of production to come down?—By increasing you output.

23,009. That is fewer men per unit of output?—You mean fewer men in proportion to output?—Quite so; I agree with you.

23,010. So that you intend in the future to have a higher production per man than you have now, and it is in that way that you are going to get greater efficiency?—I think that will be the result.

23,011. The figures we have up to the moment do not seem to show a tendency that way, do they?—That is the fault of the present system of ownership and control.

23,012. So that it comes to this, that because they have not nationalisation the men are not doing now what they could do: they are not putting forth their best efforts?

Mr. R. H. Tawney: What they could do under nationalisation.

Mr. Evan Williams: They are not doing as much as they could do.

Mr. Sidney Webb: They are not doing as much under private ownership as they could under nationalisation.

23,013. Mr. Evan Williams: They are not doing their best?—I have not said that. Let me answer for myself.

23,014. That is what I want you to do?—By the improved methods, by the economy that men see every day in the mine could be made if they had control, by improved machinery, by the abolition of royalty rents and wayleaves and colliery owners' profits, the cost to the consumer of coal would be considerably reduced as well as the quantity produced per person being increased.

23,015. So that you intend the quantity per person to be increased apart entirely from what is due to the introduction of machinery?—I think that would result, unless it was that the thicker seams were being worked out and they were getting into thinner seams.

23,016. I mean under similar conditions?—Quite so.

23,017. So that after all it comes to this, that a man is capable of making a greater effort than he is making now?—I have not said that.

23,018. We will not argue it?—I do not know what you mean by greater effort. He will make an effort.

23,019. Never mind?—I want to put this quite plainly. The greater effort probably that he can be capable of would be a mental effort. That is, he would give the value of his experience and his knowledge to the management, and that would produce better results. I am not sure that it would be possible to increase the application of his physical energy. It would, however, prevent—and this takes me back to the question of output, which I overlooked in my answer—these continual strikes, which are a tremendous injury to the output, and probably had as much to do with the reduction of output in the first quarter of this year as anything else.

23,020. Your view then is that the desire for nationalisation is at the root of these strikes that have taken place now?—It is the lack of co-operation and co-ordination at the present time. It used to be when I was a young man that there were many attempts at what was called restriction of output. I am not sure that that prevails much at the present time; it may do in some districts. I do not think it does much in South Wales, but if it does not I would be surprised.

23,021. It does?—Well, what is the cause of it? A man's wages represent his share of that which he himself and others produce, but his wages are governed by the price of the commodity. When he has produced an abundance then the supply at once reduces the price, and his wages are in consequence reduced, with the result that while there ought to be more for everybody, including himself, he gets a less share. Need we wonder that under a system of remunerating labour of that kind that the men resort to a restriction of output?

23,022. I quite agree that is one of the evils of determining wages by selling prices?—Yes.

23,023. To come back to a more practical point, how do you propose that the present cost of coal to the community is going to be reduced?—By the reduction in the cost of producing it.

23,024. By the introduction of more machinery?—Yes.

23,025. And greater effort on the part of each man?—Quite so.

23,026. What effect do you think the seven hours' day is going to have upon output?—I think the seven hours' day, although I believe that is a matter now settled, will give men more leisure.

23,027. I am speaking now of what decrease an output do you expect from the seven hours per day?—I think by the improvement in machinery that may be made the output will not be anything like so much reduced as has been supposed. I think improved methods will overcome that to a considerable extent, but not to the same extent as it would do if the miners themselves had a share in the control.

23,028. You do expect an increase in the cost as the result of the seven hours' day?—I think temporarily there will be.

23,029. So that the present high cost will be still further increased after the 16th July?—Of course, we have been under an abnormal state of things for four or five years which I think has considerably increased the cost. When we get to normal times largely that will disappear.

23,030. Then you contemplate a reduction of wages when we get back to normal times?—Not necessarily a reduction in wages.

23,031. Is it possible to get an appreciable reduction in cost without any reduction in wages?—Yes.

23,032. So that you expect without any reduction in wages the cost of producing coal may be brought down in the future?—Without reducing wages I say you may get a reduction in the wages cost per ton.

23,033. So that you would have fewer men per ton of coal?—If you apply up-to-date machinery and the best methods of transport.

23,034. Your view is that under nationalisation you would get more machinery and improved methods underground?—I think so.

23,035. You think the present antagonism, where it exists, of men to machinery will disappear?—I do not think you will find much antagonism to machinery—at least I have not had that experience.

23,036. Unfortunately, it does exist in some parts?—I should be surprised to learn it.

23,037. Do you think that nationalisation will put an end to the unrest that exists at the present time in the industry?—Very largely, it will.

23,038. Do you not think that the greater part of the unrest is due to the extreme section which do not approve of nationalisation?—No, I do not think so.

23,039. You do not think that the serious unrest, the subterranean unrest, which goes on is the more dangerous at the present time?—I really do not know what you mean by subterranean unrest.

23,040. It is the agitation that goes on that produces a large number of the strikes that we have

8 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

in South Wales for no reason at all very frequently—irritation strikes?—You state that, but I am not sure that my friend Mr. Winstone will agree with you.

23,041. Mr. Winstone does not agree with a large number of the strikes that take place?—You will continue to get these strikes until men feel that they themselves have control of the industry they are in, until they feel their responsibility. You cannot get men to think without responsibility.

23,042. You think they will be quite satisfied once they get nationalisation?—Neither you nor I will ever be satisfied.

23,043. That is what I am afraid of—that nationalisation will not put an end to dissatisfaction?—I am sure it will not.

23,044. So that you do not hope for any great improvement?—Yes, I do. The dissatisfaction is so great at the present time that you may still retain some dissatisfaction while you get rid of a lot.

23,045. There are people who are striving for one thing, but once they get it there is some further thing they want?—I dare say. That is one of the fine traits in human nature, which always keeps us going on.

23,046. And that will continue?—Most decidedly. We want to apply that co-operatively, instead of one seeking to outrun another.

23,047. So that you do not think we shall obtain the Millennium when we obtain the nationalisation of mines?—I do not know what the Millennium is.

23,048. I do not think anyone does. Under the scheme put forward by Mr. Slessor you make the Miners' Federation of Great Britain the dominant body in the arrangement, do you not?—I do not think so.

23,049. There is no other body of workmen to take any part in the arrangement at all?—No.

23,050. The Miners' Federation has the appointment of half the Central Districts and the Pit Councils?—Half the Council less the Chairman.

23,051. Even if they do not represent the whole of the workmen?—Do you mean mine workers?

23,052. Yes, mine workers.—There is a movement going on—probably you know of it—which is making rapid progress, that all mine workers will be within the Miners' Federation within a short time.

23,053. But it is not inconceivable that there may be a split oven in the Miners' Federation?—What is conceivable is a thing that I would not like to answer for.

23,054. At any rate, you are making the Miners' Federation the body which has the power of appointing half the Council a permanent thing in the Bill?—Quite so.

23,055. And not that they should be representatives of the men working at the colliery?—Because they are representing men working at the colliery.

23,056. Because they are at the present time, you mean?—Yes.

23,057. There is one question I want to ask you on the purchase price. How would you deal with the case of a new colliery, say, that cost a quarter of a million and had an output of 50,000 tons only, with the whole of its future before it in coal unworked? Under your scheme the maximum that you could give for a colliery of that kind would be £50,000—a colliery on which a quarter of a million had been spent?—The capital that is put into it would appear in the form of Government Stock. We do not contemplate paying for capital that has never been put in—otherwise uncalled-up capital.

23,058. Suppose there is a new colliery on which a quarter of a million has been spent, but which up to the present has only an output of 50,000 tons a year?—I might refer you to sub-section 2 of Section 9 and sub-section 3.

23,059. Is not all that governed by sub-section 1 of Section 9—provided that in no case shall the maximum be more than 12s. a ton and 10s. per ton respectively?—No. Sub-sections 2 and 3 provide for exceptions.

23,060. "The Commissioners in arriving at such computation shall also have regard to the actual gross and net profits." Now a colliery such as I have described to you would probably have no profit at all?—Might I ask you to read sub-section 3?

There, full provision is made for the position you name.

23,061. If a colliery in full working made 5s. a ton profit, you would restrict that colliery to two years' purchase of its profits?—No, we do not propose that system of purchase.

23,062. No, but you fix a maximum in the case of that colliery two years' purchase of its profits?—We do not measure it at all. We measure it upon probable output in case of full development—what would be the output of the mine under normal conditions.

23,063. But in a case of this kind subject to a maximum of 10s. a ton on the output, which in this case would be a maximum of two years' purchase of its profits. In the case of a colliery making 3s. 4d. a ton you give three years' purchase, and in the case of a colliery making 2s. 6d. a ton you give four years' purchase?—Yes.

23,064. In each of those cases would you give the same value for the colliery?—We do not contemplate basing the price on profits made, otherwise I am inclined to think we would hang a burden round the necks of the people of this country which would be just as burdensome as that which already exists.

23,065. Although you might be giving less than the value of the property taken over?—As long as people who have capital in a mine get that capital out again, carrying with it an interest upon stock as we propose, we consider that they have got all that they are entitled to get.

23,066. And if they could show that the capital they had in the mine was more than 10s. a ton on the output, would you give them that?—I would say we place this maximum because we believe that this maximum that we name would cover fully any legitimate capital. We do not propose to buy out Bonus Shares.

23,067. I am not suggesting that. If it could be shown that the real capital in the mine was more than this, would you still refuse to give it?—I think there must be a limit put to it, and we have allowed a liberal limit, otherwise there is no guarantee at all what may happen.

23,068. So that you pay up to a certain point, and you confiscate if it is over your limit?—I do not think there will be any confiscation at all.

23,069. If you do not pay the actual value, there will be, on your own showing, confiscation?—No. I believe that this maximum will fully provide for any legitimate capital.

23,070. You take the minerals without paying anything?—You take the minerals without paying anything.

23,071. Would you take the land on which the colliery stood?—No; we take the use of the land if it is required.

23,072. For nothing?—No, I do not say that.

23,073. You pay the landlord for the use of his land and take the minerals without paying anything?—Yes, we take the minerals.

23,074. But you would pay for the use of the land?—Quite so—not a monopoly value, such as is paid now.

23,075. Is that quite consistent?—When the question of nationalising the land arises we shall be glad of your assistance.

23,076. When it does arise you propose to take that without payment?—I do not know. We have not got there yet.

23,077. Land is property acquired in the same way as minerals have been acquired?—If you can help us in that matter we will talk it over.

23,078. I want you to help me in this matter now?—I am not here to deal with land nationalisation.

23,079. Any help I could give you would be in the direction of showing that you are taking something, for which you ought to pay, for nothing. Coming to the powers of these Councils, would you give the Pit Council both commercial and management powers?—No, certainly not.

23,080. You would not give the Pit Council any commercial powers?—No, most decidedly not.

23,081. Would you give them power neither to sell nor to buy?—No.

23,082. The whole of the buying would be done by the District Council?—Let me say this, that all these regulations will be laid down first by the

28 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

National Council and then by the District Council. Regulations will be laid down as to the powers, duties and responsibilities of the Pit Council. Personally I am only expressing my own view, but I do not think the Pit Council will have the selling of coal. They will, I am inclined to think, along with the managers, make their requests. There will be a system of requests for that which is necessary for the working of the mine. They will probably go then to the District Council. I have no doubt regulations will be made by which they can purchase small matters, but when it comes to, say, the introduction of new machinery, I think in that case the best system would be for the manager and his Council—because I am assuming they are going to work together and not against each other—to make their request to the District Council just in the same way as a manager at the present time would have to get liberty from his Directors to do it.

23,083. It really means giving a blank cheque to the Mining Council to arrange all the duties of the District and the Pit Council?—The Mining Council would be the unit as representative of the nation. They would delegate what powers they considered necessary to the District Council and to the Pit Councils.

23,084. Who do you suggest should settle wages and individual wage rates to start with?—I think these would largely be settled, as they are now, by negotiations between the Miners' Union and the Councils.

23,085. The Miners' Union would negotiate with the Council, which is composed, as to half, of members of the Miners' Union?—Quite so.

23,086. That is for individual standard rates at each pit?—Yes, in the case of individual standard rates, due regard being had to past wages; wages in other industries and all the exigencies of the industry would enter into these considerations.

23,087. General wage rates would be settled nationally, I take it?—Yes, general wage rates would be settled nationally.

23,088. Do you approve of the Mining Council taking over the inspection of mines in the way suggested in their Bill?—I think we do propose that the Mining Council should take all those duties now discharged by the Mining Department of the Home Office.

23,089. So that they would be the controlling power over all the inspectors of the mines?—They would.

23,090. There would be no independent inspection by another Government Department?—No, that would be the Department.

23,091. Mr. R. H. Tawney: You propose that the Mining Council should consist of 20 persons plus the Minister, do you not?—Yes.

23,092. Was not the original proposition that it should consist of 10?—That was so. I think I made that suggestion last time I was before the Commission.

23,093. What was the reason for the change?—Because we considered, after fully discussing it, that five on each side would scarcely make room for the various people that should be on such a Council. As I said, we want experts in mining, experts in overseas trade, experts in home distribution; I might illustrate a number of others, but it was in order to make room for the appointment of that class of men that we thought the number should be increased.

23,094. That is to say, 10 are to be nominated by the Government, and I suppose they are to represent the consumers' interests, like railways, shipping, household consumers, and so on?—Quite so.

23,095. As to the 10 who are nominated by the Miners' Federation, are they always to be members of the Federation?—No, not necessarily.

23,096. For example, the 10 nominated by the Federation are really to represent the persons working in the industry?—That is so.

23,097. Whatever grades of workers?—All grades of workers.

23,098. For example, it might include managers?—I can imagine that even managers would continue to do what they have now commenced to do, that is, forming a strong trade union to look after their own interests.

23,099. What I am concerned with is this: Is it, or is it not, the case that you put the representation of the mining industry on the Council entirely in the hands of one particular section of workers, or would the representation possibly be that of several different sections of workers?—We believe that the time is coming quickly when all mine workers will be in the Miners' Federation. We do not think it is necessary or advisable to provide for other workers who are not now in the Miners' Federation.

23,100. That is to say, what you may call the managerial experience would come in through the Federation like any other class of workers. It would be represented through the Federation?—Or it might be represented through the other side of the Council.

23,101. Could you tell me something about what you conceive of these Pit Committees exactly doing? I understand from you that you do not at all want to alter the legal responsibility which at present rests on the manager?—No. I think Pit Councils would largely see that the policy for the mine, as laid down by the District Council, was carried out.

23,102. Would it be true to say that the Pit Committees would work within definite limits which were prescribed for them by a superior authority, and which they could not alter?—That would be so. I think that is provided for in the Bill.

23,103. And that superior authority would consist ultimately of the Mining Council?—Quite so.

23,104. Where there are 11 representatives of the general public with 10 of the miners?—That is so.

23,105. It is hardly accurate, therefore, to say that the Mining Council has a blank cheque, except in the sense which any Minister of State has a blank cheque, which he has not, of course, at all, because he is responsible to Parliament?—And the Mining Council would be responsible much in the same way. I assume.

23,106. As to the daily work of the Pit Committees, what do you conceive of them dealing with? Would you give some examples?—As I have said, they would see, first of all, that the policy laid down by the District Council was carried out for that mine. They would probably discuss with the management what the best policy was for that mine, and generally report to the District Council. If it was necessary to alter the existing policy, they would make a joint report to the District Council, which would have the authority to change the policy.

23,107. That is to say, what these Pit Committees really do is, they would give the men at the particular pit a means of representation, discussion, criticism, and reporting?—That would be so. It might be a question of advisability or otherwise as to whether a certain section of a seam should be worked at any given time, or whether it should be left to some future time—or machinery, if any new machinery was to be introduced, what it was advisable to have, and these requests or proposals would go to the District Council.

23,108. Would it be true to say that the existence of such Pit Committee interfered with the legal responsibility of the manager?—Not at all. As I have said, no one could interfere with the legal responsibility of the manager. Even a director or a managing director, at the present time, could not do that.

23,109. Would it be true to say that the relations between the Pit Committee and the manager would be somewhat analogous to those existing between the present Board of Directors and a manager?—Probably more harmonious.

23,110. That is to say the fact that the manager reports and discusses with a committee would not prevent him from discharging his full legal liabilities?—I think it would be a considerable assistance.

23,111. The righteous indignation which has been expressed at the mere idea of the manager presenting reports to a committee is a little beside the mark in view of the fact that he habitually does that at the present time?—I think it has been almost ludicrous to men who know the position.

23,112. The committee that you propose would consist of people who work in the mine. The committee

28 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

to which he reports now I gather sometimes does not?—I am not sure how often directors go down the mine.

23,113. You suggested that there might be a change of attitude on the part of mine workers under nationalisation. Could you tell us something about that more definitely?—I mean it is a psychological question, so to speak?—Largely, it is. Of course, that will have its outcome.

23,114. On the other hand it has a very practical consequence?—Quite so.

23,115. I think your suggestion was that in the present temper of the mine workers the mineral resources of the country are not worked to their utmost capacity?—I do not think they are.

23,116. Why should nationalisation produce any change?—Because men would feel that they had control or some control over their own energies, and that they were not merely at the will and direction of another being. They would be in a better position than the horse that they have to drive, or the machiwo that they have to attend. As I have said on a previous occasion, it is that desire that cannot be crushed that is making itself felt in the ranks of labour at the present time, and has given rise to more unrest than anything else.

23,117. Would it be true to say that what you suggest is this, that you would get for the first time more or less intelligent and active co-operation on the part of the mine workers, instead of more or less passive obedience. Is that the suggestion?—That is so.

23,118. I have only one more question, and that is this: You have probably seen the scheme of profit-sharing that was put forward?—Yes.

23,119. I understand the motive of that scheme was to offer the workmen a financial incentive to produce more?—Yes.

23,120. Do you think that that kind of incentive will produce the result that is desired: I mean cause the industry to be carried on more efficiently and produce industrial peace?—I think in my first *présis* I pointed out that the unrest was more than a question of pounds, shillings and pence.

23,121. You do not expect a large number of people to believe that. You have been pointing that out all your life, but you do not expect everybody to believe that?—I think there is a great failure to appreciate that point.

23,122. On the other hand, it is, in the most accurate sense of the word, a highly practical point?—It will have practical results.

23,123. *Sir Adam Nimmo*: You indicated that you expected that all the societies that are outside the Miners' Federation, not affiliated with it, will probably at an early date be members of the Federation; but supposing that that position is not reached, would you consider it reasonable that these outside associations should be represented on the various councils?—I do not think in an Act of Parliament that it is necessary to provide for these.

23,124. But why not?—Because the tendency is to come all together.

23,125. But if they are outside just now and they represent a large body of workmen associated with the collieries, is it not reasonable that they should have a place within the scheme of future representation?—Would you give me an instance of to whom you refer?

23,126. Take, for example, the Association of Surface Workers?—I do not think they represent a large section.

23,127. They represent a considerable body of men, and they are an independent association. Do you not think that they will ask to be represented upon these councils?—No.

23,128. Are you able to speak for them?—To this extent, that I think the Miners' Federation, as you know, determined the conditions under which these men work at the present time.

23,129. Assuming that they remain outside, and that they desire representation, would it be your view that they should have representation outside of the representatives that you are to appoint or nominate?—I do not think so. I do not think it is necessary that they should.

23,130. I think you are evading the question, if I may say so. You know that there has been considerable difficulty in the past in connection with these and other men?—I think the difficulty has probably come from associations outside of mine workers, but who have members among mine workers, and we do not contemplate that these associations have anything to do with mining, and I do not think you, as a colliery owner, would desire that they should.

23,131. Assuming they remain outside, do you insist that your representation on the Council should be the same as mentioned in the Bill?—Quite so.

23,132. And if those societies are to have representation, they should have it out of the other number, not out of the number that you appoint?—I have not said that they should have representation.

23,133. I am asking you, if they desire to have representation, how they should obtain it?—That would be a question for His Majesty.

23,134. In any case you intend to hold on to the number of representatives that you have?—That is quite so.

23,135. Further upon the Bill I observe that you propose to take over shale mines. May I ask if it is in contemplation to take over (let us say) the shale oil industry in Scotland in that connection?—Yes, as the Mining Council finds it desirable to do so, they will have power to do so.

23,136. That industry will be entirely in the hands of the Mining Council?—They will have power to take it over.

23,137. May I ask, seeing that you propose to take over the shale mines, would it be in your contemplation that you would take over the shale oil industry in Scotland?—That again is a matter for the Council after it is established. Under Section 5 we introduced that provision especially to deal from time to time with these questions.

23,138. I take it then that we are to regard it as a possibility?—Quite so; they would have the power to do so.

23,139. Is it to be suggested that the shale oil industry is to be dealt with in connection with valuations on the same principles as are laid down for the valuation and acquisition of coal mines?—I think it is definitely stated in the Act that this valuation can only apply to coal mines.

23,140. Would you satisfy me regarding that?—If you look at the 10s. and the 12s., it is governed altogether by that.

23,141. Then may I take it that if an industry like the shale oil industry in Scotland was to be taken over, the valuation determined in respect of that industry would be based upon all the considerations surrounding the industry?—It would be based on the estimated capital in the industry.

23,142. It would in any case be quite a separate and independent valuation?—Governed by that principle that I have stated, that is, the estimated capital in the industry.

23,143. I want to ask you one or two more questions about valuation, because it is rather difficult to know where we are. You will keep me right, if I am putting the position not quite rightly within the Bill. It seems to me that there are three considerations within the Bill that may be taken to determine value. First of all, there is a certain rate per ton of output, either 10s. or 12s., as the case may be. Then there is the value as at the 4th August, 1914, and there is the value at the passing of the Act. Am I to take it that the valuations under the last two headings, that is, the valuation at the 4th August, 1914, and at the passing of the Act, are quite independent valuations?—I think we are asking for information about all these things. All these factors doubtless will go into the consideration of the question when the valuers make the valuation.

23,144. And to determine the value altogether apart from output?—In some cases that would be so. It would be in the case of a mine that was nearly exhausted and the capital nearly all redeemed. It would be so in the case of a mine that had just begun to be developed.

23,145. Might I take it that in dealing with this Bill the colliery owners could have no real idea as

28 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

to the principles of valuation that were really to be applied?—Oh, yes; because the colliery owners would be represented on the Commissioners.

23,146. Let us take it a little further. When you come to deal with the valuation based upon profits under section 9, sub-section (2), you take into account profits for five years from August 4th, 1914, and then you say that the profits thereafter may be taken into account. Now do you intend by "thereafter" to mean this: the whole period between August 4th, 1914, and the passing of the Act?—Will you point out where the principle of profit is to govern the purchase price?

23,147. It is brought in in section 9, sub-section (2): "The Commissioners, in arriving at such computation, shall also have regard to the actual gross and net profits which have been made in the mine during such years or thereabouts"?—Yes, and to such sums as have been set aside for depreciation or development.

23,148. I do not object to that. My point is this. You notice that the word "thereafter" is used. May I take it that that means the whole period from the 4th August, 1914, to the passing of the Act?—I take it that the whole period covered here would be taken for the purpose, not of increasing the maximum, but rather of deciding beneath the maximum what should actually be paid.

23,149. That is to say, really after all these maximum figures which are suggested are more or less of a blind: they are not determining factors?—Do you mean that they are not the minimum?

23,150. I mean that they are not the minimum certainly?—Certainly they are not the minimum.

23,151. But after all it looks like this, that the coalowner has no assurance when you have finished dealing with this valuation that he is going to get anything like 10s. or 12s., as the case may be?—He may not.

23,152. You gave me the reply that in dealing with the valuation based on profits you take the whole period up to the passing of the Act from the 4th August, 1914. Now that will cover the period of control, will it not?—Certainly it will.

23,153. Are you aware, or are you not, that during the period of control there have been enormous variations between collieries in respect of their profits?—I think all that would be considered by the Commissioners.

23,154. Would you say, then, that, assuming under control the profits of collieries have been materially reduced, that the valuation of these collieries should be reduced because of the effect of control in reducing the profit?—I think the purpose of getting the returns asked for here in respect of profits is to ascertain whether the pit is really worth taking over or not—whether it is worth purchasing or not; the valuation would not depend upon profits, but really upon whether the pit was worth taking over.

23,155. You bring it in in the Bill?—Yes.

23,156. Would you not agree that the coal owners in those circumstances would have no assurance whatever as to the valuation that was to be determined, nor the principles upon which it was to proceed?—He would have his representative on the Commission.

23,157. As far as the Bill is concerned it is an entirely open question what he would get?—This clause does not lay down that profits shall be the factor in determining the value. It rather gives powers to the Commissioners to get all the information that they require in connection with any mine.

23,158. But you do agree, do you not, that the contingency that I refer to might be a contingency that may require to be dealt with in determining the valuation of the colliery? That is to say, the profits having been affected by arbitrary conditions?—Most decidedly. You should consider all the factors.

23,159. Do you think that would be a fair consideration to have before you in dealing with the valuation of the collieries?—I think they would consider it fairly.

23,160. Supposing that the Miners' Federation, in the meantime, took some drastic action against the collieries and reduced the profits in the collieries, and you came to take them over at a later date,

would you say that the effect so produced upon profits should be taken into account?—I say the Commissioners, again, would consider every factor if that happened to be one, which is purely imaginary.

23,161. You would not say that in a fair deal such arbitrary conditions should be taken into consideration at all?—I think they must be allowed for in exceptional circumstances.

23,162. And yet I think you have clearly indicated that you want to pay the fair price?—You heard Mr. Cooper discussing as to what was a fair price. I do not want to fall into that mistake which evidently Mr. Cooper thought I fell into on the last occasion.

23,163. I take it that we are agreed that the fair price is to be paid; that may neither be determined by you nor by me, but by somebody else?—The Commissioners will pay a fair price within the instructions laid down for their guidance.

23,164. May I ask the question who advised you as to the determination of the value of 10s. in respect of a mine with an output not exceeding 100,000 tons, and 12s. where the mine was over 100,000 tons? On what is that value based?—A few years ago Professor Merivale, who was a professor of mining in Armstrong College, Newcastle, and who was also Agent and General Manager of the Broomhill Colliery, and was recognised in Northumberland as one of the ablest authorities on mining, published a paper in what is known as the Colliery Managers' Pocket Book. He makes his calculation and gives the following results. I do not want to read all the reasons he gives.

23,165. If you say to me that your authority is Professor Merivale, I am content to take it in that way?—That is so.

23,166. *Sir L. Chiozza Money*: Were you not going to quote something?—I was going to quote the figures he gives.

23,167. *Sir Adam Nimmo*: Would you give us the date of the book?—1908. He said collieries up to 80,000 tons per annum, 12s. per ton; 150,000 tons per annum, 10s. per ton; 400,000 tons per annum, 8s. per ton; 750,000 tons per annum, 7s. per ton on one year's output. He is speaking with special regard to Northumberland mines, but he goes on to say it also corresponds pretty well with the estimate for the whole of England given by another authority.

23,168. Is it upon that view that the Miners' Federation have put down these limits?—Yes.

23,169. You would not be surprised, would you, if I were to put it to you that very few, if any, mining engineers would adopt that view of Mr. Merivale's? Would you be surprised?—I would.

23,170. May I put this to you. Is it not the deeper mines that are putting out the largest tonnage to-day?—Necessarily, I think.

23,171. It is the deeper mines that are putting out the largest tonnage? Do you not require to sink relatively a much larger sum of money in a deep mine than you do in a shallow mine?—That is why I have said it necessarily requires a bigger output.

23,172. Have not these larger mines usually a longer leasehold and a longer life?—I could not say that.

23,173. But you know, and there are very few men who know more about the general situation of the coal field than you do. Take some of the large holdings that you know of—the large mines—do you not know whether those have large holdings and have a long expectancy of life?—Certainly they have large holdings. They could not afford to put a deep shaft down on a short holding.

23,174. And, therefore, a long expectancy of life?—I thought you were putting to me the length of the lease.

23,175. I am trying to get at this point. In the case of a mine yielding more than 100,000 tons per annum you say that it should only be worth 10s. per ton of output, and you agree with me that in those cases, apart from the larger expenditure, you have a larger leasehold and a longer life. Now I put this to you, are not these last two considerations of very great consequence in determining the valuation of that mine?—I think as you increase the output you decrease the amount per ton invested.

28 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

23,176. Do you intend to give these collieries nothing at all as against the longer expectation of life that they have?—The expectation of life would not take them beyond the limit laid down.

23,177. It looks as if you were not prepared to take all the considerations fairly into account?—Within the limits I am prepared to leave that to the Commission.

23,178. So long as a fair value is determined?—So long as fair value is determined within the limits laid down.

23,179. That would, of course, necessarily require to be irrespective of the limits laid down?—No. I said within the limits laid down.

23,180. I suggest that you are introducing an arbitrary limit there, and not fixing a fair value. I understand that in determining the valuation you simply deal with the mine and its equipment?—Yes.

23,181. Is it intended to exclude all houses from that valuation?—I think we provide that houses should be valued separately.

23,182. Is the same to apply to wagons?—No. I should say this, although that is not mentioned, but wagons probably would follow the same line of valuation in this respect; houses are shut out because some companies may have a large number of houses which they provide for the workmen, while another company may not have a single house scarcely. Therefore it is necessary that they should be valued separately; but, following that same line with regard to trucks, I can conceive that one company may own scarcely a single truck, while another company may have all that is required.

23,183. You have just brought out the point that I wanted. I think we are agreed about this, that some collieries have no houses and a few others a considerable number, and some collieries have no wagons, while others have a large number of wagons?—That is so.

23,184. Therefore I take it you agree that all these outside properties would have to be dealt with quite separately?—I think so.

23,185. Would you think the same applied to a colliery washery?—No, I do not think so.

23,186. Why not?—Because the washery is part of the plant of the colliery.

23,187. But still there are a large number of collieries that have washeries?—That is quite so.

23,188. Would you value those collieries on the same basis of amount per ton as the collieries that have no washeries?—Do you suggest to me that a different form of valuation must obtain wherever there is a difference in the plant established in the pit?

23,189. I would assume that, surely?—It is altogether impracticable.

23,190. Would you not say that under a fair valuation you would take into account all the plant and have regard to the character of the plant?—No, I would take into account the capital invested, which would necessarily cover the plant.

23,191. You see you put these arbitrary limits, which I suggest may not permit of a fair valuation, and I take it we are agreed that, with regard to houses and wagons and outside properties that are not common to all the collieries, they would be separately valued?—I think so.

23,192. Now taking the general question of the adjustment of wages as provided for within the Bill. Why is it suggested that the Mining Council before making or altering any regulations, or conditions of employment, including wages, should consult the Miners' Federation of Great Britain? Why is that provision put in?—Because the workmen ought to have a voice in determining what their wages should be.

23,193. Have you not a voice through your representatives on the Mining Council? Have you not a very powerful voice?—I think you cannot shut out a great body of miners from raising the question of advances in wages, and they must have liberty to go to their employers, who would be the Mining Council, in order to prefer their request.

23,194. In an important matter of this kind does it not appear as if you were afraid of the Mining Council?—Not at all.

23,195. Why should you make that provision?—I think the Mining Council after hearing the views of the Miners' Union would do fair. The men would accept their decision loyally, largely because they know that their interests were being looked after by part of that Council.

23,196. I do not think that covers the whole situation, if I may respectfully say so, because later on you provide for a possible arbitration, but I take it you do not agree with compulsory arbitration?—You are speaking of under the existing state of things.

23,197. No, I am referring to your Bill. Your Bill says you may vary wages and go to arbitration, but you may not, is that not right?—I think every case of general wages would be referred to arbitration where there was failure to agree.

23,198. Would it be reasonable, having regard to the fact that you would be dealing with the State, that you should agree to compulsory arbitration in these circumstances?—I think regulations would have to be laid down.

23,199. Is it really not the case that this machinery is inserted here in order that you may retain in your hands the strike weapon? Coming to the truth of things is not that really the position that you want to be in?—I think it is quite true that we must retain the strike weapon. At the same time I think the incentive to use it and the need to use it will be largely taken away under nationalisation.

23,200. Still, you propose to keep it in your hands, even against the State?—That is so.

23,201. Now in that connection take Section 4 of the Bill, which refers to the rights of Trades Unions. May I take it that that clause means this, that all the rights which the Trades Unions have got now, including the right to stop work in sections or by general strike, are to be preserved?—Yes, that they would still exist.

23,202. They would have freedom of action to use the weapon which they used just now to secure the conditions that they desire to secure?—Yes, with the need to do so largely reduced.

23,203. Now coming to some other details in connection with the working of the trade under the system that you propose, I suppose that it would be necessary in dealing with the question of distribution to fix the prices for all the varieties and qualities of coal that exist at the present time?—I think the councils in making these regulations would take fully into consideration all the necessities of the case. They would decide that.

23,204. From the consumer's point of view you are aware, I suppose, that before the war the consumer bought the quality of coal that suited him best?—When he could get it and afford it.

23,205. We are dealing, of course, with the pre-war position, and he bought then at the market price. How are you going to test the market price in respect of these variations of quality under your scheme?—I think the experts in the trade now can fairly well tell you the different values of the different coals.

23,206. You propose to use all the experts in the trade just now to deal with this problem?—We certainly propose to use experts. I am not sure that we need them all.

23,207. From the consumer's point of view, how are you going to secure under your scheme that he gets the quality of coal that he wants?—By request and negotiation with the Council, and in cases probably through the medium of his Consumers' Council.

23,208. But is it not one of your proposals to adjust the whole distribution of the coal so as to give the consumer the coal that you think he ought to take?—I think the Council would meet the requirements as far as ever it was possible in the national interest to do so.

23,209. Is it not the case that during the time that an attempt has been made to deal with the distribution of coal under control that the consumer has been forced to take a great deal of coal that he did not want?—That has been under war conditions.

23,210. Would not the same thing be likely to prevail under a nationalised system?—I scarcely think so. In fact, I do not think so.

28 May 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

23,211. Would not your desire be to try and cut down transport as much as possible just as the Controller desired to do it?—As far as it was desirable to do so, yes.

23,212. And in carrying that out, would you not be likely to come up against the consumer?—I think the consumers' point of view would always receive consideration.

23,213. You make that as a general statement, but there is nothing to cover the position within the scheme?—I think the responsibility of the Mining Council would cover all that.

23,214. Take the case of export for the moment, because I am very much concerned about export, and would like to know how you intend to deal with it. Is it your intention to retain the present system under which the existing exporter does the trade?—The Council would get the assistance of authorities and experts in all oversea trade.

23,215. That does not answer my question?—They would be governed generally as to what was the best method when the whole of the coal production was co-ordinated.

23,216. I have no doubt you have formed some view on this very important aspect of the problem. I

take it that you come from an exporting district?—That is so.

23,217. You are no doubt very fully alive to the importance of the export coal trade?—Quite so.

23,218. You must have some views as to how to handle it, and I would like to know what those views are?—The policy of the export trade would be laid down by the National Council which would employ their agents.

23,219. You have no view as to whether the present exporting system should be carried on?—You mean the coal export pure and simple—the middle-man?

23,220. Yes?—I think it would be found that he would be gradually eliminated.

23,221. Is it your view that you would raise up new men who would undertake this side of the business?—I think there are more than sufficient now in the trade.

23,222. Do you not attach very great importance to the knowledge and experience of the existing exporters?—I think we must do so.

23,223. I took it from your previous answer that you contemplated doing away with them altogether?—No.

(Adjourned to to-morrow morning at 10.30.)

SECOND STAGE—TWENTY-FIRST DAY.

THURSDAY, 29TH MAY, 1919.

PRESENT :

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM.

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

SIR ADAM NIMMO.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH.

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB.

MR. EVAN WILLIAMS.

SIR ARTHUR LOWES DICKINSON, }
SIR RICHARD A. S. REDMAYNE, } (*Assessors*).

MR. ARNOLD D. McNAIR (*Secretary*).

MR. GILBERT STONE (*Assistant Secretary*).

MR. WILLIAM STRAKER and MR. JAMES WINSTONE, *Recalled*.

23,224. *Sir Adam Nimmo: (To the Witness.)* When we adjourned last night we were dealing with the question of exports?—Yes.

23,225. And you suggested to me that the present exporters as a body would be dispensed with. I want to know particularly how the export trade in coal is to be handled under nationalisation. I suggest to you two things as being necessary for the proper handling of the export trade: (1) that there would be freedom of movement in regard to prices; and secondly, that there must be room for rapid decision. Will you say, if you agree with those two conditions, how they can be met under a system of nationalisation?—I think the National Council of Mining would avail themselves of your assistance if you are not a member of it, and would decide these matters.

23,226. Do you mean that they would bring in the best advice of those who were interested in the trade at the present time?—I think they would.

23,227. Do you agree that the speculative element in the export trade is of great importance?—Do you mean so far as competition between private companies at the present time is concerned?

23,228. No, I mean this: Is it not a very important element in the working of the export trade that a man should be able to take into account the international factors that are bearing upon the coal position?—I think that the Mining Council would take into consideration all the factors bearing upon the well-being of the country.

23,229. Yes, but that is not really my point. I suppose you agree that in the export trade you are dealing with very keen competition at all times?—That is so

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

23,230. And you have to watch the competition?—Most decidedly.

23,231. You agree that there are more factors that may require to be taken into account in dealing with the export trade than possibly in dealing with the home trade?—I would not like to say that.

23,232. Let me take you on this line: would you not require to take into consideration the question of freights?—I think the Council would. I am not sure that that is done to any extent now.

23,233. Is it not done by the exporters at the present time?—I am just wondering, in face of what has taken place to-day.

23,234. Have you not to consider this problem from the point of view of normal conditions?—I do not think that the Mining Council would do anything with their part of the nation's industry that was likely to injure any other part of the industries of the nation.

23,235. But what about the position from the point of view of foreign competition? Take, for example, this case: Assuming that an export market was common to this country, to Germany, and America, and that they had freedom of movement in regard to prices in this country; assuming an order came into the market which had to be secured by this country as against those other countries, and, taking everything into account, the exporter from these other countries, having regard to freights and other considerations, felt disposed to cut his price materially to secure the order when offered, how could we deal with a situation of that kind under nationalisation?—Under nationalisation, as under an exporting company or a coal owners' company, the agent of any of these parties would have a latitude allowed him just as he has at the present time.

23,236. Do you mean that he would be entitled under your scheme to cut the price, say, half-a-crown a ton?—Within a limit he would most decidedly.

23,237. But suppose that limit prevented him from securing business over foreign competition?—Just as it prevents him now in many cases.

23,238. But does not the present exporter very often take huge risks both in respect of freights and coal prices in order to secure the trade for this country?—That may be so.

23,239. How would he be able to do that under a system of nationalisation?—By being allowed the latitude that I have referred to.

23,240. Do you suggest that Committees set up to deal with the export trade would permit of such latitude?—I think they would.

23,241. Would they not require to meet and consider the situation?—They would meet just as directors meet now when they are deciding upon their own trade.

23,242. Would not important time be lost in carrying out such an arrangement?—No more than is lost at the present time.

23,243. I suggest at the present time, dealing with the export trade, you have a very rigid system in the control of prices?—At the present time?

23,244. Yes?—I suggest that the agent has a good deal of liberty.

23,245. I do not think, in the present situation, he has?—I am speaking of the situation under private ownership.

23,246. Yes, but I understand you propose to do away with that under nationalisation?—Yes, but nationalisation does not mean that the Mining Council shall be always at the elbow of the agent.

23,247. Does not working through and acting through a central organisation necessarily bring about rigidity?—That all depends upon whether it is bureaucratic or controlled under a system of Council such as we have suggested.

23,248. Would that make any difference so far as the composition of the Council is concerned in regard to rapid decisions?—Most decidedly. In a bureau and under bureaucratic management everything has to go to that centre, and there is no latitude.

23,249. Do you think committee work ever gets through a position of that kind sufficiently rapidly?—I think it will get through under our system and just as rapidly as it does now.

23,250. Is it not the case in connection with export more than anything else that you have to take the business when offered, or go without it?—That is so.

23,251. And you must make provision in your scheme for dealing with that precise situation?—That would be, but remember your latitude allowed to the agent.

23,252. And even if it meant shillings a ton in reduction of price you would allow such a latitude to the agent?—He would do just as he does at the present time and consider whether there is going to be a balance between cost and selling price.

23,253. In what sense would either the District Council or Mining Council have any real control over the situation if they allowed such latitude?—Just the same as that which directors have now.

23,254. I notice that you say in your *plans* that so far as the miners are concerned they are tired of Advisory Councils. Why is it, in your view of the acknowledgment of that principle, that you only propose to give the consumers an Advisory Council under nationalisation as proposed by you?—We do not think that the consumers can possibly manage the trade.

23,255. No; but do you not consider that they are very vitally interested in the trade?—And their vital interests will always be duly considered.

23,256. But merely from the point of view of an advisory capacity?—The Council would know their requirements and their situation, and that would get full consideration, as it does not get at the present time.

23,257. Do you mean to say these committees would take all the interests of the consumers into account?—Most decidedly they would.

23,258. Take a case, for example, before the war: a consumer, if he felt aggrieved in regard either to quality of coal or delivery of coal, and believed that the supply was in breach of his contract, could sue the supplier. How do you propose under nationalisation to protect the consumer in that respect?—I think in the proposed Bill the Council can sue or be sued.

23,259. How do you propose to carry that out, because I understand it will be exceedingly difficult?—Of course, I am not a lawyer. The procedure laid down in the Law Courts would meet that situation.

23,260. But you intend provision should be made for a Council being sued in those circumstances?—Provision is made in the Bill that they can be sued.

23,261. Who would pay the fine?—The guilty party.

23,262. Do you mean the Mining Council?—Most decidedly, if the Court's decision was against it.

23,263. Where would the money come from?—Out of the industry.

23,264. But you do recognise that the consumer in this matter is very vitally interested?—He is always vitally interested.

23,265. Would it not be desirable that a real place should be given to the consumer in the Councils controlling the industry?—I do not think so. I think it would be better conducted by men who know the industry. That is the advantage we will have under nationalisation which we have not always now.

23,266. Take the position of the workmen in the consuming industries: would it not be reasonable that they should demand that they should be represented on the Councils in view of the coal being a raw material that they use?—Not short of communism. If you suggest we should establish communism, then all parties should be considered.

23,267. Are not these workmen vitally interested in the price of coal?—Most decidedly, and they are at the present time.

23,268. Should not their interests be protected in some way in connection with a scheme for nationalisation?—Will you tell me how they are protected at the present time, or under your proposed scheme?

23,269. They are protected, I suggest, by the open competition in the market in respect of the price of coal?—Which enables the coal-owners at the present time to exploit the community.

23,270. I am sorry I do not agree with that. That is what I suggest is the protection which is afforded to the consumer at the present time?—Let me sug-

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

gest that the Chairman himself and the other ten representatives appointed by the Government will take special care of the consumer and all the rest of the community.

23,271. You may say so, but I understand there is no provision made within the Bill for it?—There is provision made within the Bill for His Majesty to appoint ten members and the Chairman of the Mining Council.

23,272. Yes, but there is nobody directly looking after the interests of the consumer or the workmen in the consuming industries?—They can always present their requirements through the Consumers' Council and will be much more fairly considered than at the present time.

23,273. That is merely an advisory council I think you agree?—The Consumers' Council would be an advisory council.

23,274. Now I notice that in the Bill in connection with the Mining Council you propose to give either His Majesty or the Miners' Federation the right to withdraw at any time members from that Council. What is the object of that?—I think it follows a precedent in all Government offices at the present time.

23,275. That during the period of a man's appointment he may be withdrawn?—Quite. Even Cabinet Ministers can be removed.

23,276. Yes, but they cannot be arbitrarily removed?—Oh yes; they are removed sometimes even before they know about their removal.

23,277. Would not the position which would be reached under that proposal be this: Taking, for example, the representatives of the Miners' Federation upon that Council, they would be merely delegates of the Federation?—Oh no—

23,278. I put it to you: Is that not the principle which is involved?—May I suggest that you allow me to answer one question before you ask another?

23,279. Is that not the principle which is involved in this?—What principle is that?

23,280. The principle that if you have the power to remove your members from the Mining Council at will, they become more or less your delegates?—No, they are not our delegates. They will have just the independence of, and in fact probably more independence than, the agents of companies have at the present time.

23,281. But if they do not serve the Federation according to the Federation's views, you reserve the right to remove them?—I suggest that, as a business man, you would not suggest that in a case of gross inefficiency a man should be retained.

23,282. Would not the members (putting it quite frankly) acting for the Federation upon that Council know that they were there merely to carry out the wishes and instructions of the Federation?—Not necessarily; they would know that they were there to serve the nation, and the miners would know that.

23,283. Would they not know that it was within the power of the Federation to remove them at any time?—And they would be just as well assured that they would not be removed unless there was serious cause for removal.

23,284. Do you really suggest that these men would be in any sense independent men?—I do suggest that they would be.

23,285. Do you suggest that the same principle is to be applied to the subsidiary committees, that is to say, the District Councils and the Pit Committees?—Quite.

23,286. These members representing the Federation are to be removed at the wish of the Federation and at the will of the Federation?—I think the Mining Council would lay down regulations governing these things for the District and Pit Councils.

23,287. Still you do not quarrel with me on the principle that they are there at the will of the Federation?—Just as any servant of a company is there at the will of the company now.

23,288. In view of the possibility of change of membership in that way who is to be responsible for mistakes that are made?—The industry would be responsible. I mean they would feel the results of mistakes which are made.

23,289. Who would be responsible for continuity of policy and working the mines?—The Mining Council.

23,290. But supposing the constitution of the membership was changed from time to time, who would be able to see that continuity of policy was maintained?—The wisdom of the men would see the necessity of continuing a policy until it was advisable to alter it.

23,291. But we have to consider this possibility, that the men who were acting upon these Councils might be changed at frequent intervals; it is a possibility?—Yes, but I do not see that they are going to alter the policy necessarily because they are newly appointed.

23,292. Would there not be a real chance of that?—I do not think so. I trust a good deal to the intelligence of the men; after all, they are more than machines.

23,293. With regard to the acquisition of the minerals, I take it that you do not question the legal right of those who are in possession of the minerals at the present time?—I am not well acquainted with the laws which govern these things, but I believe there is an English law under which a man legally possesses a thing after so many years' possession.

23,294. But I understand you are not here seriously to suggest that they have not a good legal title to their property?—Really judging from what was laid before you by representatives of the royalty owners, they did not seem to be able to produce their legal deeds.

23,295. I take it that your view on this point is that you do not think they have a moral right to their property?—That is quite so.

23,296. Does that not carry us a long way if we have to begin to consider moral issues?—It is really carrying us where we ought always to be.

23,297. But is there not a difference practically between all the individuals making up the community as to what is a true moral standard?—Do you suggest that moral considerations do not enter into the consideration of colliery companies now?

23,298. I do not say that, but what I ask you is this: Is there not a very different view existing between individuals as to what is morally right and what is morally wrong?—I have no doubt that there is a good deal of difference between you and me.

23,299. Therefore your view as to what is morally right may be different from mine?—Quite.

23,300. Would that not carry us a very long way in regard to questions of property?—I think after all that there are national standards of morality and common grounds upon which everyone agrees—even you and I.

23,301. I suppose you have some things that belong to yourself, or you think they belong to yourself?—Not much.

23,302. It does not matter whether it is much or little. The point is this: With varying views existing with regard to rights of property, might you not be assailed in respect of the particular property you possessed on the ground that you had no moral right to it?—By some crank I might, but by the general conception I do not think I would be.

23,303. Are you rather wanting us to assume that it may be the view of a crank that those who are in legal right of their minerals have not a moral right to them at the same time?—I think the revelations made before this Commission have given the general conception that these royalties are held immorally.

23,304. But, assuming your principle was adopted, would it not amount to this, that no man would be really sure that he could call anything his own?—I think that which can be said to be a man's own is his life, and yet there has been no hesitation in conscripting that or confiscating that for the benefit of the nation during the last five years.

23,305. But you would not like any man upon your principle to come along and say, "I do not admit that the clothes you are wearing are your own or the watch which you have"?—Most decidedly not.

23,306. Is there any difference in principle?—I do not think even you will contend that there is not.

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

23,307. Is there any difference in principle?—Most decidedly there is: Some one made the watch, and some one put labour into it; some one did something to create my watch. I wonder who has done anything to create the minerals.

23,308. If a man bought a house and paid so much money for it, and thought it was his own, some one might come along and say, "On moral grounds you had no business to make the money in the way you made it to purchase that house"—I think somebody might, but that is not a general conception.

23,309. Would not that really raise the whole issue which is raised here?—No, I do not think so.

23,310. I suggest it would?—I suggest it will not.

23,311. Now, I want to take you to the sort of underlying principle on which you seem to base a good deal of your views. You seem to think that the pro-war system of ownership and management was bad because it rested on a selfish basis?—It was not as good as it might have been.

23,312. I take it that what you suggest is that, because it rested on a selfish basis, being the basis of competition and struggle, as you express it in your *précis*, it was morally wrong?—Yes, I said that it led to moral wrongs.

23,313. I think you indicated that it was morally wrong?—Oh, yes.

23,314. Now, take our school competitive system which gives awards for merit: Is that morally wrong?—So far as it would lead to dishonesty, it would be wrong.

23,315. But, in itself, it is not wrong?—No.

23,316. You merely have to judge by the results whether it is morally right or morally wrong?—I think the best judgment you can apply to anything is by results.

23,317. Would you say the same thing applied to our university system in giving awards as the result of merit?—I would not say there is any parallel between that and competition in trade.

23,318. You are not objecting to the competitive system?—Not in that sense.

23,319. Do you agree that the competitive system may bring out the very best that is in an individual?—And it may bring the very worst out.

23,320. That is a question of result, but does not attack the competitive principle in itself?—I was speaking of the competitive principle in trade, and that is where it brings out the worst.

23,321. You mean you are merely judging by what you consider bad results?—Yes.

23,322. But would you not agree that the competitive system, either in schools or universities, or other walks of life, is calculated to bring out the best that is in people?—I think it does help, but I do not see any parallel at all between the two things.

23,323. Surely there is a parallel in this respect, that what you want to provide in order to bring out the best in people is a real incentive—you must give them something to work for, must you not?—Yes.

23,324. And you must give them something surely in the direction of reward?—I think so.

23,325. Taking individuals as we know them?—Yes. Might I suggest that there is a higher reward than merely personal gain?

23,326. I am not quarrelling with that view, but I think we have to deal with the run of mankind as we find them from day to day?—Yes. We are improving, and that is why we propose nationalisation.

23,327. Take the Miners' Federation of Great Britain: Does it or does it not act for a particular class of the community?—For the miners.

23,328. It looks after the interests of the miners by themselves. Would you say because it did so it was a selfish combination?—I would say that the Miners' Federation, while looking after the interests of the miners, always has in view the interests of others.

23,329. Does it primarily look after the interests of the miners?—That is its primary purpose.

23,330. Therefore it is selfish in its aim?—No.

23,331. Is it not morally wrong because it is selfish? I am asking you on your own leading principles?—I think you are giving an interpretation to those that they will not honestly bear.

23,332. Is the Miners' Federation a party to the Triple Labour Alliance?—Yes.

23,333. Does that Triple Labour Alliance look after the interests of particular classes?—It does.

23,334. Is it not selfish in its aim in doing so?—No, because it always considers the interests of others.

23,335. Where is the evidence that it considers the interests of others?—May I give you an instance? The miners could have always demanded anything they cared to demand during the war, but they did not do it.

23,336. Do you think that is a parallel case? Do you think that is looking after the interests of the community in a real sense?—I think they refrained from doing that because they valued the interests of the community.

23,337. Do you not think they went as far as they could go without really seriously injuring the nation?—Without injuring the nation, yes.

23,338. When you came to consider your most recent demands for wages and hours, did you consider the interests of the general community?—We did.

23,339. Do you suggest that these demands took into account the interests of other people? I put it to you as a man?—I put it to you as a man that they did most decidedly.

23,340. Did you know the industry, or the other industries, could carry what you were demanding?—We believed that they could.

23,341. You believed that they could?—Yes; and I question that there will be a heavier burden to bear.

23,342. What enquiry did you make into that position before you made the demands?—We considered the general situation and especially the enormous profits made by the private owners of the big industries in this country.

23,343. And yet you knew, I understand, at the time you made the demand upon the mining industry, that the coalowners were not making the profits?—

We knew perfectly well the industry was making enormous profits.

23,344. But the Government was getting the money?—That did not affect us.

23,345. And that the money was being used to carry on the war?—I take it the Government was getting the money for the good of the community, and the community is now in question.

23,346. I suggest to you when you made these demands you were not taking into account the interests of the community in the sense in your *précis*?—I cannot help your suggestion, Sir Adam. I can only assure you that it is not true.

23,347. Now I want to ask you this. In connection with your scheme the Miners' Federation have to hold an important place in the scheme of joint control. Is that not so?—Hold an important place?

23,348. Yes?—Yes, I think so; that is obvious, I think.

23,349. Do you suggest that all these Councils will not act under the pressure of the Miners' Federation of Great Britain, taking things as they are and looking the situation in the face?—They will look after the interests of the community much more than under the present system.

23,350. What organisation will stand behind them? Will it not be the Miners' Federation of Great Britain?—The Miners' Federation of Great Britain, of course.

23,351. Does your Federation meet at regular intervals?—It does.

23,352. Does it define the policy which is to be carried out in every mining district in the country?—No, it does not.

23,353. Does it not decide the broad issues that you are agreed upon?—During this war it has.

23,354. Did it not do so before the war?—No.

23,355. Did you not pass resolutions in favour of certain policies in connection with your Federation?—We passed a resolution in order to try to unify as far as possible the policies, but we have not yet succeeded.

23,356. Did that policy not condescend on wages and hours?—During the war it has.

23,357. And before the war, too, I suggest?—No. I suggest to you that you know that Scotland had

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

its own method of regulation of wages; the English Conciliation Board had; Northumberland and Durham had; and Wales had. They were all separate systems.

23,358. Were you not in the meantime passing resolutions in favour of a common standard of wages?—I have said we were endeavouring to unify these things. We have not yet succeeded, but we hope to do so.

23,359. Is that not another way of saying you were defining a policy for the whole country?—Just as the Mining Council will define the policy for the whole country.

23,360. When the miners are nationalised, will the Miners' Federation meet as before?—I suppose so.

23,361. And it will continue to advocate its policy in relation to the whole country?—Yes.

23,362. And I take it the delegates so appointed upon the various councils will be there to carry out its policy?—The delegates, as you call them, but which I do not—the members that they appoint will be there at all times under all circumstances, either temporarily or permanently, to do their best in the interests of the nation.

23,363. I know that is your view?—Well, I cannot express anything else.

23,364. What I want to know is this: Do you seriously suggest that, under a system like that, with the Miners' Federation as the strong body in the background, it will be possible to secure what you call industrial stability?—I suggest that you are assuming the two sides of the Commission always to be at war with each other.

23,365. Well, I assume this, and I want to point this out to you: Do you see any possibility under nationalisation, with the Miners' Federation existing as I have suggested and allied to the Labour Triple Alliance, of having any identity of aim?—After all, the organisation between the other five is stronger even than the Triple Alliance—that of the nation itself.

23,366. Will it not be natural that you should be laying emphasis upon wage questions, and that the miners will doubtless be doing that?—And the other side will be watching the other interests, so that you will arrive at a just conclusion in any case.

23,367. Do you really think that is how it will work out?—I do.

23,368. The other side will be interested in balancing the accounts from a financial point of view, whereas I put it to you that the representatives of the miners will have a greater interest in pressing wages and other similar questions?—With a full knowledge that the accounts must be balanced.

23,369. Yes, but you may suggest a remedy for the balancing of accounts by raising the price of coal?—To the injury of the community, and that is where nationalisation would benefit the community in a way it does not benefit under private ownership.

23,370. And yet with the right to raise the price of coal under a Government monopoly you do not propose to give the consumer a real place in the Councils of control?—Because there are already ten and the Chairman, who is there in the interests of the general community.

23,371. Yes; but I suggest that in the situation you have a very important factor in the Miners' Federation of Great Britain being in the background?—Just as the other side always has the balance in its favour with the nation behind it and 11 members, one of them having, probably, a casting vote.

23,372. But I suggest to you that you do not give the general community a real place in your scheme. The most you give the consumer is an advisory relationship?—If you can imagine the 10 appointed by His Majesty, with the Chairman, as having no interest in the community, you may be right, but I cannot imagine such a situation.

23,373. I suggest to you that in the circumstances they may be open to very considerable pressure?—I think the consumers will bring pressure to bear upon the other side.

23,374. No; I mean the other members upon the Mining Council will be open to very considerable pressure through the Miners' Federation of Great Britain?—The greatest pressure will be the welfare of the industry and the welfare of the nation.

23,375. I am taking you on your leading principles, one of which is that we are anxious to secure industrial stability?—I think we will do that.

23,376. I think the factors of industrial stability are not present?—I suggest they will be present in a way they have never been present before.

23,377. And yet you do not seem to be sufficiently fair-minded to give the consumer?—Do not suggest that I am not fair-minded.

Sir L. Chiozza Money: Sir, really Sir Adam is suggesting that the witness in the chair is not sufficiently fair-minded to answer a question. I really must protest against that. The trend of these questions is abominable.

Sir Adam Nimmo: I will put the question in another way.

Chairman: Very well.

23,378. *Sir Adam Nimmo:* You do not propose within your scheme to give the consumer a real place in the control of the industry?

Mr. Sidney Webb: He says he does.

Sir Adam Nimmo: No, I do not think he does.

Mr. Sidney Webb: As a matter of fact, there is the Government which represents the consumer, which will have the ultimate control.

Witness: I do not think I can add anything to what I have said on that.

23,379. *Sir Adam Nimmo:* I will take you on the point suggested by Mr. Sidney Webb?—I am sorry if you fail to understand me.

23,380. No, I think we understand each other. I will take you on this further point. Is there any evidence, either in the past or at the present time, that the trade unions of the country have any special respect for Governments?—In the past they have not had much, because they have had so little to do with Governments.

23,381. But take the position at the present time. Do you think that there is any evidence that they have any special respect for Governments?—Respect by the trade unionist for Governments will grow just as Governments grow to represent the people.

23,382. Does it not amount to this, that the trade unions of the country are quite ready just now to challenge the authority of the Government at any time? Is not that so?—I do not quite follow what you mean.

23,383. Do not the trade unions of the country (take the Miners' Federation of Great Britain, or take the Labour Party generally representing an industry) take it upon themselves to challenge the authority of the Government, if they think it suits them to do so?—Will you instance a case?

23,384. Take the present case where representations had been made with regard to the withdrawal of troops from Russia, or the withdrawal of conscription. Has it not been suggested, and more than suggested, to the Government that they ought to take immediate action in that direction?—That is not challenging the Government.

23,385. I am going on to ask you the further question: Is it not the case that in that connection it has been suggested that you would adopt what are called industrial means to secure your aims?

Sir L. Chiozza Money: Sir, may I ask whether that question is in order? *Sir Adam Nimmo* is asking whether a trade union has requested the Government to withdraw troops from Russia. May I ask whether that has anything to do with nationalisation?

Sir Adam Nimmo: I submit that it has. The point that I am seeking to get out is that you get industrial combinations which are challenging the Government.

Mr. Sidney Webb: Under the present system.

Sir Adam Nimmo: I am putting it that that is what is being done.

Chairman: I think it is getting a little far from the subject, but I understand that Mr. Straker wants to answer the question. What do you want to say?—I only want to say that any Government that institutes a principle or a policy that affects the whole life and well-being of the people, without that having been before the people—nay, more than that: the Government having promised that they

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

would not introduce it, then I say any action would be morally right to upset that Government, and that applies to conscription.

23,386. *Sir Adam Nimmo*: I take it that that simply means, in other words, that if your view collides with the Government's view, you propose to enforce your own view?—We propose to upset the Government for the reasons I have given.

23,387. Is the situation going to be any different in that respect under nationalisation?—Quite, because under the system that we propose to establish, of a national council, a district council and pit councils, a position such as has now arisen with the Government of this country can never arise.

23,388. I think you answered me yesterday that you proposed to reserve the right to strike under a scheme of nationalisation?—Yes, the miners reserve the right to strike.

23,389. So that, if your view, even under nationalisation, differed from the view of the Government, you might propose to try to force the hand of the Government by striking?—That is so.

23,390. Is that not really the crux of the whole thing that is presented to us?—While I agree that that right must be preserved by the miners, I think the need to use that power would be tremendously reduced under the system that we now propose.

23,391. Do you think that there is any evidence from past experience that that is likely to be the case?—Whenever men understand and feel responsibility, there is less likelihood that they will do anything to interfere with the well-being of that in which they are engaged.

23,392. You are suggesting in your *précis* that there is going to be such a reformation in the whole outlook and spirit of the men that differences will not arise?—I did not say that.

23,393. May I put this to you: Your view of the future being such as it is under nationalisation, would it not be a fair test of your belief in that, that the Miners' Federation of Great Britain should be disbanded?—I am sure it would not.

Mr. Sidney Webb: Is that seriously suggested by the Mineowners' Association?

23,394. *Sir Adam Nimmo*: You seem to have a very strong objection to having your wages regulated under the proposals of the National Industrial Council: I mean as far as a minimum wage is concerned. Do you think that, with regard to wages, the mining industry can hope to stand by itself?—I think they will give full consideration to the whole circumstances of other industries.

23,395. Is that not really avoiding an answer to my question?—I do not think so.

23,396. Can you expect to fix a minimum wage in the mining industry which is out of relationship to the minimum wages in other industries?—I do not think it will be.

23,397. Why then should you object to adopt the proposals of the National Industrial Council for adjusting the minimum wage?—I think the National Industrial Council, if we have to discuss that, is merely for the purpose of patching up the present conditions of things while we are here for the nationalisation of mines.

Mr. Sidney Webb: The National Industrial Council has never proposed that there should be any minimum wage for any trade. The whole of your question is proceeding on a mistaken assumption. There has never been any suggestion that the wages should be settled by the National Industrial Council.

Sir Adam Nimmo: I have never suggested that. I used the word "propose" advisedly. What I suggest is this, that the National Industrial Council proposes a minimum wage for all the industries.

Mr. Sidney Webb: Pardon me, that is a mistake. The National Industrial Council has never proposed that. The only person who proposed that was Lord Gainford, and he was making that proposition on a mistaken conception of the whole intentions and purposes of the National Industrial Council.

Sir Adam Nimmo: I do not agree with that.

Mr. Sidney Webb: Apparently Lord Gainford did not even suggest it.

Sir Adam Nimmo: Let us come back to the principle which lies at the back of it, which is this: Have you hopes that in the long run the wages can be adjusted disproportionately to the wages which are adjusted in other industries?—I do not think that they will ever be disproportionate to others, considering all the circumstances and requirements of the miner's life.

23,398. I think we would agree with each other, that it may be necessary to differentiate to some extent in connection with the special conditions of mining. Would it not in the long run work out in this way, that as far as the minimum wage in mining is concerned it will have to be correlated to the minimum wage in other industries?—I do not know what the minimum wage in other industries would be.

23,399. I suppose you would agree that it is of the greatest consequence in these other industries as to what the minimum wage in the mining industry is? The wages depend on the price of coal to some extent?—But even the community has no right to secure its coal at a price which does not properly remunerate the men who get it.

23,400. I am not suggesting that. The point I am on is this: When you are dealing with the wages in a mining industry, you are required to adjust these to the needs of other industries?—I have already said that repeatedly.

23,401. I suppose you intend that the mining industry should pay its way?—Most decidedly.

23,402. You do not intend, do you, under nationalisation that it should be a subsidised industry?—That is only putting the same question in another way.

23,403. I know, but I want to be quite sure that you agree on that point, that the industry must be self-supporting?—Yes: I think I have answered that.

23,404. And that wages must be adjusted to bring that about. Do you not anticipate that under nationalisation the nation may take more out of the industry in one way and another? Let us take a period of good times as against a period of depression: would you agree that in a period of good times the nation would be entitled to receive more from the industry than in a period of bad times?—I think there probably would still be fluctuation in the trade, but nothing like what has been the case.

23,405. That is not my point: I merely want to get at this principle, that, assuming that the nation has to make provisions for all the necessary developments in the industry, would you agree with me that it was reasonable that the State should, in a good time, take more money to itself from the industry to make such necessary provision than in a bad time?—I have not suggested that under all circumstances there must be an even balance between cost and selling price.

23,406. Then do you see any difference, if you accept that principle, between the nation's position at that point and the position of the owners under the scheme that they suggest to you?—Under nationalisation, all accruing, even in that sense, from the industry would go for the benefit of the community, whereas at the present time it goes into the pockets of a few colliery owners.

23,407. You would agree that in the good time that I am referring to the nation should get more out of the industry than in a bad time?—I think the Mining Council would decide that from time to time. I am going to assume that they would have just as much intelligence in conducting the trade as the present colliery owners.

23,408. Do the colliery owners really suggest anything different in principle from that; do they not propose to rest your wages upon the actual financial ability of the industry from time to time?—I do not want to be pressed as to what they do lest I may be considered not to be fair, but the way in which they, say at the present time, are exploiting things is not, to my mind, creditable to them.

23,409. If I may say so, I do not think it could be said that the coal owners are exploiting the community at the present time. The point I was putting to you was this: The owners have suggested resting the wages of the men upon the actual finan-

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

cial ability of the industry. Can you ever put your position further than that at the best?—I have said wages ought to be a first charge on the industry.

23,410. I think we agree about that. As far as the minimum wage is concerned, but starting from that standpoint, the suggestion is that the full measure of the financial ability of the industry should thereafter be taken into account, and that it should be divided as agreed upon. Can you ever get your position any higher than that?—The Mining Council, in considering prices and the general policy of the trade, would also consider the wages to be paid. I do not imagine that they could leave any factor out.

23,411. You are not really dealing with the question that I am raising with you, but we will leave it at that. I want to ask you now, on the question of production, one or two questions: You say that under nationalisation you would get a larger production at a lower cost. You indicated yesterday, in reply to the question that was put to you, that you thought that the reason for the reduced output at the present time was due to overcrowding in the pits?—And strikes and stoppages.

23,412. Take the question of overcrowding, on which you laid some emphasis: Do you really suggest that that has any serious effect at the present time in reducing output?—I should think, if you asked any colliery manager, he would tell you so.

23,413. Do you know of any cases?—Yes, I do.

23,414. Do you say that they are having any material effect?—Most decidedly.

23,415. Would you say that that applied all over the country?—I assumed that as a practical man, and I think you will agree with me as a practical mining engineer that if you overcrowd your pit you are not going to get the same produce per person employed.

23,416. That may be as a matter of principle, but what I want to get at is whether in your view at the present time it is a material consideration at all?—I know pits where the men have voluntarily agreed to increase the number in each working place so as to give a share to their unemployed brethren returning from the army.

23,417. Are these exceptional cases?—No, I think they are general.

23,418. *Mr. R. H. Tawney*: I did not quite catch your answer. You said you knew of cases where the men had voluntarily decided on something.

Sir L. Chiozza Money: Do you mind repeating the circumstances?—They voluntarily agreed that the number working in one place should be increased in order to give employment to men returning from the army.

23,419. That reduces the output?—Yes, that reduces the output.

23,420. *Sir Adam Nimmo*: Does that answer the question?

Chairman: It is not for him to say whether it answers the question. It is for us to say.

23,421. *Sir Adam Nimmo*: Would that affect the total output of the country?—If that prevails, as I think it does, all over the country, that men are being crowded into the mines, probably to a greater extent than even in Northumberland, because I believe there are fewer introductions into the mines of Northumberland during the war than in other districts.

23,422. Could you give other cases, because I think the matter is of some importance?—I could give you another case in Northumberland.

23,423. *Chairman*: Are you able to come back here towards the end of next week, because we have seven or eight gentlemen whose evidence must be taken to-day, who have to return to business, and I am afraid we have not the time to occupy with you much longer. *Sir Adam Nimmo* has been cross-examining you for 2½ hours?—Yes, I could come back.

Sir Adam Nimmo: I want to deal with this point further, because I think if you are to base anything upon this point, we ought to have evidence in detail with regard to it.

Sir L. Chiozza Money: That is an observation. It is not a question.

23,424. *Sir Adam Nimmo*: Are you suggesting to me, with regard to this question of output, that the overcrowding of pits is general?—I think it is, so far as I have been able to learn. That is a complaint.

23,425. Would you be surprised if others come forward and say it is nothing of the sort?—If any colliery owner were to say that, then I would say, You are not carrying out your pledge to re-employ your men when they came back from the war.

23,426. On the question of production, I think you indicated yesterday that you had no desire to bring about any combination against the general community: is that so?—I said, we are not prepared to combine with the colliery owners for the purpose of exploiting the community.

23,427. Nor with anybody, but the colliery owners were in question then.

23,428. Would you say that at any time in the history of the country, the motive for producing output could be greater than it is at the present time?—Do you imply that the motive is selfish gain?

23,429. No, I understand that your motive was the interest of the community?—Yes.

23,430. Could the motive to serve the community ever be greater than it is now?—I see no evidence of a desire to serve the community at the present time on the part of the owners.

23,431. Should not the motive of the miners be stronger to produce coal at the present time?—I think they have had due regard to the interests of the community.

23,432. And yet the output of coal all over the country is going back?—For the reasons that I have given.

23,433. I notice that you lay considerable stress in your *précis* upon this idea that under the pre-war system the workmen were in what they called a servile position: do you really seriously put that forward?—I do.

23,434. Take their position with regard to wages, was that a servile position?—It is always a servile position when men are almost entirely under the control of another.

23,435. Were they in a servile position with regard to the handling of wages in the past in connection with the Conciliation Boards of the country? Were not the miners on an equal footing on the Conciliation Board to deal with all questions of wages?—Yes, that is so.

23,436. Was there not an effort made in connection with all disputes committees to set the men on an equal footing to discuss the various difficulties that arose between the parties?—That is so.

23,437. Do you suggest in these circumstances that it is reasonable to say that the men were in a servile position?—I say it is a reasonable thing to say. I can see no other when all their energies are being directed for an end that they are not allowed to understand and are being directed by another.

23,438. But a very strong effort was made, was it not, to secure principles of co-operation in the industry for the settlement of all difficulties?—Miners have from time to time endeavoured to force colliery owners into that position. We have somewhat succeeded.

23,439. Have not the colliery owners shown an increasing disposition to supply co-operating machinery to settle differences?—Just as they have been compelled to do so.

23,440. *Sir Leo Chiozza Money*: Something has been said with regard to a fall in output. Do you not attribute something of the recent fall in output to labour troubles?—Yes, I have already said that.

23,441. Are you aware that there have been quite serious losses of output, for example, in the South Wales districts because of such stoppages?—I think that has been more marked in South Wales than elsewhere.

23,442. (*To Mr. Winstone.*) Was there a stoppage in Monmouthshire recently?—Yes.

23,443. Do you mind telling us the nature of that stoppage?—The stoppage took place at the Risca Colliery in Monmouthshire where 15,000 men were idle for several days owing to a danger arising from gas, a shortage of timber, and the dukie rope cutting into the timber and cutting through the rails.

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

23,444. That is what we would call a safety strike?—Yes.

23,445. That caused a stoppage?—Yes. Then at the Bedwas Mine the men are out to-day because of a safety stoppage. The owners declined to stall the place, and the men were fearing that a crush would take place, and so they stopped.

23,446. (To Mr. Straker.) Are you aware that there are well-authenticated reports that there is a very great fall in output in Germany at the present time?—I have not seen those reports.

23,447. Are you aware that our chief competitor in the coal export trade in the past has been Germany?—Quite, especially in the French market.

23,448. Is it not the fact that our chief exports are made to European markets?—That is so.

23,449. Is it not the fact that, although we did not go into the late war with commercial objects, the result of the war is to put Germany out of active competition for at least a number of years?—I think even some of our Allies are finding the result now of Germany being out of competition.

23,450. Is it not the fact also that Germany will have, as part of the reparation she is to make, to give up coal exports which she could otherwise make?—Yes.

23,451. To make reparation to Belgium, to France, and Italy?—If they take the coalfields from her, as proposed, that will happen.

23,452. In other words, in respect of the main competition which we had in the coal export trade in the past, it is pretty clear, is it not, that that competition will be greatly decreased during the next decade?—I am not sure that that will follow.

23,453. Let us have your opinion quite frankly?—If France gets these valuable coalfields, then we get the competition of France instead of that of Germany.

23,454. But not perhaps as a coal exporter. France is not in the position to export coal?—No, but she will not be under the necessity of taking so much from us.

23,455. Quite so; but on the other hand it seems pretty clear that Germany will not be in a position to compete?—Decidedly.

23,456. Generally throughout the world, I ask your opinion: Is it not the fact that labour everywhere is demanding better conditions of life?—I think that is especially so with the German miners at the present time. I believe they have secured conditions they never had before.

23,457. Is that not also true of America?—That is true of America.

23,458. Sir Adam Nimmo put something to you with regard to the distribution of coal during the war, and suggested to you that it furnished an argument against nationalisation. Is it not the fact that the war conditions were so extraordinarily abnormal that they have thrown no light whatever on the nationalisation of coal in times of peace?—They did show the necessity of restraining colliery owners in the prices to be charged.

23,459. Is it not the fact that the coal owners went to the Coal Controller and got the prices put up in respect of certain Admiralty contracts in order to get more money out of the Government, that is to say, out of the community? Has not that been proved in evidence before this Commission?—I think it has, and they have also always wanted the control removed so that they might have unlimited power of charging whatever prices they could get.

23,460. It comes to this, that whereas the prospective Mining Council is charged with the intention of exploiting the nation of the community, we know already that the coal owners have exploited the community in actual fact.

Sir Arthur Duckham: Is that a question or a statement?

Sir L. Chiozza Money: I hope I am not too closely following the model of questions to which you, Sir Arthur, did not object just now.

Sir Arthur Duckham: I merely want to know whether it was your opinion or whether you were asking the witness's opinion.

23,461. Sir L. Chiozza Money: I will try to put it in the form of a question. I am afraid I am an imperfect cross-examiner. Is it the fact that, in your opinion, the suggested evils of nationalisation, with regard to exploiting the community, have already occurred under the present system?—In a way that will never occur under nationalisation.

23,462. Have you ever seen any indication, on the part of colliery share-owners, that they desire to study the interests of the community?—I have not.

23,463. Have you ever heard of colliery directors studying the interests of the community?—I have not.

23,464. Are you aware that a very large number of colliery directors, like some of those who have appeared in evidence before us, are directors of many undertakings?—That is so, including firms of coal exporters.

23,465. Is it not the fact that this proposed Nationalisation of Mines and Minerals Bill sets out that it is not merely a Bill to nationalise mines and minerals, but to provide for the national winning, distribution and sale of coal and other minerals?—That is so.

23,466. Is not English employed in those words, and do you not intend that English to be effective, that the Ministry of Mines is to study the community?—That is its purpose as distinct from the present owners of mines.

23,467. If it is suggested that those words are not strong enough, are you willing to accept any form of words, however stringent in their expression and severe in their meaning, to impose on the Minister of Mines the welfare of the nation in respect of coal as distinguished from the welfare of the coal-owners?—If the Bill as drafted does not fully state that, the miners would have no objection, because that is the purpose they have in view. I have no objection to alterations being made.

23,468. You have read what is commonly called the Sankey Report, have you not?—Yes.

23,469. Have you specially read paragraphs 9 and 15, both of which were printed in heavy type, the first of which, I think, you quoted in your evidence, condemning the present system of ownership and working upon the evidence so far heard?—That is so.

23,470. And the second, which, in language which I will not comment on, points out that the colliery worker has for a generation been educated solely and technically, and that the result is a great national asset, and why not use it. Has your attention been directed to those two paragraphs?—Yes, and I fully agree with them, as I have stated, that the colliery owner in the past has not been utilising the knowledge and experience of the workmen.

23,471. Were those paragraphs very fully considered at the meeting of your delegates which accepted what is called the Sankey Report?—With a fairly good knowledge, I think, of the influences at work when we took our ballot vote, I feel absolutely confident that the result of the last ballot would not have been in favour of acceptance if it had not been for these two paragraphs that you have read.

23,472. As you allowed me to be present on one of those occasions, I can confirm what you say; but is it the fact that the miners would not have accepted the award as to hours and as to wages if those paragraphs 9 and 15 had not appeared in what is commonly called the Sankey Report?—What is paragraph 15?

23,473. Paragraph 15 is the one that refers to enlisting the valuable knowledge of the colliery workers in the direction of the management of the mines?—That is so. That really points out a new vista of sharing in control and responsibility that they have never had before, and because of that responsibility and probability in the future they accepted the award.

23,474. Is it the fact that speaker after speaker at the decisive meeting which decided to enter into an honourable obligation with His Majesty's Government, accentuated and called attention to those paragraphs, and to their value to the community and to the miners?—And to the districts as in the National Conference that was done.

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

23,475. It is the fact, is it not, that His Majesty's Government, whether they were right or whether they were wrong, and quite apart from the merits of the case, did enter into those honourable obligations with the miners of the country?—I take it they are not going to go back on it.

23,476. Having asked you that, may I direct your attention to what Lord Gainford said in his evidence before this Commission? Lord Gainford, speaking on behalf of the Mining Association, and knowing of the Sankey Report and knowing of its acceptance by His Majesty's Government as an obligation of honour, said: "I am authorised to say, on behalf of the Mining Association, that if owners are not to be left complete executive control, they will decline to accept the responsibility of carrying on the industry, and, though they regard nationalisation as disastrous to the country, they feel they would, in such event, be driven to the only alternative—nationalisation on fair terms." Have you read that paragraph?—Yes, I have.

23,477. Do you take it, therefore, that the Mining Association of Great Britain, having rejected the Sankey Report in paragraphs 9 and 15, so far as they relate to joint control of the industry, do accept the principle of nationalisation in that paragraph, not because they like it, but because they feel they are driven to it?—Yes.

23,478. Even if this were not so, let us suppose that the Government had not entered into an honourable obligation; do you think that educated men would consent in the long run to the continuance of a position in which their means of livelihood are owned by others?—That is the cause of so much of the unrest at the present time—that the means of livelihood are in the hands of others.

23,479. That is to say, if I may use a figurative expression, that the miners do not only want bread, they want something more than that—is that not so?—I think I have stated that in my first *présis*.

23,480. Do you not think that the million miners who carry on this arduous and dangerous occupation resent the suggestion that they are an inferior order of beings who are not to be trusted with any real or effective share of management?—Of course I have resented that as strongly as I could and be respectful. I have regretted considerably that the whole attitude of those opposed to nationalisation seems to be the outcome of a distrust of working men.

23,481. With regard to the alternative scheme of profit-sharing, did you observe that Lord Gainford in his evidence claimed a larger profit than 1s. 2d. a ton?—He claimed that that would not be sufficient.

23,482. He also suggests that the proposition of the mineowners, if we may take it at the value put upon it by themselves, is that there is something for the miners also in this scheme of theirs after they have got more profit?—After the miners have produced it for them.

23,483. Does that not suggest that the only method of getting it is to get it out of the consumer? If the mineowner is to get more profit and yet there is more promised to the miners, is it not rather to suggest that they are to league themselves together in order to get more profit out of the consumer?—That is one of the reasons why I have said that, in my opinion, the miners will never agree to a scheme to get more out of the community.

23,484. Mr. Slessor, in his evidence, very properly said in the terms of the Bill as you have drafted it, it is possible for the Mining Council to take over, for example, iron and steel works where they are associated with mines in one undertaking. Is that so?—I think it is. It gives that power.

23,485. You have a disclaimer clause in this Bill?—That is so.

23,486. Is it your intention, if it is your view that the Mining Council should not take over iron and steel works, that the disclaimer clause should be exercised not to take them over?—Of course, the Council would decide for itself; but, in my opinion, any works away from the vicinity of the mine it would be a mistake to take over. Of course, circumstances may alter in the future that they could be taken over, but so far as I can see at present it would not be advisable.

23,487. Would you be willing to accept, as an emendation from this Bill, a specific exclusion of iron and steel works and things of that kind that are not directly associated with the colliery undertaking in the sense that coke ovens are? Would you be willing for a clause to be put in the Bill specifically excluding iron and steel, for example?—I would not be willing to exclude anything closely associated with mines.

23,488. Would you be willing to exclude iron and steel specifically?—I would rather retain the power in the Mining Council, acting in the interests of the nation, to do for the advantage of the nation what is seen to be necessary as time passes over.

23,489. I am putting it in this way, if I may, that I think you yourself put it, that the Mining Council has a big job on its hands, and it certainly would not for a very long period even think of taking them over?—I do not think it would.

23,490. In those circumstances, would you be prepared to accept a specific exclusion of those undertakings, seeing that this is a Bill not to nationalise iron and steel industries but the coal industry?

Mr. Robert Smillie: Does not the Bill only provide for nationalising the mines and minerals, if it is passed in its present form?

Sir L. Chiozza Money: Yes. I am only asking Mr. Straker if he would make a specific exclusion?—I would at the present time, but I should like always to have power in the future, as it might be found advisable to take even these over if they are associated with a mine.

23,491. Sir Arthur Duckham: You would like the power left in the Bill?—Yes, I would.

23,492. Sir L. Chiozza Money: I have only two points further to put to you. The first is with regard to competition. Have you any objection to competition in the sense of personal emulation or the competition of individuals in point of merit? Have you any objection to competition of that sort?—I think that was the word I was after when Sir Adam was contrasting competition, or, rather, was comparing competition in trade and competition in scholastic attainments.

23,493. Is it not the fact that some of the keenest competition in the world has been between persons who have not the faintest conception of getting a penny out of it, as, for example, when scientists compete with each other in investigation or when the commanders of submarines compete with each other in war. Are they not the most effective instances of competition that have even been known?—I agree to that. I think I have stated that, in other words, when we deal with the system of comparing pit with pit, manager with manager, system with system, and so on, in all that the spirit of emulation would enter in and be a much higher form of incentive to enterprise than the present selfish idea of gain is.

23,494. Do you not think it would be essential to give mine managers the chance of promotion?—I have said managers would be remunerated according to the responsibility they are under, the larger positions being always open to the men of greater efficiency.

23,495. Is it not the fact that the only competition you object to is the competition in making profits out of the community?—Yes.

23,496. It has been suggested that somebody might come along and take your watch from you because you had advocated the nationalisation of mines. Is it not the fact that there is all the difference in the world between property in personal things and property in things which gives you a command over the lives of others?—Most decidedly.

23,497. Is not the only objection you have an objection to a form of property which puts one man at an unmanly disadvantage to another man?—Something that makes his whole life subject to another man.

23,498. So that whereas you and I are here talking on level terms one with another, if you were a mineowner and I were a miner we should not be here on level terms?—Yes.

23,499. Whereas if I were the mineowner and you the miner I could give you the sack?—You could use me at your will.

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

23,500. *Sir Arthur Duckham*: I have one or two questions on your *précis* first, if I may. On the first page at the top of the second column you speak there of the man who gives his labour to the industry having at least an equal right to executive powers in every department of the industry with the man who puts his capital into it. I asked one of the mineowners the other day if under the profit-sharing scheme they appointed directors to look after the workmen would that in any way meet or assist the miners?—It would not. It would mean a combination, which I have already said I object to, of colliery owners for the purpose of exploiting the community.

23,501. Why have the Miners' Federation refused to be connected with the National Industrial Council?—I think, as I have said, it was largely because it was so evident that the object was merely to patch up the existing systems prevailing in the industry under which workmen are employed.

23,502. I ask you the question because it seems to me that surely the help of the Miners' Federation would have been of very great assistance to the Mining Council. Do you not think it is necessary that the whole of the industries of this country should get together?—I think it is necessary to reconstruct. If we are still to retain all the old systems we shall get exactly the same results in future.

23,503. You want to reconstruct by eruption?—No.

23,504. Rather than by general arrangement?—We do not expect that there is going to be an eruption of the coal trade. A change of system is not necessarily an eruption.

23,505. Why do you consider that under nationalisation there would be a decreased cost of production of coal?—Because I have said that all the experience and practical knowledge of working men will be at the service of the industry. All the economies will be exercised by everybody in the pit. Everybody will be co-operating together for the best result, instead of there being that antagonism which I am sorry that colliery owners are assuming always to be existing even under nationalisation.

23,506. There is antagonism only on one side?—No, antagonism on both sides, most decidedly.

23,507. Do you suppose that under a nationalised system the cost of production of coal would be lower, and presumably if you do that you suppose that the wages cost per ton would be lower?—That is so.

23,508. On page 2 you speak of the experts. You say: "Positions on the expert staff of the mining industry and even seats on the National Council will be open to the greatest ability. No such incentive to real worth has ever been or can be offered under private ownership." What seats on the National Council would be open to these men—the Miners' Federation seats, the Government seats—or are you going to create new seats?—I think the whole of these seats would be open as vacancies occur, of course.

23,509. To the Miners' Federation, of course?—To both sides.

23,510. The other side is mostly taken up with consumers. I was wondering whether you would agree that the Miners' Federation side should have these experts?—The Miners' Federation side will appoint experts among their number; that is why we increased the number from five on each side to ten on each side.

23,511. On this question of discipline—it is a question I have asked before, but not of one who is so competent to answer it as you are—is the discipline at the present time under the Trade Unions good?—Yes.

23,512. That is to say the Trade Unions obey the executive absolutely?—I am speaking with particular reference to miners.

23,513. Do you say that the miners obey their executive?—I think it is good; it might be better.

23,514. Have you cases where the miners do not obey the Executive's instructions?—I think there have been cases in other counties than Northumberland.

23,515. You are happy in Northumberland?—I think we have a splendid record for 40 years.

23,516. Some of your spirit may have gone into Northumberland?—I may have got it there.

23,517. You cannot speak for the other counties with regard to their discipline, can you, because it is rather an important matter?—I think it must be conceded for other counties that the few cases where there has been any departure from decisions by their Associations are extremely rare and speak very highly for the miners' organisation.

23,518. You do not know of any case in the Midlands at the present time, do you? I ask you because I heard of a case the other day where the Miners' Federation were anxious to stop a strike and the men will not go back?—I do not remember it for the moment.

Mr. Robert Smillie: You might perhaps allow me to correct that statement.

23,519. *Sir Arthur Duckham*: If I am technically wrong pray correct me. Does not the Miners' Federation want to stop the strike?

Mr. Robert Smillie: The Miners' Federation knows nothing at all about it.

23,520. *Sir Arthur Duckham*: Then I beg your pardon. At Question No. 22,633, if I may read it to you, you were asked: "Supposing last week you purchased mineral property and paid cash for it, would you claim that now it is not your property?" Then your answer: "I would be in the position of a man who buys stolen goods." Are you not in a much more serious position? Presumably the man did not realise that he had bought stolen goods, but have you not been buying coal which has been stolen? If you follow that argument through, have you not been receiving stolen goods yourself and secreting them in your coal cellar?—No; when the community gets the coal it gets what belongs to it.

23,521. You are not the community?—But I am part of it.

23,522. So is the man who bought this coal part of the community?—He is part of the community most decidedly, but he has no right to purchase that which belongs to the community to the exclusion of the rest of the community.

23,523. But he does not?—He does.

23,524. He does not keep it away from the community?—No, but he buys the value of it.

23,525. So do you buy the value of it?—He buys a value that he has no right to.

23,526. You can see a difference between the two things?—Most decidedly.

23,527. A man buying a bit of land and you buying a bit of coal—I am afraid I cannot see the difference?—It would take a lot of explaining away, I should think.

23,528. With regard to this Bill, the chief point I want to ask you is this: Is the Bill subject to revision and only a tentative suggestion how to meet the case, or is it a hard and fast line laid down by the Miners' Federation, that that is what we want and what we are going to have?—There is nothing put in that position in this world that I know of.

23,529. I ask from the point of view of helping. It is subject to revision?—We have put it forward because it embodies our suggestions for the better management and ownership of the minerals and the working of the minerals which belong to the people.

23,530. You would be quite willing to have revision made?—There will probably be a lot of revision in the House itself.

23,531. I am not talking of the House, but I take it you would consider any revision?—Decidedly.

23,532. You speak about valuing minerals. Why go to the bother of valuing them if you are going to confiscate them?—I think it is desirable to know the value of what you are confiscating.

23,533. Is it?—Oh yes.

23,534. The value does not appear in any balance sheet if you confiscate it?—No, but it is necessary to see exactly how the nation has been robbed.

23,535. You only want it for that purpose?—Yes, for information.

23,536. With regard to paragraph 1 and the question that *Mr. Smillie* spoke on just now and that *Sir Leo* was asking you questions on, with regard to taking over, selling, winning, and distributing coal and other minerals, in a broad sense that would

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

include a very great deal of the industries of this kind—iron mines, lead mines, china clay mines and fireclay mines, and industries attached thereto?—Yes; these are all powers given; but, as I said, Clause 5 was a disclaiming clause, so that they could be taken over, as it was found advantageous to do so.

23,537. Dealing with the disclaiming clause, do you realise that that disclaiming clause would absolutely make the ordinary industrial life of this country impossible?—I do not think so.

23,538. Put yourself in this position and imagine that you have a works—an iron mine or a coal mine, with a blast furnace attached, and the Mining Council disclaimed this mine: they would have a perfect right to come back and take it over when they liked. Would you have any heart in running that mine or blast furnace or anything else, with it hanging over your head that it is going to be taken from you, and that your effort is going for nothing?—I think that would hurry up the Mining Council in taking it over, but I should expect that the Mining Council would take over the mines as quickly as possible consistent with other liabilities.

23,539. You say "mines" in your answer, but may I put it to you that in this Bill it is much more than mines: it is all the works which are attached, it is the steamboats, wharves, railways and so on, and I put it to you that if this Bill were carried out to its fullest extent you would take control of a large part of the industry of this country?

Mr. Sidney Webb: As far as it is attached to coal mines.

Sir Arthur Duckham: You have your coal mines or iron mines, and you may have your blast furnaces, your steel works, your rolling mills and the whole thing on an estate, and you have power to take it over. You say "disclaimed." If you have power to take it over after disclamation, surely all the life would be gone out of that undertaking?—I do not think so.

23,540. We have had several witnesses before us who state that the sitting of this Commission has taken the life out of the coal industry, because practically no development is going on at the present time?—Surely that is a state of things that reflects terribly on the coal owners.

23,541. Is anybody going to spend money on trying to find his minerals to-day if he knows there is a suggestion that they may be taken away for no payment to-morrow?—All that he put into it, he will get paid for.

23,542. No, you confiscate it?—That is, the minerals.

23,543. Any man who has proved his minerals, after spending money on doing so, you take his minerals?—I am not sure that many mineral owners do that.

23,544. They have to pay money for their minerals being worked?—No, they have claimed payment from somebody who has found the minerals for them.

23,545. Surely mineral owners have tested and tried their property and have paid money for it being tried and proved?—In some cases. I think, judging from the evidence of that Pioneer Society, we find that they have actually to pay a rent to the mineral owners in order to be allowed to find the minerals for the benefit of the mineral owners.

23,546. That may be so in some cases. The point I want to put to you is—and what you do not appreciate, presumably—that this disclaimer clause would upset a large part of the industry of the country?—I think money put into borings, as you suggest, by a mineral owner, would be part of mining, not necessarily as the value of the royalty, and that would be compensated for.

23,547. A bigger question is, is it still your opinion that this disclaimer clause, as drafted here, would be a possible way of working the taking over or the not taking over of these large interests in this country?—I think it provides for taking them over just as it is advisable to take them.

23,548. What are the people who own the property to do meanwhile?—They would be getting, just as they are always getting, out of it a return for their services.

23,549. These people could not have a long-sighted policy, which is certainly the only way of running a business, because they might be taken over at any time without any notice?—But with full compensation.

23,550. You have limited the compensation?—Necessarily.

Mr. Sidney Webb: Not the Associated properties.

23,551. *Sir Arthur Duckham:* I am talking about the mines that he disclaims?—That limit, we consider would be ample to meet all cases.

23,552. There is just one other point: I have shown you my fear, and you do not agree with me that there is a fear; if these other industries are coming in, why should not the workpeople in these other industries and these other interests have a direct voice in electing the ten members of the Mining Council?—As industries may be outside of mining, although I do not contemplate it for a long time—but should that ever come—that will be a matter for fair consideration.

23,553. Therefore you would be quite willing, in this Bill, to have the Miners' Federation as the nominators of these ten members deleted, and you would agree that these ten members should be appointed by the workpeople in the industry or industries controlled by the Mining Council?—I have not said that.

23,554. Would you, on the basis that you now agree, be willing that these men should have a voice?—No, I say at the present time the taking over would be largely confined to the taking over of coal, whereas the Miners' Federation would fairly represent the people employed in the coal-mining industry.

23,555. Therefore, at the moment you would not give the mine surface workers or engine men a voice?—The engine men are largely members of the Miners' Federation now.

23,556. We have had evidence that did not seem to show that?—I may tell you for your own information they are now.

23,557. You hope to get the managers, technical experts and others?—Yes; therefore it is not necessary to make special provisions at the present time.

23,558. Are you hoping to get the management, surveyors and others?

Mr. Robert Smillie: And the mine owners.

Sir Arthur Duckham: I agree, if you do that it would be a happy condition of affairs; you could then exploit the public.

23,559. One point with regard to the Mining Council. You have twenty whole-time men sitting. What would they do? Is it suggested these twenty men should sit round a Board Room table all day and talk?—I would allow them to go out to meals.

23,560. I agree to that. I am trying to get at these things. I have had a certain amount of experience in organisation. What will these twenty men do? Will they talk all day or has each one different executive powers?—They will have the whole policy of the whole industry to look after, and I think they will have just as much as they can manage.

23,561. With all due deference, twenty men sitting round a table, I cannot conceive them talking all day about the general policy, you know?—We have not laid that down. They will have to work each day.

23,562. Whole-timers?—But I think you said you were a member of half-a-dozen directorates and you are a hard-worked man?

23,563. My directors' meetings do not take me ten hours a month?—Then you are not so hard worked as it was suggested.

23,564. That is not what I call work; that is amusement. May I put it this way. Do you know anything about this Council. I should like to know if it is like the Army Council which Mr. Slessor likened this Mining Council to or the Board of Admiralty or the Ministry of Munitions Council. They only meet very rarely; they are not their whole time there?—I am not sure they manage it very well.

23,565. They do the best they can with the material at their disposal?—They have not the control after all.

23,566. That is the point I want to make. Take the Mining Council who has the control of the Mining Council?—The Mining Council.

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

23,567. Which part. Do you bring everything to the vote if there is disagreement, or is it that the Minister decides?—I put it they will work together as one Council.

23,568. It does not always go like that. If there is a difference of opinion do you put it to the vote?—The Mining Council would decide its own regulations.

23,569. That is to say, by vote?—Probably they will; but I do not expect the vote will always be five on one side and five on the other.

23,570. You suggest the decision of the Mining Council might be by vote, and if the Minister of Mines is outvoted he has to carry out the wishes of the majority?—Yes, he would have to carry out the instructions of his Council.

23,571. You do know that is against the present way of working a Ministry?—That may be. I have not much admiration for the present system.

Mr. Herbert Smith: It needs reconstruction.

23,572. *Sir Arthur Duckham:* Now I will deal with the matter of consumers. *Sir Adam Nimmo* dealt with it pretty fully. The consumer has as much interest in the coal as the miner?—No, I would not say he has as much.

23,573. Why not?—He merely consumes coal just as the miner does, but the miner has the additional concern that he has to get it.

23,574. Quite. Then you know that unless there is a consumer you would not want the miner?—Quite. I thought you asked about contrasting the interests of the two parties. I say the miner has a double interest from the fact that he has to produce it. He is also a consumer of it.

23,575. The only protection you give the consumer is a possible Advisory Council with the protection he might receive from the representative of the Government?—From the protection he will receive from the representative of the Government, otherwise they will be unworthy of the position.

23,576. So many representatives of the Government are unworthy?—I quite agree.

23,577. I hoped you were taking an opposite view?—That is why we make provision for the removal.

23,578. On that point of removal, it is most difficult to remove a member of a Government staff, or anybody who has anything to do with the Government?

Sir Leo Chiozza Money: Mr. Straker does not refer, for example, to Postmaster-Generals when he says that.

Sir Arthur Duckham: Is this interruption necessary? If you want to get a little point in, make a point. I do not see why you refer to Postmaster-Generals, unless it is something you have against Lord Gainford.

Sir Leo Chiozza Money: It is Members of Parliament ordinarily speaking and persons put in responsible positions. Mr. Straker did not mean to reflect upon those. If he did, he did it most unjustly.

Witness: I am not going to reflect upon anybody: it is the system I reflect upon.

23,579. *Sir Arthur Duckham:* You would not propose to give the consumer an absolutely definite position on the Mining Council?—No.

23,580. You would not give him a definite position as a consumer?—I think the consumers will be fully represented.

23,581. You might possibly have some percentage in order to safeguard the consumers. Would you give them a definite representation of, say, three or four members on the Mining Council?—No. I would leave that to the judgment of His Majesty always. I think with all the faults of the Government it would see to that wisely.

23,582. In paragraph 17 of the Bill there are two points. You say at the end of Clause 1 that it shall be payable out of moneys provided by Parliament. Presumably you mean by that the issue of Mining Stock?—I think these are legal clauses.

23,583. You do not mean it comes out of the ordinary Exchequer?—I understand these legal clauses are necessary and follow the usual form.

Mr. Sidney Webb: It cannot come out of anything but the Exchequer. The question is how the Exchequer is fed.

Sir Arthur Duckham: The question is Mining Stock.

Mr. Sidney Webb: Money provided by Parliament can only be issued by the Exchequer. It is a technical term.

23,584. *Sir Arthur Duckham:* In sub-clause 2 you say: "Provided that moneys received under this Act in respect of the sale or export or supply of coal or other minerals (including the moneys received from the Government Departments) may be directly expended in or towards carrying out the purposes of this Act." That is to say, any money you receive you can use for what purpose you like. That means to say, you could carry out your capital extensions out of revenue?—It means the industry will be self-supporting.

23,585. It could pay its capital expenditure out of revenue?—It will have no other source, I take it.

23,586. It could raise more capital. I ask you this because a great point has been made in this Commission that you should not pay capital charges out of revenue.

Mr. Sidney Webb: The Bill does not provide for it.

23,587. *Sir Arthur Duckham:* In Clause 15 it says: "The net surplus profits then remaining shall be applied in establishing a sinking fund and, subject thereto, in establishing a depreciation fund in respect of capital expended." Is it proposed to use the net profits for reducing the price of coal, or is it going into the business?—I think the sinking fund would probably be used for the purpose of redeeming the stock issued to the present colliery owners from time to time.

23,588. You mean wiping out Government stock—reducing the capital?—Redeeming the capital.

23,589. Not for reducing the price of coal?—That would all depend upon the many circumstances that would enter into the trade as to what the price of coal should be.

23,590. In Clause 19 you speak about the Mining Council making regulations. May they make all the regulations without referring to Parliament? Is the Mining Council free from the control of Parliament?—No.

23,591. Therefore they would have to refer to Parliament?—They would be in much the same position in relation to Parliament as the Home Office is now and the Mining Department of the Home Office.

23,592. They would be the same as any Government Department at the present time. The control of Parliament would be as complete as it is over any Government Department at the present time?—Yes, it would be.

23,593. There is just one question with regard to the wages. It was brought to my mind by a document that was given us here. You say you feel that under the National Control with the Miners' Federation more closely interested wages will be better?—I did not say that.

23,594. I do not want you to commit yourself in that way. I am not trying to catch you. If the workers had a hand in the control of the wages, the wages would be fairer, I will not say better?—The wages will be fair with due regard to other industries.

23,595. I only raise the point; here again I would like you to correct me if I am technically wrong, that the wages in South Wales, we have heard here, are about £4 per week at the present time for labourers, and yet the colliery workmen in the neighbourhood are advertising for check weighmen at £2 10s. a week. Is that a mistake, or is £2 10s. in South Wales considered a fair wage for working men?—I cannot answer for South Wales. I would not consider it a fair wage.

Mr. Winstone: There may be various circumstances concerning the check weighmen.

23,596. *Sir Arthur Duckham:* It is at the Red Ash Colliery.

Mr. Winstone: If it is the Red Ash Colliery, I know that there is probably a dozen men employed there.

23,597. *Sir Arthur Duckham:* I am told about 70 or 80. My point, Mr. Straker, is this: If there is a man employed you would not pay him less wages than he should get?—No, I do not think so.

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

23,598. If the proper wage in South Wales is £4, they ought to offer £4 for these check weighmen?—Yes. I agree.

23,599. *Mr. Herbert Smith:* Mr. Cooper and Sir Adam Nimmo and Mr. Evan Williams made a point of reduced output. You have given some reasons. Are there not other reasons? Did not Nottingham stop three weeks during that period entirely?—I think I have already mentioned Notts. I mentioned a stoppage in South Wales and also Notts.

23,600. Do you think during the controlled period owners have done their best at collieries to get the large coal output?—I would not like to reflect upon them in that way. I think the restriction upon development was greater than it ought to have been, and if the miners' side of the Coal Controller's Advisory Board had been consulted or had had any power in it I think they would have managed that matter better than it has been managed.

23,601. Would you think a colliery that in 1918 employed 90 more men at the face than it employed in 1917, because in 1917 there was no control, should have 87,000 tons of coal less output?

Mr. R. W. Cooper: The control was in 1916.

23,602. *Mr. Herbert Smith:* You are right. A colliery that had 90 more men in 1916 than in 1917 reduced its output by 87,680 tons in one year, would you not think there was need of an enquiry there?—I think it ought to have been enquired into.

23,603. I want to put it to you that there has not been that interest with coalowners during the control as there was when free?—They have been awfully anxious to get free of the control.

23,604. You and I were on the Control Board as advisory people; how much we got to know about control?—Our advice was not sought much, was it, and we were never sure that it was going to be accepted when given.

23,605. Sir Adam when he was on it was anxious to get away from us and went and joined the Government to make it better, and made it worse. Is not that the fact?—I think colliery shares have gone up since Sir Adam went on to the Board.

23,606. I want to put it to you that Sir Adam when on that Advisory Board was able to do something more from their advisory side than we were, because it has been admitted in evidence that they put 2s. 6d. on coal per ton that was not necessary, and that was done by the coalowners' advisers on that advisory board?—They certainly had a good deal to do with the financial arrangements and we had nothing whatever to do with them.

23,607. Our thoughts were directed as to how much corn we could take from the pit pony?—And what sort of pick shafts we could get. That is why I say we have had more than enough of such Advisory Boards.

23,608. That is why we rebel against that sort of control?—That is so.

23,609. You had another point put to you with regard to the opposition of workmen against machinery. Is that sound that workmen are against the introduction of machinery?—I have not found it. I can only say I was surprised to hear it and I still hesitate to believe it without proof.

23,610. Has not the difficulty largely been when machinery has been introduced it was a question of prices and the employers wanted to take prices off, which they were not justified in doing?—I have known many disputes as to how much should be paid men who were working with these machines. That is a different thing from objecting to the use of the machine.

23,611. You were asked another question by Mr. Williams or Mr. Cooper as to whether you did not think the output, on the change of hours, would decrease?—I said I thought temporarily there would be a reduction.

23,612. Would you not go further and say if the present system of transport in pits and getting men to and from the pit was not altered it would continue to decrease?—I said it would not continue because I think all the things would be altered.

23,613. Another question put to you was that when you get an inefficient servant you have difficulty in getting him removed. Have you served on Local Councils?—You mean Municipal Councils?

23,614. Local governing bodies?—No, other than a Parish Council.

23,615. You do know in these Local District Councils they appoint men that are called Sanitary Inspectors?—I do.

23,616. And their appointment is supposed to be ratified by the Local Government Board?—Yes, and they cannot be removed other than by Government.

23,617. Have you not seen any removed when they have been doing their duty because they complained of insanitary dwellings. Have you no case in your recollection?—No, I do not know a case of that kind.

23,618. There is no difficulty as far as the present system is concerned in collieries in getting inefficient men removed, is there, if they are proved to be inefficient?—There would be a difficulty in removing a director if he were inefficient, would there not?

23,619. There would be a difficulty in removing a director if he were inefficient?—I suppose the shareholders may have the power. The disadvantage would be they would not know if he was inefficient or not.

23,620. With regard to the export railway rates. Do you think the present method of railway rating for taking coal is fair? Let me give you a case in point. I live at Barnsley. To take coal from Barnsley to Hull to be burnt in Hull would cost 4s. 2d. per ton. If it was going to be exported it would be taken for 3s. 7d. Is that right? For the coal burnt in the country 7d. a ton more in carriage is charged to the people than for export?—There are a large number of these anomalies in the coal trade. I know even at the pit mouth ordinary consumers purchasing coal will have to pay as much for it as if it was taken many miles away.

23,621. We have heard a lot about minimum wages. We want to get this clear because we want everybody to know our business as far as they can know it. Do you think there can be any satisfaction in mining areas when there are varied minimum rates which there are existing to-day from 7s. 3d. down to 3s. 5d. base rate?—I think one of the advantages of the nationalisation of the mines will be that men will be paid wages as miners and not be determined by the locality they live in.

23,622. Dealing further with the minimum wage, it does not include all workmen. Even if they accepted the principle of minimum wage, there are certain men excluded?—It only applies to underground workmen to commence with.

23,623. There are more laws against men getting it than for their getting it?—While it includes underground workers the payment of it is so hedged round by restrictions that a large number of men do not get it and thereby create a lot of friction.

23,624. Largely, is not the manager the determining factor whether the workmen shall have it or not?—In the first case he is. There is a tribunal to which such disputes can be referred.

23,625. To be decided by an independent Chairman?—Yes.

23,626. There are things that cannot go to an independent Chairman?—Yes, it is hedged about by restrictions that exclude it.

23,627. In some districts he is excluded at 60?—In some districts 65 years of age.

23,628. In some districts if he does not work all the time the pit works, he is excluded; that is to say, if he loses one turn of the work?—It was so in Northumberland. We have a slight amendment now to that.

23,629. Do you agree that all opposition from our friends against nationalisation is to the country's interest?—No, I think they have admitted that personal gain is the great incentive to activity.

23,630. They realise it is a very profitable industry and they want to stick to it to the last moment?—I am only taking them at their own philosophy, as they take me at mine.

23,631. Take their own balance sheets. Do not you think it is really personal interest that makes them oppose nationalisation?—I assume that from their own philosophy.

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

23,632. Has a miner ever attempted to lay it down that he is simply out to nationalise for his own selfish gain?—I think we have made that clear in all we have done in connection with that matter. Sir Adam was talking about other trade unions with members at collieries.

23,633. I was right in saying to start with that you, on behalf of the Miners' Federation, talk for 99 per cent. of underground workmen apart from officials?—I think the Miners' Federation, in determining the condition of underground workers, determined the condition for all these except the officials.

23,634. Do not you think you are here representing, on behalf of the Miners' Federation, 99 per cent. of the men that is lowered down, men and boys?—I would not like to say 99 per cent.—that our membership constitutes 99 per cent. I am not sure it is quite so high as that, but the conditions even of those who are not members with us are largely determined by the Miners' Federation.

23,635. I want to get you from there to the surface. It is on the surface that Sir Adam was making this point. Do you think you represent surface workmen of all kinds, engine men, shopmen, yard labourers and pit-head men to the extent of 99 per cent.?—I think we shall, now we include the Engine Men's Associations.

23,636. *Mr. Frank Hodges:* By the Engine Men's Federation do you mean the colliery engine men and boiler foremen?—Yes.

23,637. Are you aware that they have a membership of 25,000?—Yes.

23,638. Are you aware they have just effected an affiliation with the Miners' Federation of Great Britain?—I think I did inform Sir Arthur Duckham of that.

23,639. With that addition the representation of 75 per cent. of the surface workers would be considerably increased?—Quite. We also include the Coko Men's Association now.

23,640. In the light of that new development should I be exaggerating if I put it that the Miners' Federation of Great Britain now represents 95 per cent. of the surface workmen?—I think we probably do, though I have not the exact figures.

23,641. What do you think is the purpose of these continued assertions in reference to the declining output? Do you think the purpose is to merely give the public information, or to prove a conclusion that some people have already in the back of their minds?—I think it is to play upon the fears of the public.

23,642. In what way?—Because of the reduction in output they are going to have to pay a higher price for the coal.

23,643. Do you think that is part of a cleverly calculated scheme to prejudice in advance nationalisation?—I do not like to enter into motives at all, but that is the effect of it.

23,644. That is the effect of it?—Yes.

23,645. You have not got sufficient information to judge whether that is the motive?—No, I have not.

Mr. R. W. Cooper: That is hardly a proper question.

Mr. Frank Hodges: You can very often prove motives if you have sufficient data. As a lawyer, Mr. Cooper, you know that very well. Do you appeal to the Chairman?

Mr. R. W. Cooper: Yes, I ask the Chairman if that is a proper question.

Chairman: We can get on now.

23,646. *Mr. Frank Hodges:* You have, I take it, come to certain conclusions as to the causes of declining output, some of which you have already given in evidence?—Yes.

23,647. I have before me some figures which are official and which I will put to you. I have before me a return showing that from January to March of this year there were lost through disputes in these coalfields 2,079,000 working days in three months, and there were involved in the disputes 458,000 men, nearly half-a-million men. Would you come to the conclusion, if these figures are correct, that you have discovered a most obvious cause of the decline in output in the first three months of this year?—I think that cannot be denied; unfortunately it is true.

23,648. In addition to the disputes which those figures indicate and prove, has it been brought to your notice that there are also collieries that are not working full time through lack of trade at the present moment?—I am not aware of lack of trade, but for lack of the means of getting the coal conveyed away from the pit—lack of trucks.

23,649. Would you be surprised to learn I got letters as the Secretary of the Miners' Federation? I have had one this morning, from colliers in South Wales, in which the workmen appeal for some steps to be taken in order that they can secure regularity of employment. Would you be surprised to hear I get letters of that description?—I would be surprised to hear it.

23,650. I got them. You do not know the South Wales district very well?—I do not.

23,651. Then I will put this question to Mr. Winstone. (*To Mr. Winstone.*) Have you heard, Mr. Winstone, of the Ton Mawr Colliery in the Avon Valley?—Yes.

23,652. Are you aware that a colliery only last week lost four days for the want of wagons?—Yes.

23,653. And the men then considered themselves to be in a most serious position through the inefficient system of providing them with a regular supply of trucks?—That is so.

23,654. *Sir Adam Nimmo:* What is the size of the colliery?

Mr. Straker: I think that obtains in some pits in Lancashire.

Mr. Frank Hodges: They send a special request to me to go into it.

Mr. Evan Williams: It is a small colliery.

23,655. *Mr. Frank Hodges:* (*To Mr. Winstone.*) Do you know of any other complaints in that area that have come under your notice of men being unable to work for the want of wagons?—Generally, for some months there have been some complaint from the area down to the western part of the coalfield.

23,656. Would it surprise you to learn, Mr. Winstone, when these workmen were about to have the advance in wages under the Sankey Report, they only got just half of what certain other workmen got in collieries that were working regularly, on account of the fact that from the 9th January up to the period in April when the Sankey Award was brought out they had only worked half-time?—It would not surprise me at all.

23,657. Do you consider that in itself would show in the return when one is considering the output of the last three months?—Certainly.

23,658. When you were acting as the President of the Miners' Federation last year, do you remember the coalowners put in a statement immediately after the armistice in which they put forward figures indicating that 60,000 workmen had enlisted during the war and the South Wales Miners' Federation asked the owners how many they could at once put on in the South Wales coalfield if the war came to an end immediately?—Yes.

23,659. Do you remember the figure given?—I do not remember the figure now. They can be got.

23,660. If I said the number they said they could put on at once was 13,000, would that represent it?—I am almost positive that was the figure.

23,661. That is to say, the owners could only put 13,000 out of the 60,000 of these soldiers on in South Wales if the war came to an end on a particular day?—Yes.

23,662. Do you remember how many they said they could put on in three months' time after the cessation of hostilities?—I think it was 20,000.

23,663. The figure was roughly 20,000?—Yes.

23,664. Do you remember the number they could put on six months after the cessation of hostilities?—I am not quite sure. I rather think it was another 10,000.

23,665. The total at the end of six months came to exactly 30,000. Do you remember how many they estimated as casualties, that is to say, men who would not return?—I do not know exactly.

23,666. Would it surprise you to know it is in the neighbourhood of 7,000?—Yes.

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

23,667. That left a balance at the end of six months of 23,000 workmen for whom the owners could hold out no hope of finding work?—Yes, and by newspaper reports this morning there are 16,000 miners idle now.

23,668. I was going to put that to you.

Mr. Evan Williams: Is that in South Wales?—In the coalfield.

23,669. In the whole country?—Yes.

23,670. *Mr. Frank Hodges:* I am speaking of what you know to be an absolute fact, that at the end of six months after the end of hostilities the owners would find themselves with a balance of unemployed men numbering 23,000?—Yes.

Mr. Evan Williams: I may tell you that the figure as far as three months or six months is concerned is purely conjecture.

Mr. R. W. Cooper: The Controller has some figures.

23,671. *Mr. Frank Hodges:* I am endeavouring to get some light upon the question of the fall in output. I think it is valuable that the Commission should have this information. Do you know, Mr. Winstone, that there were collieries in South Wales which, when the armistice came about, had the full complement of men which they had before the war broke out?—Yes.

23,672. And there were still anything from 50 to 100 or 150 men belonging to that colliery who if discharged forthwith could not get work in that colliery?—Yes, that came to my knowledge in my district.

23,673. Do you know the colliery management resorted to expedients to get men into the mine who were returning even though they had not been developing sufficiently to absorb them?—Yes, and there are many collieries where the real coal-getter, the man who works at the face, works on the surface now because there is no place for him underground.

23,674. Would you agree if I put forward the proposition that the proportion of men engaged in the colliery has considerably fallen?—Yes, I should think so.

23,675. Would that be due to the fact that the areas in certain collieries have not been properly developed during the war?—Certainly, the areas have contracted naturally.

23,676. Have you, as President of the South Wales Miners' Federation, had brought to your notice the case of the Risca Colliery where men proposed to go out on strike because the mine was being improperly developed?—Yes, there is rather a serious history connected with that colliery. In July last year the men came out because of a fire. They were idle for a very long time. In the early part of this year they were out again, because of an excessive amount of gas and a shortage of timber and the ropes cutting into the rails and into the timber that was erected. Any practical man will know of the serious state of affairs that means. It is one of the largest collieries in the South Wales coalfield.

23,677. Do you know the Nine Mile Point Colliery?—Very well.

23,678. Do you remember the workmen at that colliery had to embark on a strike at one time because the management were developing the worst seams in the colliery and leaving the best seams until the market conditions became better and the control was lifted?—Yes, they urged the colliery company to develop a piece of coal which was nearer to the colliery, and admitted to be better coal, and which could not be developed because of the opposition of the royalty owner. We went to the Home Office about it and saw Sir Richard Redmayne. He promised to take steps, but I do not think anything has been done up to the present time.

23,679. As a matter of fact, the worst seams were continued to be developed and the best seams are still undeveloped in that colliery. If those are the facts a combination of those facts must have a serious effect upon output?—Certainly.

23,680. First of all, there is the fact of the overcrowding of the colliery; secondly, there is the fact of the colliery companies not having developed their mines properly during the war; and, thirdly, there is the fact of industrial disputes. I put it to you, is

there a fourth fact? Is there a certain psychology of low production being gradually developed in the men's minds in the mining industry?—I have no doubt about that.

23,681. Would you regard that as one of the most serious things everybody has to consider?—I think so.

23,682. To what do you attribute that view which some miners hold that it is right to keep their output within reasonable limits?—They are disinclined to produce wealth for other people.

23,683. Would you say this Commission, if it does not take that factor into consideration, would be missing one of the essential facts in the situation?—Yes, certainly; and there is another factor, the more they produce the more are their wages to be reduced.

23,684. Do you know as a fact that you have certain collieries in the South Wales coalfield where under the piecework system men have been able to make good wages, and immediately those wages have exceeded certain figures the prices have been cut?—Yes.

23,685. You have known of that?—Yes. There is a very serious dispute on at the present time, or it was a week or so ago.

23,686. *Mr. Evan Williams:* Where?—Ebbw Vale.

23,687. *Mr. Frank Hodges:* It involved five collieries?—Yes.

23,688. Was the Ebbw Vale Colliery idle for three months?—Yes, longer.

23,689. In fact there was somewhere in the neighbourhood of between 150,000 and 200,000 tons of coal lost?—Yes.

23,690. So much for the apparent causes of declining output. I would like to ask you, Mr. Winstone, because you are familiar with this, if you have read the coal owners' scheme for the future?—Yes.

23,691. Do you remember a reference that one of the Commissioners made to the scheme and he said it could be compared with a sliding scale?—Yes.

23,692. A sliding scale does give the workmen, does it not, a share of increased prices as well as giving the owners a share to the increased prices?—Quite.

23,693. Do you know that historically in South Wales they had a sliding scale in operation from the year 1877 to 1898?—I think it was from 1875 until 1898.

23,694. During that time there was no maximum imposed upon the workmen's wages. If prices went to the highest possible pinnacle the workmen would share to some extent in the inflated prices?—They went up to 78½ per cent., if my memory serves me correctly.

23,695. That was the highest point. Do you remember because of that system the South Wales miners engaged in a strike which lasted for six months, one of the hardest strikes in the history of the country?—Yes, that is well known.

23,696. To abolish that system?—Yes.

23,697. If the owners come forward for the future with a scheme which has the element of a sliding scale in it you would not hope that the South Wales miners would take kindly to it?—They certainly would not.

23,698. It is suggested that this is an agitation peculiar to some subterranean influence in South Wales or in the industry generally?—That is not so.

23,699. Do you know a miners' agent or a miners' leader in South Wales who has refused to subscribe, or has refused to address meetings, urging the men to accept the Miners' Bill as it is presented as being for the time being the most scientific plan of dealing with the industry?—Not one, and all our work is done in the open, even in the open air, so that anyone can come to the meetings; even Mr. Williams, if he cares to.

23,700. The suggestion that this agitation was caused by a few discontented miners you would not treat seriously?—It is the well thought out and the well defined policy of the members of the Miners' Federation.

23,701. Can you take your mind back to the year 1904?—Yes.

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

23,702. Do you remember the Annual Conference Resolution of the year 1904?—No, I would not tax my memory.

23,703. I do not want to put it in evidence. There is a volume of our proceedings for the year 1904. Our annual conference was called specifically to consider the question of the nationalisation of the mines?—Yes.

23,704. Have you read that?—Yes. May I say the collieries to which I have referred as being idle are some of the largest collieries in the South Wales coalfield, and they are therefore of much more importance because of the loss of output.

23,705. That reminds me, Mr. Winstone, of a very significant event that occurred during the war. Do you know that owing to the differentiation in the work obtained by the collieries in South Wales during the war they had to set up an entirely new scheme to allocate the trade?—Yes, a joint scheme.

23,706. On that Joint Allocation Committee were representatives of the Miners' Federation?—Yes.

23,707. Did they not have the task set them of providing uniformity of employment for the men in the coalfield?—Yes.

23,708. Did they not have to make arrangements for collieries who were only working one day a week to work four days a week, and those that were working six days a week to work less?—That was the general policy, yes.

23,709. Is it true to say the South Wales Miners' Federation has had as it were a taste of effective control in the allocation of trade?—Yes.

Mr. Evan Williams: None of our schemes were put into effect because a rapid change came over it.

Mr. Frank Hodges: The scheme operated for quite a time and the basis of the scheme determined the trade of the collieries for a long time, and you and I were on the committee.

23,710. Mr. Evan Williams: You gave us valuable information, but it was not put into operation?—Returns were put forward showing what had been done.

23,711. Mr. Frank Hodges: Do you remember the different classes of coal produced? Do you remember the coal owners said such a scheme was impracticable?—Yes.

23,712. The buyers would buy the best class of coal and leave the worst class?—Yes.

23,713. And therefore the collieries producing the worst class would not work regularly?—Yes.

23,714. Do you remember the collieries producing the worst class worked regularly after that came into operation?—Yes, very regularly.

23,715. I would like to ask Mr. Straker one or two questions. (To Mr. Straker.) With regard to the financial proposition, Sir Adam questioned you yesterday about the 12s. and 10s. purchase price which you have in the Bill. Have you read Dr. Stamp's evidence before this Commission?—Part of it.

23,716. It is available for you to read the whole of it?—Yes.

23,717. Do you remember reading the portion dealing with the actual capital in the industry at the present time?—I think he stated £135,000,000.

23,718. That includes the royalties, I think. He says on page 35: "It was estimated for the census on production at £128,000,000." Then, later, when it was estimated for, as he described it, the capital, he said: "The capital here is what you would call the excess profits duty capital, that is to say the hard money at stake." Then he says: "The average for the five years is £0.51. That is just about 10s., so it will be seen that that estimate which has been used from time to time of 10s. a ton was very closely borne out by the balance sheets that I was able to have examined."

Mr. R. W. Cooper: That is capital employed as defined by the Finance Act.

23,719. Mr. Frank Hodges: "On the output of the five years before the war the capital would therefore be about £135,000,000. Suppose we were to regard 5 per cent. as a minimum return thereon, there would be a charge of £6,750,000 out of the £13,000,000 to £14,000,000 that has been referred to as the profit of the coalowners, leaving £7,250,000 as the profit

over and above that minimum return." If that estimate was taken as the basis, would you still agree that 10s. per ton and 12s. per ton would be fair in accordance with the estimates of impartial persons?—Taking the largest output we have had, I think that was in 1913, it was 283,000,000 tons, if I remember correctly.

23,720. Mr. R. W. Cooper: 287,000,000 tons?—£135,000,000 given by Dr. Stamp works out on an average at about 9s. 6d. per ton. With an average of 9s. 6d. I think the limit or the scale we adopt of 12s. and 10s. is ample—you must have some below and some above—because with an average we think that always a sufficient scale to meet all cases.

23,721. Mr. Frank Hodges: It is suggested that this money or this value should be acquired by the issue of Government Stock. Have you considered what percentage that stock would bear?—I think the Bill makes provision that it shall carry as near as possible something like the nearest equivalent stock. If you take War Loan it would only be 5 per cent.

23,722. In the Federation Scheme, under the Bill, you have put forward if the stock was issued at 5 per cent. the coalowners who hold the stock would get until that stock was redeemed 6½ million pounds per annum?—That is so.

23,723. Do you consider that the industry of this country if it has to provide for future improvements and if it has to endeavour to keep the price of coal down for the community can afford indefinitely to pay owners of stock 6½ million pounds per annum?—We do not propose to pay it indefinitely. We propose to establish a sinking fund to redeem the stock.

23,724. How do you propose to establish the sinking fund?—Out of the industry.

23,725. Would you rather not say that should be a charge for the whole country?—Quite, but the country would then own the mining industry.

23,726. You appreciate the difference. If the industry itself is to bear out of profits that it might make the payment of this annual sum of 6½ million pounds and out of the profits it has to provide its own sinking fund for redemption of capital, do not you think that is putting the owner in a favourable position as compared with the men who have to work in the industry in the future and the community?—I think it is a favourable position, because they will get that return on their capital without any risk or trouble at all. I think, if you take Professor Merrivale's figure in that pocket-book which I handed in, you will find that he calculated at that time the average gross return in the coal industry was only 5 per cent. Since that time I think it went up to 10 per cent.

23,727. Do you not think if these become the terms the Miners' Federation may be criticised by the rest of the labour movement for offering too generous terms for the acquisition of this property?—I think we are offering generous terms.

23,728. Do not you think the Miners' Federation would be subject to criticism by the rest of the working classes of this country?—They may be. I could not answer that question.

23,729. Mr. R. W. Cooper: I do not mean to ask you anything on what Mr. Hodges has asked you. With regard to the book you handed in yesterday, which appeared to be the authority upon which you were basing your maximum of 10s. a ton, may I call attention to the fact that the figures referred to in the book refer to capital invested? Let me read what it says: "Taking this figure 9s. per ton, the capital invested in the Northumberland collieries"—that is the expression throughout?—Yes.

23,730. The question I asked you about was fair selling value?—Yes, I remember you and I differed as to what was fair.

23,731. I suppose you agree with me there is a great difference between capital invested and fair selling value. Will you answer that "Yes" or "No"?—I am afraid you cannot get an answer to a question of that kind "Yes" or "No," or to all these questions.

23,732. Surely?—No.

23,733. Let me illustrate it. If you and I put up £100,000 and employed it in opening up a coalfield

29 May, 1919.]

MR. WILLIAM STRAKER—MR. JAMES WINSTONE.

[Continued.]

and sinking a pit, that is the capital we have invested. If the pit, after it had been equipped by us with our £100,000 was put upon the open market for sale and if it fetched £200,000, that is the selling value?—Yes. I would not say that was fair.

23,734. Take the contrary case. It might be, of course, that what you and I spent £100,000 upon would only fetch £50,000 in the market?—In buying and selling in that form you suggest there is always the speculation as to how much they can exploit the workers and the community.

23,735. I am talking about the selling value of anything. The selling value is what the article will fetch in the open market, is it not?—That is so.

23,736. *Mr. Robert Smillie*: Have you heard any complaints from the Ashington Colliery as to men not being able to get away their output?—At many of our pits.

23,737. Has there been a complaint from Ashington that it is quite impossible to take away the output from the mine?—That is so. We have had worse cases than even Ashington.

23,738. I do not know whether it is correct but it has been put to me that it is only possible to take away the output of about two-thirds of the number of men employed?—I have one pit in my mind where the men declared they were getting only half away what they could produce.

23,739. It is not possible they get the fullest output where 1,300 men may be employed underground and it is only possible to take away 800 men's output. That reduces the output of the men employed?—That is where the overcrowding comes in.

23,740. That there is such a case as that I mean?—Yes.

23,741. Do you know whether the price of export coal and bunker coal is still governed by the Coal Controller?—I understand from what I see in the press that bunker coal is not controlled in the way that it has been, at least, of the prices having gone up enormously.

23,742. Do you know what the result of the withdrawal of the price of bunker coal would be?—It had gone up from 31s. 6d. to 60s. and from 34s. 6d. to 70s. and that in 2 or 3 days.

23,743. That is because of the control being removed?—Yes.

23,744. Is there any reason why the same thing should not take place with regard to coal consumed at home if the control was withdrawn?—I have already asked the question of consumers as to what they think they would have been paying if there had been no control. The fact is there cannot be any question they would have been paying as much as neutrals have been paying.

23,745. The coal at the present time to local consumers, to manufacturers and householders is supposed to be controlled up to a point beyond which it must not go?—Yes.

23,746. If that were withdrawn have you any reason to believe that the price of coal for household consumption and also manufacturers might not go up 10s. or 15s. a ton?—I expect it would be nearly doubled.

23,747. Providing it was merely left to competition?—Yes, provided it was left to competition.

23,748. You have never known colliery owners voluntarily selling coal at a less price than they could secure?—No, I have not.

23,749. Have you been surprised during your long negotiations in the coal trade with regard to wages and other questions how little of the human element has come into the negotiations so far as the mine owners generally are concerned?—It reminds me of a case where a fine old man wanted to be relieved from going to work on a Sunday evening because he

wanted to go to church, but the manager at that time told him his religion was to get the pit to work.

23,750. That has been about the position of the religion forced upon our miners by our beautiful system of working the mines in this country?—Most decidedly.

23,751. Is it the case the miners have been anxious to introduce something of the human element into the relationship between coal-getters and coal consumers?—If it were recognised the men are more than machines, it would be better.

23,752. They will have to recognise that?—By the spirit expressed by them at the present time they will only do that as far as compelled.

23,753. I do not expect the coal owners will do it, but the nation will do it?—Yes.

23,754. Have you, in your experience as a member of the executive of the Miners' Federation of Great Britain, known of any discussion which has taken place or resolution passed advising the workmen individually or collectively to restrict their output?—Rather the opposite. I can remember when I was a young man the policy of restriction was very much advocated, but in the matter of 30 or 35 years now I know of no miners' agent who has not condemned that policy.

23,755. You are at present giving evidence upon oath. I would like to put it to you, do you feel there is an attempt at the present time being made in the district by the workmen themselves to reduce output?—I can only speak with regard to that so far as my own district is concerned, and there is not.

23,756. I suppose Mr. Winstone will reply to the same question. (*To Mr. Winstone.*) In the same way as far as South Wales is concerned, there has been no deliberate organised attempt to reduce output?—No, not organised.

23,757. It has been suggested, and resented by Mr. Cooper and some of his friends, that efforts are being made to advertise to the country at the present time the calamity likely to take place if the mines are nationalised. Do you think there is an attempt being made by the owners of the mines and minerals to frighten the country?—I say all sorts of men, including novelists and journalists of all kinds, are writing articles for nearly all the papers in the country condemning nationalisation, so I assume there is a well organised campaign going on.

23,758. Did you read the report in the newspaper the other day of a meeting of shareholders of a very large South Wales company, the Cambria Company?—I do not think I saw it.

23,759. Are you aware, Mr. Winstone, there was a meeting?—Yes.

23,760. Are you aware the chairman made what was said to be an interesting speech?—Yes, it appeared in the "Times."

Sir L. Chiozza Money: And paid for.

23,761. *Mr. Robert Smillie*: Are you aware speeches were directed against nationalisation and in favour of all control being taken off the mines?—That is my deduction.

23,762. Did he not say that control, or the Sankey Award, had cost the company 40 per cent. in dividends?—40 per cent. of excess profits.

23,763. Do you know whether or not that was an advertisement paid for by somebody?—It had all the appearance of such. I am not prepared to say definitely.

23,764. You could not prove it?—No.

23,765. Do you know the general feeling amongst miners is it was an advertisement?—I could not say that definitely.

Chairman: We are much obliged to you, Mr. Straker, and Mr. Winstone.

(*The Witnesses withdrew.*)

(*Adjourned for a short time.*)

29 May, 1919.]

MR. JOSEPH SHAW.

[Continued.]

Mr. JOSEPH SHAW, Sworn and Examined.

23,766. *Chairman*: I believe you have been appointed by the members of the Incorporated South Wales and Monmouthshire Coal Freighters' Association to give evidence on their behalf?—Yes.

23,767. I think you are a past Chairman of that Association and you are Chairman of the Powell Duffryn Steam Coal Company, Limited, Chairman of the Bedwas Navigation Colliery Company, Limited, Chairman of the Chislet Colliery Company, Limited, and Chairman of the Normandy Shipping Company, Limited?—Yes.

23,768. Your *précis* says that the Freighters' Association is composed of colliery owners and coal exporters, having a combined output of 19,000,000 tons per annum, and employing about 85,000 men?—Yes.

23,769. And the Powell Duffryn Company have an output of nearly 4,000,000 tons per annum, employing over 18,000 men?—Yes.

23,770. I am going to ask Mr. Frank Hodges to cross-examine you on behalf of the Commissioners on my left and Mr. Evan Williams on behalf of the Commissioners on my right, and I will ask you now to be good enough to read your *précis* and to make such remarks as you desire to make from time to time as you go through it?—I am much obliged. I just might mention that Mr. Evan Williams raised the question about the figure of 18,000 men. Those 18,000 men are not all colliers as you will find out as I go on. We have all sorts of various works and those men are the total number of the men we employ. Then, of course, at Bedwas and other places I have mentioned, we have other men. That figure of 18,000 only applies to the Powell Duffryn Company.

Now, first of all, on the question of production:

"Under private enterprise, the coal output for the United Kingdom has expanded very rapidly during the last 40 years, and the following table gives the output of the whole country.

COAL OUTPUT.

Year.	United Kingdom.	South Wales.
1873	128,680,131	16,180,728
1883	163,737,327	24,975,433
1893	164,325,795	30,154,739
1903	230,334,469	42,154,191
1913	237,430,473	56,830,072

Percentage of increase in 40 years } over 123 per cent. over 250 per cent.

The number of persons employed during the same period has been as follows:—

NUMBER OF PERSONS EMPLOYED.

Year.	United Kingdom.	South Wales.
1873	489,085	
1883	492,422	80,697
1893	663,385	124,655
1903	834,766	159,161
1913	1,118,452	233,134 "

The reason I put these tables in is this. I want to show that private enterprise has not been, as has been suggested, standing still. We have put our best leg foremost and everyone knows what we have done in South Wales. We have put our best leg foremost and have taken every opportunity to press on the trade.

Now there were certain questions mentioned I think in the first part of your enquiry about the Powell Duffryn Company, so that I thought I would like to make a personal explanation about that company. My *précis* says: "The Powell Duffryn Company, which originated in 1864, had a chequered career for many years, and for the 15 years 1873 to 1888 was unable to pay any cash dividend." I will put a table in here to explain the whole thing. It will shorten matters to put the tables in because it will explain the whole matter. First of all, I will put in tables 1 and 2.* (Same handed.) Table 1 shortly shows what it says at the head: "Rates of dividend paid on ordinary shares in respect of 40

years ending 31st December, 1913." I ought to mention here that although, of course, we have been carrying on for the last five years, I have not carried it any further because we were on the pre-war standards, but I can give figures, if you like, as to the amount which was divided during these five years. The second table simply shows the amount of capital expended in sinking new pits during the 20 years ending 31st December, 1918. I took this out to 1918, but of course latterly during the war we have not been able to spend much capital, as we have not had the men.

23,771. *Mr. Robert Smillie*: May I ask on whose behalf the evidence is given?

Witness: The Freighters' Association.

23,772. *Chairman*: Taking that table shortly, that shows the total amount of capital expenditure cost in sinking new pits, erecting new coke ovens and washeries during the 20 years ending 31st December, 1918, as £731,000?—Yes, that is to show what we were doing. My company was attacked by some gentleman here on the ground that we were making enormous profits. I want to point out that we were not making enormous profits, and if you look at that table there you will see what we did. During those years we were down until we got into 1907. For the first years we were nursing the concern. It was an absolutely bankrupt concern in 1888, and so far bankrupt that I advised the directors at that time, when I joined the Board, that we ought to wind it up.

23,773. *Mr. Robert Smillie*: Sir, may I ask you again with regard to this witness's evidence? The colliery owners have called their witnesses and finished with them. (To the Witness.) You are supposed to come here to represent the freighters?—I think, with the Chairman's permission, that I have a right to protect my company when accusations are made against it.

Mr. Robert Smillie: Certainly.

23,774. *Chairman*: Yes. Now will you take your *précis* quite shortly?—Yes. You will see that our output would have been up to 5,000,000 tons now if it had not been for the war, and we hope to get it this year to 4½ million tons. Then this is a point upon which I am bound to protect myself. My *précis* says: "In 1890 the area of this company's properties was 7,500 acres, to-day it is 21,500 acres." I want to point out that we and a good many of the collieries in South Wales own freeholds which, I understand from what we have heard yesterday afternoon and this morning, we are not going to get any compensation for if the proposal of the Miners' Federation is carried out; that is, we are absolutely to be deprived of what we gave hard cash for. I think so far as I can make out from my books, the cost of those freeholds to the Powell Duffryn Company was about £60,000.

Then with regard to the wages we have paid, I have a table which shows that we paid £30,000,000 in wages, and the amount of cash we paid to the shareholders was £2,470,000. I have the details of that if anyone wants it.

With regard to electricity, Mr. Hann has given evidence about electricity, and I do not know that there is any necessity for me to go into it except that I do not think Mr. Hann told you that we have a most absolutely interlocked concern. I mean we have our coke ovens, we have our by-product plants and distillation plants, and brick and pipe works. It is a very composite concern, and when you are dealing with a matter like nationalisation, or any other taking away of other people's property, if I may say so, we have a very complicated question to deal with.

23,775. *Chairman*: We have all come to that conclusion.

Witness: And it will be more complicated when I go to the export and transport question. Then I think there is an accusation made by Mr. Merz, who I do not think quite understood it. With regard to the great question of coke ovens, I think he said that we do not put up enough coke ovens, and that

* See Appendix 71.

29 May, 1919.]

MR. JOSEPH SHAW.

[Continued.]

we are not sufficiently up-to-date in coke ovens. It is a question in this country of steel works. We find coke is a very difficult thing to export, especially in South Wales, because export coke is nearly all sent out in part cargoes, and you cannot send it to a place that does not want Welsh steam coal. Therefore we are largely dependent for the sale of our coke upon the steel works. I do not know if Mr. Merz is going to put up these large electric stations all over the country, and depend upon the gas to run them. We have big gas plants as well, and we were one of the first to use gas engines on a large scale. We have these things running, and we can use the gas, but if we cannot sell our coke it is no use trying to put up coke ovens. You will have the country full of coke until you educate the people, or until we can grind up the coke and turn them into *brique*, as they call them in French, or bricks.

23,776. *Sir Leo Chiozza Money*: Does it occur to you that under a Ministry of Mines you could educate the people very much more than you can do it as a private individual?—I do not think so. I am perfectly certain I can educate people better than most people.

23,777. *Chairman*: Now will you go to the question of housing?—There has been a great deal said about housing. I have myself, personally, taken a very great interest in housing in South Wales, and I have brought with me original plans which I must have back. (*Producing plans.*)

23,778. *Chairman*: Yes?—There are two sets of houses, ones we were building in 1904, and ones we were building, or getting built, which is a better term, just before the war. I will hand you the plans, and you will see there are three classes of houses there. I do not want to go into them.

23,779. *Chairman*: Will you hand them to Mr. Frank Hodges, who will ask you some questions about that?—Yes. Mr. Hodges will let me have them back?

23,780. *Mr. Frank Hodges*: Yes, certainly.

Witness: They are signed on behalf of Lord Tredegar, who has to pass these, so that the landlords are looking after the housing as well as myself. These were others we were doing just before the war. (*Producing further plans.*) I am sorry to say that now I have a problem before me that I do not like to face very much, but I want 3,000 more houses built almost immediately, and those houses which cost in the neighbourhood of £200 to £250 in the time of peace will not cost £450 to £500. I have a table showing the amount of money we spent. If I take the round figure we spent £250,000 in houses ourselves and we have subscribed to other people (I have the details) £100,000.

There is just one thing I should like to mention with regard to safety. We have taken a great deal of trouble and expense in looking after the safety of the men and we are always making experiments. I will give you one instance with regard to stone dust. It was very necessary to find the right kind of stone dust to use. We have made many experiments down our shafting to find the right stone to use. Mr. Budge, who carried out that experiments, read a paper for which I think he got the Lewis Medal at the Institute of Engineers in Cardiff. Anything we discover is open to all the other colliery people to have.

23,781. *Sir L. Chiozza Money*: Do they adopt them?—Yes.

23,782. All of them?—I do not know. There may be some who do not. I cannot tell you every colliery in the district.

23,783. I only asked you, and you say you cannot tell me. If you do not know you will tell me you do not know?—We always do, and if anyone discovers anything I am after it.

23,784. You will not resent my asking a question?—No. May I interject this? It may be said that I have been fairly successful at Powell Duffryn.

23,785. *Chairman*: It will be said?—And I tell you I have been very unsuccessful in various other concerns in coal.

23,786. I am sure that is not your fault?—But these things are not taken into consideration when you are discussing the prosperous ones. For instance,

there are the Windsor, Freystrop and Billingsley mines, where I have dropped all the money I had in them.

23,787. *Sir L. Chiozza Money*: Is the coal industry like the building industry; does it live on its losses?—No, but a great many of these places have to be shut up after five years. The men have had their wages and we people suffer. I want to point out that it is a very speculative trade, and I do not think it is a trade in which to speculate with the taxpayers' money.

23,788. *Chairman*: Now will you go to transport?—With regard to transport, I say in my *précis*:—

"The collieries in South Wales and Monmouthshire are nearly all situate in narrow valleys, and there is consequently very little room for siding accommodation near the pit head. The great bulk of output in South Wales is exported to foreign countries, and the shipment trade plays a most important part in the trade of the district."

I have a table, No. 9, showing this, which I will put in.* (*Handed.*)

"No coal is stocked at the pit head and the smooth and regular working of the collieries is governed to a great extent by a regular supply of wagons, which are quickly taken to the port of shipment, the coal tipped into a waiting steamer and the wagons returned as quickly as possible to the pit head. There is, in fact, an endless chain of loaded wagons going to the port, and empties returning from the port to the pit."

This is a most important thing which we have to do, and the whole of the handling is a most delicate thing from the pit to the port. As you know, ships are stemmed to arrive, and sometimes when they arrive the first thing is they have to go into dry dock. Before they are stemmed we have to prepare a certain amount of coal which has to go to the dock, and we do not always know which dock they are going to. We have four docks in South Wales—Newport, Cardiff, Penarth and Barry. They have no sidings, which makes it very much more difficult. Speaking personally, in South Wales the Powell Duffryn Company are much better provided with sidings than anyone else.

23,789. *Chairman*: Is that at Bargoed?—We have two great groups of sidings, one the Middle Duffryn, and the other the Bargoed, and down the Rhymney Valley, so that we have more room than most people, and that saves a certain amount of wagons, because I can hold a certain amount of coal at the colliery, and there is enough coal at the docks as soon as the ship gets under the tip, and then I can feed her with the coal in our sidings. The question is that we must be in touch from the colliery and the Cardiff end, and know exactly where our wagons are, and how they are running and how the ship is.

23,790. Are you in favour of pooling wagons?—I am dead against it. I will tell you why, and it is for this reason. I have been fighting the pooling of wagons, and I must say the Railway Executive have been very good about it, because they have left me our wagons in South Wales during the war, except a few the Coal Controller deprived me of, and which I cannot get paid for, and as to which no one knew where they had gone. We had orders to send away wagons to the Moira colliery and some Leicestershire colliery. They were 50 wagons. We got indignant letters from the Moira colliery to say they did not want them, and did not know who sent them there. That shows some of the difficulties of these things. We do not approve in South Wales of the pooling of wagons, because we must be in touch and have control of these wagons in our own hands. Whoever owns the wagons of the country, we will have to have the same number of wagons allocated to us and handle them in the same way, or the trade will come to a standstill.

23,791. Are you in favour of having the whole trade from pit to port in one hand?—No, it is too big. There is a limit to the man who can manage it. If you get beyond the unit of management, you get complications, and you get too many committees overlapping each other.

23,792. *Sir L. Chiozza Money*: You do not think the pooling of wagons in Germany interfered with

* See Appendix 71.

29 May, 1919.]

MR. JOSEPH SHAW.

[Continued.]

the efficiency of their export trade, do you? They were efficient in spite of the fact that they pooled wagons, although it was a foolish thing to do?—The Prussian State Railways have laid themselves out a good deal to assist the export trade. I have been out in Westphalia and know it very well, and I have been in Germany very often, but absolutely the language of the German coalowners about the State handling of the trucks has been indescribable. I have seen collieries in Germany and works standing idle, because the German State Railways had not wagons to give them. In 1913 the Prussian State admitted they would have to spend £3,000,000 at once and £20,000,000 in all to provide proper facilities for the trade. I should like to point out with regard to wagons, while I am on the point, that not 2 per cent. of the Powell Duffryn wagons go inland. They are all shuttled down from the colliery to the port and back; it is simply a shuttle business. I say in my *précis*:—

“The whole coal trade of South Wales is governed by the word ‘despatch,’ and in our own case we have loaded as much as 10,000 tons into one steamer in 36 hours and 48 hours including bunkers. It is the excellence of the management which keeps our collieries fully employed, and in proof of this I may say in the 20 years prior to the war, in spite of our enormous output, the demurrage paid by us only averaged £480 per annum. In some years our collieries have not been idle for one day in consequence of lack of wagons or tonnage.”

You see the great difficulty we have is to try and feed the ships so as to avoid demurrage, and at the same time to keep the collieries always working. It is a very difficult position and requires very delicate handling and constant and sympathetic touch between all the departments.

23,793. *Chairman*: Do you think the nation would be able to do what you are able to do?—You would have everything stopped if you had to go through the routine of all these Government officials which we have had lately. We are only able to carry on by patience and perseverance. Everyone knows when you get a lot of these committees it always means want of responsibility, and you must have people in touch with each other who will take responsibility.

23,794. Now will you deal with exports?—My *précis* says: “The exports from the United Kingdom and South Wales have increased as follows:—

EXPORT OF COAL (INCLUDING COKE AND PATENT FUEL).

Year.	United Kingdom.	South Wales.
1873	16,076,628	3,499,000
1883	29,439,891	8,299,000
1893	37,488,070	13,235,000
1903	63,605,349	20,926,000
1913	98,338,104	31,952,000

This shows an increase of nearly 10 times in South Wales, in the 40 years.

The export trade has been built up by private enterprise, and it is owing to the colliery companies and exporters having developed and pushed Welsh coal abroad, that such a magnificent export trade has been built up; the close co-operation, and give-and-take, between colliery owners and coal exporters has been an immense benefit to the whole industry.” What I mean about that is this. You cannot carry on export business unless you can absolutely be in close touch with your exporters. I am to a certain extent an exporter myself. We sell a tremendous lot of our coal free on board to exporters. It is one of the most difficult things unless you are in absolute constant touch, and have men who are able to take responsibility and be able to say to the exporter if he is in difficulties, “I will give you this. I can make an arrangement. We will either ‘marry’ your contract”—you know the expression—“or give you a rebate to enable you to carry on your business.” It is all that kind of thing which must be done by private enterprise, and it cannot be done by the State. You will see I say, “At one time the Powell Duffryn Company from very small beginnings, have built up a big French trade, and are to-day doing, probably, one of the largest businesses in France of any colliery company in this country. At one period

the Powell Duffryn Company exported largely to India, but gradually this market was lost owing to competition from Indian coal. The Company at once set about finding other markets, and as an instance they sent representatives out to the Argentine and developed an important business with the South American ports.”

I have Table No. 16 with regard to that, and that shows what the Bombay trade was.* (*Producing table*.)

23,795. *Sir L. Chiozza Money*: Nevertheless, our total exports increased in spite of the loss of this trade?—I will explain that if you will cross-examine me about it presently. That has entirely to do with the Admiralty. So far as the South Wales export trade to Bombay is concerned in private ships, we did not send a ton last year. I am only putting the facts. Then I say:

“It has been the experience of the South Wales Coal Trade that when a market has been threatened with competition, which it is impossible for this country to successfully contend against, the trade has shown sufficient enterprise, under private management, to find other markets in other quarters of the globe. The South Wales coal trade has to face serious competition in all parts of the world.”

I put in two tables, Nos. 10 and 11, from which you will see the figures of the competition.* (*Same produced*.) “In the Baltic countries, in France, Belgium and Italy, there is competition from German and American coals.” You have those on the tables. Then there is another competition which, since I had those tables prepared, I have found out about. I knew it before, but I missed it in the tables. It is South Africa (Durban and Delagoa Bay) which are now shipping coal up to Aden and Bombay. They are sending coal now at a good deal lower price than we can do it. They have cut us clean out of Aden, and they are coming close to Alexandria, which is one of our ports to export to. They are doing it exceedingly well. In Delagoa Bay I know of two ships of 6,000 tons each loaded in 20 hours. They have very fine appliances. I think Mr. Herbert Smith raised the question about export coal being carried at lower rates on the railways. In South Africa they allow on export coal 11s. a ton.

23,796. *Mr. Herbert Williams*: Is that a rebate on the railway rate?—Yes, a rebate on the railway rate. Naturally, as you know, train loads for export are much easier to handle on a railway than one truck load going down to a coal merchant. Then I say in my *précis*:

“German coal mines have been untouched by the war, whilst the United States has, since 1914, enormously increased its coal output. Their figures are as follows:—

OUTPUT OF COAL IN UNITED STATES AMERICA, 1911 to 1918.

	Short Tons.
1911	496,000,000
1912	534,000,000
1913	570,000,000
1914	513,000,000
1915	531,000,000
1916	590,000,000
1917	651,000,000
1918	685,000,000

The United States coal had, before the war, been obtaining a footing in our principal European markets, and this position has materially been strengthened since 1914.”

I have two tables dealing with that, Nos. 14 and 15, which I will put in.* (*Same produced*.)

“Our markets in the Far East have been practically lost to us through the competition of Indian, Japanese and Australia coal. As a result of private enterprise the export of coal has increased enormously with great advantage to the whole nation, particularly when one considers the question of imports. Coal to the East Coast of South America forms the outward freight which cheapens the cost of bringing wheat and maize to this country.”

I put in a table comparing the amount of coal going out to South America and the amount of corn

* See Appendix 71.

29 May, 1919.]

MR. JOSEPH SHAW.

[Continued.]

in money value coming back to this country. That is Table 12.* (*Same produced.*) That includes the freight. In dealing with the values there, the values of the coal are free on board at Cardiff, Barry and Newport. The value of the corn is as landed at Liverpool or whatever the port is, so that it includes the freight back, but does not include freight out on the coal. Then with regard to coal to Spain and France, the case is similar. That is Table 13.* (*Same produced.*) "Coal to Spain and France helps to pay the return freight on iron ore and pig-wood." It is the same kind of comparison showing the outward freight with the coal bringing the ore and the pig-wood back to England. Then I say:

"I put in a table showing the value of the total coal exports in this country for the 10 years prior to the war, taken from the Board of Trade Returns:—

VALUES OF COAL, COKE AND PATENT FUEL EXPORTED FROM UNITED KINGDOM 1904-1913.

	£
1904	26,862,386
1905	26,061,120
1906	31,504,291
1907	42,118,994
1908	41,615,923
1909	37,129,978
1910	37,813,360
1911	38,447,354
1912	42,584,454
1913	53,659,660

The grain and flour imported into the United Kingdom in 1913 cost this country £85,500,000, including freights."

That is freights coming back and not going out.

"It will be seen that the amount we received for our exported coal in 1913 paid for nearly two-thirds of the whole of the grain and flour, including freights, imported into the United Kingdom in that year.

Contracts for South Wales coal are usually made in the Autumn of each year, and colliery owners, in settling their prices, have to keep in touch with markets all over the world."

Not only that, but a great number of us in South Wales have what we call a Department. We joined this to save expense, and that department collects information all over the world, so that we can ascertain rapidly what the freights are likely to be and where the incoming market is likely to be—that is one thing we always have to look to, to see where there is going to be a good corn harvest, for instance. If there is a good corn harvest in South America, we know what price we can ask for the coal.

23,797. *Chairman*: Do you think it would be a good thing for the whole of the kingdom to adopt that?—It does not apply to the whole of the kingdom; South Wales is rather by itself. I see Mr. R. W. Cooper there. We are a little bit in competition with Mr. R. W. Cooper sometimes, and I do not want to let him have all the information we have about our secret trade.

23,798. *Mr. R. H. Tawney*: Would it not be an advantage to the public to know these things?—I do not know that it would matter 2d. to the public.

23,799. It does not matter to the public whether you or Mr. Cooper do the job; either would do it excellently?—It is a very curious thing that previously to the war—which has upset everything, and we do not know where we are—a good many years ago there used to be a half-crown difference between Mr. R. W. Cooper and me, and if the freights went wrong and we charged more than half-a-crown for our coal, the ships would go up to Newcastle.

23,800. *Chairman*: Do you think the result of competition between you and Mr. R. W. Cooper is that the coal industry generally does not get the price it ought to get for the export coal?—We do not think that. We get the very highest price we can and keep the collieries going. You may take that for certain and so does Mr. R. W. Cooper, but we have difficulties sometimes in ships leaving us for some reason or other.

23,801. *Mr. Arthur Balfour*: And do you think if the mines were nationalised and our Government was selling coal to other Governments, they would get a lower price than you do?—I cannot imagine it; it is beyond me. I think if you nationalise, you will have no export trade at all.

23,802. *Sir L. Chiozza Money*: That is very simple?—Yes, and you will shut up all the South Wales collieries.

23,803. *Chairman*: Now, will you proceed with your proof?—Yes. "The members of my Association are seriously concerned at the prospect of nationalisation, and are of the opinion that if the British Government is to become a trader in all parts of the world and maintain offices and agencies in each of the 600 foreign ports to which British coal is shipped, nothing but disaster can follow. In a business so complex as to the opening and holding of foreign markets, often demanding elaborate arrangement and investment in foreign coal consuming industries, no Government can hope to compete with the individuals who control the export trade in American and German coal. I have been to Germany on various occasions, and am of opinion that the State-owned mines of Germany are not so successfully managed as those under private ownership."

I know the old Hibernia and Shamrock. That was bought by the Prussian Government, and I will tell you the reason why it was given that name. That was the first colliery ever sunk in Germany, and it was sunk by a fellow countryman of mine, Mulvaney by name. I know those collieries, and I have been over them all. They were a profitable concern before they were bought by the Prussian State, and I know that they have managed to turn that property into a loss because I have seen the accounts. I do not know, after what I have said, whether it is worth while to put in the pamphlet. It was a pamphlet that was got out for the Coal Owners' Association of South Wales compiled largely from newspaper cuttings. On page 11 you will see a summary of the thing where it states that the German State Mines are not so profitable.

23,804. *Sir L. Chiozza Money*: You would not ask us to believe that what a German journalist writes is any more true than that statement that the telephones are absolutely bankrupt?—I have been out in Germany, and for years I used to see the Hibernia's accounts. I know what profits they used to make, and I have read all the various figures from the various accounts about carrying on that trade. Just at the present moment it is very hard to get figures from Germany, but I know for a fact that those collieries were turned into a loss.

23,805. *Chairman*: Now the last sentence of your *précis* is: "I am of opinion that nothing but disaster can follow the placing of the mines under Government control, and that no interference with private ownership, which has been so successful in the past, should take place with regard to such an important key industry as the coal trade."

Witness: What I mean by that is this: People like myself and Boards of Directors go into a speculative concern, and we ask people to subscribe. If they are satisfied with me, and that I am a fairly sound man to back up, they will come in; the only change that we are speaking about now is that individuals will have to work the coal trade just as before, but they would not have the same initiative. Now what they are asking you to do is not to ask people to put money voluntarily into a risky concern, but nationalisation means that you are going to let people who have not the same interest that I have gamble with the taxpayers' money. Nationalisation means this—that you are going to let people whose name would not get a brass farthing in the City gamble with the taxpayers' money.

23,806. Do you think any change is desirable at the present time?—There is always some change that would be very desirable.

23,807. What change is desirable?—With regard to the question about wages, I am not at all sure that we have not been going on a very wrong system of wages, that is, putting wages solely on the question of price, because that has rather encouraged the men

* See Appendix 71.

29 May, 1919.]

MR. JOSEPH SHAW.

[Continued.]

to stint the output, because their idea was that they could keep the output down. I have known this fact happen: they thought the price would rise, and, therefore, their wages would rise. What we want is to get output up and any form or shape of arrangement which could come about by which the men could be paid on their exertions, that is, if they put more coal out they should get more money, would be better. They should be paid by exertions and not by price altogether, although, of course, price would have to come in.

23,808. You tell us that that is your view of what ought to happen. Have you any idea as to how it should happen?—Once you get the principle adopted, it is for people sitting round a table to find the details of it, and it is very easy to work when you get both sides together.

23,809. There is a good deal of unrest at present in South Wales?—Yes. Do I not know it! Bedwas was mentioned this morning by somebody; I happen to be chairman of the Bedwas Colliery. There we have had an irritation striko going on.

23,810. What do you think the cause of that unrest is?—There are two men down there at that colliery—I do not mind telling Mr. Hodges, there is the check weigher and a man called Watkins. He said, "I am not of the Independent Labour Party; I am a Bolshevik: I am a pure revolutionary." He is fighting the Executive at the moment, and that is the trouble. I do not know whether he wants to get Mr. Hubert Jenkins's place or not; but as soon as over we get that colliery going and begin to get it right again, they come out on some excuse or another; now it is a safety striko, because we introduced a method that is working all over England perfectly safely.

23,811. That is a very unfortunate state of things. You have told me what you think the cause is; now, what is the remedy?—The remedy is the usual rough and tumble remedy—either a strike or a lockout.

23,812. *Mr. Frank Hodges*: I think you are adopting that last remedy at Bedwas, are you not?—I think the men are out without notice.

23,813. Is there any truth in a report that appears in the paper this morning, that you have turned the strike into a lockout by way of revenge?—Not revenge, but I am not going to carry it on under present circumstances.

23,814. Have you decided to lock the men out?—I do not know.

23,815. Have they been locked out?—Instead of looking after my business down there, I have had to be sitting here.

23,816. As a matter of fact, your business is not directly connected with the colliery, is it?—How do you mean?

23,817. You are not directly connected with Bedwas?—Certainly; I am chairman of the company. I am not chairman of companies unless I know every mortal thing that is going on and have a finger in the pie.

23,818. Do you not think that that is a lot for one man to do?—I do not work eight hours only; I work much longer than that.

23,819. *Sir Leo Chiozza Money*: Then we must nationalise you.—I am going to Honolulu if you nationalise—that will be the only decent place to go to.

23,820. *Mr. Frank Hodges*: How does the Powell Duffryn Colliery go on in your absence?—Here I have telegrams and letters coming in all day.

23,821. In fact, you have had to set up a bureau in London to keep the industry going on?—Yes; I manage to carry on, and fairly satisfactorily.

23,822. But you do not carry on?—I beg your pardon, I do carry on; I know everything that is going on. Mr. Hann consults me every day.

23,823. We have had Mr. Hann giving evidence here, and Mr. Hann understands the industry, I believe, does he not?—Mr. Hann is the best colliery manager in the Kingdom.

23,824. You pay him for his brains, do you not?—How do you mean, "pay him for his brains"?

23,825. You pick his brains?—I pick his brains?

23,826. Certainly.—We pick each other's brains. I do not mind telling you this, if you think I have no brains. I was the first man to introduce electricity

into collieries in South Wales on a large scale, because I happened to know a little about electricity, but Mr. Hann was afraid of it.

23,827. Are you a mining engineer?—No, I am a barrister by profession. If you like to take it this way, I am a jack of all trades and master of none.

23,828. Then it is a good thing that you have Mr. Hann, who is a master of one?—It is a good thing I have him because he is a first-rate engineer, and he would not be with me if he was not; I know when to pick a man when I see him.

23,829. I am sorry you came here as a member of the Powell Duffryn Colliery Company under the guise of giving evidence on behalf of the Freighters' Association?—Why do you attack me? You brought a man here—I cannot remember his name, I think it was Mr. Davies—what he was and what he is I do not know, but he gave evidence about my enormous profits and the capital that I put in. What is on that very table is not the capital involved in the concern, because we kept the capital down all those years that we did not pay a dividend.

23,830. I will not ask you any question about the Freighters' Association, because I regret to say that I have gathered very little from your *précis* on the freightage question. I thought we should have had some help from you there. I should like to put to you one or two questions about the Powell Duffryn Company, seeing that that was the burden of your argument?—No, I beg your pardon; the burden of my argument was the great competition we are going to get, and have already to meet, in foreign parts.

23,831. You have put in some plans of houses and some tables, have you not?—Yes.

23,832. I see there are some houses near Pengam?—Yes.

23,833. Do you know how many houses you put down to an acre there?—I do not know.

23,834. I do. There are 20 to the acre?—I will tell you this, if you want to know: there are a great many people whom I know in the colliery districts and in other places who would much rather live in streets than they would in these houses where there are 20 to the acre, because they can talk across the back wall to one another.

23,835. Do you know that they are 20 to the acre?—I do not know that.

23,836. Then you know very little about Powell Duffryn?—I do. What I tell you is this, that a great many of these people prefer to live in a street because they can talk to their neighbours across the back wall.

23,837. How very interesting?—You will have to educate them up. Then I will tell you another thing—

23,838. Will you tell me what I want to know?—A great many of these difficulties about the houses is that the bad tenant makes a bad house. That is not only the case in South Wales.

23,839. Do you think 20 houses to an acre is a proper number?—It depends on circumstances entirely.

23,840. Does it not depend on who has to live in them, from your point of view?—If they want other houses, they can have the choice of them.

23,841. You have built better houses?—Look at those houses.

23,842. I have been looking at them, and the living room is 9½ ft. in length by 10½ ft. in width?—When we built some houses which were a great deal too big for the people, we found that we had two families living in every house.

23,843. Will you keep to the plans?—But that is absolutely the fact.

23,844. The facts are explained on the plans?—We built houses that were too roomy, and the people did not want them: all it did was to encourage two families living in a house.

23,845. How many houses do you think there ought to be to an acre?—The modern idea is 12.

23,846. *Mr. R. H. Tawney*: Eight?—It varies: some people say 12, some say 8.

23,847. *Mr. Frank Hodges*: Is that the number prescribed in The House and Town Planning Act, in any of the regulations issued by the Local Government Board or by any local authority?—The whole thing

29 May, 1919.]

MR. JOSEPH SHAW.

[Continued.]

is under discussion so much that I have not followed it. What I always did was to cut away the wash-house from the cottage so as to prevent the steam going upstairs, but the Local Government Board will not have it now, so that the steam goes upstairs and makes all the sheets wet.

23,848. I will pass you these plans back again. The average size of the living room, I see, is $9\frac{1}{2}$ ft. by $10\frac{1}{2}$ ft.—Some of those houses are bigger than that.

23,849. I do not see any on those plans. Then again there is no hathroom in them?—About the bathrooms, you often find the cocks and hens in the bathroom.

Sir L. Chiozza Money: Do you put that in evidence, that the cocks and hens are in the bathrooms?

23,850. *Mr. R. H. Tawney*: Do you advance that as a reason for not providing baths?—We would provide baths to-morrow if the people would use them.

23,851. *Sir L. Chiozza Money*: Different kinds of people to yourself, I suppose?—Since the return of the soldiers, there is much more application for baths than before.

23,852. The chickens are not in the baths as they used to be?—We found out over and over again that they were never used. I am telling you what I know of my own personal knowledge.

23,853. *Mr. Frank Hodges*: You did not know how many houses you have to the acre?—Where you have a large number of houses in a particular spot, I could not tell you how many there are to the acre.

23,854. Do you know how many houses you have at all?—The living room in this house is rather bigger than what you say: it is 11 ft. by 13. I cannot go into them all.

23,855. *Sir L. Chiozza Money*: You cannot go into them because they are too small?—No, because I am in a hurry. I tell you that these are well-built and good cottages.

23,856. *Mr. Frank Hodges*: Are you answering the question I asked you?—I am looking at this plan to correct you. Here is one here 12 ft. by 8.

23,857. That is less than what I said; I said $10\frac{1}{2}$ ft. by $9\frac{1}{2}$?—All I can say is, that the houses that are empty first, when there is a slump among the men, are always the good houses: that is invariably so.

23,858. Do you know that you have the reputation of being the worst colliery company in the South Wales coalfield, as far as wages are concerned: do not you know that?—No, I never heard that.

23,859. Let me tell you this, that until 1915, when the new agreement for the South Wales coalfield came into operation, the Powell Duffryn Colliery Company was the only colliery company in South Wales of a big character who did not pay 6 turns for 5?—Oh, you are trotting that old dispute out again.

23,860. Do you call that an old dispute?—It has been going on for years.

23,861. It is a fact, is it not, that whereas the whole of the South Wales colliery owners were practically paying six turns for five, the Powell Duffryn Company did not?—My recollection is that that was not the whole of South Wales. It was an old agreed rate.

Mr. Frank Hodges: I do not think you are treating this question in a serious sense. I think you are flippant in the matter, and I do not propose to ask you any more.

23,862. *Mr. Evan Williams*: With regard to this question of 6 turns for 5, is it not the fact that about half the collieries in South Wales were paying it and half were not?—From our valley to the centre of the coalfield they were not.

23,863. Taking the men employed, was it not about half and half?—Yes, half and half.

23,864. Now coming to the question of export, there is very little I want to ask you. The point of vital importance, to keep regular working in an exporting colliery, is delicate touch between the port and the pit?—Certainly.

23,865. You must have a man at the port whose concern it is to keep certain pits going?—We have to have a man at the port who is watching the ships, the trucks and everything, and we must know exactly where our trucks are so that we can keep the colliery going the next day.

23,866. Whatever system of ownership you may have, it is imperative, is it not, that you must get certain men to work certain pits?—Yes.

23,867. Without any division of responsibility or working?—Certainly. The least little bit of grit in the thing will stop the collieries, or have the ships on demurrage, or both.

23,868. You must give the man at the pit discretionary power to take a decision immediately?—Certainly. They have to have that power. We put responsibility on men that no Government officials would be allowed to have.

23,869. It frequently results that there is a possibility of a pit being idle the next day?—Yes.

23,870. The man at the dock knows that he has power to give another 3d. a ton freight to get a ship that he would not get otherwise?—Certainly; he must have absolute responsibility. If he makes a mistake, I am on his back, but he takes responsibility; and if he only makes a mistake of judgment, I pat him on the back and say, do it again.

23,871. Do you think it is possible for a District Council, set up under the Miners' Scheme, to do that?—I know exactly how the thing is done, and I have built up this trade. I know that any system of bureaucracy would pull the whole trade to a standstill.

23,872. The same personal touch must be maintained between the exporter and the buyer?—There must always be that touch.

23,873. With regard to internal transport, it has been stated at this Commission that 700 million tons of transport on railways have been saved by the scheme of the Coal Controller. You are a director of the Great Western Railway Company, are you not?—Yes.

23,874. Have you any experience of what has been the result on the Great Western Railway?—We have not saved one ton mile, and the South Wales coal-owners were very much put to it by the trucks being out so long. We very nearly had the colliery stopped because of the trucks going to a district they had never gone to before. They got blocked, some in the Severn Tunnel, and we lost time, by the trucks being out, as much as a week.

23,875. There may be an actual saving?—I do not know what there may be under other railway companies, but there was not on the Great Western Railway.

23,876. Would the conditions be any different in any other railway company?—That I do not know.

23,877. So that it does not follow that the saving shown on paper is so in practice?—All I know is from personal experience that it is not so.

23,878. When you speak of demurrage, you mean demurrage on ships?—Demurrage on ships.

23,879. Which is as important as keeping the colliery going?—I put in those two tables, from which you will see that we very often have demurrage, and at the same time the collieries were not stopped.

23,880. When you speak in South Wales of a colliery being idle and being short of wagons, that really means shortage of tonnage to take the coal away?—Yes. It means this: very often we have all the trucks that we consider necessary, and some keep more than are necessary to safeguard that, because you have ships that come into dry dock, and perhaps are kept ten days or a fortnight there; we have trucks standing waiting for the next ship to come in, and consequently there are no empties to go back to the colliery, and the colliery gets stopped.

23,881. The number of wagons that a colliery has must depend on the class of coal?—Certainly. The Powell Duffryn Company are producing large coal, small coal, washed peas and beans and nuts, and those all have to be sorted for the particular markets, and you have to keep a sufficient number of wagons to accommodate them all.

23,882. I only want to put one other question just to clear up a statement that was made yesterday by Mr. Hughes, the head surveyor. He told the Commission, that his salary was £335, plus house, light and coal. I believe you have looked into that matter and can tell us what is the actual amount of money received by this gentleman?—We have been in the habit for a good many years past, and during

29 May, 1919.]

MR. JOSEPH SHAW.

[Continued.]

the war we have continued it, of paying bonuses, and I find that Mr. Hughes last year got £50 bonus as well as his £335, and I see the estimate of the value of his coal, rent and gas is another £60. We take that into consideration when we make up their salaries.

23,883. Was that £60 pre-war?—Pre-war.

23,884. *Mr. R. H. Tawney*: Was the bonus paid pre-war?—No, that was paid last year.

23,885. That is to say, his normal salary was what?—£335 a year.

23,886. That was stated to us by Mr. Hughes?—Yes. He is quite right to say that, but he did not say that he had a bonus. For the last ten years we

(*The Witness withdrew.*)

Mr. Robert Smillie: The witness Hughes said, when the question was put to him at 22,263, this: "Will you tell the Commission what is your own salary?—(A) £335 a year. (Q) Are there any privileges?—(A) House, coal, fire and light. (Q) In addition to the £335?—(A) Yes. That is a recent increase I had within this last month. (Q) What were you getting before the war?—(A) Before the war, £200."

Mr. Evan Williams: He has omitted all reference to the bonus.

Mr. R. H. Tawney: He was not getting a bonus before the war; the witness told us so himself.

Sir DANIEL MACAULAY STEVENSON, Sworn and Examined.

23,890. *Chairman*: Sir Daniel Stevenson is one of the gentlemen from Scotland. I do not intend to read all this proof, as time is getting on. I do not say that it is not all important, but I am going to read only the material parts.

"*Précis of Evidence to be given by Sir D. M. Stevenson.*"

I have been appointed by the Scottish Coal Exporters' Association, of which I was Chairman for eighteen years, to give evidence on their behalf on the two following questions submitted to them by the Secretary of the Coal Industry Commission:—

(1) The probable effect of the Nationalisation of mines and minerals upon the Coal Export Trade.

(2) The best method of working the Coal Export Trade if Nationalisation is decided upon.

On these points I speak for the Association, but should I be asked questions on other points my opinions on them must be held to be my own.

1. The Export Coal Trade is so intimately bound up with the whole economic life of the country that it seems to me that it must be carried on. To abandon exports, or even to reduce them substantially, would mean ruin to shipping by throwing out of employment the tonnage at present engaged in carrying coal to foreign countries."

"There is an impression among many of my colleagues that Nationalisation in any form would greatly reduce output, and consequently render impossible the maintenance of exports on pre-war bases. With this I agree in so far as the period of reconstruction is concerned. There is already a serious shortage, and if this were accentuated, resulting in the further diminution of the quantity available for export, the consequences, as already pointed out, would be disastrous; but so far as I remember, every time that there has been a substantial improvement in miners' wages or working conditions, whether as the result of agitation or of legislation, there have been prophecies of disaster to the trade. Events have falsified these prophecies. We have no precedent for such an upheaval as is now in contemplation, and no doubt it would take years to evolve a satisfactory working scheme. In the meantime I think there would be much trouble and loss in store for the coal trade, but convinced as I am that the export part of it must be, and therefore will be, maintained, I believe that all interested in the production of coal would have to adapt themselves to the international situation and produce it on such conditions as would permit of successful competition both in manufactures and in exports."

were giving bonuses. He had not £50 the year before, because his salary was smaller.

23,887. *Mr. Evan Williams*: You pay a bonus every year?—Yes.

Mr. Frank Hodges: We had better look this up, because where there is this one man in question we had better consider it carefully.

23,888. *Sir L. Chiozza Money*: Do you think that £445 is a sufficient salary, in view of the cost of living?—A surveyor is not the most important man about the pit.

23,889. You think it is enough?—I think it is enough under the circumstances.

Mr. Robert Smillie: Either Mr. Hughes or Mr. Shaw must be wrong. Mr. Shaw said he was paid £335 before the war.

Mr. Evan Williams: No; Mr. Shaw said he was getting a bonus before the war.

Mr. R. H. Tawney: He did not say so to me. He said to me he was not getting it.

Mr. Evan Williams: He said, for ten years he was getting a bonus, but it was not £50 before the war.

Chairman: I am much obliged to Mr. Smillie for calling attention to it.

"Owing to the high prices obtainable just now in neutral countries there is a mistaken idea prevalent that Great Britain has an asset in coal for which she can get practically any price. The tendency is to forget that for some years there has been a dearth in Europe which even since the Armistice has not been made good. American production is increasing rapidly, and no doubt before long the United States will be able to export coal on a much larger scale than hitherto, and economists even in Germany itself are satisfied that one of the first things that she must set about doing is to export coal freely in exchange for food and raw material."

"When I come to deal with methods, I see what appear to me all but insurmountable difficulties. The buying and selling of coal to foreign countries is carried on chiefly by telephone and telegraph—telephone conversation between the colliery salesmen and the exporters, telegrams between the exporters and the foreign buyers. Under Nationalisation I suppose there would be an official salesman who would fix the same price from time to time for all buyers, whereas the colliery companies are in the habit of differentiating between buyers according to their standing, honourability, amount of business they control, and so on. They also give special prices for special markets—a lower price for a market which takes regular quantities all the year round, or which serves as a dumping ground at times when orders are scarce in the general trade."

"Perhaps I ought to allude to another probability—what has come to be called "peaceful penetration." If there were a uniform Government price for all buyers, like the price of postage stamps or railway tickets, the first thing that would happen would be the sending by foreign buyers of representatives to London and the coal-selling districts to take the place of exporters—a proceeding against which the Board of Trade has strenuously set its face."

Then Sir Daniel quotes from the Commission appointed by the German Government, and the Report says: "They recommended the setting up of an organisation to be called the German Coal Association with power and freedom, because one of the worst dangers was the elimination of initiative and of a sense of individual responsibility, on which qualities the success of private business depends. The report adds: 'If responsibility were to be devolved on committees or to depend on the consent of controlling authorities, if every decision were to be the result of lengthy discussions or of a wearisome system of reports, if there were no one prepared to identify himself with the consequences of any step taken, if every directing person is to be encircled by a series

29 May, 1919.]

SIR DANIEL MACAULAY STEVENSON.

[Continued.]

of committees whose members he must first convince before action can be taken in each case with the best will of all concerned, the German coal industry would be brought to a complete standstill. . . . On this point the Commission is quite unanimous; it lays the strongest emphasis on the rôle of the man who directs industrial life, and its suggested organisation wishes to leave to him the greatest possible amount of freedom; but, in doing this, the Commission is convinced that this does not contradict democratic principle."

23,891. *Mr. Arthur Balfour*: I take it that if the coal mines of this country were nationalised there would be a standard price?—I think so.

23,892. Otherwise one person of the community would be favoured against another person?—That is what we feel.

23,893. Therefore, if you were competing for an order of the Italian Railways and the Americans cut the price you could telephone to your colliery and they could meet the competition at once?—If they think fit.

23,894. *Mr. Herbert Smith*: Do you know that? Why not let the witness say so? You are telling him that they do so, and I object to that sort of business.

Witness: If I tell the colliery people that America is making a quotation which will lose us the order unless we reduce the price so-and-so, they, of course, knowing me as an old friend of the colliery, will either agree or will say that they have so many orders that they do not mind losing it, and if they want to keep it they will cut the price.

23,895. *Mr. Arthur Balfour*: What will happen if you telephone to the Controller of the Coal Mines and tell him that he must cut the price?—I have come here with the hope of finding out. I cannot see what would happen. I feel that if the Controller fixes a price I cannot very well haggle with him unless he does what the German Commission say, that is, give the representative of the export department a perfectly free hand to operate as the collieries do at present with the exporter.

23,896. Then he would be accused of giving you undue preference against another member of the community?—I think that is very likely.

23,897. If he did not give you a prompt decision the order would be lost in the meantime?—It would go to America.

23,898. Do you sell coal sometimes to foreign buyers landed at an inland town in the country?—Very seldom—unless you call Rouen and Paris inland towns.

23,899. You do not see any way in which national coal mines could work the export trade?—I do not.

23,900. Do you think there would be any competition between the Governments? Do you think the British Government would enter into a contract to supply the whole of the coal to Germany?—Germany is a large exporter of coal. She exports more coal than she imports.

23,901. Take France?—Take Italy, where there is practically no production, and certainly no export. That would be a better instance. There has been an attempt during the war to carry on an arrangement between the British Government and the Italian Government, and every time that the Italian Government have come and said, "Sell to us direct," the British Government has said, "No, we will not; you must buy your coal through the exporters."

23,902. You can imagine that political differences might arise out of the export of coal?

Sir L. Chiozza Money: I do not know whether he has quite finished that. He said the Italian Government had come here and demanded to buy from the British Government.

Mr. Arthur Balfour: And the British Government, knowing the position, declined to do the business?—In deciding that way the British Government had all the exporters on its side and all the collieries. I ought to explain that for Sir Leo's benefit, for this reason, that the British Government, more or less with the advice of the exporter, said if we allow Italy, who wants 10 million tons of coal, to have all that order in one hand she will be able to squeeze the country into either giving low freight or

low coal prices. The result was that they decided that it was a wise thing to insist on the competition in Italy being continued, and it not being all in one hand.

23,903. *Mr. Robert Smillie*: I suppose you anticipate that under nationalisation the export trade would be carried on as before?—I hope so, but I cannot see how it is to be done.

23,904. I suppose in any form of new legislation it is hardly possible to see how things are to be done until it is proved by experience that they will be done?—That means, of course, a time of very severe trial, and it might be a very long time.

23,905. You say that there is an impression among many of your colleagues that nationalisation in any form would greatly reduce output. On what is that based? I take it that is amongst your colleagues who are coal exporters?—Yes.

23,906. On what do they base that fear?—It is very difficult to answer the question on what do they base their fear. Looking back just now we find that the output which is got now is about 60 million tons or 70 million tons per annum down, and yet there is a desperate need for coal both in this country and in foreign countries. There are said to be a number of industries idle for want of coal, and yet we cannot get the output.

23,907. Is not the output of every country down at the present time?—No; the American output has risen over 100 million tons during the war.

23,908. But it is down considerably at the present time?—Since last year I cannot tell you.

23,909. Are you not aware of the fact that in America they put in stock millions of tons of coal, and that they are now lifting it and that the collieries are standing idle in their district?—I am not aware of that.

23,910. You can depend on that as being the statement that has been made during the last two or three days.

Sir Arthur Duckham: It is very interesting to us to have the statement that there are millions of tons of coal stored in America, before the Commission.

23,911. *Mr. Robert Smillie*: Would you not expect in consequence of a war such as we have been through and 300,000 or 400,000 of our people having joined the Army that the output would be down?—We were not surprised at the falling off when the calling up of the men on such a large scale took place, and as a matter of fact, taking the figures of the output for 1913, 1914, and 1915, there was a falling off in that year. It rose a little in 1916, if I remember rightly. In fact, notwithstanding the great calling up of men there was a slight improvement in the output in one year, and we were hopeful that as other men were drifting into the works it would be increased, but it did not. It has fallen now the worst fall of all.

23,912. I want to put to you that that fall has taken place from the private ownership of mines. You say that your colleagues are of opinion that nationalisation would lessen the output?—My colleagues think that the output has fallen because although the men are there they will not turn out the coal.

23,913. Are your colleagues connected with the collieries in any way?—Almost all exporters are interested in coal mines.

23,914. Must they not base their opinion on statements which they get from colliery managers in coal mines?—There are committees which are charged with the distribution of coal at present.

23,915. Surely it must be somebody at the colliery?—There are committees all over the country just now, which are in charge of the distribution of coal—there is the Coal and Coko Supply Committee. I was a member of that Committee for a short time in Glasgow, and there are two exporters who are still members of the Committee. They state that the output is falling in spite of the number of men being greater than it was at the beginning of the year.

23,916. Tell me your own opinion. Do you think that the workmen are putting out less than they were two or three years ago?—Per man they are certainly.

23,917. You are sure of that?—I am sure of that.

29 May, 1919.]

SIR DANIEL MACAULAY STEVENSON.

[Continued.]

23,918. We should like to have the figures to prove that; that is, per man per shift worked. You and others make the mistake of taking the annual output and dividing it up by the number of days in the collieries worked. You must take the output per man per day worked. I think you will admit that that is the only fair way to get the output per person employed?—Yes, I think so.

23,919. I want to put it to you that the treatment of coal at the pit bank is very different now to what it was even a few years ago. Is it not divided up into different kinds of coal?—It is not so well done now as it was five or ten years ago. Just now the buyer will take anything he can get that is black.

23,920. It is rather a serious charge that you and your colleagues are making, that the miners are not producing coal as they ought to do or as they did before. I put it to you if you divide by the persons employed in a mine you would find out the output per person employed, and you would make a mistake, because there are thousands employed in a mine who were not employed previously in the manipulation of coal?—Not as compared with five years ago, and five years ago we had the biggest output we ever had.

23,921. I think you will admit that there are many persons coming back from the Army and working in the mines who were previously good coal getters, but who will not be able to produce the coal they did before. They may be just recovering from wounds. Do you expect them to be?—We expect that the last 100,000 who were taken away will do as well as they did before.

23,922. That all arose out of your fear that nationalisation would reduce output; but does it do us any good to tell us that the output is reduced now under private ownership? Why ought it to be further reduced on nationalisation? Would not the same men be working in the pit, and would they not be managed in the same way working under nationalisation?—And, therefore, under nationalisation the output would go on falling automatically.

23,923. As a matter of fact, we want the mines nationalised in order that we may raise the output by better development of the mines. That is our desire, and it is always dangerous for people who do not know about mines to give opinions of that kind such as you have expressed in this paper?—I have been stating the facts staring us in the face every day. We are told every morning that the output yesterday or last week was so much down on the output of 1918, and that is a very serious thing in a time of real peace.

23,924. You are not dealing with something you see every day. You are making the statement that if the mines are nationalised there will be a reduction of output?—I hope not. I am stating that my colleagues have that fear.

23,925. *Chairman:* Are your views different from those of your colleagues? You keep on saying that your colleagues say this?—Might I say that I only dictated this print yesterday and I read it coming up in the train last night. Consequently I am not quite sure of the exact terms of it, but it is something like this: my colleagues dread very much the nationalisation of mines, because they think it is going to further reduce the output which is already very low.

23,926. What is your own opinion?—I say with them it is staring us in the face that a reduction of output is going on now. Whether it is true or not that nationalisation would reduce output immediately. I believe in the long run output would be restored because the country cannot live without it. That is my point. The period of restoration might be a year or two or it might be ten years, and they say that in ten years a lot of us would be dead.

23,927. *Mr. Robert Smillie:* Did you write this *précis* yourself?—I dictated it.

23,928. And you say you did not know what was in it?—Really, Mr. Smillie, that is not fair. I dictated it, and I read it in the train coming south. It is more or less badly done, but I think it represents fairly what I intended to say.

23,929. I think this statement would be probably as you put it: "There is an impression among many of my colleagues that nationalisation in any form would greatly reduce output." I want your opinion on that?

—I have said that I believe it will in the first instance.

23,930. You believe that nationalisation in any form will greatly reduce output?—Yes.

23,931. Will you give us some reason for it?—I have not seen any form of nationalisation put forward which would not give a lot of bureaucratic management, which, if I may say so, is invariably, I think, inefficient, and I was very much surprised at first to find that the German Commission's Report of the present socialistic German Government confirms that view and states that the national mines of Germany have been very much less efficient and very much worse managed than the privately managed mines in Germany.

23,932. *Mr. R. H. Tawney:* You remember what they recommend?—They recommend a very free hand in the management.

23,933. They recommend what they call socialisation?—What it comes to is that they recommend that the man who has charge of the buying and selling of the coal should have a free hand and should be the responsible man to the State.

23,934. *Mr. Robert Smillie:* In your *précis* you quote something from the finding of a German Committee?—Yes; a Government Commission.

23,935. Has it not been fashionable for some years now not to believe anything made in Germany or said in Germany?—It has not been fashionable with me.

23,936. I think you were blamed for believing in Germany, and so was I?—Yes.

23,937. You say that our Government set its face against buyers of coal from other nations coming here?—No; against their coming as a nation.

23,938. They would not object, would they, to individuals coming to buy here?—From the Government?

23,939. Individuals who desired coal abroad—would they prevent them coming here and buying it?—To buy from whom?

23,940. Purchasing coal at all?—Not at all. They do not object to their coming here.

23,941. Would they object to their going to Sir Adam Nimmo?—No, not at all.

23,942. I suppose you were aware that there was a control price for coal exported to France?—I was and am aware. It is still in existence.

23,943. Did you export coal during the war to France?—Yes.

23,944. Are you aware that exporters in this country actually sent over persons to France, who became coal agents there and bought the coal from exporters and raised it by £1 or 30s. a ton to the consumer?—We knew or were told that something of the sort was being done. The doing of anything of the sort was simply roguery and nothing else.

23,945. Are you aware that exporting firms in this country sent their own clerks out to France who bought coal exported by their own exporters and became coal agents and made fortunes by it?—I do not believe any respectable or decent person did anything of the sort.

23,946. But I believe the coal exporters did it, though no decent person would do it.

23,947. *Sir Arthur Duckham:* Do you mean that all coal exporters are indecent persons?

Mr. Robert Smillie: No.

Sir Arthur Duckham: It sounded so from your question.

23,948. *Mr. Robert Smillie:* The control for prices has been withdrawn, has it not?—We are informed that the control cannot possibly be withdrawn for a long time yet. It will not be withdrawn this year certainly, and it may go on for a year or two; but the control as regards the limitation of prices for foreign countries has been very much relaxed. This is the 29th of May; I think on the 31st or the 1st of next month the control will be altered to this, that there is a minimum price fixed and the exporter can charge as much as he likes if he is able to get it. But up to the 31st of this month the price for France, Belgium and Italy is fixed and we could not get more than a certain price, and France, Belgium and Italy were getting coal at less than its value.

29 May, 1919.]

SIR DANIEL MACAULAY STEVENSON.

[Continued.]

23,949. *Mr. R. W. Cooper*: They were getting coal at 30s. were they not?—There is a tremendous table of prices.

23,950. That has to be the minimum?—Yes, that has to be the minimum.

23,951. So that beyond that point there is a free and open market?—Yes; but the Coal Controller will not take less than that for his stuff; therefore it is controlled.

23,952. Is not the effect of that this, that the price of coal to the Allies has gone up very materially beyond 30s.?—It will go up from the 1st June.

23,953. *Mr. Robert Smillie*: It was stated last Thursday or Wednesday that the price had already gone up for bunkers by over £1 a ton. Is that true?—Yes, it will be true.

23,954. What I am trying to get at is that the price has already gone up for bunker coal?—Yes.

23,955. And after a certain time you say the price will be removed for export to France?—Yes.

Mr. R. W. Cooper: After Monday?

23,956. *Mr. Robert Smillie*: I want to know who is getting this £1 that is already put on the bunkers?—The collieries.

23,957. Now supposing you had orders for coal with a colliery to deliver it and the coal price was removed and you get 20s. a ton more for it, would the colliery owner get that in a case like that?—I am not quite sure that I have got your question correctly.

23,958. Shall I put it again?—Yes, please do so.

23,959. Supposing you had arranged with the colliery company to deliver 10,000 tons of coal and in the meantime the controlled price had been removed and you put up the price by £1 a ton, would the colliery company or you get the extra benefit?—The buyer of the 10,000 tons in the foreign country would get the coal on the basis of the price that I had paid for it up to the 1st June. After the 1st June whatever price the colliery company charge for the coal, which will probably be 20s. or 30s. more than this week, the colliery gets the extra price and the exporter merely gets what is called the commission on that.

23,960. I was not dealing with everything after Monday. I was dealing with what has already taken place?—He gets nothing beyond the commission—a maximum of 1s. a ton.

23,961. As a matter of fact is it not possible for the price of coal to go up between the time you purchase and the time you sell it?—In the time before the war.

23,962. Is it not possible now?—No.

23,963. Would you say that no middleman has made any greater profits out of the raising of the price of coal in former times?—I do not think so.

23,964. Then the colliery owner must get it?—The money goes into the colliery exchequer and through the colliery exchequer to the Controller.

23,965. *Sir Adam Nimmo*: Would you mind asking him whether he knows that there has been a general rise in bunker coal?—Yes, there has been. It is fixed by the new scale. There has been a new deliverance by the Coal Controller with regard to bunker coal.

23,966. *Mr. Robert Smillie*: I want to get back to my statement. A newspaper published in London said, a few days ago, that the Control price had been removed from bunker coal, and the price had suddenly gone up 19s. 6d. to 22s. 6d. a ton, that it had increased to that extent. Do you know if that is the case?—By "Control price" was meant a minimum and a maximum. The price was a schedule. I am sorry I have not got that with me.

23,967. Will you give a straight answer: Has the price of bunker coal gone up?—Yes.

23,968. How much?—I expect that statement will be quite right: about £1 a ton.

23,969. Why could you not have said that?—I do not know. I am not in the bunker trade and do not know the amount of it, but the moment that you release the maximum and make the maximum unlimited, up goes the price so long as there is a tremendous scarcity, as there is at present.

23,970. You say that that is the inevitable outcome of it, so far as bunker or export coal is concerned, if the other people are prepared to pay it?—Yes.

23,971. That is to say, if you get the orders?—Yes.

23,972. Would not the same thing take place for our home trade if the demand was there?—Yes.

23,973. Then it would be a wicked thing for the Government to remove the Control price in this country and allow the coalowners to put it up £1 a ton?—If the Control price for the home trade were removed, up would go the price.

23,974. Are you aware that the mineowners are doing everything in their power to get the Control removed?—I am not aware of that, but it is quite natural.

Mr. Evan Williams: It is not true.

Mr. Robert Smillie: It is true. You signed a report hedging for the Coal Control to be removed at once.

Mr. Arthur Balfour: Is that the Coal Control price?

Mr. Robert Smillie: Yes.

Sir Adam Nimmo: I understood you to say that the special move was to get the Coal Control removed.

Mr. Robert Smillie: I said the coalowners were moving heaven and earth to get the Coal Control removed.

Sir Adam Nimmo: That is not the thing.

23,975. *Mr. Robert Smillie*: We have had it stated everywhere in this Commission that the Coal Control is a bad thing. It is your opinion that if the Coal Control were taken away, the price would go up?—Yes, the price would equalise itself. Just now some Scandinavian countries are paying 85s. a ton for the very same coal that the Frenchmen are getting for 28s. Next week the Frenchmen will have to pay something between the two, because probably the Scandinavian price will fall.

23,976. *Sir L. Chiozza Money*: Are you sure it will fall?—I think it would be very likely to fall.

23,977. But you are not sure?—One cannot be sure of the future.

23,978. *Mr. Robert Smillie*: It would be a good thing if it did?—Excuse me, referring to what Sir Leo said, if there are 20 million tons of coal available for export, of which 3 millions or 4 millions only are allowed for the Scandinavian countries and the rest for the Latin countries, the Latin countries will not pay the 80s., they may pay 60 or 70s., and the price for Scandinavia will come down; the price will equalise itself.

23,979. You are anticipating that?—If the whole of the coal countries were thrown into a pool and the price equalised, instead of the price being 80s. for Scandinavia and 20s. for the home countries, the price for the home countries would rise to 35s. or 40s.

23,980. What you are saying is that three-fourths of the exported coal will, within a very short time, rise from 30s. to 60s. a ton?—Yes, until America is able to pour in coal to start with.

23,981. That is a very nice prospect, that the whole of the coal exported is going to be 30s. a ton more. Supposing the mines were nationalised and the prices fixed for various grades of coal at, say, 20s., 25s., 26s. or 27s. a ton, that that was to pay wages and cost, depreciation and other things, and our exporters were to buy the coal at the colliery at that price, would that interfere in any way with our export trade, if the export trade were still left in the hands of the present exporters?—If the Coal Controller, or whoever is the representative of the Government in the future, said, My price is 28s.—

23,982. At the pit?—Or at the harbour, it does not matter—if the price is 28s. at the harbour, then to the Frenchman who asks me for a price I can say that the freight is 15s., and if he says 28s. is the Controller's price, I add the two together and get 43s., and I telegraph to the Frenchman whatever price I think fit, not less than 43s. The Frenchman telegraphs me back, "Your price is ridiculous; I am offered American coal at 40s." What I had to do in pre-war days was to go to the colliery and say, "Here is this message from So-and-so in France; he is offered coal at 40s., which is as good as the coal

29 May, 1919.]

SIR DANIEL MACAULAY STEVENSON.

[Continued.]

I am offering at 43s.; can you reduce your price?" He may say, "My coal is better coal, but you can take off 1s." Then I telegraph that to the Frenchman and he may accept that or may refuse, but the fixing of the price here has nothing to do with it; the price I had to sell at is the price that the Germans or the Americans will take.

23,983. I suppose you have applied to the colliery company for a reduction in price?—Yes.

23,984. I suppose you have done that very often in the past?—Yes.

23,985. You have appealed to colliery companies for a reduction in price?—Yes.

23,986. We thought you had done that, but we could not get evidence of it until now. When you were appealing to get something off per ton to send coal abroad you were reducing our wages?—No, I was reducing the price of your food.

23,987. Do you know our wages were fixed on the selling price of coal, and when you went to the telephone to get a shilling off the price of coal, that price went into the books? Were you aware of that?—If I had not got the shilling off, 10 per cent. of the collieries would have been standing idle.

23,988. Better for the collieries to stand idle than the men working at a starvation wage. Under nationalisation the nation would have to make more and the persons producing the coal would be getting wages to enable them to live. Under nationalisation you can come to the Government and say: "I must reduce the price of the coal I have to export"?—Yes.

23,989. Is that your position?—Yes.

23,990. *Mr. R. W. Cooper*: Were you consulted by the Coal Controller before he issued this recent circular of his?—Yes.

23,991. Has this recent circular which has gone out as an edict from the Coal Controller removing the restriction on the price of coal to France had your approval?—Certainly.

23,992. I should like to understand the reason for that?—The reason was that our country was giving away coal at a great deal less than its value—it was giving away coal, its most valuable asset, for a great deal less than its market value. The fact of the matter is, I think it was in December last, I told the late Sir Guy Calthrop I thought the time had come when we should cease to coddle the Allies with regard to coal.

23,993. At the same time half a dozen coalowners gave the opposite advice, not to remove the restriction?—The Coal Controller hears statements of his Consultative Committee. That Committee is formed of coal exporters and coalowners, whom he calls on from time to time when he issues new directions and consults as to the best way of doing the thing.

23,994. *Mr. Robert Smillie*: When did you advise the Coal Controller?—In December.

23,995. Are you aware there was what was called the Coal Control Advisory Board, consisting of mine-owners and miners' representatives, and there was, and is still, an Advisory Committee, as far as I know, with representatives of the trade?—There are so many Committees. I am a member of one of them. The one I am a member of is called a Consultative Committee—the Controller's Consultative Committee.

(The Witness withdrew.)

MR. JOHN ADAM ST. JOHN GREENER, SWORN and Examined.

24,009. *Chairman*: Mr. Greener is a gentleman who speaks with regard to the export trade in the North of England. I am sure the members of the Commission will pay very great attention to his *précis*, but whether they desire to ask him any questions is another matter altogether. Mr. Greener says he is a member of the firm of W. Mathwin & Son, coal exporters and shipbrokers, of Newcastle-on-Tyne and elsewhere.

"(1) *The probable effect of nationalization of mines upon the coal export trade.*—"In principle" this should have little, if any, effect.

Indeed such a pooling of resources might—theoretically speaking—offer certain advantages.

23,996. Are you aware there has been a Coal Controller?—Yes.

23,997. Are you aware they had what was called an Advisory Committee of the Coal Controller? I cannot tell the exact name of it.

Sir Adam Nimmo: Advisory Board.

23,998. *Mr. Robert Smillie*: Is anybody in the country so ignorant as to say they do not know they had an Advisory Board?—They also had an Advisory Committee.

23,999. Were you aware of that?—Yes.

24,000. You advised the Coal Controller to lift the control price as far as France and Italy were concerned in December?—Yes.

24,001. Are you aware that the Advisory Board has never heard of that until now?—I cannot answer that.

24,002. *Sir L. Chiozza Money*: Do not you think, in regard to the condition of France and Italy, it was rather extraordinary advice, and that we should be such bad Allies to raise their price in the times of suffering? Does it not show the commercial spirit at work again?—If our Government wished to make grants to our Allies we ought to make them direct and not in an indirect way. Nobody knew how much the grant was, and both France and Italy were not in the least bit pleased.

24,003. Do not you think, in view of the extraordinary shortage of coal in Europe, that the export price of coal would rise not only to the height now existing for Scandinavia, but higher prices? You think there would not be the equalising?—I think there would.

24,004. Do not you think the price of coal to the consumer in London would approximate to that, say, in Scandinavia, in view of the shortage that obtains?—The control has nothing to do with the price in London—the export control.

24,005. I know that. I know the price of coal to the consumer is limited. I say if the control was taken off, is it not a fact that the price of coal to the consumer in London would be at least £3 a ton?—I believe it would.

24,006. Do not you think the public ought to know that?—I am pleased they should know it.

24,007. Do not you think the impression is created that the Controller has unduly put up the price of coal, and Mr. Harold Cox repeats it again and again?

Mr. Arthur Balfour: May the witness answer a question without your making speeches?—What was the question?

24,008. *Sir L. Chiozza Money*: Do not you know the impression has been created in the Press that through the action of the Coal Controller the consumer is paying more for his coal than he ought to pay? I put it that but for his action the consumer would be paying very much more?—But for the action of Parliament—the Limitation of Prices Act. Under the Limitation of Prices Act the consumer in this country is paying a good deal less than he would pay otherwise. There is no doubt about that.

Chairman: We are much obliged to you, Sir Daniel.

To commence with the State would command the assistance of experts who, under private enterprise, have accustomed themselves to commercial usages, and who count the cost before plunging into any venture.

Would the State management of mines, however, be maintained in the future with strict regard to efficiency and economy?

Experiences of nationalisation and Government Control do not, unfortunately, warrant the assumption.

The danger is that, say, twenty years hence, the management of mines will have become established as a branch of the Civil Service—that employees, having "passed their examinations," will be considered qualified to adequately fill any post into which

29 May, 1919.]

MR. JOHN ADAM ST. JOHN GREENER.

[Continued.]

they may be pitchforked. Under private enterprise a man stands or falls not by his "credentials," but by the actual results of his labour.

State organisation is notoriously slow. It lacks soul and imagination. It is difficult—almost impossible—to find co-ordination between departments. Whether the work is done efficiently or otherwise, the relation to cost is only a minor consideration. Fads and wild schemes are liable to be pursued only to end in hopeless failure.

The possibility is that nationalization would ultimately result in a decreased output and a considerably increased cost.

The future of the coal trade cannot be judged in the light of the present. We are at the moment living in a fool's paradise. About two thirds of the production is being delivered for home consumption at little over actual cost, and fabulous values are being obtained for the small surplus shipped to neutrals.

Comparison of Prices.

	Home Consump- tion.	Shipment Allies.	Shipment Neutral.
	s. d.	s. d.	s. d.
Best Northumber- land steam—			
To-day ...	25 0	37 0	85 0
July, 1914 ...	14 0	14 0	14 0
Best Durbam Gas—			
To-day ...	22 6	32 0	70 0
July, 1914 ...	12 0	12 0	12 0

In 1900, during the South African war, the highest price for Northumberland steam was 30s., and from 15s. to 20s. were the highest figures paid during the industrial booms of 1907 and 1913.

What the "normal" may be hereafter it is difficult to say, but certainly we cannot look for restoration and reconstruction of industry on anything like the basis of present inflated prices. War created extravagances. Peace will enforce economies.

It is possible there will be an over-production of coal—world wide—before the effects of the next industrial boom are felt. Germany must work. She will supply large quantities of coal to France, Belgium and Italy. She will probably compete with us in Scandinavia, and now that America has the ships we may regard her as a much more serious competitor for the future.

The demand—the outstanding demand above all others in the next generation—will be economy and efficiency, with emphasis upon the economy. Can we rely upon that under nationalization?—Does the risk justify the gamble?

(The Witness withdrew.)

Mr. ARTHUR ANDREWS, Sworn and Examined.

24,010. *Chairman:* Mr. Andrews is a witness who speaks as to the anthracite trade in South Wales, which is the chief seat of the anthracite trade of the United Kingdom. It is an important branch of the coal trade, but, of course, not the largest branch. I am sure, Mr. Andrews, we shall do the same to you as we shall with regard to the last witness—read your proof and pay the greatest attention to it. We will not trouble about the steam coal, as we have had a very large body of evidence with regard to it. It is very important to see what you say with regard to anthracite. Mr. Arthur Andrews states:—

"1. He is President of the Swansea Chamber of Commerce (Incorporated) and Managing Director of Arthur Andrews & Co., Ltd., Coal Exporters, Swansea.

2. He has been selected by the Swansea Chamber of Commerce to offer evidence before the Royal Commission, specially in reference to the anthracite and steam coal trade of West Wales.

3. He has been engaged in the South Wales Coal Trade all his life, and for the last sixteen years at Swansea. He has therefore a thorough knowledge of the peculiar trade of the Western portion of the coalfield, both anthracite and steam.

Steam Coal.

4. The western side of the South Wales coalfield differs very materially in some respects from the

As a taxpayer I would vote against it, and I think that any such proposed drastic change should be submitted to the country for the final decision.

(2) *The best method of working the coal export trade, if nationalization were decided upon.*—In my opinion the best method would be for the business to be conducted through the medium of recognised coal exporters.

They know their business. It is their duty to cultivate markets abroad. They have to seek orders in normal times. If, as may be inferred, we are likely to be faced in the future with keen German and American competition there will have to be all the greater display of enterprise on our part.

Exporters act for, and they offer necessary and varied accommodation to, the receivers in foreign countries. Very few collieries have ever deemed it prudent to adopt the rôle of exporters in their own right, and it is hardly conceivable in this respect that where collieries have feared to tread the State will step in and try to do the business.

Minimum prices for the respective districts could be fixed—and modified periodically as circumstances dictated—by some Central Control or authority. The selling and the trading facilities, however, should be left to the districts separately, so that advantage could be taken of obtaining the full "market" value. In other words, except a safeguard of minimum prices, there ought to be practically a complete system of local control in each district.

This proposal has also the advantage, to commence with, of creating the least possible interference with the ordinary and general conduct of the coal export trade.

As time went on it is conceivable that amalgamations of exporters might ensue, just as under nationalization, for management purposes and convenience, the mines would probably be "grouped." Even a fusion of interests might ultimately obtain, but these changes would be made only in the light of an extended experience of the new order of things.

As an alternative to merchants, collieries or the Government would have to set up an Export Department for all coals, which would be large and costly, and would in all probability amount to more than merchants' profits. Foreign buyers would probably have to appoint buying agents to arrange and attend to their shipments while the collieries or Government would have to finance the transactions and give credit."

We are very much obliged to you for your *précis*. We shall all carefully consider it. I do not know if anybody wishes to ask any questions. (No reply.) Thank you, Mr. Greener. We shall bear your *précis* very carefully in mind.

eastern side and Rhondda. The collieries are on a much smaller scale of output, and the coal differs to a marked degree from the coal worked in the Rhondda and Monmouth portions of the coalfield. It is very soft and friable and in the cutting, handling, and shipping, produces an abnormal quantity of small in proportion to large. So marked is this tendency that a considerable proportion, probably the main proportion of the collieries in West Wales, have ceased to screen their large coal, and therefore only produce thro' and thro', or unscreened coal. In many instances even this thro' and thro' coal only contains approximately 20 per cent. to 25 per cent. of large or lump coal, the rest being small.

This disability, in comparison with other and competing coals in South Wales, entails very special marketing in order to make markets for this very difficult class of coal. In order to dispose of the small coal, and for which there is very little real demand on the continent, some of our exporters have been obliged to erect themselves fuel works in Franco, or assist financially their French customers to put up fuel works. Engineers have been sent out to France and other countries, in order to educate customers to the use of West Wales small and thro' coals, and the fact that there is a quietly growing market now for this class of coal is undoubtedly due solely to the

29 May, 1919.]

MR. ARTHUR ANDREWS.

[Continued.]

individual enterprise of both colliery proprietors and coal exporters in West Wales, firms which have expended much money and time in the past years and are only now beginning to realise the fruits of their labour.

Witness cannot conceive that under national ownership of mines such individual enterprise on behalf of any particular district could or would be undertaken successfully. On the contrary, he conscientiously believes that only under private enterprise has it been possible to continue the steady development of the West Wales steam coalfield, under the most difficult and depressing conditions.

Anthracite.

5. This is a class of coal practically peculiar to West Wales. It is a comparatively new industry in the commercial sense, as is shown by the fact that the production has more than doubled during the last fifteen years or so.

The output of saleable anthracite in 1899 was only 1,817,800 tons, whereas in 1913, the last full year prior to war conditions, it has risen to 4,156,517 tons.

It has taken many years of patient industry to bring its undeniable merits before the notice of the consumers at home and on the Continent, and it is a safe statement to make that in no other section of the coalfield has it been necessary to so fight its way into use as in the case of anthracite.

6. The first introduction of anthracite to continental consumers was made about 1831 when the coal was sent to France and Germany in sacks and literally given away in order to induce consumers to make trials. The large coal was broken by hand into nuts. Special stoves were designed and constructed by the pioneers of the industry, and were sold under cost price and often fitted free in order to demonstrate the peculiar merits of the coal for household purposes. A member of one of these pioneer exporting firms actually spent 12 months in San Francisco, wholly engaged in the introduction of anthracite to that market. Witness himself spent some months in Sweden soon after the washing anthracite was commenced in West Wales, engaged in propaganda work, and succeeding in introducing washed anthracite into Sweden after a very great deal of effort and expense.

Witness had to sell the coal at considerably less than cost price in order to get the trials made, but the result to the trade justified the sacrifice, and Sweden is now a most important market.

Witness gives these illustrations in support of his statement that anthracite, by reason of its peculiar characteristics, has proved a most difficult coal to develop and introduce to home and foreign markets.

7. Very expensive and complicated machinery has now been erected in most of the anthracite collieries for the washing of nuts, beans and peas, which effectively removes most of the stone, shale, and other impurities from the coal.

8. Although anthracite was first brought to the notice of consumers as a very excellent household fuel, research work has since proved it to be specially suitable for use in gas engines; for making calcium carbide and for steaming purposes by means of special bars and furnaces.

9. The result of these developments is entirely due to the energy, enterprise and pioneer work of exporting houses who will probably never personally reap the full benefit of the work and money they have expended, but the trade as a whole has benefited enormously and its growth and expansion is wholly due to individual effort.

In this case also, as in the case of the West Wales steam coal trade, witness cannot imagine that such strenuous pioneer work would have been undertaken by State controlled or owned collieries, either by way of scientific propaganda, research and educational work or the expenditure of such enormous labour and money as has made the trade what it is to-day.

The principal reason for his belief that the Government cannot hope to develop an industry like the coal trade with anything like the same efficiency as the private owner and the exporter is:—

Coal will remain essentially a competitive article, not so much in the case of the home trade, but most certainly for foreign markets.

Foreign Markets and Competition.

10. Witness appends as follows a list of our principal foreign markets, and in the second column he indicates the foreign coal fields from which the keenest competition is experienced:—

Markets.	Competing Coalfields.
France	French, Belgian, German, and American.
Italy	French, German, and American.
Spain... ..	German and Spanish.
Mediterranean	German and American.
Scandinavian	German and American.
Eastern	Japanese and Indian.
South America (East Coast).	American and South African.
South America (West Coast).	Australian and American.

11. The vital principle of Government management is not and has never been based on competitive lines, for Government management or control has of necessity in the past created a virtual monopoly. It is his opinion, therefore, that State machinery for the ownership of the mines and the distribution of the production would not respond readily to competitive conditions, and that as a result this country would lose many of its markets to foreign competition, unfettered by State ownership and spurred on by keener efforts of private enterprise, with its greater elasticity in meeting special conditions. Governmental control in this country in the past has not suggested much elasticity in meeting new conditions, even when that control has created a virtual monopoly, and he cannot therefore believe that he can hope for any improvement in this respect in dealing with a strictly competitive article like coal. The very system is all against such a belief.

12. The State as a commercial or trading concern has not a single success to its credit, notwithstanding the fact that it has had the undoubted and immediate effect and benefit of creating an absolute monopoly in its trading career. The postal service, the telegraphs and the telephones are striking illustrations of failure—failure to make the services pay commercially, and, what is even worse, failure to provide a good service. The position of the telegraphs is deplorable, and has been working at a loss of approximately £1,000,000 per annum. The State control of the telephones is a failure and compares unfavourably with the private management of the National Telephone Co., both in point of cost and service.

If this be the result of State control on industry protected by monopoly, it is reasonable to assume that the nationalisation of the mining industry cannot be effected with any hope of success, bearing in mind that 20 per cent. of the total production of the United Kingdom is exported and is therefore subject to keen world-wide competition. This is specially appreciated in South Wales, where over 50 per cent. of the production is exported.

An important point, too, for consideration is that keen price cutting for world markets may convert the commercial aspect into the political, a very dangerous feature when inspired and conducted by Governmental control.

13. The coal-trade, governed as it is by world-wide competition, is of necessity a very speculative trade, and sellers, whether collieries or exporters, are often forced to accept onerous conditions of sale in respect of payment, guarantees of quality, &c.

Witness cannot think that a Government Department would readily lend itself to such conditions, and without which it could not possibly secure or maintain certain valuable markets which have been built up by private enterprise, willing to shoulder such responsibilities in the face of the keenest foreign competition. Government service does not tend to mould its servants on competitive lines, and he greatly fears the very system would break down badly under world-wide competition, with the inevitable result that this country would lose many of their hard-won markets, thereby causing irregular working of the mines, and consequent unemployment of miners and all labour attached to the great coal shipping industry."

29 May, 1919.]

MR. ARTHUR ANDREWS.

[Continued.]

24,011. Do you wish to say anything more about the last paragraph of paragraph 12? You are one of the only witnesses who has dwelt upon that point. That is an important point. You say: 'An important point, too, for consideration is that keen price cutting for world markets may convert the commercial aspect into the political, a very dangerous feature when inspired and conducted by governmental control?'—I consider that a very important point. I have been rather struck in the evidence I have read so far that that point has not been referred to prior to this or I have not seen it. It does strike me at present the coal trade is essentially a commercial article, but dealt with as it may be now as it is proposed to rather under a nationalisation system, any reciprocity arrangement made between country and country for any other purpose might easily bring that out of the commercial and take it into the political at once. As an example, let me make my point in this way. Assuming we were extraordinarily short of, say, iron ore, and to get iron ore we had to make a special arrangement with Spain on a reciprocity basis whereby for the return of that ore we undertook to give them a certain quantity of coal at a certain price, perhaps it may seem at a too favourable a price, but a price less than the price we gave to other nations, that at once, in my opinion, takes it out of the commercial aspect and puts it into the political, and would cause naturally or may cause serious difficulty amongst the other nations. It is an aspect, I think, that requires rather keen consideration.

Chairman: I do not want to ask you anything on the Report. On that point I shall ask Sir Leo to assist on one side and Sir Arthur Duckham on the other.

24,012. *Sir L. Chiozza Money:* I will ask you some questions upon this rather interesting point which you have mentioned. Are you aware that during the war the economic situation of the Allies, not only our Allies, France and Italy, was saved, but this nation with others was collectively saved from disaster by collective action in buying?—I think that was so.

24,013. Do you know they, in spite of the extraordinary difficulty of the circumstances, made successful arrangements by which they bought up the whole of the export supplies of different countries in the way of wool, in the way of wheat, and other articles; they pooled them and distributed them so that the consumers in each country got their needs satisfied with a fair amount of satisfaction?—I think that was so.

24,014. Do not you think that was rather a tribute to what can be done by collective management?—Yes, but I think that was done, and I am going to rather qualify the answer in this respect, that that was under war conditions. We can do, and have been able to do, many things under war conditions we should not be able to do when coming up against world-wide competition. War conditions have enabled us to, if I may say so, ride rough-shod over all the conditions. That will not apply under normal conditions.

24,015. Forgive me if I suggest to you that the conditions in times of war present greater difficulties than could possibly obtain in times of peace?—Would you say that, Sir Leo? I am not quite certain that it is so.

24,016. I suggest to you that the number of markets in which one could buy were limited, the dangers of transport were enormous; that indeed the whole of the concomitant circumstances were extraordinary and more difficult and dangerous than could possibly obtain under any conceivable circumstances in times of peace?—On the other hand, does it not suggest also that after all it was the United Kingdom, it was Great Britain and France, in other words, the Allies, formed for the time being during the period of war the greatest possible and strongest combination ever known; therefore, under those circumstances, they were able—call it by force or what you will—to make arrangements which under normal conditions would never have been possible.

24,017. May I suggest there were shortages which could not possibly exist in times of peace. There was a limitation in buying that could not exist in times

of peace. Therefore, taking those two elements alone, if these things were not only possible but accomplished during the war—the public did not know what was being done for them—and that was successfully done, do you think it passes the wit of man to arrange such a trumpery matter as the export of a few million tons of coal in times of peace, if you will excuse my using that expression?—I still think the conditions under war conditions made it possible, whereas under normal conditions it would not be possible, under the conditions of prices, too. During war we must agree that the Allies themselves have paid for war commodities prices which under normal competitive times would not have been possible. That has contributed to it, I think.

24,018. I cannot ask you to change your opinion in a few minutes. I can only ask you to think over the considerations I have put before you. Have you considered, taking the balance of probabilities, the position in Europe during the next ten years at least will be such that there will be a demand for coal and for many other commodities beyond the powers of Europe, with any assistance it can get from America, to supply?—I think it must be so.

24,019. Does it not follow, therefore, that even if it were granted, which I do not grant, that it would be difficult to establish an export system under nationalisation, there really exists no risk at all, because there will be a greater demand than any system could possibly be called upon to supply. In other words—I hope I am not making a speech—is it not the fact that there really is no risk, so far as the export trade is concerned, in entering into nationalisation at this time and that during the next 10 years the demand for coal will be more than we can possibly supply?—Drop the question of the period out.

24,020. The period is rather important. We are addressing ourselves to a particular condition at a given time. In 1919 the things are what they are. Consider the next 10 years, and, as a practical man, are you not rather inclined to agree with me?—The period goes. Certainly for a considerable period, but I am not prepared to pledge myself for 10 years.

24,021. There is no real risk to the export trade in this country owing to nationalisation for the next 10 years. If it takes time to adapt itself to circumstances that element can be ruled out?—My reply is these questions have been asked to-day in respect to a possibility of German competition. I quite agree with the answers given that for a time, at any rate, it is quite impossible to expect any keen competition from Germany. I was never seriously afraid, as an exporter, of American competition. To-day I am very much more seriously afraid than I ever have been. The position with America in the past has been she has had the coal but not the tonnage. To-day, under war conditions, she has built up a magnificent mercantile marine which has put America into a very much keener competitive position than she was in or could have been in but for the war. I do fear her to-day, and I am meeting her to-day in my export business.

24,022. One is with regard to Germany. As to Germany, I think you admit that in all probability in the near future, not counted in a year or two years, but probably for ten years or more, there is no reason to fear German competition in coal in Europe will be as strong even as before the war?—Give me the period of years.

24,023. Ten years, or even a little more?—That, again, is wandering into the region of guess work. With regard to the Germans—we may say or think about them what we like—we do know one of their characteristics is recuperation. There is no doubt the export of coal to them is going to become a matter of vital necessity. I should not be surprised if the coal industry of Germany will be made one of the first things to encourage the whole attention of both Governmental and private opinion in Germany to recover that trade. Whether it is going to take 10 years or not is rather difficult to say. I think it is going to recover very fast and very much faster than we anticipate.

24,024. Might we not go further and say that if any recuperation does take place in Germany there

29 May, 1919.]

MR. ARTHUR ANDREWS.

[Continued.]

will be need to import coal into North Germany?
—Why should that be?

24,025. As before the war, for economic reasons?—
Of British coal, do you mean?

24,026. Yes?—Was not the import of British coal a
negligible quantity prior to the war?

24,027. No, very considerable?—I do not think so.

24,028. If you do not know much about it, I will
not ask you about it. Now as to America. You said
something about ships. May I suggest to you who-
ever owns the ships does not matter; it is the length
of the voyage and cost of the voyage that matters?—
Yes.

24,029. Does not that rule out what you said about
America owning ships? Is it not the fact the con-
ditions of competition between ourselves and America
after the war as before the war really excludes
America from the European markets, unless really we
have forgotten how to do business altogether?—The
business is being done on a delivery basis, cost, freight
and insurance. It entirely is a question of marrying
the various costs and bringing them up to the deli-
vered price. Sales may be cheap and freight may
be dear; the distance might make dear freight. We
do know also that America, with her huge produc-
tion of coal, is capable of seriously undercutting, I
say to a certain extent, which is capable of bridging
the difference of freight by that undercutting of
price.

24,030. You know she did attempt it before the war.
She succeeded temporarily for a short period, and
then competition fell and almost disappeared by 1913?
—That is quite true. That was five years ago, prior
to the serious change in her mercantile marine posi-
tion.

Sir L. Chiozza Money: I think Mr. Andrews' Re-
port is very fair and useful.

24,031. *Sir Arthur Duckham:* Sir Leo was speaking
with regard to this satisfactory arrangement being
come to during the war for controlling prices and dis-
tribution of materials?—Yes.

24,032. There was a world shortage in these mate-
rials?—Clearly.

24,033. That made it possible to make the pur-
chases?—Yes.

24,034. I suppose the Allies were fairly closely
united?—Yes.

24,035. That rather assisted the operation?—Un-
doubtedly it made it possible where under ordinary
conditions it might not have been possible.

24,036. Under nationalisation you seem to fear the
question of the difficulty of working an export trade?
—That is so.

24,037. Is one of the reasons that there might be
a fixed price for coal in the country?—I think that
would almost of necessity follow.

24,038. Would that fixed price be detrimental to you
in your export trade?—Of course that would be
largely controlled by the prices which were current
amongst our competing coalfields, either by way of
Governmental monopoly, as I said, or free coalfields.

24,039. Do you envisage coalfields in England as well
as national coalfields?—No, you misunderstand me.
Take the German coalfield, that is partly Govern-
mentally owned.

24,040. Would it be a disadvantage to you in your
dealings abroad to have this fixed price?—I think it
would.

24,041. And for export trade it would be essential
to have a flexible price?—Yes.

24,042. Would it affect you as it would other con-
sumers to have only one body of people to deal with
in your trade—the State?—It would affect us to this
extent—I am speaking entirely as an exporter—that
meeting as we would flexible prices from competing
coalfields we should at least know at once we are in
business or out of business by having fixed prices on
this side. Do you follow what I mean?

24,043. I do not quite follow?—I mean this much.
We should know our fixed price under nationalisation,
assuming there were fixed prices; knowing also
approximately the prices prevailing in competing
coalfields we should know almost immediately whether
we were able to compete as regards English coal or
otherwise.

24,044. Sir Leo asked you with regard to there not
being much possibility of competition within the next
ten years. Is there any competition to-day for
American coal in the South American market?—Most
certainly. As far as the South American markets are
concerned; it is non-existent as far as British coal
is concerned.

Sir J. Chiozza Money: I was speaking of Europe.

24,045. *Sir Arthur Duckham:* I am speaking of com-
petition in the world market?—We have lost the
South American market entirely.

24,046. Is there competition anywhere else?—Yes,
in Sweden. American coals have been sold to Sweden
itself.

24,047. Therefore the competition is with us to-day?
—It is actually with us to-day.

Chairman: We are very much obliged to you, Mr.
Andrews.

(The Witness withdrew.)

Dr. JOHN THOMSON WILSON, Sworn and Examined.

24,048. *Chairman:* I believe you are a Doctor of
Medicine and you hold the Diploma of Public Health,
and you are Medical Officer of the County of Lanark
and Medical Officer of Health of the three County
Sanitary Districts?—Yes.

24,049. You say, in the course of your *précis*:—

“The County of Lanark is, for the administration
of Public Health, divided into three areas, the Upper,
Middle, and Lower Ward Districts. Each area is
administered by a District Committee, and, except
in matters of capital expenditure and rating, act
almost independently of the County Council in all
matters relating to Public Health. Coal mining is
an important industry in the Middle Ward, which is
a large industrial area. The Upper Ward is largely
agricultural, but in certain localities there is a con-
siderable mining population. The Lower Ward,
which is near Glasgow, has also some miners. The
statistics relating to these areas are as follows.”

You show here a table of “Occupation Mortality
in Scotland.” I think this is with regard to all
Scotland, is it not?—Yes.

24,050. We have already had that. I thought
perhaps it referred to Lanark itself, but I will just
draw attention to the three salient facts. You take
a table of deaths per 1,000 workers, age period 25 to
45, for the period 1890 to 1892. Agricultural
labourers seem to be the lowest with 4.52, and

builders, masons and bricklayers seem to be the
highest with 15.04. Coal and shale miners are
7.3. I think those figures come out more or less
the same with regard to the years 1900-1902?—Yes.

24,051. I think the same proportion is maintained at
the next age period, which is between 45 and 65?—
Yes.

24,052. Then you set out a very interesting table
which we have also had given to us. Then we come
to another interesting table (Table A) at the bottom
of page 2 shewing the “Comparative Mortality of
Men, 25 to 65 years of age, in different occupations,
1881-2-3.” I think the people who seem to live
longest are clergymen, priests, and ministers.
Gardeners are next with 108; coal miners are 160.
Inn and hotel service seems to be the worst with 397.
That table is set out under the heading of “Mortality
in Relation to Occupation,” by Dr. William Ogle,
and the last paragraph of that reads:—

“Of the death-rates thus obtained the lowest was
that of men in the clerical profession, and for the
sake of easy comparison I have taken this lowest
death-rate as my standard. I represent it by 100,
and the death-rate of each other profession or
industry is represented by a figure duly proportionate
to this standard.”

Then it goes on to set them all out. Then on the top
of page 3, second column, it says:—

29 May, 1919.]

DR. JOHN THOMSON WILSON.

[Continued.]

"There remains yet one industry among those exposed to inhalation of dust of which I have not yet said anything—I mean coal mining. This I have reserved to the last, as requiring special consideration. Seeing the conditions under which coal miners work, in a hot and dust-laden atmosphere, and their terrible liability to fatal accident, it might naturally be expected that their death-rate would be excessively high. As a matter of fact, this is far from being the case. Even when fatal accident is included their death-rate is by no means an excessively high one; and, putting accidents aside, the death-rate from disease alone is exceptionally low, being almost exactly the same as that of agricultural labourers.

The question is, To what is this comparative exemption due? There are two possible explanations: one, that it is simply due to the picked character of the miners, inasmuch as none but strong men are likely to adopt so laborious a calling; the other, that there is some special preservative condition attaching to the industry; and, as the most notable of the conditions under which the coal miner works, is the necessary inhalation of coal dust, or other matter given off from coal, it is to this that most writers who have adopted the second explanation attribute the comparative immunity. 'It is in the highest degree probable,' says Dr. Hirt in his well-known treatise, 'that coal dust possesses the property of hindering the development of tuberculosis, and of arresting its progress.'

Then you set out a number of most interesting figures and we are much obliged to you for your proof.

24,053. *Mr. Robert Smillie: (To the Witness.)* I think you can say a few words on the housing question of Lanarkshire?—Yes.

24,054. I suppose you know the housing conditions of the Lanarkshire miners?—Yes, and I did send on some proofs of that some time ago and I have some of the details here.

24,055. *Chairman:* Would you just tell us what they are. We have not time to go through the 60 or 70 pages of proof which you have been good enough to send in. Will you just tell us from your own knowledge?—The tables taken from the last census show that the two-apartment dwellings prevail mostly, but one-apartment dwellings come next, and then the three and four-apartment class, and then above that.

24,056. *Mr. R. Smillie:* Do you remember going round a portion of the county with Mr. Forgie, Dr. Haldane and myself?—Yes, I do.

24,057. I think we went to your house when we finished?—Yes.

24,058. Do you remember showing a map of the county in which there were certain black spots?—Yes.

24,059. I think you yourself had prepared it from your own knowledge?—Yes. You were naturally anxious to find out what accommodation was available for washing in the miners' houses.

24,060. That was the reason for our visit?—Yes, and I took you to the parts where I thought you would see the evidence you wished to get.

24,061. I want to call attention to that map. On that map you pointed out certain parts which were darkened, and you said if any infectious disease broke out, you would know at once where it would spread to. Do you remember that?—No, I do not remember that particularly, but the localities I took you to were Blantyre and Belshill, and round that way.

24,062. I want to call attention to the map which you showed?—I am sorry, I cannot remember that.

24,063. Had you a map in your house of the county in which there were dark portions, one being Blantyre and two or three other places as to which you told Dr. Haldane and the rest of us that if any infectious disease broke out it would be sure to spread to those particular parts?—No, I do not remember that, I assure you.

24,064. Is the housing worse in some parts than others?—Yes.

24,065. Have you a map in your house with black portions on it where the housing is worse?—No, I have not such a map that I can remember, but a great deal has been done since you and Dr. Haldane

went round with me in meeting those conditions. In Blantyre we have had water-closets introduced. I remember Dr. Haldane being shocked at the midden privy system in the Blantyre area where you had miners' houses with midden privies, but within two or three years of your being there they were all converted into water-closets.

24,066. But that is not the case all over the county?—No, it is not the case all over the county, but it was very largely introduced wherever there is a good water supply and an efficient drainage system. In other words, although we had in the City of Glasgow the midden privy system existing for a long time, and longer than in other parts of Scotland, yet we tried to introduce that water-closet system very fully and completely.

24,067. I think it is six or seven years since we were round?—It is more than that.

24,068. It is when the Royal Commission on Mines was sitting, 1909 or 1910?—I have your report beside me and I think the date of that report was earlier than 1909 or 1910.

24,069. Well, it is hardly necessary to trouble about the time. You were strong in your condemnation of single-apartment houses for the miners at that time, were you not?—Yes.

24,070. I think you went so far as to say that no family should be required to live in a house of one apartment?—Yes, I believe I expressed myself that way.

24,071. I think for some years you have done everything in your power to induce the County Council to see to it, and that your scheme of housing was carried out to that extent?—Yes.

24,072. Have you changed your mind since then?—No; but I may say that, so far as coalowners' housing is concerned, we have had no plan since 1900 which shows one-apartment dwellings. That is to say, I can give you figures of the actual number of houses built by coalowners since 1900 and I think there are only 12 out of 1,000, which is about 1 per cent.

24,073. Have you changed your mind on the question of one-apartment houses?—No.

24,074. You are still of opinion that families should not live in one-apartment houses?—Yes, but there is this difficulty. If miners marry early and they have no way of furnishing more than a one-apartment house, we would rather see them in a one-apartment house suitably constructed than living in lodgings or something worse than that. Take things as they are to-day; you have miners getting married and the wife going to her home and the husband going to his mother's home and living there when they are married. You have also the case where the wife lives with a married sister or some relation of that kind. Now that is a very undesirable thing. No matter how humble the home may be, it is certainly far better than starting married life under these conditions.

24,075. I think you have gone the length of expressing your opinion that a one-apartment is very suitable for an aged couple or a young married couple?—I believe that was a reasoned argument as conditions existed in 1909.

24,076. Is that really your feeling?—If they can afford something better, good and well; but it is far better to be living in a little house of their own than to be living in lodgings.

24,077. But that is not the way in which it is put. That it is far better that they should be living indoors than lying outside anyone would admit, but it is put that you rather advocate a single-apartment house?—No, I am not an advocate of single-apartment houses. I can get the actual words of the Report if you like. You will find it is a reasoned argument which I can go over bit by bit, and if you find me wrong, you can correct me. I am not an advocate of one-apartment houses. We have a very high birth-rate in our districts due to the fact largely that people marry early in life and often with not sufficient means to furnish a house and live under these conditions properly.

24,078. Of course at the present time you know in nearly all the mining centres in the middle of the county that the people who have married recently,

29 May, 1919.]

DR. JOHN THOMSON WILSON.

[Continued.]

the young people, have very often gone into a room of either the man's father or mother, or the woman's father or mother where there has been a two-apartment house?—Yes.

24,079. You know there are two families in many cases living in a single-apartment house?—Yes, very largely due to the war condition. That is to say, all building operations ceased during the war and many of these men have come back from the war and were anxious to get married without delay.

24,080. But for fifteen years you have been advocating that there should be some scheme of housing in Lanarkshire?—Yes.

24,081. I believe you have been doing everything in your power, or were at one time, to get the county authorities to move?—Yes.

24,082. But you could not get them to move?—I do not think you should put it in that way. Up to 1909 we did not have Parliamentary power; that is to say, the Housing and Town Planning Act, 1909, was the first Act of Parliament that gave us much power to go ahead with the housing scheme. Since then we have also had the miners' agents on our country committees, who have been most helpful in pushing along with things, and I should think you may take it that with a mining agent as Chairman of our Housing Committee in the Middle Ward things have been going along very well.

24,083. You do not seem to be moving very much?—Yes we are.

24,084. With regard to the housing accommodation in Hamilton, are you responsible to the Borough Council?—No.

24,085. Take Larkhall and so on. If there were houses available for the workmen to go to do you think you would be justified in condemning some 1,000 houses as unfit for the people to live in?—I have given actual figures in my *précis*, but I will put it to you in this way. Four years before the war 1,000 were condemned and 4,000 were renovated. We have on our books just now about 2,000 that require to be dealt with and are being dealt with in the way of new housing schemes.

24,086. May I take it the majority of the older houses owned by colliery companies are simply founded on the clay without any attempt to have a damp-course to them?—I think that the houses built in early days were so constructed, but I think the bulk of them now have been condemned as unfit for human habitation. That is to say, the lack of a damp-proof course may give rise to dampness, and that we say is a nuisance, dangerous to health, and we condemn the house if it is damp.

24,087. Would you believe about 70 per cent. of the houses owned by employers in Lanarkshire are of that kind and that it is only those built within the last 10 or 15 years that have a damp-course?—I could not give you figures, but I will take it from you if you say so. Of course, it does not prove dampness. It is quite easy to protect a house without a damp-course and not have dampness in the walls, but a great deal depends upon the subsoil.

24,088. I think your explanation as to the low death-rate of the miner is probably accurate, and I was going to put it to you, but you put it more clearly than I can. You say it may be accounted for by the fact that it is only the strong that go to the mines?—Yes.

24,089. And probably the weaker are kept out of the mines and put to some other industry. Is the mortality amongst other children more favourable than amongst the miners' children? That is to say comparing miners' children with other children?—Comparing the miners' children as a class with the children of another class?

24,090. No, I mean the children of the mining villages of Lanarkshire as we understand them as compared with the middle-class and upper-class children?—Well, I will put it in this way, that the infant death-rate—that is to say infants under one year of age—among the mining classes is higher than among the wealthier classes. If you take houses of three or four and more rooms, the death-rate may be only 60 per thousand infants, but among the mining communities it is perhaps as high as 110 or 120. But

you have to remember that the population that produces most of our babies to-day is the working classes.

24,091. But it is percentages you are dealing with?—I want to lay stress on the fact that where the mortality is high you have also a high birth rate, and it is the working classes that have the highest birth rate.

24,092. Does not the same apply as you go higher up than one year? Does it not also apply to two years?—I have no statistics taken out for that age period, but I believe for the next two or three years it will be high.

24,093. You do not know whether it has been higher in the past or not?—So far as my own statistics are concerned I have not taken out the figures.

24,094. *Sir Adam Nimmo*: I think you have heard the criticism and know something about the criticism which has been passed upon coal owners in Scotland with regard to the housing conditions of their men. May I ask if you regard that criticism as quite fair?—No. I am sorry Mr. Robertson was not aware of the immense improvements that have been carried out since the 1909 Report was issued. Take the firm of James Nimmo and Company.

24,095. That is specially referred to; perhaps you would deal with it now?—The information in 1909 was that the conveniences consisted of pail privies and open ash-pits. We got a drainage scheme introduced into the Holytown area, and immediately afterwards water closets were provided. We then got a scavenging scheme introduced, and the ash-pits were abolished also. So that the fact with regard to privies and open ash-pits is that they are non-existent.

24,096. In fact, the statement made by Mr. Robertson was not correct?—That is so.

24,097. And did not represent actually the position at the time he spoke?—It did not.

24,098. Do you know the houses at Eastfield in the Longreid district?—I did at one time, but it is a very decadent area, and they are practically all empty now.

24,099. Do you know that certain houses there were reconstructed at the beginning of the war?—Yes.

24,100. Twenty houses?—Yes.

24,101. Do you know whether all these houses have been occupied or not?—No, they have not all been occupied, but water closets were provided in each of these houses.

24,102. Do you know whether the poorer houses in the neighbourhood have been occupied in preference to those houses?—I do not know that.

24,103. Do you think that the housing conditions of the mining population in Scotland do prejudicially affect the death rate among the miners?—It is exceedingly difficult to associate health and housing. That is to say, you will get a very bad house, or a lot of bad housing, and yet the mortality would not be as high as you would expect it to be. In going into a court of law we do not require to produce vital statistics to prove that there is actual injury to health going on, because it is impossible; but we simply state that there are sanitary defects which must be dealt with.

24,104. Do you think the man in the south quite understands the housing question in Scotland?—Well, I have been through some of the mining areas about Coventry with a committee, and I know the housing there is very different to what we have, but we have adopted in our new scheme somewhat that plan and type. The two large apartments provided for the Scottish houses will contain, perhaps, as much cubic space as the three and four apartments in the South Country house.

24,105. Is that not a fact very much overlooked in comparing houses in Scotland with houses in England?—I believe it is.

24,106. That the two rooms in the houses in Scotland are much bigger?—They are.

24,107. Are the miners' houses in Scotland that you know of either better or worse than the housing conditions generally applicable to the industrial population?—No, the housing conditions relating to all classes of labour are on the same plan, more or less.

29 May, 1919.]

DR. JOHN THOMSON WILSON.

[Continued.]

24,108. Have you found that the coalowners in Scotland have been very ready to carry out your instructions in regard to improvements on houses where you considered them necessary?—Most of them have; there are just one or two exceptions.

24,109. But generally speaking?—Generally speaking they have been very ready and very willing, and I would say this much, that notwithstanding the fact that in the City of Glasgow you had the working classes housed in one-apartment dwellings—even provided by the Corporation of Glasgow and provided with common conveniences—yet you have certain firms, like James Nimmo, whom I will take again, if you like, who were amongst the earliest to provide single water closets and sanitary conveniences for each dwelling.

24,110. Have the houses which have been put down by the coalowners in Scotland been steadily progressive?—They have, undoubtedly.

24,111. What is the character of the most recent houses which have been erected in Scotland?—They are big, roomy, two-apartment dwellings, each with their own scullery, water closet, slop-sink, gravitation water supply and everything that you would desire in the way of modern conveniences.

24,112. As a medical officer, have you looked upon that housing accommodation as satisfactory?—I have plans in my possession that I can show you to prove that.

24,113. Are you aware of the statement that was referred to by Mr. Robertson, which was alleged to have been made by Dr. Russell, the late Medical Officer of Health for Glasgow?—Yes. No doubt it is an affecting story, but the Glasgow Corporation, whom he served, appointed a Housing Commission some 10 or 12 years ago, and after that Commission sat and deliberated, the Corporation built workmen's dwellings, all one and two-apartments, in the proportion of three one's to six two's. These are out in the Riddrie district.

24,114. Do you know when Dr. Russell's statement was made?—It is long ago.

24,115. Was it as far back as 1888?—Perhaps not quite so far back as that. He wrote it in connection with a Church Society.

24,116. *Mr. Herbert Smith*: May I ask you one question, because I want to see what Mr. Robertson said? You seem rather anxious to defend James Nimmo & Co. Let us see what he said in his *précis*?—What I said is perfectly true.

24,117. But let us see what Mr. Robertson said in his *précis* with regard to James Nimmo & Co.:—"James Nimmo & Co. (Chairman, Sir Adam Nimmo; Chairman, National Association of Coalowners), Holytown Mine." Then you refer to pages 175 and 176 of the Medical Officer's Report, which says this:—"Holytown Mine. 438 employed. One hundred and seven two-apartment houses, one storey, brick built. No damp-proof course, no garden ground. Sculleries used as wash-houses, no boilers, thirty-six pail privies; eighteen open ashpits"?—That was all remodelled when we got that drainage system introduced and the scavenging system.

24,118. Is that on pages 175 and 176 of the Medical Officer's Report?—May I get it?

(The Witness withdrew.)

Sir KEITH PRICE, Sworn and Examined.

24,133. *Chairman*. I believe you are a director of Price & Pierce, Limited, Wood Brokers?—Yes.

24,134. You say in your *précis*:—

"In November, 1914, I was asked to take up work in connection with the supply of explosives at the War Office, and was subsequently transferred in 1915 to the Ministry of Munitions. In 1917 I was appointed Member of Council for "X" Group, and continued in this capacity until the Armistice, when the groups were re-arranged and all the Government factories working under the Ministry of Munitions were included in my group. In March of this year I returned to my ordinary vocation.

My knowledge of coal is confined to the early days of the war, when I was responsible for the production of the bye-products from those collieries having coke

24,119. I mean what Mr. Robertson said?—I have copy of the report here; I can tell you.

24,120. Is this what Mr. Robertson said. He is only quoting the Medical Officer?—There was a very fiery paragraph in our "Glasgow Herald"—"Deplorable Conditions." May I call your attention to it?—I have the cutting here (*producing same*.)

24,121. I can understand Sir Adam Nimmo wishing to get clear of it, but I want to know what the doctor said?—What was said was true at the time the report was made. Why Mr. Robertson made a mistake was that he did not find out what alterations were made.

24,122. I want to have a word with you on your experience of Scotland because we happen to know something about Scotland. I went up to Scotland in 1887 and went to Cambuslang. Do you think it was unusual to have to be called out of bed because you were in the same room where child-birth was going to take place, as these were only one roomed houses?—That is not desirable.

24,123. Is it true, as a matter of fact, that it has happened scores of times?—First of all, I was born in Cambuslang, and I remember quite early the miners rows when I was there, but I cannot say what was the accommodation provided. What part of Cambuslang are you referring to?

24,124. I was there in 1887.

Sir Arthur Duckham: Does that affect us to-day?

24,125. *Mr. Herbert Smith*: There seems to be an intention to glide over this. We are talking about one-room houses. Sir Adam objected when Mr. Frank Hodges made a statement saying it was not so, but I put it, and the doctor seems to agree. There are single-room houses now and he recommends two-room houses. (*To the Witness*.) Have you two-room houses where you live?—Two-room houses are very popular with the working class.

24,126. Have you a two-room house where you live?—No.

24,127. Would you like to live in a two-room house?—I believe I would.

24,128. Well, there are plenty if your idea is carried out, to go into. I suggest you ought to shew an example by living in one?—With regard to Cambuslang, I was not Medical Officer of Health in those days. Cambuslang in 1887 was simply managed by a Parish Council.

24,129. One of the things I want to make clear now you are here is that Mr. Robertson was here before, and all he quotes is a Medical Officer's statement?—What he did quote I believe might be true at the time the report was made. What I am telling you now is that that report would show that it was a basis of action, and immediately the facts were put before the various sanitary authorities, they did take action.

24,130. I think you will admit Scotland is fifty years behind England?—We have been a poor people compared with England.

24,131. You will admit that there are many scores of houses now in a similar position to what James Nimmo & Company's houses were in when this report was made?—Yes, and if we are only spared for a few years, they will soon be wiped out.

24,132. You have a lot of sins to wipe out, and the sooner you start the better.

ovens, these being required for explosives purposes. In this capacity I was a member of the original Coal and Coke Distribution Committee of the Board of Trade.

As member of Council "X" during the war I was responsible for the control of over 50 Government factories and establishments and some 80 explosive stores, the factories representing an expenditure of over £25,000,000 on works and plant.

My evidence must be considered as my personal views only.

I consider that the Government factories which came within my group were satisfactorily run, and that the management and results did not compare unfavourably with private enterprises. The factories may be divided into two groups:—

29 May, 1919.]

SIR KEITH PRICE.

[Continued

- (a) Those which were run entirely by the Department.
 (b) Those which were run by private contractors for a management fee on behalf of the Department.

It is difficult to say which system proved the more efficient, as a fair comparison of the working of chemical and explosive factories is difficult to make, but on the whole it can certainly be said that the factories under Group (a) compared favourably with those under Group (b). The two largest factories, viz., H.M. Factory, Gretna, and H.M. Factory, Queen's Ferry, were run under Group (a). In the case of factories run under Group (b), resident Government Accountants were installed and close supervision always maintained from Headquarters.

While maintaining that the Government factories which came within my purview were satisfactorily run during the war, I have the very strongest opinion that in peace time the reverse would be the case.

The Department had the advantage during the war, not only of the extreme keenness and loyalty of the workpeople and the management, but also the advantage of having been able to secure some of the leading engineers and chemists of the day to manage and administer the factories. These men came from all parts of the world, and either worked voluntarily or took relatively small salaries in order to do what they considered their duty to the country. It would be practically impossible for the State to secure these men in normal circumstances, and, in fact, I know that the majority of them would refuse to serve the State during peace time in view of what they consider the irksome and inefficient system with which they have had to contend, quite apart from all questions of remuneration. As regards remuneration, I cannot see how it would be possible for the State to pay the salaries which men of the class to which I refer above can command in the open market. Under Government control there is, to a large extent, no reward for efficiency, and inefficient men can keep their positions under nearly every circumstance; this cannot lead to the economic administration of industrial concerns.

My experience of those Government factories which were in existence previous to the war confirms me in the opinion that Government factories cannot be operated on competitive or economic lines, owing to the cumbersome nature of the procedure which is inevitable under Parliamentary and Departmental control.

Among the objections against Government control to which I attach importance are the following:—

1. The management having so little say in:—
 - (a) the appointment and selection of staff;
 - (b) the grading of salaries;
 - (c) the lack of authority in dealing with labour;
 - (d) the efficient maintenance of plant, i.e., the scrapping of obsolete plant and the installation of up-to-date plant.
2. The weakness of any Government organisation in purchasing raw material on competitive lines (a condition which did not operate during the war owing to so many prices being controlled and material being rationed).
3. The weakness of any Government organisation marketing its products. I cannot see how this can be done satisfactorily on commercial lines without acute controversy.
4. Political pressure will certainly be brought to bear whenever questions of closing down inefficient or uneconomical concerns arise, or even on lesser subjects?—Yes.

24,135. *Sir L. Chiozza Money*: I have read your *précis* with great interest, and you know I took some interest in your Department when I was myself connected with the Ministry of Munitions. I think that your verdict on the Government factories is that they compared favourably with those run by private contractors for a management fee?—That is so.

24,136. That is to say, that the factories which were run sometimes, as you say, by men who did the work voluntarily, and sometimes by those who took relatively small salaries, were not worse than the

factories run by private contractors for an independent contractor's fee?—Yes.

24,137. Would it not be true to go a little further than that and say that many of these State factories actually did produce in the war goods at a lower cost than the prices for which contracts had been made with private contractors?—Yes, that is the case.

24,138. Did that not lead to this—that the prices paid by the Government to private contractors were in a number of cases revised downwards, because of the successful work of the State factories?—That is the case.

24,139. So that we not only saved money in the State factories, but actually saved a lot more money in the private factories, because we were able to show what the cost of production of goods actually was?—To a certain extent, that is the case. Of course, it was also assisted by the fact that the contractors' accounts were carefully audited.

24,140. And by the Costing Department of the Ministry of Munitions?—Yes.

24,141. I think that is true of cordite, is it not?—Conditions were rather difficult in the cordite trade. The production increased so enormously. Where you started with a production of a few tons a week, you suddenly came into thousands of tons per week, and the difference in the cost of production on the large scale was very appreciable.

24,142. With regard to sulphuric acid, did there come under your attention the price at which that was produced and the cost at which it was produced at Gretna?—Yes.

24,143. Was it a favourable cost?—Very favourable.

24,144. Was it very favourable as compared with sulphuric acid produced and contracted for elsewhere?—No, you cannot say that. The sulphuric acid which was produced at Gretna was strong or fuming sulphuric acid, which we usually call oleum. With regard to private contractors, I think I can state before the war there were only two oleum works in this country and they were rather old. The oleum plants at Gretna being absolutely modern and up-to-date were able to produce at a very much improved cost.

24,145. There is no doubt it was a very favourable cost?—Yes, they had the latest advantages and everything was quite modern.

24,146. And it would not be an exaggeration to say that if the whole of the industries of the United Kingdom were managed as efficiently as Gretna and were furnished with plant as up-to-date as that at Gretna, the cost of production in this country would decrease and its power in the market of the world increase?—That is probably the case. Of course, you have a factor to remember in that *carte blanche* was given to do the best thing on the best scale, and you had the best men and the most up-to-date methods of production and management possible.

24,147. It is a fact, is it not, that in addition to calling in business men like yourself, the Ministry of Munitions also called upon scientists who were not, in the ordinary sense of the word, business men?—That is so.

24,148. Take Mr. Lambourne with the coke ovens; he was not a business man, was he?—No, he was not.

24,149. Did he not come from some college or school?—Yes, to the best of my knowledge.

24,150. Did you have the assistance of Dr. Spielman, of the Institute of Chemistry?—Yes.

24,151. Those are only samples of the kind of men brought into the Ministry of Munitions and made an active State service in the war?—We had scientific men come from all over the world. We had three leading professors from Australia, who insisted on coming over.

24,152. It is not unfair to say, so far as the actual fact is concerned, quite apart from how it was done, that there is a good deal to say for the success of State enterprise during the war?—Yes.

24,153. And I think you rather doubt the continuance of that in peace time, because you feel the State cannot get the assistance of such men in peace?—I am sure it could not get such men in peace. I have very grave doubts on that subject.

29 May, 1919.]

SIR KEITH PRICE.

[Continued.]

24,154. I noticed that opinion in your *précis* and it very much interested me. Have you ever examined the existing state of the municipal undertakings of this and other countries?—No; I have never had any occasion to study it.

24,155. Well, let me suggest to you that other nations in their State Government and in their local and municipal government have had no difficulty in getting the assistance of the very finest organisers and scientists to help them. Is it not rather true to say that men are proud to serve their country in those connections?—I should not have said so myself. My experiences of municipal gasworks and municipal electric works, such as they are, does not lead me to that conclusion.

24,156. You know, do you not, that both municipal gasworks and electric works produce their gas and power at least as cheaply as private concerns, and I think I am not going too far in saying they produce them more cheaply?—That is not my experience as regards electric power.

24,157. But you know it is the fact from collected statistics that the supply of electricity to the public from municipalities is cheaper than from companies?—I do not know enough about it to say so.

24,158. But that would show, if it were true, that they managed to get the assistance of capable engineers?—I presume it may be so.

24,159. And if you take the State railways of the world, is it not the fact that in Germany, in Switzerland, in Norway, in Sweden, in Denmark, in Japan, and in Australia, all those State railways have the most capable men at the head of them, and men who are acknowledged to be leaders in their profession?—There, I am afraid, I should entirely differ from you. That is not my experience, with the exception of the German State Railways. I have travelled a good deal, and the German railways were very good. If you take France, the Orleans State Railway is disgraceful. When the L'Ouest was taken over it was very bad, but I think it was worse after the State took it over.

24,160. I do regard this as of very great importance. Do you really suggest to us in time of peace the Electricity Commissioners who were being set up by the Government, and who would have the great responsibility of carrying on the electric work of this country, would not be able to command capable engineers to assist them? You know the Government electricity work?—Yes, I am aware of it.

24,161. Do you suggest the Government could not get the assistance of Mr. Merz and men like that?

24,162. *Sir Arthur Duckham*: As whole-timers?

Sir L. Chiozza Money: Yes.

Witness: I should very much doubt if they would. It depends upon what salaries the Treasury are prepared to offer.

24,163. Does that answer it? If you really can offer them a remuneration according to their status, they will be only too glad to come?—I think when you talk of the electricity trade, there is just the possibility of it, because it is in such a dreadful state at present that men for the good of the country might come forward to do it. That is one of the few industries in which I see the possibility.

24,164. Is it not the fact that if you take the public enterprises of the world as a whole, you have the most capable men in charge of those things?—I should not have said so. I should say private enterprise had the most capable men.

24,165. Take the town of Cologne where our soldiers are. Have they not the most capable electric supply, and is it not managed by a most expert man? It surprises our own soldiers who are asking why our own towns are not so well fitted up?—Quite so, but look at London on the other hand.

24,166. But London has not got it, unfortunately. Take the Panama Canal. Is it not the fact that America was able to get hold of the very finest engineers and scientists, who sacrificed their lives in some cases, in order to make that State enterprise a success—and that in time of peace too?—You might do it for one State work which stands out as something on which a nation's reputation depends, but for ordinary everyday work like producing commercial material my opinion is the reverse of yours.

24,167. You think that a capable man of affairs or a scientist would rather serve 10,000 shareholders

than he would serve his country?—The Government methods are so cumbersome and so annoying that I think in peace time you would have the really first-class men refusing to do it.

24,168. Are you not rather going by your experience of a time when labour was short and men were being drained into the Army and mechanics had got to be rationed out and every material had to be rationed out, and when if you wanted to establish a new enterprise under your department, and you had to co-ordinate it with other demands, and ask whether shells were not more important than something you wanted to do? Are you not misled in comparing that with a time when there would be freedom of action in peace?—I may have been unfortunate, but with regard to serving in peace time, I have had conversations with the best men I have come across, and the majority of them, or the most important people, told me that on no account would they continue in Government work.

24,169. Is it not the fact, taking your own operations in the Explosives Department, that we had to set up Committees to find out how to safeguard this country in respect of glycerine, one of the chief things you wanted?—Yes.

24,170. And we had to set up a Committee to safeguard us in respect of glycerine—you remember the Committee on which I and others served?—Yes.

24,171. Ought we to have had to set that up if the business men of this country had done their duty? I put it to you?—That is a very difficult question.

24,172. I put it to you, is it not the fact that business men of this country in the year 1915 (I am speaking of things of which I have some special knowledge) sent out to the Continent in 1915, supplies of fat which contained very large quantities of glycerine which were wanted for explosives?—Were they not sent to Holland under agreement?

24,173. Some of it was sent under agreement, but I am speaking of things which were sent out under the most dubious circumstances and which had to be stopped?—If you say so I accept it.

24,174. Is not that what led to the setting up of committees of which you know?—I am certainly not aware of it.

24,175. Is it not clear that there was an edict against trading with the enemy. If business men of the country had done their duty, there could not have been need for a committee to keep fat in this country and it would have stopped in this country without a committee to help it?—It seems to me that that is a question for the Government and they should not have allowed it to go out.

24,176. There was a law against it?—But how did it get out?

24,177. Because the profit of private merchants sent it out. It was a gain to the individual to send it out because he got a high price on the Continent. Therefore private gain operated against national interest?—I am not sufficiently aware of those facts to answer the question.

24,178. *Sir Arthur Duckham*: Did these men that came in from all parts of the world and worked voluntarily, and worked at comparatively small salaries, come at a time of stress to the country when it was in great need?—Yes.

24,179. In the ordinary working of the country you do not think they would have come in the same way?—Certainly not.

24,180. Take your own case: would you be prepared to serve your country at the salary of the Prime Minister?—I do not suppose I would.

24,181. There was one man working under you, was there not, who gave a great impetus to your Department, I believe, and who could certainly command in the open market to-day double the salary of the Prime Minister. In fact I believe he was offered a salary commensurate with that?—Yes.

24,182. Do you think it likely that that man who was so valuable to you in your work would come back and work under State service?—Taking the man I think you have in view, that man was in South Africa. *Sir Starr Jameson* cabled that the British Government required his services. He was 40 miles from Cape Town, and the boat left in 1½ hours. He caught the boat, but without any luggage or anything at all. That is what he did to come here.

29 May, 1919.]

SIR KEITH PRICE.

[Continued.]

When he left he said he would never again take up any Government work except in time of war.

24,183. You mentioned the great difficulty of getting rid of inefficient. Have you found that a great deterrent for economical working in your department or other departments in the Ministry of Munitions?—No, because during the war we were so short of staff that really you had to take anyone you could get. But looking at the Government service as a whole, so far as I am aware, you may take it that unless a man does something really bad he is fixed for life.

24,184. You cannot sack an inefficient?—Such a thing is almost unheard of.

24,185. One point raised by Sir Leo to-day was this question of glycerine, and there was toluol which he raised the other day. The point is that these things were not required in these quantities before the war?—There was no demand in this country for them.

24,186. Therefore you could not imagine any private enterprise or Government Department retaining or building up stocks of these things to anything like that which was commensurate with our requirements in war time?—I think that the War Office ought to have made some preparation for holding stocks, but, apart from that, there is no possible reason why they should be kept in the country. It is rather the contrary; you should encourage exports, if you cannot use them here.

24,187. Would the stocks have had to be very big to be any use to you?—We should like to have had

some reserve previous to the war, but with regard to the quota of fats and oils, the answer to the point which Sir Leo was after is this, I think, that there was no machinery here for extracting the glycerine which was required in the early days of the war.

24,188. Did you find that the men worked better in your Government factories, where they were not working for profit, than they did in the private factories where they were working for profit?—Well, the men I was concerned with worked so well that I would not like to express an opinion.

24,189. They did not work any better in a private factory than in a Government factory?—I should not like to say so.

24,190. You had a certain interest in the Woolwich Arsenal at the end, had you not?—Yes.

24,191. Did you find better conditions so far as output and discipline and general content with the workers ruled than in a private enterprise?—No. It was not so with Woolwich Arsenal, unfortunately, I suppose, because it was a pre-war factory, and that is one of the examples which weigh very much with me.

24,192. With regard to costs at Gretna and other Government factories, did they include a proper allowance for costs as compared with all the very heavy expense they had at these Government factories?—Yes, the costs were kept on a proper commercial basis.

24,193. So that the comparison is a perfectly fair comparison?—Yes.

(The Witness withdrew.)

Sir JOHN MANN, K.B.E., Sworn and Examined.

24,194. *Chairman:* The Commission have asked you and Mr. Webster Jenkinson to come and give evidence, and they have said under the circumstances they do not think they desire to ask you any questions because the matter is a very technical one. What I propose to do is to read your proof. I will ask you first of all, is the evidence which you have handed in a *précis* of your views on the question?—It is.

24,195. I will read it:

"*Précis of Evidence by Sir John Mann, K.B.E., Chartered Accountant (Messrs. Mann, Judd, Gordon & Co., London, Glasgow and Newcastle), Controller of Munitions Contracts, Ministry of Munitions.*"

He says:

"1. I shall be glad to give the Commission any information in my power on methods of ascertaining costs of production—a subject which I have studied throughout my professional life. Ten years ago, with my partner, Mr. Harold G. Judd, C.B.E., I published a small book on "Colliery Accounts" which includes some notes on colliery costing.

For nearly four years past I have been engaged in finance and contracts work in the Ministry of Munitions, where special departments formed under my direction have demonstrated the supreme importance of accurate knowledge of costs of production. It will be understood that any opinions expressed as to the work of the Ministry are personal and should not be treated as official.

I may add that for many years my firm has been called in from time to time to verify, for the satisfaction of the miners in Scotland, the statistics (mainly of realised prices) submitted by Scottish coal owners to the Conciliation Board. I have, therefore, some knowledge of the methods of accounting in use in Scottish collieries.

2. The following are the principal questions which I anticipate the Commission may wish to put to me along with very brief answers thereto based mainly upon Scottish experience:—

(a) What type of accounts are kept to show the cost of coal mining?

Answer.—Generally very complete and prepared on sound principles, but extremely varied in details.

(b) Are the accounts open to any substantial improvements?

Answer.—No, except in some of the smaller concerns.

(c) Can statistics be compiled comparing results of one colliery with another?

Answer.—Yes, but many adjustments would be necessary to ensure true comparisons owing to the great variety in detailed methods of accounting in use.

(d) What results may be expected to follow a close comparison of working costs throughout the country?

Answer.—Nothing but good, through disclosure of the relative strength or weakness of the management through showing up sharply any cases of waste and extravagance and distinguishing excess cost due to natural handicaps.

(e) Would the introduction of a uniform style of colliery cost accounts be feasible and advisable?

Answer.—Yes, if prescribed by Government.

3. The ascertainment of costs of coal-mining, taken by itself and apart from its by-products, presents little difficulty, indeed it is one of the simplest cases for costing. There are few processes, and there is one unchanging unit of production—the ton.

The market price is generally fixed by outside conditions and without very close reference to costs of production. The cost accounts, therefore, differ from those of many manufacturing industries where price is directly based upon cost, *e.g.*, complicated engineering work where elaborate preliminary estimates of probable cost are first prepared, followed by a close scrutiny of the cost of each operation, culminating in comparison of actual cost with original estimate.

4. Colliery cost returns are prepared at frequent intervals for every colliery I know. Sometimes the forms used are rudimentary and fallacious, but these occur generally in small cases, what may be called domestic cases, managed by or under the immediate personal supervision of the actual proprietor.

In large group of collieries and in cases where the general direction is not on the spot, elaborate and systematic statistical records are kept based upon

29 May, 1919.]

SIR JOHN MANN, K.B.E.

[Continued.]

prompt returns from each pit. The larger the group the more exact and useful are the statistics. The result of the cost returns is sometimes, though not always, reconciled with the financial accounts at the close of each quarter or half-year.

5. Proper colliery cost accounts should show clearly the results of the use of machinery—coal-cutters, washers, etc. They should also show separately (distinct from coal mining) the financial return from the ownership of workmen's houses, railway waggons, the operation of attached brickworks, coke-ovens, by-product, and recovery plants. There is room for improvement in the methods in which subsidiary accounts are kept.

6. Without cost returns the management would be helpless, but, on the other hand, there is a distinct risk of relying too much upon the mere preparation of the returns. Their value lies in their use. After all, costs are but instruments in the hands of the mining engineers and export managers—tools which must be kept polished and sharpened and above all be used with intelligence and judgment. Too often has a cost system been introduced and expected immediately to work miracles of itself forgetting that costing is but the diagnosis, which is valueless unless followed by curative treatment.

7. There are broadly three functions of colliery management for which intricate and accurate cost statistics are of essential value:—

- (a) in the detailed practical day-to-day management of each pit.
- (b) in deciding the general technical policy of colliery development.
- (c) in determining prices and general commercial policy.

8. Cost returns are the basis of any supervision and criticism of the details of management. They should throw up items of excessive or over-average cost and thereafter point the way to inquiries as to the cause whether unavoidable or due to carelessness, inefficiency, waste of stores, explosives, electric power, etc.

For instance, the records of cost of coal-cutting by machinery should account for the whole working day of each cutting machine and show the exact number of minutes during which the machinery is standing idle and the precise cause or causes given by those in charge. The cost of the idle time of machinery is a very important factor—often not fully appreciated.

9. Comparative costs will show clearly cases of collieries (or it may be particular seams of coal in a colliery) which are suffering from some special unavoidable handicap, geographical or geological, *e.g.*, distance from market, thin seams, heavy water, long underground haulage, and so on. It is possible to calculate an allowance for these drawbacks in order to gauge relative efficiency.

10. For the guidance of the general policy of the management on its technical and practical side, the cost returns are of course vital, whether in discussing proposed extension of the workings of any pit, opening additional pits in an area, introduction of machinery or improvements in existing machinery.

11. Costs are no less important on the strictly commercial side. Although the work of the coal salesmen may seem confined to bargaining in the home and foreign markets, it is absolutely essential that the directing minds should know how far prices may be reduced without giving away sovereigns with the coal. In this connection proper cost accounts should subdivide the general expenses, or oncost, into these items which vary and those which do not vary with the volume of output. Otherwise it is more difficult to settle questions of policy—to decide at what point orders should be refused or whether a certain pit should be closed, etc.—problems obviously demanding great discretion, clear cool judgment, and, of course, involving great responsibility.

12. My general experience of the value of statistical costing has been amply confirmed by my special experience in the Ministry of Munitions. The costing

work of the Ministry was carried on with two main objects:—

- (a) to adjust with the producers the prices of raw material and finished products, and
- (b) to assist in the practical and financial control of the new national factories.

13. The use of production costs in price negotiation does not seem to have a bearing upon the work of the Commission, but, if desired, I shall be glad to explain the methods adopted through technical and accountancy costing to arrive at fair and reasonable prices during the war, and as a result to save very large sums for the National Exchequer.

14. Some details of the second function however—national factory costs—may be of direct help to the Commission. This work has latterly been specially developed in the hands of my colleague, Mr. M. Webster Jenkinson, C.B.E., Chartered Accountant, Controller of Factory Audit and Costs, whose work has clearly proved the value of comparative cost returns to the factory managers.

15. The Ministry of Munitions installed complete systems of costing in all the important national factories and supervised and introduced improvements where necessary, into the systems in use in the works of certain contractors where the Ministry was directly interested in the costs of production. The information yielded by these costing systems has been of inestimable value to the Ministry, not merely in disclosing the actual costs of the article made in such factories, but also in indicating the relative efficiency of one factory compared with another and the variations in efficiency and economy at the same factory. The analysis of the costs into the various operations performed on any one article also afforded valuable information as to the cheapest method of carrying out each operation, thus indicating at each factory any particular operation or operations which may have been weak or costly.

16. The installation of a costing system, especially in factories of a temporary nature, met with some opposition in certain cases, but any such opposition ultimately disappeared, and the factory managers almost without exception recognised its value, not merely for statistical purposes, but as a guide to them in efficient works management. It may fairly be claimed that the system of costing introduced and developed in national factories has been of a most thorough character and embodies all the latest practices.

17. The investigation by Ministry accountants of contractors' actual costs also met with a good deal of opposition, but this latterly almost entirely disappeared.

18. One result has been that many manufacturers have been induced to improve their existing systems of costing and in some cases where records were practically non-existent, to instal costing systems, and generally a much needed impetus has been given to scientific ascertainment of costs both on the accountancy and technical sides.

19. I am convinced that the time has come—whether or not there be nationalisation of the coal mines—for “all the cards to be placed on the table” with regard to the cost of production of coal. I have for long felt that the reiterated demand of the miners for certified data as to cost of production as well as for realised prices, should have been granted earlier. I also believe that much misunderstanding and suspicion—prominent factors in industrial unrest—will be removed by periodical submission of such data to the miners.

Full discussion and explanations should follow, more particularly as to establishment charges (oncost)—those inevitable, but rather elusive items of interest, depreciation, sinking fund, deadwork, unproductive expenditure, which are so difficult to reduce to an intelligible rate of cost per ton. One has every sympathy with employers' hesitation to disclose information hitherto jealously guarded with the utmost care but I find, from conversation with employers, that they recognise that the undoubted tendency of the times is towards publicity.

20. For instance, I believe that full and frank discussion of each cost return between the colliery

29 May, 1919.]

SIR JOHN MANN, K.B.E.

[Continued.]

manager and a Committee chosen from experienced workmen, intimately acquainted with the working of each pit, would be surprisingly educative and helpful to both sides. Substantial progress will be made by taking representative workmen into counsel, letting them understand the risks of the business, the ease with which a profit may be converted into a loss, the amount and perplexing effect of the out-of-pocket expenses, the savings through coal-cutting and coal-washing, the profits or losses from bye-products, the calculation of the charges made to other departments, the disastrous effects upon cost of a drop in output, the reduction in cost through continuous working, and so on.

21. The benefit would not by any means be confined to the men, the management would obtain valuable hints and suggestions; for the men's eyes, ears and wits would gradually be enlisted on the side of economy and efficiency. Their influence would make for repression of slackness and waste, and the replacement of indifference and apathy by a spirit of helpfulness and co-operation.

22. Whatever happens, whether nationalisation in any of its forms is instituted. I am satisfied that a uniform type of accounts and cost returns for collieries and their auxiliary industries should be pre-

scribed by the Government, and that the results should be reported to a central authority. Details of the forms could readily be settled by the Inland Revenue for Tax purposes, on the one hand, and by the Board of Trade through the Coal Controller, for industrial purposes, on the other hand.

23. A valuable precedent exists in the Railway Companies (Accounts and Returns) Act, 1911, passed to secure uniformity in the presentation of the accounts of railway companies and no doubt in the hope of obtaining reliable comparisons of costs framed upon uniform bases. But as the Board of Trade have no power to inquire into the detailed methods employed by different companies, there is great divergence in practice, and satisfactory comparisons cannot be made without careful adjustments. Uniformity is possible if a central authority has power to enforce observance of its instructions.

24. The ascertainment of cost of distribution of household coal, as I know from experience, presents no special difficulties beyond those arising from lack of accurate and complete data.

24,196. That is your evidence?—Yes.

Chairman: We are very much obliged to you for your valuable statement.

(The Witness withdrew.)

MR. MARK WEBSTER JENKINSON, C.B.E., Sworn and Examined.

24,197. Chairman: Mr. Webster Jenkinson gives valuable evidence to the same effect, and it is headed:—

“*Précis of Evidence on ‘The Importance of Efficient Cost Accounting to Coal Industries and the Means which should be adopted to secure it.’ By M. Webster Jenkinson (Fellow of the Institute of Chartered Accountants, Controller of Factory Audit and Costs at the Ministry of Munitions).*”

“I am a Fellow of the Institute of Chartered Accountants now practising on my own account, but at one time a member of the firm of Hadfield, Riddell & Co., of Sheffield, and subsequently in partnership with the late Sir George Franklin, F.C.A., in London.

In the course of my practice I have been responsible for the audit of collieries, coke oven plants and coal merchants.

At the Ministry of Munitions as Controller of Factory Audit and Costs I have, *inter alia*, been in charge of the audit and costs of all the national factories, and, with the exception of the explosive factories, have been responsible for the systems of costing introduced.

These systems necessarily vary according to the type of undertaking, and, with the exception of the iron ore mines in Cumberland and Lancashire and certain quarries, the cost systems at national factories, &c., would not be applicable to the coal industry.

At one time I was also responsible for the Cost Investigation Department, and carried out investigations into the cost of coke and pig iron.

2. Value of Efficient Costing.

The value of efficient costing in business administration has not been recognised generally in this country. The main purpose is not merely to determine the production cost in order to fix the selling price, but to give a detailed analysis of how such cost is made up so that comparison of the various items of expense may be made, and waste and extravagance avoided.

The benefit derived from the costs depends entirely on the extent to which the information thus obtained is used by the management in the control and administration of the business.

3. Use of Factory Costs by the Ministry of Munitions.

The following procedure was adopted in the Ministry of Munitions to use the cost results obtained from national factories in the control of such undertakings:—

(a) A uniform system of costing was laid down for each class of factory and printed instructions given showing in detail how the costs were to be compiled so that uniform results could be obtained.

(b) The detailed cost returns were forwarded monthly to the Department of Factory Audit and Costs, and, after examination, sent to the corresponding Administrative Department so that the technical experts attached to such department could explain the causes of high costs, &c., at factories which showed unfavourable figures.

(c) The Department of Factory Audit and Costs directed attention to cases of high costs, waste, &c., and these questions were taken up by the Administrative Departments with the factories.

(d) In some cases the Administrative Departments circulated the cost results to the factories in comparative form, with the result that the attention of factory managers was directed to economical production.

(The allocation of work was also based as far as circumstances would allow on the production cost results of each factory.)

(e) A monthly meeting of each Administrative Department was held when the costs of the factories under the control of the Department were considered.

At this meeting a representative of the Costs of Production (National Factories) Committee and a representative of the Department of Factory Audit and Costs were present.

(f) A meeting of the Costs of Production (National Factories) Committee was held each month, when a report of each sub-Committee was presented and any unsatisfactory cost results, after full enquiry into the cause, reported to the Financial Secretary.

The knowledge afforded by the costing and other efficiency data obtained has been of very great value to the Ministry, giving information as to the actual costs of manufacture which could be used in fixing prices paid to outside contractors and indicating the relative efficiency of the factories in each group.

As the larger part of the work in the National Factories has been of a repetition character, systems

29 May, 1919.]

MR. MARK WEBSTER JENKINSON, C.B.E.

[Continued.]

of process costing have been possible and the cost of each operation obtained, thus showing the relative efficiency of various methods of manufacture or type of operation and the variations each month in the efficiency of each operation at a factory and its efficiency compared with the corresponding operation in other factories in the same group, thus enabling the most economical methods to be adopted.

The value of the cost results is best illustrated by the fact that the introduction of the cost systems was generally strongly opposed at the outset by the factory managers, but when they realised the practical use which could be made of the information contained in the cost returns they co-operated to the best of their ability in carrying out the system laid down and frequently asked for more detailed results than originally provided in order to secure efficient works management.

4. Colliery Costs.

Probably owing to the fact that the ascertainment of mining costs is comparatively simple, it is usual for most mining concerns to get out costs—generally weekly or fortnightly—but in some cases the cost sheets are badly designed and the results obtained unreliable.

On the other hand, in large collieries there are exceedingly good costing systems in operation, and a valuable fund of statistical information is collected and used by the management for control purposes. In such cases the cost results are usually reconciled with the financial books.

Costing in mines differs from that of the average manufacturer, as the selling price of the product does not depend on the production cost, whilst the nature of the product is more or less unchanging, the only variation being in quality.

Nevertheless, an adequate costing system is equally as important to the mine management as to the manufacturer, for, whereas the latter can to some extent, as, for example, in the engineering trade, estimate from drawings what each job should cost, the mine manager must rely on his cost returns in order to ascertain the expense of production.

Capital and revenue expenditure are also going on concurrently and cannot generally be made the subject of separate works orders as in a factory.

The increase in final cost, due to extraneous causes, such as flooding, falls of roof, subsidence, geological conditions, and the high costs arising from working thin seams, long distances from coal face, &c., are only brought to light by a scrutiny of the cost returns, and then only can the comparative efficiency of one colliery with another be ascertained.

It is no exaggeration to say that the management of a colliery cannot determine its policy as regards development and extensions of workings, introduction of machinery, markets, or retrenchment in production cost unless complete and accurate cost statistics are available.

5. Factors which increase Costs.

In a colliery the factors which increase the cost of production above the normal cost may be divided into two classes, viz. :—

- (a) Avoidable.
- (b) Non-avoidable.

The latter, as pointed out in para. 4, include such items as flooding, falls of roof, subsidence and geological conditions, &c.

The "avoidable" costs consist of such items as:—

- (a) Waste of stores.
- (b) Idle time of machinery.
- (c) Inefficient plant or tools.
- (d) Idle time through breakdowns (not always preventable). Waiting for material, &c.
- (e) Faulty works organisation.
- (f) Waste of power and lighting.
- (g) Extravagance in administration.
- (h) Careless buying.
- (i) Old-fashioned methods of production.
- (j) Incompetent staff.
- (k) Inadequate haulage and raising facilities.

Attention is focussed on such factors on the consideration of the cost returns, but it is necessary:—

- (1) That the costs be so framed that such items are brought to light.
- (2) That the cost results are actually used by a management sufficiently expert to understand the lessons taught by them.

6. Limitation of value of present Cost results for Comparative Purposes.

The collection of the cost results of a number of collieries for comparative purposes is at present liable to give misleading ideas owing to the diversity of treatment of different items of cost, e.g.:

- (a) The allocation of expenditure between capital and revenue will not have been made on a uniform basis.
- (b) Depreciation will have been written off at varying rates.
- (c) Dead work will be treated differently.
- (d) Establishment charges will in some cases include interest on borrowed money, which has no relation to the cost of production, and other items representing expenditure of an unproductive character.
- (e) Selling charges will not always be clearly earmarked, certain expenses being grouped under other headings in the establishment charges.
- (f) Stores, explosives, pit timber, &c., will sometimes represent purchases during the period, and in other cases quantities actually used.
- (g) Rents received, bye-product plants, etc., will be treated differently.
- (h) Coal sent to washing plant, coke ovens, etc., will at some collieries be charged out at a standard (or fixed price) and at other collieries at the market price.

7. Unification of Cost Returns.

There would appear to be no reason why a standard form of cost return for collieries and their subsidiary operations should not be prescribed by Government in the same way that the forms of accounts for railway companies are laid down (Railway Companies (Accounts and Returns) Act, 1911).

Such form should only be settled after consultation with the large collieries known to have efficient costing systems in operation, and should generally comply with the requirements set out in the memorandum attached (Appendix 1). A standard cost return could not, however, be prescribed for very small pits, and, in any case, the form would vary in detail in different districts."

24,198. I should be much obliged to you if you could give me an idea of what you mean by very small pits, because, suppose one was recommending this, you cannot use language of that sort, for there would immediately be a long discussion as to what you mean by very small pits. Would it be possible to say a pit in which the output is so and so?—My idea was that a Committee should be formed, and they should decide that pits with less than a certain amount of output should not be required to fill in the form.

24,199. I want to get at what your own view is. Do you think it would be 50,000 tons a year?—I think you could go below that mark and say 25,000 tons. That is only a rough idea.

24,200. I simply wanted to know what was in your mind. You might, if you were a member of that Committee, advise that?—I have not considered it in any detail.

"The use to be made of such cost returns would depend on the determination of the future of the coal industry, but the following possible uses suggest themselves:—

- (a) A Costs of Production Committee could be set up in each district to consider the cost results, and, after taking into consideration excessive costs due to unavoidable causes such as flooding, faults, breakdowns, etc., all of which would be noted on the cost returns, such Committee would draw the attention

29 May, 1919.]

MR. MARK WEBSTER JENKINSON, C.B.E.

[Continued.]

of the management to high costs of production and to savings which could be effected by the use of machines, etc.; technical experts would be sent to enquire into the cause of high costs and find, if possible, a remedy.

(If the present system of ownership continued, such Committees would be formed by the mutual co-operation of the coal owners in each district who would share the expense.

The objection might then be raised that the efficient colliery was contributing to make the less efficient more profitable, but in the interests of the coal industry a broader outlook of the mutuality of interests should be taken.)

- (b) Industrial Councils, composed of representatives of the owners and miners in each district, should be afforded an opportunity to consider the production costs and other efficiency data. If the workers were allowed to study some of the facts relating to the business many misconceptions would be dispelled.
- (c) A complete digest of the production costs and corresponding selling prices, showing details of wages, royalties, wayleaves and management, should be prepared so that the position of the industry as a whole could be reviewed periodically with a knowledge that the information available had been compiled on a reliable basis.
- (d) If mining royalties were fixed on a sliding scale based on the costs of production (instead of at fixed rates per ton or sliding scales varying with the selling price), the cost returns would form the basis of calculation.
- (e) In the case of labour disputes it would be very useful to have reliable comparative data of the details of production costs in each district.
- (f) If Statutory powers be taken for Government intervention in the case of collieries which are badly managed, or if the miners are to have any share in the profits of the industry, the adoption of a uniform system of costing would be inevitable.
- (g) Should any system of control over distribution at pit mouth be formulated, the analysis of the selling and distribution charges of all collieries would necessarily have to be obtained on the same basis to facilitate comparison.

The use to which such cost returns might be put will, however, depend on the future control of the industry, but for illustrative purposes there are attached examples of comparative statistics (Appendix 2) obtained by the Ministry of Munitions in the case of the Cumberland and Lancashire iron ore mines (the figures are fictitious) and also an example of the form in which the cost results of National Factories were presented for comparative purposes (Appendix 3).

8. Coal Merchants' Accounts.

Generally only the large merchants prepare monthly cost statements showing the expenses of distribution, the accounts of the small men being badly kept and affording little information for management control purposes.

The system of accounting required is exceedingly simple, the expenditure being grouped under various headings in order to show details of the purchase price of coal handled, carriage, and distribution and administrative expenses.

It would not appear feasible to lay down any standard system of accounting that could be enforced by Government, but the various Coal Merchant Associations might arrange for a memorandum to be prepared showing how the accounts should be kept, and the Associations might also retain firms of accountants to render assistance to their members in introducing such systems.

9. Selling Price fixed by periodical Cost Investigations.

It has been suggested that the practice of investigating costs as adopted by the Ministry of Munitions in fixing contract prices might be applied to the coal trade in order to determine the price to be paid to the consumer.

Apart from the difficulty of carrying out periodic investigations of this character, a uniform system of accounting would be necessary to facilitate comparison and in fixing prices:—

- (a) Profits or losses on the purchase of material would have to be ignored.
- (b) Profits from subsidiary operations should not be taken into account.
- (c) The investigations would have to be carried out by accountants expert in the trade.
- (d) Percentage limits would have to be agreed for certain overhead charges.
- (e) Collieries adopting special economical methods of production or producing under particularly favourable circumstances would have to be excluded in calculating the average.

The danger of price fixing on the basis of cost plus a definite fixed profit is that the incentive to economical production is destroyed. The rate of profit should increase as the cost of production decreases if cheap production is obtained by the adoption of economical and efficient methods.

If it be desired to adopt procedure to limit the selling price the following method might be adopted:—

- (1) Appoint price committees in each district to fix the maximum selling price in consultation with the representatives of the trade association.
- (2) Authorise such price committees to have investigations of the costs of production made if not satisfied with the figures presented to them.
- (3) Appoint an appeal council to consider the results of such investigation in case the trade association dissented from the price fixed by the price committee.
- (4) Insist on cost records being kept in a form either prescribed by law or as agreed between the trade association and the price committee.

10. Introduction of Cost Systems.

Excepting in the case of large collieries with efficient accounting staffs, a system of costing cannot be introduced merely by forwarding forms of the prescribed returns required and printed instructions explaining the methods of account keeping.

In the majority of concerns the accountants are totally incapable of introducing proper costing systems, and frequently the size of the undertaking would not justify the expense of a whole-time highly skilled accountant.

To produce reliable cost results entails the organisation of the whole accounting on an efficient basis in order to secure the proper allocation of expenditure; and although the final cost returns of a number of concerns may be uniform the internal records must necessarily vary according to the individual circumstances of each undertaking.

If some system of uniform cost accounting be adopted it would therefore be necessary to appoint advisory accountants in each district who could instruct the accountants at each colliery how the costs were to be kept, and these advisory accountants would have to re-organise the book-keeping systems to achieve the results desired.

Until the colliery accountants were sufficiently trained frequent periodical visits would be necessary.

On the other hand, the re-organisation of the accounting systems on an up-to-date basis would in many cases save considerable clerical labour, thus enabling the accountants to devote the time necessary to the preparation of costs."

29 May, 1919.]

MR. MARK WEBSTER JENKINSON, C.B.E.

[Continued.]

24,201. There was one question I wanted to ask you on this, and that is how long would that job take? Would it be a matter of 8, 10 or 12 months?—It all depends how large the districts were. If you divided the country up into districts and you had supervising accountants, there is no reason why you should not have univorsal cost accounts in six months. In the national factories we got it in much less time.

24,202.

" APPENDIX 1.

BASIS OF COST ACCOUNTS FOR A MINING GROUP.

Note.—The following suggestions are not intended to deal comprehensively with the details to be given in a colliery cost return, but merely to indicate generally the class of information required to facilitate comparison of the results of a group of mines.

The system of cost accounts adopted by any group of mining undertakings should answer the following requirements before the results obtained can be accepted as reliable, viz.:—

- (1) It must be capable of reconciliation with the financial books which should be designed to show a complete analysis of expenditure and revenue.

(*Note.*—This analysis of expenditure in the financial books is essential to an effective examination of costs, as only by a close scrutiny of individual heads of expenditure is it possible to suggest economies and to detect leakages.)

- (2) It must be capable of reconciliation with stores and stock records.
- (3) It must provide for the elimination of all factors which are not common to all the concerns or to all the periods under review.
- (4) It must be so designed that material surface alterations or extensions, and improvements in underground workings, as disclosed by the mine plans, will be reflected in the cost returns.
- (5) It must provide for the collection of statistical data showing the production per worker under various conditions, time lost, etc.
- (6) It must show clearly the results of machinery used (*e.g.*, coal cutters) and bring out separately the detailed costs of washing plants, crushing and screening plants, etc.

The accounts of coke ovens and attached by-product and recovery plants, brick works, workmen's cottages, etc., must of course be kept distinct.

In addition to showing the actual cost of "winning" the product, an adequate system of cost accounts must be in effect practically a monthly "Intelligence Report" dealing with all matters germane to the working and development of the mine as well as to the sale of the mine product.

- (1) *Reconciliation with Books of Account.*

(a) Analysis of Materials and Stores Consumed.

Headings should appear in the cost returns in respect of each group of materials for which separate stores records are kept, and the figure included as a charge against production each month should be the actual consumption of that material for the period (not the amount purchased during the month). A proper classification of stores is essential if economies are to be effected and waste avoided.

(b) Analysis of Labour.

Wages must be analysed so as to disclose the nature of the work upon which the employee is engaged; that is to say, differentiation must be made between surface workers and underground workers, and those classes again subdivided in accordance with the work upon which they are engaged, the broad principle involved being that the wages of the miners (or, to

prevent a misunderstanding of this term, the "coal getters" or "ore getters" wages) must be kept strictly apart from the wages of all other workers, as only by this means is it possible to get effective comparative figures with regard to the cost of output. A further sub-division of coal getters' (or ore getters') wages is necessary as between those working with hand tools and those operating pneumatic borers, cutters, or other mechanical appliances. This is necessary in order to obtain information as to the comparative cost of the different methods of obtaining the product.

(c) Analysis of Working Expenses (Oncost).

(*Note.*—The use of the word "Oncost" is avoided because to the layman it is a term capable of misapprehension, while to the professional accountant it leads often to purely academic discussion.)

All working expenses should be analysed in the financial books and the cost accounts be so designed as to include headings for all these accounts or groups of accounts. Economy in respect of working charges is only possible if a detailed analysis of these accounts is made.

- (3) *Uniformity of Conditions.*

(a) Output.

Before comparative costs can be of any use as between mine and mine or between period and period a common base for effective comparison must be fixed, *i.e.*, before unit costs can be effectively compared, all factors must be eliminated from each case which are not common to all cases under review. For example, it would be unfair to compare the cost of a mine the product from which is saleable immediately it is brought to the surface, with the cost of a mine the product from which requires to be "washed" before it is saleable in the same category as the former. The figure for output, which is the usual divisor in unit costs for mines, must, therefore, be on a basis common to all the mines in the group. It may be either the actual tonnage brought to the pithead, or it may be the saleable or marketable tonnage, according to the conditions ruling.

(b) Washing Plant, Crushing and Screening Plants.

Where these subsidiary process plants exist at mines, and the product disposed of obtains a special price, higher than the normal price, as the result of such processes, the raw product as it comes out of the mine should be charged up to these plants at the pithead price and separate cost accounts should be raised to deal with these processes, otherwise the inclusion in the ordinary mining cost returns of the costs of working these processes would completely vitiate effective comparison with other mines where such plants were not in operation.

(c) Saleable By-Products and other Sales.

In the ordinary course of mining operations it may happen that limestone or other materials of a marketable nature are brought to the surface in such quantities that they form an appreciable item of revenue. In such cases these sales must be clearly shown distinct from coal or ore sales, otherwise comparison with the costs of other mines where the same conditions did not pertain would be vitiated.

(d) Coke Ovens.

In the case of coal mine accounts, separate cost accounts must be raised for any coking process and its relative by-products.

The coke ovens will be charged up with coal at the price which that coal would have realised from an ordinary customer in open market. Only by this method will it be possible to judge if the coke ovens are being worked as profitably as similar undertakings not allied to a coal company.

This method has the further advantage of showing where the total profit or loss has been made.

29 May, 1919.]

MR. MARK WEBSTER JENKINSON, C.B.E.

[Continued.]

(4) *Extraordinary Expenditure.*

Expenditure of an extraordinary nature, resulting in alterations in mine plans, should be shown in the cost returns.

For example, if a new shaft is being sunk for, say, ventilation purposes, if the accounts are loosely kept it is possible that the cost may be wrongly included under the head of "Wages and Materials used upon Direct Production."

The use of a schedule in the cost returns for extraordinary expenditure (that is to say, for expenditure other than upon direct production or the ordinary normal working of the mine) would keep before the management the progress of all schemes of improvement, exploration, development or boring work. A periodical examination of the mine plans, which are altered in accordance with the progress of the underground workings, would lead the management to look to the cost returns to disclose under "Extraordinary Expenditure" the cost of the extensions or alterations disclosed on the plans. This would be the best method of preventing development work being included under ordinary mining costs. Whether the management ultimately might decide to charge the cost of such development work to "Capital" or to "Revenue" is not at the moment relevant.

(5) *Statement of Workers' Production Efficiency.*

Where mines are similar in character, and where the product obtained is worked under similar conditions, considerable information may be obtained by comparing the average yield per man per day.

When the yield per man per day is less in one mine than the other, the attention of the management is at once attracted and investigation instituted.

Assuming that the basis of comparison is the unit of saleable tonnage, such a difference may be explained by various circumstances, e.g.:—

- (a) Actual "slacking" by the getters.
- (b) Deadwork.
- (c) Machine tools used to a greater extent in one mine than in the other.
- (d) Some stoppage of work due to a "fall" or flooding.

The above illustration refers to the yield per miner or ore-getter (*i.e.*, the man actually engaged on getting the mineral).

A similar comparison of the output per man per day for all "underground workers" or for all "surface-men" will disclose where mines are overstaffed or where slacking prevails.

Further investigation of the unsatisfactory yield per man may lead the management to discover some one factor which is retarding production, such as "inadequate underground haulage" or "inadequate raising facilities."

(6) *Comparison of Costs.*

Having decided upon the unit of cost, and having determined the common base upon which this unit is to be calculated, the cost accounts should afford for purposes of comparison:—

- (a) The total cost per ton of any one mine with another.
- (b) The cost per ton of any one item of expenditure of one mine with the same item in another mine.
- (c) The total cost of each mine per ton month by month.
- (d) The true average total cost per ton of the group of mines concerned.

(7) *Criticism of Selling Prices.*

Although the primary object of cost returns is to show the actual cost of obtaining the marketable product and the analysis of such cost, a complete system of cost returns will also disclose the average prices obtained for the product. By means of this information it will be shown, assuming an equal metallic content and that other conditions are alike, whether any one mine is selling at a price less than the average obtainable in the group for a product of that quality.

APPENDIX 2.

IRON-ORE MINES IN CUMBERLAND AND LANCASHIRE.
MEMORANDUM EXPLAINING THE COMPOSITION OF
COST RETURNS AND THE METHOD OF UTILISING THE
COMPARATIVE FIGURES.

(Note.—The figures used in the attached cost returns are entirely fictitious and do not show the results of any of the mining companies. The figures have been created purely for illustrative purposes.)

The following notes upon the cost schedules received by the Ministry of Munitions from the Cumberland and Lancashire Iron-ore Mines will explain the general purport of the cost returns and the use made of the information afforded thereby:—

"A," the Cost Summary, is the principal statement; Schedules I., II., III., IV., and V. being supplemental statements showing how the details are made up.

"B," Schedule V., is the workers' efficiency return, indicating the output statistics.

A.—"Cost Summary."

Column (1). "Tons produced."

The tonnage shown is the actual saleable tonnage—that is to say, in certain cases where the ore contains an excessive proportion of "dirt," the ore has been "washed" in order that the output from all the mines may be compared upon an equal basis.

The total of this column is compared with the totals of previous months, and any decrease or increase in tonnage is noted. The increase or decrease is then traced to see if the result is due to any particular mine or group of mines, or if the increase or decrease is consistent throughout the district.

For example, if a very considerable fall in tonnage is noticed in any one mine which cannot be explained by causes already known at headquarters, such as a fire, flooding, or fault in the workings, the decreased output is notified to the local technical representative, who is required to report upon the reasons for such decrease.

Column (2). *Wages.*

The percentage of wage cost per ton is compared with the previous month and differences which cannot be explained by variations in output, recent wage awards, or other cases are reported to the technical representative in the district.

Column (3). *Materials.*

The cost per ton of materials is compared with the previous month, and differences which cannot be explained by variations in output, or known variations in price, are reported to the technical representative in the district.

Column (4). *Other Charges.*

Variations in cost per ton are similarly reported where these are unexplainable by conditions known at headquarters.

Column (5). *Total cost per Ton of "raising" Ore.*

It will be noted that, in addition to calculating the total cost of "raising" per ton for each mine the true average total cost for the group has also been worked out. This true average total cost is of use when compared with the figures of the previous month in estimating future expenditure after making allowance for known changes in wages and cost of materials which are likely to occur.

Column (6). *Profit to Mining Company.*

The figure used of ls. per ton is merely illustrative of the rates varying according to the terms of the agreement under which the mines were taken over.

Column (7). *Total Cost to Ministry.*Column (8). *Selling Price.*

The average selling price per ton is compared in each case with the average of the previous month. Variations in the selling price obtainable are compared and differences noted. Although these selling

29 May, 1919.]

MR. MARK WEBSTER JENKINSON, C.B.E.

[Continued.]

prices are "controlled," changes occur in the selling price, due to varying metallic content and to the presence of lumpy ores in some cases, which greatly increase values. Any considerable fall in price is at once notified to the technical representative in the district for his investigation and report.

Column (9). *Other Sales.*

This column shows distinct from ordinary sales the proceeds from the sale of sand and limestone extracted in the course of exploration or development work. If these sums were included under the head of "Sales" they might entirely vitiate comparison with selling prices of other mines.

Columns (10) and (11). *Columns for Profit and Loss.*

Attention is at once attracted to variations in the cost of production by an increased profit or an increased loss, or by the conversion of a profit into a loss or *vice versa*.

General Comments.

Mine (P).—In the case of this mine on the summary it will be noted that the output is nil. This is known to be due to flooding, which for the time being stopped productive work.

Mine (Q).—The very large cost of "raising" of 77s. 3d. per ton in this mine is known to be due to the reduced production caused by fire.

Mine (1).—The comparatively low cost of 24s. 3d. for this mine is traceable to increased production and to recent improvements in the mine management.

B.—*The Workers' Efficiency Return (Schedule V.).*

The use of the statistics contained in this schedule is obvious, so that it is not necessary to compare its uses column by column. The column to which particular attention is devoted by headquarters is "Ore raised per 'ore-getter' day." This column refers to the output of the miner upon the ore face, excluding all other underground workers. The average yield per man per day is compared with previous months. The nature of the workings in each mine is known and the average yield per man is also known. Any fall in that yield is at once noted and a report called for from the technical representative. Fall in the output may be due to development work, "dead" work, flooding, faults in the ore, &c., &c.

Take another example. Mine (S) shows a yield per man of 7·2 tons. This increased yield has been found to be due to the use of machine tools in extracting ore.

The main use of this column to the Ministry has been that through it it has been possible to check the charging of excessive development work against ordinary production costs.

(*Note.*—The above examples are, of course, entirely fictitious, and have been merely raised to explain the principle followed in commenting upon variations in costs.)

24,203. May I take it generally that the *précis* of evidence that you sent in is the evidence that you desire to bring before this Commission?—That is so.

Chairman: We are very much obliged to you for the assistance you have given us.

(*Adjourned to to-morrow morning at half-past ten.*)

SECOND STAGE—TWENTY-SECOND DAY.

FRIDAY, 30TH MAY, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. ROBERT SMILLIE.

MR. R. W. COOPER.

SIR ALLAN M. SMITH.

SIR ARTHUR DUCKHAM.

MR. HERBERT SMITH.

MR. FRANK HODGES.

MR. R. H. TAWNEY.

SIR LEO CHIOZZA MONEY.

MR. SIDNEY WEBB

SIR ADAM NIMMO.

MR. EVAN WILLIAMS.

SIR ARTHUR LOWES DICKINSON, }
SIR RICHARD A. S. REDMAYNE, } (*Assessors*).

MR. ARNOLD D. McNAIR (*Secretary*).

MR. GILBERT STONE (*Assistant Secretary*).

Mr. Evan Williams: Sir, there were a good many questions asked and statements put in yesterday with regard to the output of the collieries for the period from the armistice on to the end of March. I should like to ask for a return—I think it can be got—that would show us from June 30th last year, either week by week or month by month, the number of men employed, the total output, the total number of shifts lost by strikes and other causes, including accident, so that we may arrive at a proper figure that would show what has been the output per man per shift.

Mr. Sidney Webb: Per hewer?

Mr. Evan Williams: I doubt if those are available, but if they were they would be very useful. Particularly, I should like to have the figures from Easter, from the time of the Sankey Award.

Chairman: We will see that that is done.

Mr. Evan Williams: I want that so that we may take all the circumstances into consideration. We have heard a lot about strikes lately, but there were strikes before.

30 May, 1919.]

MR. EDWARD SMALLWOOD.

[Continued.]

Mr. R. W. Cooper: You mean time lost from all causes.

Chairman: I am in communication with the Coal Controller on this very subject, and I expect Sir Evan Jones here any moment.

Mr. Robert Smilie: You would require to ascertain whether or not it is possible for the men to take away the material—that is to say, to give clearance.

Mr. Herbert Smith: Would it be possible also to ask for a return of the number of shifts in which the men had to be sent back by the manager by reason of there being no rails or timber, etc.?

Mr. R. W. Cooper: If we could get it per hewer per shift that would be better.

Sir L. Chiozza Money: Can we also have the returns with regard to Germany? I understand there has been a great fall in output in Germany.

Chairman: If we can get it, we will certainly do so. Now I should like to make a statement as to the witnesses we propose to call in the near future. Up to the present moment the Commission has called 78 witnesses. To-day I propose first of all to call Mr. Smallwood, who will speak as Chairman of the Coal Merchants' Federation of Great Britain and as a member of the London Coal Committee. After that we shall have the advantage of hearing three miners' wives—Mrs. Hart from Lancashire on behalf of England, Mrs. Andrews from the Rhondda Valley on behalf of Wales, and Mrs. Brown from Lanarkshire on behalf of Scotland. We then have a witness, the Hon. F. B. N. Fisher, who speaks as to State ownership abroad, and a number of other witnesses representing the Post Office, retailers, and so forth. That will conclude to-day. Now I wish to speak of the other witnesses. Next week we shall call a number of witnesses who will speak on behalf of the consumers. We shall have four or five witnesses from the Associated Chambers of Commerce; we shall have witnesses from the Federation of Iron and Steel Manufacturers; we shall have witnesses from the National Gas Council, and I hope one or two other witnesses to speak as to private consumers. We shall, therefore, have a large number of witnesses in the consumers' interest. We thought it right to call these witnesses towards the end of the inquiry in order that they might be in a position to see the evidence given both on behalf of the mine owners' side and on behalf of the men's

side, and they would then be able to speak as to their views of the various proposals that have been put forward. It would have been useless to call the consumers earlier in the inquiry, because if we had done so they would not have had the advantage of seeing what those opposing views were. They will now have an opportunity, having seen what those opposing views are, of expressing their opinion upon them. When they have finished we hope to call two or three of the most eminent financial men of this country who will speak as to the finances involved in the matter, should nationalisation find favour with the majority. The last witness will be a gentleman who is in quite an independent position, and who will have had the advantage of hearing the whole of the evidence and will be prepared to answer any questions put to him by the various members of the Commission. I think we shall all agree that he will be most helpful—that is, Sir Richard Redmayne. He will be the last witness, and I hope to conclude the evidence by the Friday before Whitsuntide—that is, to-day week.

Mr. R. H. Tawney: Did you say you were getting evidence from Associations of Manufacturers?

Chairman: Yes.

Mr. R. H. Tawney: Are you getting evidence from the Trades Unions in the industries concerned?

Chairman: No, but we will get it.

Mr. R. H. Tawney: I think it is most important to have it, because they are just as much interested in the price of coal, and their point of view is likely to be very different.

Chairman: I need hardly say in reply to Mr. Tawney that there has been an invitation to these gentlemen now for some weeks, but we have not had the advantage of receiving any answer to that invitation. Now that the matter has been put forward I hope they will send us a *précis* of their evidence. As I have said, I hope to conclude the Commission by this day week. The Commissioners will then take a short holiday at Whitsuntide. It will not be a holiday really, because we shall have to read through the evidence; and I hope we shall meet either on the Thursday or Friday after Whitsuntide to discuss between ourselves as to what our course should be. Humanly speaking—and I see no reason to the contrary—the report will be in the hands of the Government, as promised, by June 20th.

MR. EDWARD SMALLWOOD, Sworn and Examined.

24,204. Chairman: This is the *précis* of the evidence of Mr. Edward Smallwood, late Member of Parliament for East Islington, Chairman of the Coal Merchants' Federation of Great Britain, and a member of the London Coal Committee. Mr. Smallwood submits that any system of nationalisation of mines and minerals that interferes with the individual enterprise, oversight, experience, and incentive of those connected with the industry must have a disastrous effect. I will ask our Secretary, Mr. McNair, to be good enough to read the *précis*, and after that I will ask Mr. Sidney Webb on my left and Sir Arthur Duckham on my right to ask Mr. Smallwood any questions they think desirable.

Secretary:

"The Coal Industry is a highly specialised one throughout the whole of its stages, not only from the colliery end, but also at the distributive stage.

Every colliery, with a view to eliminating waste and selling all coal raised at the best prices, will make a great variety of sizes and qualities, and is dependent to a large extent on those engaged on the distributive side to advise as to what is saleable in industrial centres, and also as to what classes of coal are saleable in various districts for private, institutional, commercial and public purposes.

Manufacturers and others purchasing large quantities of coal are also largely dependent upon the expert knowledge of those engaged in the distributive section of the trade for the supplies of the most suitable fuel for their purposes.

It is no uncommon case that a manufacturer may require five or six different qualities of coal, some in large and some in small quantities, for the business in which he is engaged.

Manufacturers making the same class of goods but using different boilers and appliances in the same town require entirely different fuels.

The same applies very largely to all other business and private consumers.

District by district, even in London, different kinds of fuel are required, not as the result of fancy or caprice, but due to the type of appliances used—from boilers and furnaces to the types of grates and stoves to be found in old and new houses and working class or residential districts.

Most unsuitable coals have been supplied in many cases, under present measure of control.

This accumulation of expert knowledge is the result of long and careful attention, and in a well-conducted business a record is kept of all coal most suitable for each user, even to the small private consumer.

Standardisation of coal and appliances is outside the range of possibility.

If the industry were fully nationalised the incentive and individual features that have made it so successful would be lacking.

Nationalisation of the industry would mean increased cost of production and dearer fuel, which would hamper the re-establishment of trade and cause mere unemployment in all industrial centres and in the distributive and other sections of the Coal Industry.

The private trade is a seasonal demand, and the distributor has to find other ways of using his plant, horses and men in quiet times.

Whether he be a colliery owner or distributive agent, the individual managing his own business under competitive system is dependent upon his own

30 May, 1919.]

MR. EDWARD SMALLWOOD.

[Continued.]

enterprise, incentive, expert knowledge and ability to earn an income.

Under nationalisation he would be replaced by a larger number of more or less expert men, who would take an income irrespective of whether they earned it or not, and whether the undertaking paid or did not.

Under the competitive system, the reward of the colliery owner is kept in check; under State management the industry might be used, as at the present time, for the purpose of raising large sums of money for revenue purposes.

The present high price of fuel is largely due to the measure of State control now exercised.

From this cause all classes of industry are suffering."

24,205. *Mr. Sidney Webb:* You explain that coal is not coal in fact—that it is a very complicated article, and is used for many different purposes, and is of very many different qualities. Has it been suggested that it is a single article which could be standardised? Have you ever heard that suggestion made?—I see nothing in my *précis* that in any way suggests that coal is not coal.

24,206. Pardon me—perhaps you did not understand me. I am taking this point, that coal is of different qualities and serves many different purposes, and each quality has, therefore, to be very carefully distinguished. I quite agree with you. That is a matter of very elementary knowledge. But I ask you whether that statement is made so emphatically with reference to any suggestion to the contrary. Have you ever heard anybody suggest that coal should be standardised?—I have known of several of the officials under the present measure of State control suggesting that coal should be standardised, so that it could be used in various parts of Great Britain and in certain areas into which they have carved up Great Britain for the purpose of the supply. I can give you a case in point and that is at Hitchin, which is not far down the Great Northern Line. There at present is a bar beyond which a certain class of coal cannot go. It is needed for a certain class of engine. That class of engine is a road engine working at Hatfield—not a rail engine. Hatfield is 10 or 12 miles away, and it has to go to Hitchin to get that particular fuel.

24,207. Pardon me, that is not the question I put to you. I did not say that suggestions may not have been made that some coal should not be used somewhere; but I asked you whether anybody had suggested that all coal should be standardised?—Yes, it has been suggested.

24,208. Will you tell me by whom it has been suggested that all coal could be standardised?—Not all coal.

24,209. You do not suggest that anybody has said that all coal could be standardised?—I say that it has been stated that so far as a certain district is concerned coal could be standardised for that district.

24,210. Coal could be standardised?—Could be mixed.

24,211. You are suggesting that the mixing of coal is an impossible thing?—Yes.

24,212. Then when you say standardisation you are referring to the manufacture by mixing of a common quality of coal?—That is so.

24,213. Has that been very seriously suggested?—It has been very seriously suggested.

24,214. Is that at all connected with nationalisation?—One is basing one's ideas of nationalisation a good deal upon what has transpired during the last year or two under control.

24,215. Have we had nationalisation?—We have had a certain measure of State control.

24,216. Then you are assuming that Governmental control of private enterprise is the same thing as national ownership?—We have not had the other proved yet. We have had a type of it.

24,217. I am not wanting to argue with you?—But you must allow me to answer your questions in my own way.

24,218. You are objecting that the experience of collective control of private enterprise has been very injurious?—It has been very injurious.

24,219. I quite agree; but that is not the same thing as national ownership?—It may not be in your mind, but it is in the mind of those who have had experience of State control, which gave us a fair taste of what will happen.

24,220. You are inferring that national ownership will be of the same nature, perhaps worse, as national control of private enterprise. If you do not want to explain do not, but I am only anxious to give you an opportunity of doing so. Is that what you are inferring?—I have already stated that the only idea one can get as to what nationalisation would mean is one's experience with respect to the past measure and the present measure of State control which has been obtaining.

24,221. That is your opinion of what nationalisation is founded on?—Yes.

24,222. May I infer from that that you think that public regulation or control of private enterprise in coal has been very injurious?—The public regulation of private enterprise?

24,223. Yes?—It has been injurious, but not wholly injurious.

24,224. Do you say that that is a good system? Should we go on with the public regulation of private enterprise in coal?—It is not a good system.

24,225. Has it been better than no regulation?—It has been better that we should have some regulation of private ownership of coal during a period of war.

24,226. What we are considering is what there should be during a period of peace?—Quite so.

24,227. Are we to infer from your evidence that you think public control of private enterprise in coal is injurious? Would you recommend it or not?—In a measure I should. I should want to see what that measure was.

24,228. Therefore you are not prepared to say that you wish to get rid of all public regulation of coal?—No, I am not.

24,229. At the present time you say the price of fuel is largely due to the State control of enterprise?—Yes.

24,230. Is it your opinion that if all the regulations were taken off the price of coal would fall?—No, but—

24,231. I only want to know whether it would fall or rise?—You may only want to know whether it may fall or rise, but I am not prepared to give an answer "Yes" or "No" to that question. I am prepared to answer the question in my own way, and not in your way.

24,232. Would you mind answering it?—So far as the price of coal is concerned, I should say that the price ought to be regulated as it was regulated in the early days of the war. So far as State control is concerned, we as merchants entered into the arrangement, and we were in agreement with the Board of Trade at that time that the price of coal should be limited, and I still maintain that that should be done.

24,233. Limited by Government regulation?—Yes.

24,234. Therefore, you do not advise that the Government regulation of the price of coal should be removed?—No, I do not.

24,235. I suppose that means—though I do not know whether I may take it to mean that—that as you recommend the continuance of Government regulation of the price of coal, you would be apprehensive that the price of coal would go up if the regulation were withdrawn?—Certainly, I should in a busy time expect that.

24,236. Therefore, when you say "The present high price of fuel is largely due to the measure of State control now exercised," we must take that as meaning that you think it would be still higher if there were no State control?—I should say it would.

24,237. That is in accordance with the other evidence given to us. It has been suggested to us by a very eminent coal merchant that if there were no State control we should be paying £3 a ton?—We might do so.

30 May, 1919.]

MR. EDWARD SMALLWOOD.

[Continued.]

24,238. Therefore, is it not a little misleading to say what you have done when, if the State control were taken off, we should probably be paying as much as £3 a ton?—What I do state is this, that, seeing that we have State control at the present time, prices ought to be very much lower than they are on that account.

24,239. I entirely agree with you, if the State control has brought down the price somewhat, but not enough?—It has not brought down the price. It has stopped it going up.

24,240. It has stopped it going up as much as it otherwise would do, but not as much as you wish?—That is so.

24,241. Would not the inference be from that that you must have a little more State control, or a little less?—No, I should suggest that the more State control you get, the more expensive will that control be, and the more prices will go up.

24,242. Then you say there ought then to be less control?—I have already stated that, so far as my view is concerned, the price itself ought to be regulated, and having regulated the price, it does not require a great staff. It was done by one man previous to a certain time in the Board of Trade, and was satisfactory; but the more State control you get, the more officials you get and the larger is the cost of that control.

24,243. It is very clear that you advised the Commission that the removal of all State control would result in a higher price?—Yes, I did.

24,244. I notice you say in the paragraph above that "Under the competitive system, the colliery owner is kept in check"?—Yes.

24,245. You have just been advising us that if we remove the check of the Government control and rely on the competitive system, the colliery owners will get a larger price?—I have stated that to be the case when trade was good, but when trade is bad, or when it is in its medium condition, the private ownership, or the price of coal under private ownership, is certainly kept in check under the competitive system.

24,246. Would you suggest that trade is good now?—Certainly it is good now.

24,247. I am glad to hear that?—I mean, in so far as there is a strong demand for coal.

24,248. You go on to add: "From this cause all classes of industry are suffering"?—Yes.

24,249. I should infer from that that they were not getting their coal?—They are not getting their coal.

24,250. All classes of industry, do you mean?—The very high price of coal, as a matter of fact, stops them buying as much as they would do for the purpose of manufacture.

24,251. You have just now told us that if we take away the control, the price would be still higher?—Yes, during a time of stress, but we are not proposing to legislate for the present time, but for years to come—changing our system.

24,252. We are also legislating for the ensuing few months of the year, as well as for the future?—The two things are distinct.

24,253. Would you propose to the Commission that the Commission should recommend the removal of all regulation so as to rely on the competitive system for it being kept in check, or would you suggest we should have some regulation?—I would suggest the removal of all restrictions except in respect of price and the allocation of certain quantities for certain purposes.

24,254. It is only in respect of price that you want the restriction?—That is the main thing.

24,255. Can you suggest any others?—I say in respect of quantities. At the present time it would be necessary to keep on the present system of control in respect of quantities to be allocated to gas makers, to merchants, to districts, and generally.

24,256. Then you think it is with regard to allocation to districts generally?—Until the time of stress is over.

24,257. Then I can hardly see what you mean by suggesting that from this State control all classes of

industry are suffering when you recommend that it should be continued?—I am not recommending that it should be continued, only in respect of price and the allocation to districts.

24,258. What other Control is there that you wish to get rid of: price, allocation and quantity are to be continued: is there any other control?—There is control right away from the pit into the poor man's cellar in every regard in respect of coal. All that requires a large number of officials, or is supposed to want a large number of officials, and the expense of the coal control is enormous, and that, therefore, sends up the price of coal.

24,259. Do you think the cost of the Coal Controller's office enters into the price of coal?—No doubt it does.

24,260. Are you not aware that the House of Commons is voting a sum in respect of that?—I am also aware that last June 4s. a ton was put on the pit prices for the purpose of paying the men's and boys' wages and the cost of the Control.

24,261. You do not suggest, do you, that that 4s. was put on for the purpose of paying the salaries in the Coal Controller's office?—It is not a question of what I suppose. I know that 4s. was put on to the price at the pit for that purpose, and it was so definitely stated in the House of Commons. 2s. 8d. per ton out of that 4s. was to go for the boys' and men's wages, and 1s. 4d., which was one-third, was to go to the cost of the Coal Control, which came to about 15 million pounds of money.

24,262. Have you not put it more correctly in the preceding paragraph when you say: "At the present time, for the purpose of raising large sums of money for revenue purposes"?—Yes, and that is a totally different matter, and I should like to explain that. Might I answer that?

24,263. *Chairman*: Certainly?—So far as the question of revenue is concerned, that is a totally different matter from raising the money for the purposes of the cost of the Coal Control. The prices that have been allowed, even under the present measure of State Control, have permitted the colliery owners to obtain a certain price, and that price for his coal has given him such large sums of money, as has been known to be the case by the Government and the Revenue authorities, that certain collieries, to my knowledge, have paid during this last year one as much as £80,000 in excess profits, and the year before it was higher, and the year before that it was higher, and yet, under State Control, that has been permitted, and the colliery owner and the trader generally have been pilloried for being profiteers when they have taken that which the Government has almost forced upon them for revenue purposes.

24,264. *Mr. Sidney Webb*: Thank you, that is quite right. Now I want to ask you whether, under the competitive system, the reward of the colliery owners would be kept in check more than it has been under this system?—Certainly.

24,265. You think, therefore, that if the whole of State Control were taken away the colliery owner would get less than he has been getting?—He would get less than he has been getting, certainly, year per year, but you have to extend your inquiry and your knowledge over a matter of 30 years to get at what the colliery owner has been obtaining as a reward for his services.

24,266. We have had the exact figures?—Then if you have had the exact figures, you would know, as a matter of fact, that for 35 to 40 years his reward or his profit has very much varied in that time. In times of stress and in times of good trade that has been the time when the colliery owner has walked in, and he has got very large sums of money; but the years following, say, 1873, when so many collieries were shut down, owing to high prices—owing to the high price of coal—in those days prices, for many years after, slumped and there was not a very big margin in many collieries sunk at that time; in fact, many of them did not pay at all.

24,267. You say, if you rely on the competitive system of reward, the colliery owner is kept in check?—Certainly

30: May, 1919.]

MR. EDWARD SMALLWOOD.

[Continued.]

24,268. Yet you advised the Commission to retain the control as regards limitation of price, quantity and allocation?—Yes, in time of stress.

24,269. *Sir Arthur Duckham*: I see you have a paragraph in your *précis* which runs: "Most unsuitable coals have been supplied in many cases under the present measure of control." We have heard it stated before this Commission that great savings have been made with regard to carriage in the distribution of coal?—Yes.

24,270. And a figure, which is a well-known figure now, of 700 million ton miles has been given. Can you form any opinion as to the comparative inefficient consumption of unsuitable fuel that has caused?—I can only form a general opinion, because on the coal market, and meeting men as I do from all parts of Great Britain under the Federation, one has heard some very extraordinary cases of unsuitable coal having been put into certain districts by reason of the so-called saving of 700 million ton miles.

24,271. Do you consider the people who carried out this distribution of coal, and allocation of coal, fully realised the great differences there were between different kinds of coal?—I do not think they can have realised it or they would not have made such a hard and fast rule with regard to the transit of coal as they have done in many cases.

24,272. *Sir L. Chiozza Money*: Sir, may I ask, are we going to have evidence with regard to the distribution of coal?—because all these allegations seem to be very contrary to what Mr. Davis told us. Are we going to have the gentlemen recalled who have done these things?

Chairman: I forget the gentleman's name to whom you are referring.

Sir L. Chiozza Money: I refer to the man who was responsible in the time of war, when the nation was very short of coal, and very short of railways for distributing coal in the circumstances in order to save the nation from a coal famine.

Sir Arthur Duckham: I think you will have evidence next week on that point.

24,273. With regard to your own business, is it not the fact that the only way that you can run your business profitably is to please your consumer?—That is the case.

24,274. What would happen if you endeavoured to exploit your consumer?—We should lose our customers.

24,275. As long as there was competition?—Quite so. Under the present system, gas coal has been sent to us for the purpose of bakeries. Now if there is one thing a baker does not want, it is a gas coal. On the other side, we have known bakers' coal being sent to gasworks, and if there is one thing a gas company does not want, it is bakers' coal.

24,276. *Sir L. Chiozza Money*: You know that all this was in time of war?—Shall I amplify that, Sir Leo?

24,277. *Chairman*: By all means?—I only wish to point this out, that at the same time that bakers' coal was being sent into gasworks, there was a shortage of bakers' coal in various districts, and that bakers' coal was quite as essential in the industrial and large towns for the purposes of baking bread, as it was for making gas.

Sir Arthur Duckham: You say there was gasworks' coal available at the time?

24,278. *Sir L. Chiozza Money*: Do you know that?—Of my own knowledge I do not propose to say that.

24,279. *Sir Arthur Duckham*: I was coming back to the consumers' point of view. The consumer, under competitive systems and normal conditions, is free to purchase where he likes?—Quite so.

24,280. That is presumably his greatest safeguard?—That is so.

24,281. Under a system of control he has not had that freedom?—He has had the freedom of taking the coal where he liked at the beginning of the control, and if there was any specific reason why he wished to change, he has been able to change from one merchant to another.

24,282. Say a consumer was buying a Yorkshire coal at the beginning of the control period, do you know of any case where he has had to have Durham

coal at a later period because they would not send Yorkshire coal down to him?—Yes, and in our own case we have been buyers of a Yorkshire coal for 30 or 40 years, a coal that we placed a great pride in; but during the last two years the control has not permitted us to have one ounce of that: we have had to get coal from Derbyshire.

24,283. Therefore, you have not been able to continue buying the coal you were buying?—No, nor has any other merchant.

24,284. Do you suggest that the Government control, even on the lines suggested by Mr. Webb, should continue when conditions are normal, and there is a sufficiency of coal for the market? I am talking about the control price chiefly?—I have felt during the last year or so that a control of prices should exist, even after the stress of war.

24,285. Then when you get down to normal conditions, and there is sufficient coal on the market to cause competition?—I would like to qualify that to this extent, that I think some system might be arranged by which, when coal got a certain price, and the remuneration of the mine owner was above a certain sum, it should come under control.

24,286. Something to do with the profit of the mine-owner?—Yes.

24,287. Distribution is a specialised trade, is it not?—Quite so.

24,288. You have given us some idea of the definite purposes it serves?—Yes.

24,289. In ordinary working, somebody would have to carry out those functions?—They must do so.

24,290. Whether nationalised or not, those functions are considerable?—Yes.

24,291. We might be led astray if we considered they were not considerable?—That is so.

24,292. We have had complaints made here with regard to the extortionate—I think I may use that word—or the very high profits made by the distributor, and from the figures that are given, I think you can realise that the consumer would be feeling that he has been paying too much. Can you assist us at all by justifying the differences in cost? Can you justify them, and can you tell us how, under existing conditions, they could be reduced?—Are you now speaking of the profits since the industry has been under control? I have not it here, but there was a statement attached to the Chairman's report in which he gives the prices at the pithead and the price to the seller. What I wanted from you was a justification of the difference between those two prices.

24,293. The price at the pithead was 21s. 2d., and the price delivered was 44s. Then 23s. 5d., you see, the pithead price, is given in the second table?—Yes.

24,294. The railway rate was 6s. 3d., wagon hire 1s. 6d.; then there is 4d. and the merchants' charges, labour 4s. 3d., and establishment charges 3s. 4d., profits 1s. 3d., management and interest 1s. 6d. What is the justification, for instance, of the establishment charge of 3s. 4d.? It seems a very high figure?—Had I known that I was going to be asked as to figures, I should have had those figures with me. I think that is to be gone into at a later stage of the enquiry, but as to how that figure of 3s. 4d. is made up, I should not like to charge my memory without having the figures in front of me.

24,295. Does it not seem to you a large charge for establishment?—I do not think so, considering salaries, office rent, rates, and also the cost of control, or the administration of control, in the various offices, because that has been very considerable. When all these items are rolled together, I think that 3s. 4d. can very easily be justified, and will, no doubt, have to be justified at a later stage of the Commission.

24,296. *Chairman*: I think it included rents, rates and clerical staff?—Yes.

24,297. *Sir Arthur Duckham*: If you compare that figure with a figure in other businesses, 3s. 4d. seems a very high figure?—I can only say, in answer to that, that I have no knowledge of how that 3s. 4d. is made up, because it varies in different parts of the country. I am Chairman of the Federation of Coal Merchants of Great Britain, and I can say that those figures would vary in different parts of the Kingdom.

30 May, 1919.]

MR. EDWARD SMALLWOOD.

[Continued.]

24,298. Would not that figure be reduced if you reduce the number of distributors?—No, I am quite sure that would not be the case.

24,299. You do not think, then, that that 3s. 4d. is enhanced by the large number of small distributors?—No, I am quite sure that is not the case.

24,300. Taking establishment charges alone, you think the small distributor could distribute as efficiently as a large distributor?—Yes, I am quite sure of that, and more efficiently in certain cases.

24,301. We have had the question of storing coal brought up before the Commission. Will you take a concrete case: Say you wanted to store 200,000 tons of coal: what would be the cost and the loss on that storage? Just give us an estimate?—In the first place, one has to pay the men at the present time 1s. 2d. a ton for putting the coal down.

24,302. Could you not save that by mechanical handling?—No, that cannot be done possibly on wharves and open spaces where you have to store the coal; for instance, on an ordinary coal wharf where the rails are on a level with the ground on which the coal has to be landed, especially in large towns.

24,303. I am not suggesting it to you where you have to store on an ordinary coal wharf; I am suggesting that certain dumps should be made for storing purposes, where you could have 200,000 tons of coal stored in one dump?—In London, do you mean?

24,304. Yes, or outside London; what would the charges be on that?—I should say they would be enormous. In the first place, you would have to land your coal on the outside of a town, and you would have a rate to that particular place which, under the present rating system, would be higher than the rate to London itself.

24,305. You are speaking of the railway rate?—The railway rate up to a place within 10 or 15 miles of London is higher than to London itself; you would have a high rate to start with, or if you reduced the rate to the country district, you would have to raise the rate to the London district in order to get your revenue right for the undertaking. That would be one extra charge.

24,306. What would that amount to—1s.?—There is a station that comes to my mind for the moment on the Great Northern Railway, about 9 or 10 miles from London, the rate to which is 1s. 2d. more than to London itself.

24,307. Then you would have the rate from the dump to London again?—Then you would have also the breakage of the coal, and the labour again, to pick it up.

24,308. What would be the loss in value of your coal so stored for three or four months?—That would depend largely on the time of the year that it was stored.

24,309. What would it be if it was in the summer time?—If it was exposed to the winter rains and snow, it would deteriorate anything in the neighbourhood of 25 per cent.

24,310. I presume with mechanical apparatus you could put the coal down and pick it up for 1s. a ton?—We have gone into that many a time, but we have not as yet the apparatus in view, or in mind, or in being, that could possibly help us in respect of large coal. You can in respect of such stuff as will run, such as nuts, peas and such like, but we have not at the present time any mechanical means by which we can land coal on to a dump that is on a level.

24,311. So that it comes to this. You have one shilling a ton extra on your coal to get it there. You have something from the dump to London—one shilling again?—No, the local rate under the present ownership would be anything from 1s. 6d. to 2s. from that particular place, and your railway wagon would have to be charged again, because that railway wagon sent up to that particular point where your dump is would have as high a value put on its running as if it were run straight through to London. You have again to send railway wagons down to that place and all that expense to be gone through again.

24,312. So that you might have a charge of something in the neighbourhood of 4s. a ton?—I should say very easily.

24,313. Then you might have 1s. a ton for storing? That is a figure that I have had?—I should not dispute that.

24,314. Then you have your 25 per cent. depreciation of coal?—Yes; it is a pure guess.

24,315. So that it might be an excessive matter?—I should say very excessive. From our experience of landing coal in the open in quantities of 1,000, 2,000, and 3,000 tons, we know that it is a very expensive process, although one has it run right through to your wharf, put down straight away and picked up in four or five months' time at a particular depot without any extra expense.

24,316. *Mr. Robert Smilie*: Would you tell us exactly what bakers' coal is?—Bakers' coal is a coal which comes out of the Leicestershire district so far as London and the South is concerned. It is a coal the flame of which spreads very rapidly and there is not much smoke. It comes out of the Leicestershire district.

24,317. Is it only produced in Leicestershire?—No, not only in Leicestershire. I think it is also in Warwickshire, but it does come from certain well-defined coalfields for certain districts.

24,318. Do all the bakers of the country send to Leicestershire and Warwickshire for their coal?—So far as London and the South are concerned I am quite sure that most of the coal that is used by bakers comes from that district.

24,319. And you say some bakers got gas coal?—Yes, that is the reason we got so much burnt bread in London.

24,320. From what district?—When I say "gas coal," I mean gassy coal.

24,321. Gas coal was so scarce that it could be sent even to the bakers in London?—It was gas coal which was sent to bakers in London, and they could not get anything else. Gas coal pure and simple from Durham and Northumberland was sent to London at an enormous cost and a loss to the Controller of 15s. a ton.

24,322. *Sir Leo Chiozza Money*: These are very serious allegations against the gentleman we had here before, Mr. Davies, who is responsible for these things, and I am perfectly sure we have not had the whole truth on this matter. Can we spare one minute so that I may put a few questions to this witness on this interesting subject?

Chairman: Yes, one minute.

24,323. *Sir Leo Chiozza Money*: May I ask you, do you not realise that what you have been describing are quite abnormal conditions? They are conditions appertaining to a time of war and what immediately follows, and they have no relevance whatever, I think you will agree on consideration, to nationalisation in normal times of peace?—No, I do not agree. I consider they have a very great relevance. When I understand now fully as I do what a State official can do in respect of an industry, I do not want any more of him than I can possibly help in the future. I have had more than I require.

24,324. Do you realise that we were at war, that coal was exceedingly short, that while it was short large quantities had to be sent to France and Italy to enable them to continue in the war?—I know those things, and I know also that in the earlier stages of the war, in 1915 and 1916, both the merchants and the colliery owners were put upon their honour to do certain things without any definite control, and for 12 months they carried out that which they pledged themselves to without any rise in the price.

24,325. Do you know also that railways and locomotives had to be exported from this country?—I know that also.

24,326. Do you know that if those measures of control had not been exercised and some people had not been given coal to which they had not been accustomed in the past, many would have been without any coal altogether?—I know that, and I know also that if it had been left to the distributing agents they would have been better supplied.

24,327. Have you read the evidence of Mr. Davies as to what has been done?—No, but as a member of the London Coal Committee I have learned enough to satisfy my own mind.

30 May, 1919.]

MR. EDWARD SMALLWOOD.

[Continued.]

24,328. May I say that you see it from the point of view of several thousands of coal merchants who are anxious to retain their own business?—I do not see it only from that point of view to-day.

24,329. I thought you came as the Chairman of the Coal Merchants' Federation of Great Britain?—I come as a chairman, but I have another personality than that.

24,330. I do not know what your clients would say if they heard you say that their business was uneconomical?—That rests with them.

24,331. *Mr. Robert Smillie*: I suggest you are quite wrong when you said one man was regulating the coal trade. As a matter of fact, before the Coal

Controller was appointed there was a Joint Committee of coal owners and miners, of which Sir Richard Redmayne was Chairman, conducting the coal trade of the country?—I was speaking of the one man who was the prominent figure at that time, that was the President of the Board of Trade, who made the arrangements with us, and there was not a horde of officials coming between us.

24,332. As a matter of fact, he made that advice on the recommendation of the Coal Committee composed of three coal owners, three miners and Sir Richard Redmayne?—It was voluntarily done and not by a horde of officials.

Chairman: I am much obliged to you for your evidence.

(*The Witness withdrew.*)

Mrs. MARY ELIZABETH HART, Affirmed and Examined.

24,333. *Chairman*: I am going, Mrs. Hart, to read your evidence, and when I have finished I am going to ask you if you want to say anything more.

"*Evidence of Mrs. Hart, 56, Great George Street, Wigan, on Miners' Conditions.*

I am the wife of a miner and have lived all my life in a mining district. As a social worker I have taken a great interest in the housing question, as I recognise that to have a healthy population we must have good housing accommodation."

I am going to ask Mr. Herbert Smith to ask you questions on one side and Mr. Cooper on the other.

This is what Mrs. Hart says about housing:

"*Housing.*

In the first place there is a very serious house famine in Wigan and the Chairman of the Housing Committee of the Wigan Corporation informs me that the immediate needs of the town of Wigan can only be met by the building of at least 1,000 new houses, as there are at the present time two and three families living in one house. After making full enquiries I find that the applications for the proposed new houses far exceed the number to be built, although they know that the rents will be practically double what they are now paying.

In regard to the insanitary conditions of the houses, the conveniences are totally inadequate to the number of houses; in many instances two or three families use the same convenience, and as this is usually a pail it is both unhealthy and disagreeable. There are also some houses where the conveniences are so close to the back door that a single step will take you right into the convenience, and the stench, especially in the summer, can be more easily imagined than described.

There are a large number of 'back-to-back' houses with no water supply, no wash-boilers, and from which all ashes and refuse have to be carried a considerable distance. The rent received for such houses is, owing to this system, considerably greater than that received from an ordinary four-roomed house."

Now we come to pithead baths:—

"Now regarding the pithead baths, the general opinion amongst the men was that they would much prefer them to be put into their own homes, and they had at first a fear of catching cold and a natural disinclination to pay for their upkeep, as they considered they paid enough for tools, oils, &c. But after coming in contact with other men who had had experience of pithead baths, they found that the health of the miners was greatly improved.

The women are unanimously in favour of the baths, both at the pithead and in the home, for the miner's wife under present conditions is little better than a slave. Imagine a house with one living room which serves as a kitchen for cooking and as dining room. A family of from two to six sons, along with the father, come home from work. After they have had their meal, they take off their pit clothes and wash. There are no facilities such as hot water laid on. The usual procedure is a small pan heated on the fire; each has to wash in his turn and sometimes before the water is ready, some of them have gone to sleep—they are so tired. Now could they have had a bath

before their meal they would have been refreshed and able to enjoy a walk afterwards.

The shifts are so uncertain that the housewife has to be up early and late."

I have read that now. Do you want to say anything more than what I have read?—In the first place I want to qualify this first statement, because, having read some remarks that have been made by the witnesses at this Coal Commission, I have heard it stated that the miners' wives acquiesce in the bad housing conditions because they have a low rental and they are not willing to pay more rent for the houses. That is not the case. The women cannot help themselves, because there are no houses; and I put this in simply to show that the women are fully prepared, and the men too, to pay more rent if they can get a house; because the Chairman of the Housing Committee, who by the way is a miner, told me himself that there was no possible chance of any of these families being supplied with houses in spite of the fact that the rentals would be a lot more than they are at present paying—in fact, very nearly double. I should say, too, that as a member of the Insurance Committee of the County Borough of Wigan I have had some experience of dealing with consumptive cases, and we find that after we have sent these cases away to sanatoria and they come back improved in condition, when they have been at home a short time they invariably go back to the same condition, because owing to the housing conditions and their not being able to provide rooms for the different cases they have all to sleep sometimes in one room, and the condition of improvement has not been maintained. I must say I do not want to create a wrong impression: most of the houses in Wigan—I am only speaking about the local conditions of Wigan and the Urban District—the majority of the houses are not owned by the colliery companies; they are owned by private landlords. There are very few houses in Wigan that are owned by the colliery companies. In the urban districts there are a few, but the houses are largely owned by private landlords, so I do not want to create a wrong impression. With regard to the insanitary houses, in some instances I have spoken to the women, and in fact I know them myself because they are close to where I live. The houses are back to back houses, and it entails a very great strain on the women, because they have no washing boilers and they have to carry heavy pans, and that is responsible for a great deal of the internal complaints of women—through the wives having to carry these heavy pans. And then there is the drying of the clothes in the houses. The houses are provided with lines; they wind the lines up and down, and in winter time they have to dry all the clothes in the house. The steam comes from them; there is no sitting room attached; there is only one sleeping room up and just one living room down. Besides that they have to carry all the refuse. Perhaps I might just describe the place. The street in which I live—not the house in which I live—but the street in which I live is a long row of houses on both sides; and I should say that there would be about 40 or 50 houses on one side and 40 or 50 on the other. There is a small entrance between the houses within short distances, say, of 10

30 May, 1919.]

MRS. MARY ELIZABETH HART.

[Continued.]

or 12 houses—sometimes two or three. It just depends on who owns the houses. The women have to carry the whole of the refuse down this street, up these entries, and tip it into an open place, a dust-hole. They do provide tubs sometimes to put this dust in, but usually it is tipped in; and if a door happens to get pulled off or damaged in any way the dust flies about in the dry weather, and of course, that is prejudicial to good health. With regard to the pithead baths, I am not going to say that the men themselves are very enthusiastic about pithead baths, especially the elder miners; but the younger men seem to think that they would like these pithead baths. The reason the older men give me is this, that they have a fear of catching cold, and they think that they should not be asked to pay for their upkeep because they consider they pay enough for tools and all the rest of it. There is a place called Fletchers & Burroughs; most of the miners in our district do not walk to the towns; they go by car—some as far as 5 or 6 miles—and they come in contact with the miners at that place who have used these pithead baths, and the general opinion is that they would rather have them than be without them. Having once used them, of course, they know the value of them, and they think that these baths would greatly improve their health. Now the women are unanimously in favour of pithead baths, because they recognise that it would take a lot of dirt out of their houses. When a woman has to have a lot of men coming home and she has no facilities whatever in the shape of water or anything like that laid on, and the children are playing in and out of the house while the men are coming in, (who are not always in the best of temper, owing to the surroundings), they feel that if they could have all this dust and dirt left at the pithead it would save them a lot of work, and there would be a lot more comfort in their home life. But there is one point, and that is this: I have read that it has been said in this place that these women are not so clean in their habits, and all the rest of it. I read that—I think it was last week. One of the most prominent questions that was asked me when we have had chats about this, was this: they have said, "Well, Mrs. Hart, what would happen to the men's clothes if it happened to be raining, and what would happen to the washing of the pit clothes?" Because the men's wives wash what they call their pit drawers every night; and they want to know what would happen if these pit drawers and things could not get washed. Of course we are expecting that if pithead baths are set up somebody will be in charge and that they will wash these pit clothes and dry them too, so that it will not affect the men's health in any way. Then again the shifts are very uncertain, and that has a lot to do with the health of the women.

24,334. *Chairman*: Tell me about what effect that has. You say the shifts are very uncertain. What is the result of the shifts being uncertain? Do they come home at all different times?—It has an effect on the women's health. Suppose a woman has to be up in the morning—I know women who have to be up at 4 o'clock in the morning, and the family perhaps may be going out at different times. Different collieries start at different times. Some start at 6, some start at 7. The woman has to stay up the whole of the time, because she cannot go back to bed; and she may have daughters who may be working in the mills, and she has to stay up to see them out. She has to stay up at night to see them all to bed. Probably she may have some who are in the afternoon shifts who are coming in about 11 to 12 at night, and she has to stay up to get their meals ready and see to them. As a rule, it all devolves on the shoulders of one woman. So that I think the gentlemen who have given the evidence before this Commission that Lancashire women, the wives of miners generally, are not clean in their habits and also are not good cooks should also bear that circumstance in mind.

Chairman: We are very much obliged to you, and I am going to ask two gentlemen who come from the north of England to ask you some questions. The first gentleman, Mr. Herbert Smith, is the President of the Yorkshire Miners' Association; and after that

Mr. Cooper, who comes from Newcastle, on behalf of the owners.

24,335. *Mr. Herbert Smith*: I have been looking at your *précis*, and I think we had better clear up this question of times. You have spoken of the husband and three or four sons going out to work?—Yes.

24,336. The husband, as a rule, goes down to the colliery at 6 in the morning?—Yes.

24,337. That means that you have to get up at 4 or half past 4?—Yes.

24,338. Then he would come back between 2 and 3?—Yes.

24,339. You have a son going out at one o'clock to work?—Yes.

24,340. And he will get home between 11 and half past 11?—Yes.

24,341. You have a son going out at 10 o'clock on the last shift?—Yes.

24,342. He will get back between 6 and half past 6 in the morning?—Yes, something like that.

24,343. Then you have your family to get ready for school?—Excuse me, I am not referring to my family: I am referring to the general case.

24,344. I am talking generally now. That is what happens, is it not?—Yes, that is what happens.

24,345. So that a woman is busy drying pit clothes for one lot to go out to work, then drying again, and the dirty clothes are coming in after she has cleaned her house up?—Yes.

24,346. It means that she will have to clean her house up about four times a day?—Yes.

24,347. Is it your experience, as a pitman's wife, that she is not a cleanly woman and as careful as any other woman?—I may tell you this: my work is, I collect contributions for the Wigan and District Weavers' Association, and it takes me about into a good many houses. My experience of the miner's wife is that, in fact, I sometimes wonder how they keep their houses in the condition that they are in. With regard to some of the houses I go into, the living rooms are splendid, and the furniture you can see your face in it, it is so clean and polished up; so I do not think that dirt is a general thing amongst miners' wives. I think miners' wives are clean, and I think, seeing that the facilities that they have are so small, it entails, as I say, a great amount of work, and she is little better under the present conditions than a slave, because she has to be nurse, housekeeper, shop-errand girl and everything: she has nobody to look after things for her, she has to do everything on her own.

24,348. You can quite appreciate that these gentlemen who talked about miners' wives being untidy and poor cooks—that their wives have somebody else to cook for them, so you need not put too much stress on that, because if a miner's wife had a housemaid and a cook and two or three servants, she would be tidy all the time?—She would. If she had no dirt coming in, and no dirty pit clothes coming in, she could keep her house clean and it would entail very little trouble.

24,349. Would you admit that housing is a national obligation?—Yes, I do. I think that the reason of all this is that it is profiteering in houses, I call it. I am not going to say that I know how many houses to the acre there are, but I know they have as many as they can get, and if they could have put any more on, they would have done so; I think it is owing to the fact that people own property for income: it is their income, you see, because I have come in contact, in my work, with people who have owned property. I was on a committee that had to do with consumptives. They send us round to people to give them advice. The doctor gave us the advice, and told us what was the best thing to do in the case of consumption. I have gone round to houses, and I have one special instance in my mind where a woman had her two children and her husband suffering from consumption. When I went in, she showed me one place on one side of the wall that was practically down, the plaster was off and there was no paper, and then she had to prop up one side of the staircase. It was one of those old-fashioned staircases, those open staircases—it is like lattice work at one side. She had to prop up this side of the staircase, and she

30 May, 1919.]

MRS. MARY ELIZABETH HART.

[Continued.]

said it was a danger. When the members of the Committee were told about it and she said the housing condition was at the bottom of it, they would never even open their lips, and I have come to the conclusion, rightly or wrongly—I am not going to say that it is wrong, in a way, because we know that the existing conditions breed this sort of thing—but I think it is owing to people having to have their incomes from house property. I think it is a national problem, and that the State should take into consideration the housing question, because they say the children are the assets of the nation, and how is it possible for children to grow up healthy if they have to live under such conditions? It is an absolute impossibility.

24,350. Our complaint is not particularly against colliery owners, but colliery owners owning these slums. With regard to housing, it is a national obligation?—Yes.

24,351. Have you ever, as a miner's wife, experienced cases of people being evicted in the case of a strike or lock-out?—I must say again that there are very few colliery-owned houses in Wigan, but I have heard about people being evicted.

24,352. You have not experienced it?—No, I have no experience of that matter.

24,353. You say you would rather be free from that obligation. We do not want to make housing a condition of employment?—No. I know in some districts, if there is a man working at the colliery, and especially an official—I must say I have not had experience of miners being evicted—but when they wanted a house for an official, sometimes they have given people notice to quit.

24,354. You have heard of cases of miners being evicted at Cadeby, Hemsworth and Fryston in Yorkshire?—Yes; I lived in the North of England, in the County of Durham, at a village called Birtley, and the miners have told me there, when they have come out on strike—the colliery owners owned the property, or a good portion of it—they have told me that they had evicted the miners once when they came out on strike, and they had to sleep in the fields.

24,355. *Mr. R. W. Cooper*: How long ago was that?—It is a long time since.

24,356. *Mr. Herbert Smith*: I do not want to go back a long time; I want to talk about 1918?—I must say that during the period I lived up there the housing conditions were awful.

24,357. *Mr. R. W. Cooper*: Was that at Birtley?—Yes. In fact, that was the one reason why we left it, because they expected three or four families to live in one house, and we had never been used to that, so we came back to Lancashire again.

24,358. How many years ago would that be?—About 18.

24,359. *Mr. Herbert Smith*: Have you seen the medical officer's report from Wigan with regard to housing?—I have seen it, but I could not tell you from memory what it is.

24,360. Talking about paying good rents, if I tell you that a medical officer of the West Riding said it would pay West Riding practically to pay half the rent, because they paid indirectly more in curing tuberculosis and other cases of sickness which the County Council were compelled to do—it would be a saving to pay half the rent to house people properly, would you agree with that?—Yes, the doctors do realise that. At the last insurance meeting that I attended, one doctor said that it was a waste of money, because the conditions were so bad that the people had to go back to; he said it was an impossibility to do anything, only to keep repeating the case time and again; he said if the money that was spent in relieving these cases was spent in preventing the disease, it would be a lot better. The people generally cannot help themselves. They are paying more rent even now than what they used to do for the same house that they live in.

24,361. But is this state of things existing now in Wigan, that they have to use pails?—Yes.

24,362. In Wigan?—Yes, in Wigan, in the street where I live.

24,363. It is generally said by a friend of ours that what Lancashire says to-day England will say

to-morrow. I was wondering whether that would be so in this case?—In the house where I live, we have the water carriage system, but the majority of the houses have the old pail system.

24,364. Coming now to the question of baths do you find that the difficulty with the older men is that there is no sufficient privacy with regard to baths?—Yes, that is one thing: for instance, I was talking to a miner last week and he said, "I would have no objection: I realise it would be a lot better both for my wife and for my own life, but," he said, "I do not like one thing: I think it would be the means of carrying disease." He was under the impression that a lot of men would all have to go in one bath. I told him that would not be the right thing, because I was thinking that they would have separate baths for every person, and that they would not be required to go into the same bath.

24,365. It was not intended that two or three men were going to bath in one lot of water?—No, he meant to say that the baths should be cleansed. When a person had used a bath, naturally he would leave a scum of dirt round the bath, and he wanted to know whether these baths would be cleansed before another man was expected to go in.

24,366. I may say that my experience is that they have been fairly well cleansed. Then it has been the case, has it not, that the man gets his bath, then changes his clothes, and has to carry his wet clothes home with him?—Yes.

24,367. My point is that they should be left at the colliery and dried, as is done in Germany?—That is the point.

24,368. Do you think there would be as much opposition then if that were done?—No, I pointed out at first that that is what the women think about it. They say that these men who are using baths have to carry their clothes home, and they did not think it would be wise, because it would affect the men's health just the same as if the clothes were wet and they have to carry them with them.

24,369. When a man has to ride in a tramcar, he might as well have his clothes on as over his arm?—Yes. There is a lot of dissatisfaction about that because, as a rule, men have to ride in the same cars. In our district they do not put special cars on for workmen: they can ride in any car, and the consequence is, if people get in and the men have to sit beside them they feel it: they move up, as a rule, and it is only natural, because the pit dust spoils one's clothes.

24,370. So that most of the opposition that you have heard of is derived from a false impression of what is intended by the baths?—Yes. The general opinion amongst the younger men is that it will be of value and a great boon to their health, and also a boon to their wives.

24,371. Are you satisfied that if this was clearly explained to the men, that they would have a separate bath, and that the bath would be properly cleaned out and their clothes left at the pit to dry and to have all little menfings done to them—that would remove the opposition?—Yes: I think, if there was a ballot of the men taken now, that the majority would be in favour. I think there is a distinct revolution in the feelings of the men.

24,372. Do you know, as a miner's wife, that it should remove a lot of the disease away from the home if the pit clothes were kept at the pit?—Yes. It is evident if the miner's wife has to dry a lot of clothes in the house, and the steam is rising up, it is bound to have a bad effect upon the people and the children in the house.

24,373. Then if it was so arranged that he could get home at the time when the children leave school, you could all sit down together to a meal instead of having to cook two or three dinners?—Yes.

24,374. *Mr. R. W. Cooper*: With regard to the question of the baths at the pit, do the colliers at Wigan work at places a few miles away from Wigan?—Yes.

24,375. Which would you prefer: to have baths at the pit or a proper bath-room with a bath in each house?—I should prefer the pithead bath, because it would keep the dirty clothes and dirt away from our homes, of course. That is the woman's opinion.

30 May, 1919.]

MRS. MARY ELIZABETH HART.

[Continued.]

The woman, of course, value the bath in the home, because they realise that the whole of the members of the family could use the bath, but at the same time they think that there ought to be baths at the pit-head to remove this dirt from their homes, and cause them to have less work.

24,376. So that what you would like to see would be a pithead bath and also a decent bath-room in each house?—Yes, that is what I think should be.

24,377. I have never been to Wigan, and I know nothing about it, but I understand you live in a street called Great George Street?—Yes.

24,378. I gather from what you have said that your house does not belong to a colliery owner?—No, it belongs to a private landlord.

24,379. Do your neighbours work in coal mines, or are they engaged in other occupations?—The majority work in coal mines.

24,380. The majority of those living in that street?—Yes.

24,381. Who are the owners of the houses in that street?—I could not tell you who the owners are; I could tell you who the agents are.

24,382. Are they private people?—Yes.

24,383. Do they live in Wigan or not?—No, they do not live in Wigan; some of them live towards Southport. It is not likely they would live in Wigan, is it?

24,384. I gather from what you tell me that Wigan is not a health resort?—No, it is not, I can assure you. In the majority of the houses we do not see the landlord; we do not know who the landlords are. In the majority of the cases they are simply agents.

24,385. Are they somewhat old houses?—Yes, I should say they are about 30 or 40 years old, or more than that. The house in which I live is over 40 years old, but I should say this, that the landlord who owns the house that I live in is an exception to the general rule. He has tried, as far as lies in his power, all he can to improve the condition of the

houses, but he only owns a small number, four; and he does live in the town of Wigan.

24,386. You mentioned the Housing Committee of the Wigan Corporation. I did not quite catch what you said, but I thought you said that a miner was the chairman?—Yes, he is the chairman of the Corporation.

24,387. Have you any idea how long this Housing Committee has been in existence?—It was in existence before the war, but it has been in abeyance owing to not being able to get support.

24,388. I suppose owing to the war they did little or nothing?—They did nothing.

24,389. I presume the object of this Housing Committee is to see to the improvement of the housing conditions in Wigan?—Yes, the chairman of the Housing Committee told me last week that they have chosen sites to erect houses, but he said there were more applicants for these houses than they could provide for, and they have not started yet: he could not say exactly when they could start, because, owing to materials being hard to get and the price of things generally being high, he said it was held in abeyance.

24,390. As we know it is very difficult to do any building at present?—I think the housing schemes are all in the air yet. I do not think they seem to be realised. There is not much reliance about them at present; I think it is all talk.

24,391. Apparently in Wigan, as in other places, there is a very great need for what I may call housing reform?—Yes, there is a very great need of houses and also improvement of the existing houses.

24,392. I suppose you would agree if the Housing Committee of the Wigan Corporation does not do its duty, there ought to be some power brought into existence to compel it to do its duty?—The women are taking up this matter, I may say, and they are going to try to make them do it. They have put up with these conditions long enough.

Chairman: We are very much obliged to you for having come here to assist us.

(The Witness withdrew.)

Mrs. ELIZABETH ANDREWS, Sworn and Examined.

24,393. *Chairman:* I will read this *précis* of evidence on miners' conditions by Mrs. Andrews, of Ruskin House, Stanley Road, Gelli, Ton Pentre, Rhondda:

"I am the wife of a miner, and many of my people are engaged in the mining industry. I have lived all my life in the mining areas, and as a member of the Women's Co-operative Guild, and of the Labour Party, have had many opportunities of discussing the conditions with other women.

Housing.

Women acquiesce in bad housing in Wales because they have no alternative, under the present circumstances due to the extreme shortage of houses, a shortage which was very acute in industrial areas long before the war. The statement made that women acquiesce in bad housing because they like low rent I strongly resent on behalf of the women, as they have had to pay a very big increase in rent this last ten years for the same houses and conditions. I quote Rhondda, for example, being one of the largest mining areas in Wales.

Population: 165,051. (1918 estimate.)

Number of inhabited houses: 28,384.

Number of miners: 44,460 (estimate).

The estimated need for houses at present is 1,500 to 2,000.

Houses that have been condemned before the war (not fit for human habitation) are still occupied owing to the shortage, and most of them occupied by large families. The reason is that most landlords will not rent their best houses to people who have large families. The overcrowding of these collar dwellings are to a great extent responsible for the high infantile death-rate of 103 per 1,000.

Pithead Baths.—This reform like all other reforms at first met with opposition owing to the fact that it

would bring a change in customs, and naturally would meet with prejudice. But a revolution in ideas among the miners and their wives has taken place since then. This question has been discussed at public meetings all over South Wales during the last 18 months, and especially this last five months it has become the question of the day. It was the women of the Rhondda who renewed this agitation by asking the Executive of the South Wales Miners' Federation to urge the lodges to take the matter up, and correspondence took place in the South Wales daily papers which has aroused the interest of the miners' wives all over the coalfields. Conferences are to be held at various centres to press forward the campaign. I have addressed 25 meetings since March in mining areas in South Wales, where this question of pithead baths has been fully discussed, and both men and women have realised what it means to them in raising the standard of life all round, individually, in the home life, and in municipal life. Unsanitary workmen's trains and cars would be done away with, and the miners could then travel in cleanliness and comfort. Pithead baths would reduce the physical strain on the mother caused through lifting heavy tubs and boilers. A midwife of 23 years' experience in the same district in the Rhondda stated to me that the majority of cases she has had of premature births and extreme female ailments are due to the physical strain of lifting heavy tubs and boilers in their homes which they had to do under the present housing conditions.

I have been organising among the miners' wives for five years, and have during that period been in touch with thousands of miners' wives in South Wales, and at various meetings and conferences the women have very strongly expressed their desire for better conditions, and they have realised that pithead baths along with better houses would bring those desirable conditions about.

30 May, 1919.]

MRS. ELIZABETH ANDREWS.

[Continued.]

Various statements have been made at this Commission regarding the miners' wives of Wales. They are most indignant over these statements, and resent them strongly. On behalf of the miners' wives of South Wales I most emphatically repudiate the statements that the women of South Wales are against pithead baths, and that they acquiesce in bad housing."

(To the Witness.) Will you kindly tell me anything else that you wish to say to us in addition to what I have read?—I have a few more statements which I should like to add to my evidence, but before I make those statements I should like to remove one little technical error from my evidence. At the beginning my *précis* says: "I am the wife of a miner," and it ought to read "I am the wife of an ex-miner." My husband has been in the Army three years, and for a number of years prior to joining the Army he had to give up mining owing to ill-health. I want to rectify that to make it quite clear. But I am a daughter of a miner and one of 11 children and have lived my whole life amongst miners.

24,394. Thank you. Have you anything else to add?—I have also been acting in connection with the Labour Party and the Women's Co-operative Guild. I have served three years on the District Committee of the South Wales Co-operative Women's Guild. I have also been a member of the War Pensions Committee, and I have done a great deal in regard to social work. Therefore I have come in contact with the very poorest working-class women in South Wales. They have expressed to me, however poor they are, their desire for better conditions, but they have had to acquiesce in the poor houses they live in owing to the shortage, as I have stated in my evidence. I was glad to hear Mrs. Hart state what she did about women taking up the housing question. The women in Wales are taking it up. Deputations have attended some of our Councils, urging the Councils to appoint Housing Committees and get representatives of working women on those committees. These were deputations organised by the miners' wives in South Wales. I should also like to say that a number of the miners' wives in South Wales strongly resent the fact that they have to live in houses so close to the pitheads. May I take the Rhondda, for instance? I do not know whether any of you gentlemen know the Rhondda.

24,395. Yes; one does, anyhow?—If you pay a visit to the Rhondda, you will see what kind of a place it is. All these industries have ruined all its beauties and stripped the trees and made it a drab, sordid place for the workers of the Rhondda who spend their lives in it. The houses are built practically within a few yards of the pit tops. The result is that the women who live in those houses before they can think of washing clothes have to go out to find which way the wind is blowing, because if it blows in a certain way, it is no use hanging out the clothes, because the dust from the pit would be cast on the clothes. This is not parochial evidence I am going to give, but I have had experience in South Wales and have been a great deal in the mining areas. I happened to be in Seven Sisters a few weeks ago. Seven Sisters is practically a new industrial area, and there are rows of houses built within a few yards of the pit. There is just the width of the road between the houses and the trucks carrying the coal. It means that the women there have not only to contend with all the dirt, but have also the anxiety of their little ones being run over at any time of the day, because there is no fencing whatever between the trucks and the houses. In this area also there are a lot of miners' huts which were put up temporarily, but like a good many miners' huts in other parts of the country, they have come to stay owing to the shortage of houses. I strongly resent the statement that the women of South Wales acquiesce in bad houses, and I say that owing to my varied experience all through South Wales. As regards pithead baths, this question is the question of the day in the South Wales coalfield, not only amongst women but amongst men also. There was a huge conference which had been organised held

at Porth last night, where all the women's organisations of the Rhondda, the Co-operative Societies, trade unions and councils were sending their delegates, and the question was the question of pithead baths. Many deputations visited the Treharris pithead baths. I wrote to the manager there with regard to the matter. I have been on a deputation myself to the pithead baths, and the women in South Wales are organising and banding together and sending deputations to the Treharris pithead baths. They received four deputations of women and four deputations of men since January, and the women's deputations have not only been from one organisation but a number of organisations amalgamated together. There are also several other deputations visiting Treharris pit-head baths in Whit Week. Then, as regards the maternity question, which I touched upon, I may say here, too, that I am a member of the Maternity Committee of our Council, and have led this agitation for two years amongst the women. Therefore, I speak with experience when I say that the majority of the cases of female ailments are due to the physical strain and the conditions they have to live under. When it comes to various statements being made on the Commission, I should like to emphasise my view very strongly. I only wish the gentlemen who made these statements had happened to be at some of our meetings. I could promise them a very lively time indeed, especially when they said that the South Wales miners' wives were extravagant. I am sure the gentleman who made that statement must have made a mistake. He must have meant the mine owners' wives. Then it is said that miners' wives are not thrifty, I should like to say that a large number of the miners' wives in South Wales own their own houses, and if they had not been thrifty, indeed, they would not have been able to own their own houses. With regard to cleanliness, I am sure, if any of the gentlemen who made those statements came down to South Wales, they would marvel at the way in which the miners' wives keep their houses clean under the conditions under which they live.

24,396. Is there anything else you want to say? Just look through your notes and see if there is anything else you want to add?—I should like to add something on the various points that were raised at the meetings when the discussion on pit-head baths arose. These are the points that forced themselves upon the people present: The drudgery work of the women; the physical strain on the human mother, and the moral aspect, which is very important under the housing conditions; the health of the adults and the infants—we cannot expect to reduce the infantile mortality under such conditions until we get better conditions of pit-head baths, and the dirty clothes kept away from the house; and a higher standard of living for the worker all round in home life and in municipal life.

Chairman: I should have asked Mr. Hodges, who comes from South Wales, to ask you questions, but he is not here, and I am going to ask Mr. Smillie, who is President of the Miners' Federation, to ask you questions first, and then, on the other side, Mr. Evan Williams, who comes from South Wales, as you know.

24,397. Mr. Robert Smillie: I suppose it may be taken you agree generally with the statement made by Mrs. Hart as to the condition of miners' homes?—Oh yes, I do.

24,398. I think you have not so much double shifting at pits in South Wales as they have in the North of England and some other parts?—They work three shifts.

24,399. Have you any three shifts in the Rhondda?—They are 7 o'clock to 3, 3 o'clock to 11, and then the repairers go in at 11 until 7. It means for a woman who has two sons and a husband working that if they work on different shifts, her life is nothing but slavery. She gets neither rest nor leisure under those conditions.

24,400. It makes an enormous difference to the mother in the house if all the pit men in the house work in the same shift where there is double shift?—Yes.

24,401. Do you know that a witness at one time here compared French women with the English

30 May, 1919.]

MRS. ELIZABETH ANDREWS.

[Continued.]

miners' wives and Welsh miners' wives to the disadvantage of our home wives here?—Yes.

24,402. You are aware that that was done?—Yes, and I strongly resent that too. Being a member of the War Pensions Committee and a member of the Disablement Committee, I have come in contact with men who have served for years in France, and I should like to give you their opinion with regard to French women and Welsh women. They all say, "Give me Welsh women first before the French women because of their cleanliness."

24,403. Of course, you must remember you cannot depend on what men say. Men are deceivers ever. In France they might say something else. I suppose the whole of the Welsh miners' wives do not agree with the witness who compared them disadvantageously with the French wives?—No, and another thing I may say that there is that the miners resent it too, that their wives should be spoken about in that way.

24,404. You know, I suppose, the Powell Duffryn Collieries?—Yes.

24,405. You know where they are situated?—Yes.

24,406. Do you happen to know the houses owned by the Powell Duffryn Company?—Yes.

24,407. Are there many baths in the houses?—I happen to be at a district in Monmouthshire where most of these houses are owned by the Powell Duffryn Company, called Ceffyn Forest. I was speaking there some time ago and I stayed at one of these houses, and they blamed the women for not using the baths. I do not blame the women, because these baths are put in poky little sculleries where there is no room to turn, and some of the baths have not the proper water supply that is necessary. Therefore, it is far easier for the women, instead of bothering with the bath, to get the tub in front of the fire. The other statement is that some of the miners told me there that they have to endure various hardships or grievances in the works that they would not endure because they are afraid of being turned out of their houses. The Council in that area was taking the matter up, but I have not heard the result.

24,408. They are practically confined to that particular colliery because of the conditions under which they hold their houses?—Yes.

24,409. Now a statement has been made by Mr. Joseph Shaw that the chief use of the baths was to keep cocks and hens in them?—I can understand that where they are situated. We do not hear of any mention of a bath built in the scullery in a mansion. Why should the workers have a bathroom in the scullery which is the most inconvenient place in the house? If we are worthy of a bath—and I think we are—we are worthy of a decent bathroom.

24,410. But you agree with Mrs. Hart that miners and their wives desire to have a good house and a bathroom in the house?—Yes.

24,411. But they do not desire it to take the place of the bath at the pit. They do not wish the pit clothes and pit dirt to be brought to the home?—They require them both.

24,412. Have you visited any of the modern baths at collieries where there is washing and drying?—Yes, at Treharris, the only one we have in South Wales.

24,413. Is that spray baths?—Yes.

24,414. Is each private?—Yes, quite private. It is really an ideal thing. I was rather surprised that they could organise baths in the way they have organised them.

24,415. That has removed much of the opposition that the miners had. You are aware that, generally speaking, in Germany they bath in a great open room like the room we are in, with no privacy at all?—Yes.

24,416. But if baths were provided, such as you have seen, that would remove any difficulty of that kind?—It would.

24,417. I suppose you think that bathing at the pit should be general or as generally as it is possible to make it?—Yes.

24,418. That all those who were not exempted because of some difficulty ought to use the baths if they are provided?—Yes. I understand that two-thirds of

the miners at Treharris use the baths. The ones that do not use the baths are the older men and it is just like the old saying, "It is a job to teach an old dog new tricks." It is a job to teach old men new customs. They do not wish to use the baths because they have been so accustomed to going home to bath. The older men do not use them as they ought to do but the younger men do.

24,419. I suppose you are aware that the number using them is increasing gradually?—Yes.

24,420. I believe the feeling amongst the miners' wives and mothers is unanimous practically?—Yes, it is unanimous.

24,421. *Mr. Evan Williams*: I am very interested in what you say about pithead baths in South Wales. I suppose you would agree that the responsibility for the absence of baths rests as much upon the men as upon the owners in South Wales?—Yes, I agree.

24,422. A great deal of education has been necessary to bring the men to realise the importance of it?—Yes.

24,423. Are you aware that really it is only about a month ago since any application was made formally by the Miners' Federation to the owners to consider this matter?—But the letter was sent on many months before that, and it was referred to the Conciliation Board.

24,424. I mean it only came up at the meeting before last.

Mr. Herbert Smith: Do you mean the Welsh Conciliation Board?

Mr. Evan Williams: Yes.

24,425. Do you know what happened?—No, but I have seen correspondence in the various papers and I, personally, on behalf of the women, have asked the mineowners to move very rapidly in this question, because otherwise I am afraid the miners' wives will adopt unconstitutional methods by going on strike.

24,426. I am glad to hear that, because we have at once agreed to set up a joint committee between the owners and the men to consider this question and to take steps to ascertain the wishes, not only of the men, but of their wives?—I am glad to hear that.

24,427. And I think we can promise you we shall not let the grass grow under our feet in proceeding with it. With regard to the number of men at Treharris, I think the number is not quite actually so much as you say. Do you say the difficulty is with the older men?—Yes.

24,428. Do you know Mr. Jenkins of the Ocean Colliery?—Yes.

24,429. Mr. Jenkins last Monday told us there was more difficulty with the younger men than with the older men?—The women told us differently there.

24,430. They are rather more difficult to educate, too?—I do not know.

24,431. I think you will be relieved to know that so far as South Wales is concerned the owners are seriously taking the matter up and proceeding with it?—I am very glad to hear it.

24,432. Are there many houses owned by the colliery companies in the Rhondda valley?—I could not say in the Rhondda valley.

24,433. Not many?—No. The miners there to a great extent own their own houses.

24,434. And these houses built near the pits have been built by the miners themselves, have they not?—No, they were built by private owners.

24,435. Not by the colliery company?—The huts have been built by the colliery company.

24,436. I mean the houses close to the pits?—I could not say for Seven Sisters which has been mentioned, but I can say about the huts that the colliery company owned them.

24,437. In the Rhondda valley you speak of the houses being very near the pit top?—Yes.

24,438. They are not there because the owners put them there, are they?—I understand the Rhondda valley is a very congested area. It is not the miners themselves who built them, but the private landlords.

24,439. You agree, of course, that the Rhondda valley is a very difficult place to plant housing in?—It is not more difficult than many other places.

30 May, 1919.]

MRS. ELIZABETH ANDREWS.

[Continued.]

24,440. It is a narrow valley with steep sides?—Yes; but I think we could build more on the sides than we do. We are all in the hollow.

24,441. Would you favour building houses in the valley or having a housing scheme outside with trains running up the valley?—I would favour going outside the valley, because we are too congested altogether. There is a move on foot to extend the area and get these garden cities and conveniences to take the men to and from their work.

24,442. You speak of cellar dwellings, do you mean underground cellar dwellings?—Yes.

24,443. Are there many of those?—Yes, there are quite a number in my district—a very large number in my district—and they are owned by private landlords. It means that the top part of the house comes on the main road. The cellar is underneath. There are two bedrooms right in the earth with the only ventilation a grating and a small window. Then the kitchen in which they live is on the other side and they come out the back way.

24,444. They are generally houses built on a slope?—Yes.

24,445. So that the back of the house is a window and a door?—Yes, but the bedroom itself is really shocking. I happen to know of a case only last week where a woman with six children lived in a house with two bedrooms and they up against the earth, and the only room for her to be confined in was one of those rooms, which was hanging with mildew and dirt.

24,446. They are old houses?—Not very old.

24,447. You refer to various statements made at the Commission regarding miners' wives in Wales. I think there is rather a wrong impression there. I have no recollection of any statement except one.

Chairman: Yes, Sir Thomas Watson.

Mr. R. H. Tawney: We had one yesterday.

Mr. Evan Williams: Not in Wales.

Mr. R. H. Tawney: Yes, Mr. Joseph Shaw.

Mr. R. W. Cooper: Did he make a reflection with regard to miners' wives?

Mr. R. H. Tawney: Yes, about the bath rooms and that you find cocks and hens in them.

24,448. *Mr. Evan Williams (To the Witness.)* You were referring to Sir Thomas Watson, I think?—Yes.

24,449. I think that is one isolated reference to the miners' wives in South Wales and I do not agree with him at all. I think both the miners and their wives are as clean, if not cleaner than any other class in South Wales?—I agree, and I am glad to hear that statement; but there is a statement that the women acquiesced in bad housing and they did not want pit-head baths, and I repudiate that on behalf of the women.

Mr. Evan Williams: I do not think that statement was made with regard to South Wales.

Mr. R. H. Tawney: But you have the statement, "The bad tenant makes a bad house."

Sir Arthur Duckham: But you agreed with that statement.

Mr. R. H. Tawney: I agreed with nothing of the kind. I say the bad house makes a bad tenant. Do you suggest the bad tenant succeeds in reducing a four roomed house to a one roomed house?

Sir Arthur Duckham: No.

(The Witness withdrew.)

Mrs. AGNES BROWN, Sworn and Examined.

24,463. *Chairman:* I have not the pleasure of having a *précis* from you of your evidence. I know you have been very busy and have had to travel down from Scotland all last night?—Yes.

24,464. I am just going to have a talk with you on this matter, if I may, and you will tell me what your views are. First of all, where do you live?—I live at Bells Hill.

24,465. Are you a miner's wife?—Yes, I have been a miner's wife almost 14 years.

24,466. I think you have five children?—Four sons and a daughter.

Sir L. Chiozza Money: The whole tenor of Mr. Joseph Shaw's evidence was to reflect upon the miners of South Wales and their wives.

Mr. Evan Williams: I do not agree.

Sir L. Chiozza Money: Then read the evidence.

24,450. *Mr. Arthur Balfour: (To the Witness.)* I want to ask you whether if pithead baths were made general do you think it would be a good plan to have a joint committee of the workers and the employers to work and manage them?—Certainly I do. I really think that all committees which concern the workers should have representation of workers, or the workers should have representation on any Committee that concerns the welfare or their work.

24,451. And the fund that is collected for working the baths or washing the towels can be under the control of that committee?—Yes, it could be. I happened to be on a committee at Cardiff some time ago where this matter was discussed, and we thought that the suggestion made by the Chairman of this Commission some time ago, that a penny per ton off the coal should be put towards the housing problem, could be very well utilised for the building of pithead baths and maintaining them, and that the housing problem can be very well left to the people themselves, to Municipal Authorities, and to the State.

24,452. Do you think if you made the baths compulsory it would be better to have a joint committee to educate the workers?—Yes.

24,453. Rather than make it compulsory?—Yes, I think it would be far more effective, and if the women took an interest in this I am sure they would persuade their husbands very soon to use them.

24,454. With regard to the baths in the houses, I take it sometimes the bath-rooms are very cold in winter?—Could we not get our bath-rooms on similar lines to large houses?—They have their bath-rooms and they do not complain of them being cold.

24,455. Could not that be got over by having uncovered hot water pipe in the bathroom?—Yes—some central heating for every block of houses.

24,456. You said something about ash-pits in the street?—I did not make that statement.

24,457. But you heard the statement made?—Yes.

24,458. Would it not be a good thing until such time as better arrangements are made to have tins with a cover to be emptied every day?—Yes. The custom in our district is to put the refuse outside and the cart comes along. It is a very dirty habit, and it ought to be arranged much better than it is at the present time, because it means some of our streets are in a terrible condition up to mid-day. The sheep come along down from the mountains and it makes our streets in a deplorable state.

24,459. Are they not tins?—No, boxes or baskets.

24,460. If they were in proper tins with a cover would it not be a better system for the time being?—I think something could be arranged at the back of the garden where the carts could come along.

24,461. Could not the carts come early in the morning when no one is about?—No, it is all-day work with us.

24,462. But it could be done?—Yes. But it is very detrimental when the ash-carts and the milk cart are in the street at the same time.

Chairman: We are very much obliged to you for your evidence.

24,467. Probably that keeps you too busy to write an account of your evidence. Will you just tell me what your view first of all is of the housing question, and what you think about it?—My views, so far as I can see, are just the same views as those of my other two friends. I think housing is a very vital question. In Bells Hill there are a lot of old miners' houses, but I see one company there is beginning to repair the houses and to put sculleries and sanitation inside. But there are a lot of other houses which require a great deal of repairs. All of them are in a most dilapidated condition. I think Mr. Smillie ought to know it.

30 May, 1919.]

MRS. AGNES BROWN.

[Continued.]

24,468. Mr. Smillie probably knows all about it, and I will ask him to ask you some questions. Are there many of these one-roomed houses that you know of in your district?—Oh yes, there are quite a lot of one-roomed houses in our district.

24,469. What do you think about the one-roomed house? I do not say I agree with it, and in fact I disagree with it, but what is said about them is this: Some people say a one-roomed house is a very convenient thing for an old couple to live in, because they are only by themselves, or for some quite young newly married people to live in, because they are at present by themselves. Do you think a one-roomed house is at all satisfactory for anyone?—I think a one-roomed house is most unsuitable for an aged couple or a young couple. I think they just go into one-roomed houses because they cannot help themselves for the want of houses. In fact I knew a lot of young couples who cannot get a one-roomed house, and they are living in other people's rooms, and there are others who cannot marry because of the want of houses in Bellshill.

24,470. That is not at all satisfactory. Are most of the houses round about you owned by the colliery companies or by private individuals?—There are quite a lot of miners' houses, but there are quite a lot of private houses, too. In fact, the place I stay at is under private ownership, and it is an old, old building and very much in need of repair. It has been condemned since the war broke out.

24,471. You heard the last two witnesses, Mrs. Hart and Mrs. Andrews, speak with regard to the sanitary accommodation and the dust-bins. What is your experience with regard to them? Is it the same in your parts?—In the miners' rows they have no sanitation in any way. The ashbin is at the back. They have a square brick thing to which they carry out the ashes, and put them in. There is no sanitation in any way, and the children just run about there.

24,472. In your district are there many miners' houses that have baths in them? Have they baths in the private houses of your district?—I would say 1 per cent. in the Bellshill district.

24,473. I have asked you all the questions I wanted to ask you about houses. Now I want to come to a very important question, and that is about this question of pithead baths. What do you think about that?—I think it would be a very good idea to have the baths at the pits and baths in the houses, if you could get them. I have known of cases where there were children, and a baby lying in the cot at the fire, and three men's clothes being dried round the fire, and that baby lying ill with pneumonia, and it was detrimental to the baby's health to have that nuisance there.

24,474. Do you find in your parts there are different shifts with the men coming home at different times of the day?—Yes; there are three shifts in the day: 7 to 3, 3 to 11, and 11 to 7 in the morning.

24,475. And that makes the woman's work never over; she is at it all the time?—Yes.

24,476. The sort of thing we have been told here is this, that some time ago the miners did not take very kindly to the question of having pithead baths, but that now a change had come over their views and they were beginning to see the advantages of it, and desire to have them. What is your view as to that? Do you think there is that change coming over them?—Yes, I believe the workers mean to have better conditions than they have had in late years and better conditions still in the coming years, and do not mean to put up with the same conditions they had before.

24,477. Do you think it is the elder men who rather dislike the idea and the younger men welcome it? What do you think?—I think if the baths were there, they would begin to like it.

24,478. You have heard what Mrs. Andrews giving evidence said with regard to the maternity question: Women having to carry very heavy cans of water or tubs about. Do you agree with that yourself?—Yes, I corroborate Mrs. Andrews' statement, so far as that is concerned. I have come against a few cases like that myself.

24,479. Now I have asked you all the questions I want to ask you. Do you want to tell me anything

yourself? What I am going to do is to ask Mr. Smillie, who comes from your part, to ask you questions, and on the other side I am going to ask Sir Adam Nimmo, who also comes from your part, to ask you questions.

24,480. Mr. Robert Smillie: I think it may be taken you agree generally with the statements made by the two previous witnesses?—Yes; I agree in everything they said. I think it is just my own views, and I have nothing further to express apart from what they have stated.

24,481. Are you aware that the housing conditions in Lanarkshire are considerably worse than they are in South Wales or elsewhere?—I know the death rate in Bellshill is 150 a year per 1,000 for Bellshill district alone.

24,482. Bellshill is a typical mining district surrounded with collieries, is it not?—Yes.

24,483. But you have a knowledge of other parts of Lanarkshire, have you not?—I have lived my married life in Bellshill. I have been in Hamilton and a few other places, but not living there.

24,484. Round about Bellshill and the close vicinity of Bellshill there are a considerable number of colliers' houses, are there not?—Yes.

24,485. Small villages outside Bellshill altogether?—Yes.

24,486. A very large proportion of those houses are single-apartment houses?—Yes, quite a lot of houses are single-apartment houses.

24,487. Do you know Holytown very well?—Yes.

24,488. Do you know the square in Holytown?—Yes.

24,489. I think nearly all those houses are single-apartment houses?—Yes. I have never been in the houses, but from the look of them I think they are single-apartment houses.

24,490. Did you belong to a mining family before you were married?—No, I belonged to a farming family before I was married.

24,491. Your experience since you have been married is chiefly mining?—Yes.

24,492. You have been married 14 years?—Yes.

24,493. It has been suggested here that miners ought to have built their own houses. Has it been your experience during that 14 years that you and your husband were in a position to save money to build a house?—It has been my position in the last 14 years with six in family that if I am able to keep my family week to week, it is all I can do and pay my rent without saving to pay to build a house.

24,494. I have had the same experience, but some people think you ought to have built your own house.—According to the reports in the papers we should have been able all to have our own houses from the money the miners are making, but it is not so.

24,495. May I take it at the present time you have not much more than enough to keep yourself and children and your husband?—No; and we have not the comforts we ought to have.

24,496. May we take it from your own experience in your own house and of the miners and their wives round about, that it would be a very exceptional thing for a miner to be able, during 25 or 30 years, to save enough to build a house?—I think he must deny himself a great deal if he can save anything to build. He must go without the necessary comforts of life.

24,497. Do you know there has been for a good many years an agitation in Lanarkshire amongst miners for pithead baths?—Yes.

24,498. Do you think that that would make a wonderful difference to the home life of the miners' wives if the pit clothes were left outside at the pit?—Yes, it would be a great deal less work, and we would have much cleaner homes if we had not the pit clothes coming home.

24,499. In a single-apartment house, especially where there are children, the drying of the pit clothes is very bad for the children breathing the atmosphere. The pit clothes are dried at night where the pits are day shift?—Yes.

24,500. They are hung all round the fire and are drying all night?—Yes.

24,501. The pit clothes are usually wet, either with sweat or with natural wet from the mine—they are

30 May, 1919.]

MRS. AGNES BROWN.

[Continued.]

usually damp when they come in?—I know with my own husband's clothes you could almost imagine they had been washed each night he comes home.

24,502. All that drying has to take place in the house itself?—Yes, in the one room; there is no other means. In the summer time you can put them out, but in the winter time or on wet days you must dry them round the fire.

24,503. So far as you know, there would be very little objection amongst the men themselves and amongst the miners' wives to have baths at the pit?—So far as I am concerned, and I am interested in the Women's Labour Party in Bellshill, they are all in favour of pit baths. I know, so far as the women are concerned, they are all in favour of pit baths.

24,504. If we can get pit baths established, will you and the women undertake that you will never allow the men to go back to the old system?—We will do our very best.

24,505. *Sir Adam Nimmo*: We are all getting stirred up about this housing question, and I think we are anxious to do everything that is practicable to improve matters. But, dealing with the past, would you say that there had been as much interest in the question generally on the part of the whole community as there might have been?—I would not like to commit myself. I know the workers have not been content with the houses they had, only they have been promised better houses this last two or three years and they are beginning to get impatient about them now. They want more than promises saying they are going to get them, when there are no signs of them coming.

24,506. Your view is that we have all been more or less slow on the question?—Yes, I think it is time someone was getting stirred up.

24,507. Is it not the case that the local authorities that deal with the housing question have had power to deal with insanitary houses?—I think it is needing even more than local authorities to deal with it.

24,508. I agree with you, but I refer to the fact. I suppose you would agree they have had certain powers which they have not put into operation?—I am not quite sure on that point. I know they have not made use of the power they had, anyhow.

24,509. That is the point I want. I suppose you know that they have had power to build houses, if they desired to do so?—I only got to know that one night last week at the Trades Council Meeting, when it was read out that the Council had power to advance the workers' money if they could lay so much money down when they would help them with the rest. Why was it not made known to the workers previously to war time?

24,510. You will agree that they have not really put into force all the powers that they have had?—It is not the workers that have not put it into force, but the Council.

24,511. I am not suggesting it is the workers' fault. The miners' representatives have a lot of influence in the various districts, have they not?—The miners' representatives do all they can, but they cannot build houses for all the miners.

24,512. But, of course, they might have stirred up the local authorities a little more to try and secure better conditions in housing?—I think, so far as stirring up goes, they have not been asleep. The miners' leaders and the labour agents have been doing it, but I do not think they have been very anxious to be stirred up.

24,513. You do not think they have done all they might have done, and you do not think they were anxious to be stirred up?—I think it is want of sympathy with the workers. They do not sympathise with the workers, and think we really want a better condition of life.

24,514. We will hope for a better condition of things in that respect in the future. Are most of the houses in the Bellshill district room-and-kitchen houses?—The majority. There are not many other bigger houses. If they built houses like the Government houses that have been built lately, I do not see where they are going to benefit us greatly. The rooms are tiny rooms and the rents are some of them up to £29. How do you expect one miner and family to pay £29 rent?

24,515. I can see that that is a very serious problem. Taking the room-and-kitchen house in Scotland, have you not usually two big rooms? The kitchen is usually a pretty big room, is it not?—My kitchen is about 18 feet long and 8 feet wide, and the fireplace sits out on the floor. I can white-wash the roof without going on a stool.

24,516. It is a low roof?—Yes, so that I do not reckon that is a big room. The other room is a very small one, a tiny room with a stone floor, with a ceiling you can touch, and which would go inside the kitchen.

24,517. In most of the cases of room-and-kitchen, have they not a pretty good-sized kitchen?—In some of the more modern houses they are bigger, but not the old houses.

24,518. You are complaining that the houses proposed to be put up by the County Council have too small rooms?—The rooms are not very big, but when you compare the houses with the rent, they are not adequate for the money.

24,519. You think you are going to pay too much for what you are going to get?—Yes.

24,520. Do you think if larger houses were put up in these districts there would be a strong demand for them?—Yes, and the people would not stay in the houses that they stayed in now if they could get a better house.

24,521. Do you think they would be willing to pay a reasonable rent?—Yes, to pay a reasonable rent for a good house.

24,522. I think you mentioned that the houses which are occupied by miners in the district which you know do not all belong to the colliery companies?—There are a good many colliery houses round about me, but there are not sufficient miners' houses to house the miners, and they have to go into the other houses.

24,523. Would you say, in the district you know about, that the houses which are owned by the colliery owners are any worse than the other houses?—They are much on a parallel with the other houses. One company in the Bellshill district has started to repair the houses.

24,524. The company most concerned in the Bellshill district is Wilson & Clyde, is it not?—Yes.

24,525. Have not Wilson & Clyde a lot of very nice houses there?—They are passable houses.

24,526. As houses go in the district?—Yes. They have started to put sculleries and lavatories in, but the Douglas Park houses are very poor houses.

24,527. That is, they are older houses?—Yes.

24,528. I suppose you would agree with Mrs. Hart's reply to Mr. Herbert Smith when she said she looked upon this problem as a national problem. It is a big question?—Yes.

24,529. Requiring to be dealt with for the whole country?—I think, like everything else, it should be a national problem. Everything should be a national problem.

24,530. With regard to baths; I suppose you agree that they are desirable?—Yes, they are more than desirable.

24,531. And you would like to see them bath at the pit and in the home?—Yes. Another thing I should have mentioned is that there is no recreation ground for children. There are no play-grounds for the children and nothing for the children except the streets.

24,532. That may be an improvement that will come?—We have had one or two serious accidents just lately in Bellshill: two children have been killed with the cars in the main streets.

24,533. Talking about baths, would you say that before the war there was any real stirring up on this question at all? Would you say that there was a demand on the part of the miners generally for them?—I think there has been always the ambition of the miners to better themselves, but the housing problem has been more in view lately and I think they are getting more discontented with their condition.

24,534. Of course, they have had opportunities of approaching the employers, if they had been very anxious on the subject?—I suppose they have approached their employers, but they have not got the sympathy they should have from the employers.

30 May, 1919.]

MRS. AGNES BROWN.

[Continued.]

24,535. Speaking from the point of view of the minors' wives, you desire that this question should be taken up seriously and dealt with?—I think we should demand that it should be taken up seriously and dealt with as soon as possible.

24,536. And your view is that it will add accordingly to the comfort of our homes?—I do not

see why we should not have better homes and good homes.

24,537. Would you compel all the men to take baths if they were erected, or give them their choice?—I would erect the baths and let them take their choice. You cannot compel them to do anything.

(The Witness withdrew.)

EDGAR VINCENT, BARON D'ABERNON, SWORN and Examined.

24,538. *Chairman*: I think you are Chairman of the Central Control Board, Liquor Traffic?—Yes.

24,539. I will read your *précis*:—

"The object of my evidence is to draw attention to the importance of stability in the standard of value in relation to which wages and minor salaries are fixed, and the urgency of creating, in default of stability, some adjusting machinery designed to preserve between the parties the equity and the original intention of the contract.

My belief is that one of the main causes of industrial conflict in the past—not only in this country, but in all countries—has been either such a rise in prices as has rendered wages insufficient to maintain the previous standard of life, or such a fall in prices as has rendered necessary a reduction of wages, both proceeding frequently from an alteration in the value of money.

In the past adjustments of wages, whether upwards or downwards, have been reached only after prolonged conflict, involving both strikes and lock-outs and the generation of much discontent and unrest.

If the view is correct that a change in the value of money has been the main or most frequent cause both of rise and fall in the price of commodities and in the cost of living, and if it is further correct to say that these fluctuations—being left unadjusted—have been a cause of industrial trouble, it appears to follow that the constitution of some automatic machinery to avoid unadjusted fluctuation and to maintain effective remuneration or real wages at a stable level would eliminate one of the main sources of trouble. The object in view would be to maintain the spirit and intention of the original agreement rather than to observe the letter of the contract. In other words, the underlying idea is that a wise policy would consist in adherence, not to the precise number of counters (currency) stipulated in the original bargain, but to the value in means of livelihood which those counters were designed to represent.

It is clearly possible that the relative value of the counters (currency) may alter as compared with goods or commodities, while the value of the different commodities—one with the other—may remain relatively stable. This has occurred at the present time. While the price of most commodities measured in money is more than double compared with 1914, the value of one commodity compared with other commodities has remained singularly stable. Thus articles of the most various nature, articles dependent on annual production and independent of it, articles all of which are consumed within a year and articles of permanent duration, articles produced overseas and articles mainly dependent on home production, have risen, as compared with 1914, from 100 per cent. to 150 per cent., but are still exchangeable one with the other on practically the same basis as before the war; whereas, measured in currency, their value has enormously increased.

These facts suggest, if they do not prove, that the real factor which has changed in value is currency and not individual commodities.

The object of my proposal is not to give either party to the bargain any advantage over the other, but solely to remove a grave cause of preventable friction between classes. However wisely any Commission may fix the basis of wages to-day, the basis adopted will inevitably become inappropriate and inapplicable if a further large change takes place in the value of money, leading either to a large rise or a large fall in the value of the price of commodities and the cost of living.

It has been held by some critics that such a sliding scale as I propose would be unfavourable to a permanent rise of effective wages and to an enhancement of the real scale of wages of manual workers. This is a quite superficial view. For by suggesting the means to arrive at stability for the effective remuneration of labour, my suggestion would afford a basis for stable and permanent improvement, not exposed to the double risk which must threaten any inelastic decision.

For if stability is not attained in this or some other way, any temporary advantage gained by the workers is obviously exposed to two dangers:—

(a) A further substantial fall in the value of money, involving a further increase in the cost of living.

(b) A return to or towards the old level for value of money.

In both cases whatever fixed basis you may adopt will become unworkable. In case (a) wages allowed will be insufficient to maintain the standard of living; in case (b) all marginal profit may disappear, and lock-outs or closing down are probable if not certain.

It therefore appears that some system of automatic adjustment is indispensable in these times, because the value of money has fluctuated, is fluctuating, and will continue to fluctuate violently.

The more clearly it is recognised that a vast improvement is necessary in the standard and amenities of life among the industrial classes, the more necessary does it become to establish a firm foundation for such improvement. No firm foundation can be found unless means are devised to prevent the interference of the exterior cause—viz., an alteration of value in currency—or to nullify or correct its action. Otherwise, like the moving sands which disturb the floor of the Panama Canal, it will constantly break down and destroy the elaborate construction you are now engaged upon."

24,540. *Mr. R. H. Tawney*: I think your general thesis is that the cause, or one of the causes, of industrial unrest is changes in the purchasing power in wages?—That is so.

24,541. Due to changes in the general level of prices?—Yes.

24,542. And that those changes in the general price level are due to changes on the side of currency or credit or both?—Yes.

24,543. Would you say that that was borne out by past experience? For example, I think the fall in prices came to an end and the rise in prices began in 1896, did it not?—Yes.

24,544. And up to about 1903 money wages about kept pace with the rise in prices?—Yes. The fluctuations up to the beginning of the war were comparatively inconsiderable.

24,545. Is that quite so? My recollection is that there was a very large rise in prices about 1912 and 1913?—I cannot give you the figure, but it was inconsiderable compared with the rise which has taken place since the war.

24,546. I was not anxious to argue the point. I took that as an illustration?—Yes; I do not differ.

24,547. The actual real wages were in many cases lower in 1912 than they were in 1910 if you look at the Board of Trade tables?—I should be disposed to agree.

24,548. Your proposal for dealing with that I think is to fix a certain ratio between prices and wages: that is to say, supposing prices rise four points, then there shall be such and such a percentage advance in wages?—Yes. Perhaps four

30 May, 1919.]

EDGAR VINCENT, BARON D'ABERNON.

[Continued.]

points is rather small. I was going to deal with it in the case of the larger fluctuations.

24,549. Something like that proposal was put forward by the Ministry of Labour in dealing with the question of railwaymen's wages during the war?—I take that from you.

24,550. Has it occurred to you that that is only one cause of the difficulty? Your proposal provides machinery for keeping wages in relation to prices, but it assumes a certain basis, does it not? It assumes, that is to say, that the existing relationship, or the relationship which you take as your starting point, is satisfactory, does it not?—I do not think it assumes it is satisfactory. It assures the maintenance of the real value of the contract. I do not want to prejudge the question of the basis being satisfactory or unsatisfactory.

24,551. I only want to get at the point how far your proposal really is a remedy for this problem. Let us assume for the moment that prices do not change at all?—Quite.

24,552. Do you think in that case there would be no demand for a rise in wages?—I do not say that at all.

24,553. Is not that whole class of movement due to the demand for a larger share in the product?—I only

aim at eliminating one factor of dispute. I do not touch the broader issue.

24,554. This is not a proposal to meet the demand in change of distribution of wealth?—No.

24,555. It is a proposal to eliminate one factor?—Yes, one of the factors which I think is a great factor in past and future disputes.

24,556. *Sir Arthur Duckham*: Under present conditions would the profit be adjusted or be adjustable in the same way as the wages to meet the purchasing power of money?—I think that is a very difficult question indeed. Clearly this sliding scale would have to be adjusted, not to all contracts, but to certain contracts. Those contracts might be settled by law or by private agreement.

24,557. From your very considerable experience do you think there would be any advantage in dividing the recompense of the workmen into two portions? It follows somewhat on your scheme. If one portion represented a subsistence allowance and another portion was a wage, the subsistence allowance would automatically go up with the cost of living. Would that not meet the case?—I think that might be done. I am not at all prepared to say what proportion of the total wage is subsistence and what is not.

24,558. That could be ascertained?—Yes.

(*The Witness withdrew.*)

(*Adjourned for a short time.*)

THE HON. FRANCIS MARION BATES FISHER, Sworn and Examined.

24,559. *Chairman*: This is evidence with regard to the state of affairs in New Zealand. It is the *précis* of the evidence to be given by the Hon. F. M. B. Fisher. Mr. Fisher says:—

“ I was for three years, from 1912 to 1915, a member of the New Zealand Government. I was Minister in Charge of the State Fire Insurance Department, the State Life Insurance Department, the State Accident Insurance Department, the National Provident Fund, the Pensions Department, including Old Age Pensions, Widows' Pensions, Children's Pensions, Military Pensions, and Pensions for Miners. Apart from the experience gained in these various posts, I have been familiar all my life with the problems of nationalisation, and it is on the political aspect of these matters that my view may be of value.

I have read with considerable interest some, but not all, of the evidence which has been given before the Commission. I am not interested in the matter from a financial point of view, but follow these investigations with great keenness as a citizen of the Empire.”

Those are the qualifications of Mr. Fisher. I will ask Mr. Fisher to be good enough to read those parts of his evidence to which he particularly desires to direct our attention. I will ask Mr. Sidney Webb on the one side, and Mr. Balfour upon the other, to ask Mr. Fisher such questions as they think fit?—I am quite prepared to allow the statement to stand and proceed with the examination, if you wish.

24,560. *Chairman*: As the gentlemen of the Press have copies of this *précis*, I will ask you one formal question. The *précis* you have handed in represents the views you wish to give us?—Yes.

24,561. *Chairman*: I will give instructions to the shorthand writer to place the whole of this statement upon the permanent record of the Commission. I might say we have already read this statement with great interest.

“ New Zealand has either completely or partly nationalised a great many industries, included amongst them that of Coal. If I interpret the views of many of the members of the Coal Commission aright, I would say, speaking broadly, that those who represent Labour appear to be in favour of complete nationalisation, whilst those who represent the vested interests seem to be diametrically opposed to this view.

The lines upon which I propose to proceed, if permitted to tender evidence, will be that neither of

these views is necessarily final, but that the real solution of the difficulties with which the Commission is dealing is to be met by other methods which have survived practical tests. I hope to be able to demonstrate to the Commission, not as the result of a course of theorising, but as the result of practical experience and close observation extending over a period of a quarter of a century, that the solution of the complex difficulties with which the Commission is faced can best be arrived at by legislation which is now embodied in the statute books of other countries. Working conditions, including the number of hours, the “ Bank to Bank ” clause, arbitration and conciliation, housing conditions, safeguards against mechanical dangers, including haulage, proper facilities and accommodation for the workers, superannuation, strike settlements, provisions for all these can be, and already have been, secured for the workers, without complete nationalisation, whilst the rights of the consumer have been safeguarded.

I should be most happy to place what knowledge I possess at the services of the Commission if it is considered that the experiments which have been tried and tested for so long in the Dominion from which I come would be of value. I shall, in addition, be prepared to place before the Commission the available statutes dealing with all questions referred to in this memorandum, should this course be desired.

I was especially interested in the evidence given to the Commission by Mr. Webb, in the course of which, in reply to a question, he stated that he believed there would be fewer strikes under Government ownership than under private ownership. The Government would be more responsive to the needs of the men.

With the latter part of the statement I am inclined to agree, but I think that the evidence in my own country on the previous part of his answer, would prove that it was wrong. It is a fallacy to suppose that nationalisation in itself is necessarily a cure for the strike evil. During the national strike in New Zealand in 1913, the national coal miners and the sailors in our Government steamers did not hesitate to “ down tools ” and join the strikers. The loyalty of these men to one another will not in any sense be impaired by any scheme of nationalisation. A very interesting illustration of this is furnished by our great national strike in 1890, where, unlike the case of the coal mines, where only some of the mines were nationalised, and not all, we had the case of the railways, which were completely nationalised, going out on strike as a body.

30 May, 1919.]

THE HON. FRANCIS MARION BATES FISHER.

[Continued.]

There are many illustrations which can be furnished of the employees in nationalised industries resorting to the strike as a method of securing what they believed to be their rights, and I do not believe that nationalisation or legislation of any kind will ever take away from the worker the right or the desire to strike whenever he wants to. The truth is that the strike is sometimes the workers' last and only weapon, and the State, in my opinion, has no right to attempt to deprive a man of his legitimate right of exercising this weapon when he has no other means of redress.

From the very serious results which attended our national strikes, we have endeavoured to profit by experience and devise legislation which would remove the evils which have led to industrial disturbances, and in this, I could safely claim, we have been largely successful. This result has been achieved by placing upon the Statute Book a number of Acts which have been specially designed for the purpose of improving the relations between the State, the worker, and the employer, and the chief of these Acts is the Industrial Conciliation and Arbitration Act, with its various amendments, the Labour Disputes Investigation Act, the various Superannuation Acts, and a great many Machinery Acts which have been devised for the purpose of safeguarding the lives of employees whilst engaged in the course of their duty. I will give a short resumé of the objects of these Acts which might be of interest to the Commission.

Under the Industrial Arbitration and Conciliation Act a Court is set up consisting of a Judge of the Supreme Court as President, and one representative each from the employers and the Trades Unions. The members of the Court are paid by the State. This Court fixes wages, hours, holidays, etc., after exhaustive examination into the needs of each trade, and its decisions are embodied in an industrial agreement which is binding in law.

The Labour Disputes Investigation Act was passed in 1913, and was regarded as the "missing link" in our industrial legislation. It set out the preliminary steps which were necessary to be taken antecedent to a proposed strike. Where the employees have resolved to strike, or the employers have decided to lock-out, the party contemplating action must notify the Minister for Labour of its intention. Upon receipt of this notification, the Minister for Labour convenes a meeting of representatives of employers and employed, and appoints a Chairman to preside over their proceedings. The purpose of this conference is not to attempt to settle the strike or lock-out, but to agree upon a plain and simple statement of the grounds upon which the proposed strike or lock-out is to take place. This statement, which embodies the views of both parties, is then transmitted to the Minister for Labour, and he, in due course, advertises the report of the Conference, thus enabling public opinion to form a clear and comprehensive view of the difference between the parties. This does away with the unhappy method under which strikes have taken place with the real cause wrapped in obscurity, and the general public completely in the dark as to origin.

After the report of the Conference on the reasons for and against has been duly advertised for 14 days, the party initiating the proceedings is then obliged to hold a secret ballot of its members, conducted by public officials, upon the issue of strike or no strike. This does away with all allegations founded upon intimidation and terrorism. If a strike or lock-out is decided upon, then it is a lawful strike or lock-out. If at any time pending the decision by ballot, a strike or lock-out takes place, such act is unlawful and punishable. The machinery, roughly outlined, provides a cooling process that is invaluable and prevents those impetuous temperaments, which often precipitate unreasonable and hasty action from exercising their evil and malign influence.

The Superannuation Acts also have a beneficial and steadying influence, but unfortunately it has been the case that no such scheme has been applied to groups of workers who were not either in Government employ, municipal employ, or in the employment of very large firms. In order to make adequate pro-

vision for those who did not enjoy the benefits of these large schemes, New Zealand passed the National Provident Act. Under this proposal, the single employee of a private employer can participate in all the benefits of large schemes such as that for police or civil service.

The individual makes a small contribution, the State makes a small contribution, and the employer does his part. The employee secures maternity benefits where they can be claimed, sickness benefits and a pension for his old age. Such a scheme would probably have the effect in the long run of enormously decreasing the annual charges for old age pensions. The scheme is steadily growing in popular favour, and will ultimately confer a great boon on a large section of the people for whom, hitherto, no such provision has been available.

There can be no question that the steadying influence of these humane and beneficent measures has had an excellent effect upon industrial conditions, and has provided the means of amicable settlement where otherwise a costly and injurious strike would not only have done great harm to employers, employees and the State, but would have engendered feeling which it were much better not to arouse.

I believe it is quite true that in the past the workers had not the facilities nor the money to put up a fight, however much in the wrong their opponents may have been. Give them a fair field and a fair tribunal and a great change in their attitude of mind will be observed. That there will always be a rebellious and discordant element, I do not doubt, but my belief is that the controlling judgment of labour is content with fair and reasonable conditions, and proper facilities should be accorded to Labour of exercising its deliberate judgment without the inflammatory intervention of those who do such harm in their endeavours to lead Labour against its own true leaders. From this evil every country has suffered in the past.

May I now refer to a statement made by Mr. Webb in his evidence with which I venture to express myself as being in total disagreement. Mr. Webb stated in reply to Mr. Cooper—I am quoting now from the report of the Commission published in the "Times" of April 30th—that he believed that the majority of people in these days are very largely influenced by a sense of duty in doing their job well, and that stimulus becomes more potent when people work strictly under public service.

It seems to me an amazing statement to have made in view of the fact that it is common knowledge in almost every country that the precisely opposite result is attained under State employment. The reasons for this are not hard to discover. It would be well, perhaps, to review briefly the position so far as the public service in Great Britain is concerned, upon this point.

I preface my remarks by stating that I know that in the Civil Service are many very able and very intelligent men, and I do not wish to be understood to have any desire to do any injustice to private individuals in my criticism of the Service.

To begin with, the public service could never be efficient so long as it is under political control, for, by this means, personal and family influences are brought to bear, and men without any knowledge or capacity for the positions which they occupy are thrust into them by influence, which it is quite needless to discuss. Once established in their positions, and providing that their conduct is not criminal, they are practically assured of employment for life, however efficient or inefficient they may be. We have to take into consideration, however, that where the public service fails very largely is in the automatic placement of its servants. In private employ, a man is much more likely to find his atmosphere, if I may use the expression, and thus perform more useful service.

An additional cause for inefficient results, however, is that the departmental regulations rob a man of practically all power of initiative. The principle in Government departments, so far as I have been able to ascertain, is that if you give a man power to make a decision he may make a mistake; therefore, in order to avoid mistakes, avoid decisions. Thus we have these interminable and intolerable delays which

30 May, 1919.]

THE HON. FRANCIS MARION BATES FISHER.

[Continued.]

do so much harm. See how marked a contrast there is between these conditions and those of the ordinary business man, who has to be alert and quick-witted, who could never prosper if he were hampered by the red tape that entangles the Civil Servant.

The trader, in order to be successful, must be rapid in decision, and very often courageous in enterprise. These qualities are rarely, if ever, found in the Government official. I believe that the Civil Servant would do the right thing the right way, and at the right time, if only the system under which he works would let him, but the system has so far failed to grant this power. The private business man has to pay for his own blunders. The Civil Servant's blunders are paid by the taxpayers. He is thus shorn of that responsibility which does so much to make the business man efficient.

It is, of course, difficult to devise a system by which the officials in Government Departments can be given a free hand to exercise their judgment with the freedom of the ordinary business man, and I doubt if this ideal could ever be attained. Even if it could, the incentive, which makes the business man efficient, would still be taken away from the Civil Servant. The business man is always on his job; he does not spare himself because he knows he will secure the reward of his industry. The Civil Servant has no such stimulus. He knows that whether he works fast, or whether he works slow, his promotion and his pay are not likely to be varied; indeed, he has more prospect of being promoted because of his relationship to someone in high position than because of the business capacity which he displays.

The question at the moment is, can the present system be bettered? I think it can, and I knew of no better lines than those which have been adopted in my native land. There we have destroyed political influence so far as appointments to the public service are concerned. It is a penal offence for a Member of Parliament or a Minister of the Crown to use his influence with the object of obtaining employment for any person. The whole of the public service is placed under the control of the Commissioners, who are given the status of Supreme Court Judges, and they stand like a granite wall between the Ministers of the day and the public service. The power, of course, remains for the Executive to increase or reduce the total of the vote for the public service, but not one individual item can be altered by a single penny piece so far as the Ministers of the Crown or the head of the Department is concerned.

I am inclined to believe that if such a policy were adopted in this country, it would do a great deal towards raising the efficiency of the public service, because under this system men are given the opportunity of being promoted by merit, and not because of their family connections, or any personal influences which might be brought to bear. Posts in our public service are advertised in the Press, and there is equality of opportunity for all.

Mr. Webb states that Nationalisation was called for—

- (1) as the only means of adequately improving the position of the miners with regard to housing, accidents and special disease;
- (2) as the only means of dealing economically and efficiently with the nation's coal resources;
- (3) as the only means of ensuring that the coal is supplied to the consumer with regularity, and at the lowest cost.

I do not know that any of these suggestions can be supported by practical experience. The Government can, if it wishes, within two or three months, pass legislation which would provide for the adequate housing of the miners, which would make complete provision so far as it was humanly possible against accidents, which would deal with a system of compensation or pensions in these cases where special diseases were rife, and could deal also with the question of infantile mortality. If Nationalisation is regarded as a remedy for infantile mortality, would not better and more immediate results be obtained by nationalising all hospitals and homes where children are treated, instead of starting on coal mines?

With regard to preposal No. 2, the suggestion that the State provides the only efficient means of dealing economically with the nation's resources is a statement that could be rebutted with overwhelming evidence. The State is not now, never has been, and never will, be economical. The whole experience of the past, and the experience of the present day, proves beyond all shadow of doubt that State Departments are neither efficient nor economical. It might be argued, as an illustration, that the Munitions Department during the War has been able to accomplish what private enterprise could never have accomplished. There is some degree of truth in this statement but it has to be borne in mind that, in order to achieve its end, the Munitions Department was able to utilise all private organisations in the country, it was supplied with limitless funds, and it produced its requirements without any regard to cost.

It must be borne in mind that these conditions do not apply to any branch of industry. If the system adopted by the Munitions Department were applied to an industry which had to subsist upon the competitive sale of the articles which it produced, the Ministry of Munitions would have been a bankrupt concern long ago.

I fail to see how we can unceasingly shorten hours, increase pay, and limit output and still compete with the manufactured products of countries where these conditions do not apply.

As to proposal No. 3 dealing with the regularity of supplies at the lowest cost, I venture to observe that no means of control shows a greater lack of regular action than a State Department. This is true enough where the State Department is merely acting as a competitor with private concerns, but it becomes infinitely more true when the State is placed in the position of the monopolist, for when it is the one and only supplier it is in the position to dictate its own terms, and to take its own time, and even to punish people who complain of inefficiency and insist upon business-like conditions.

It is only with the final statement made by Mr. Webb that I find myself able to agree, that by elimination of unreasonable profits the State could sell its productions at a reasonable cost, although, of course, it has to be borne in mind that this depends very largely on the nature of the mining conditions under which the coal is produced. These conditions, I have not the slightest doubt, vary as greatly in Great Britain as they do in other parts of the world, and with the varying conditions come also the variety of qualities of coal which again may affect the price and the demand very materially.

There is one overwhelming objection, however, to nationalisation with which Mr. Webb has not dealt.

I am in agreement with him that the State should always exercise its power to break down combines and rings which are enforcing unfair conditions upon all or any section of the people, but, on the other hand, I put forward this fundamental objection to Nationalisation, that it creates a monopoly—and I venture to think that Mr. Webb will agree with me that all monopolies are bad.

I hold the view that a State monopoly is even a worse evil than a private monopoly. The latter must be efficient in order to resist private competition on the one hand, and prevent the demand for State intervention on the other.

The State has no such grounds for efficiency. The State, as a monopolist, has no fear of either of these checks. It has unlimited funds, unlimited credit, no danger of competition, and parliamentary control. It is thus immune. The most colossal financial blundering would, at the worst, only result in some sort of enquiry or commission, with a belated report, followed in all probability by a speedy promotion of those who had blundered.

In the meantime, the public would suffer, the taxpayer would foot the bill, and the monopoly would lumber on.

An additional danger of State monopoly must not be disregarded, for it is all-important.

It is intensely difficult for the State to initiate industrial or commercial developments. Let it be

30 May, 1919.]

THE HON. FRANCIS MARION BATES FISHER.

[Continued.]

supposed that the State owns all the railways. It has a line running from A to B. The line is insufficient to carry the traffic. The Minister for Transport is asked to build another line from A to B. It is his business to make his railway pay. If he builds a new line, he depreciates the value of the existing line. He becomes his own competitor. A mere suggestion from him that he is going to build a new line leads to a flood of demands from all over the kingdom for similar treatment. There is a general political scramble all over the country for a share of the expenditure of the public purse.

The political tendency is gradually to start a great many public works in a great many places, and build them slowly at a great cost. This pacifies the local people, who are prepared at any time to re-cast their political views entirely according to the amount spent upon their particular railway.

In the event of a bye-election, when the Government is likely to be hard-pressed, the tendency is always to convert the constituency by the promise of large expenditure from the taxpayers' purse. When you have the Ways and Communications Bill in operation, the Minister in charge will become probably the greatest bribery expert in the world. A bye-election at Liverpool—the Government must promise them a new dock. A bye-election at Manchester—the Government must promise them a larger dock than was given Liverpool. A bye-election in Hampshire, promise the people better roads, renewed bridges, and so forth, if they support the Government. Members of Parliament appearing before their constituents will be asked: "How much have you secured out of the public purse for us?" The candidate, in dire distress during the election, will wire to the Prime Minister or the Minister for Transport and say: "Situation precarious, seat in grave danger. Must have new railway station and new bridge across the river." And the Minister will reply: "I am sorry the question of erection of new railway station and bridge across river have been overlooked owing to great pressure. Will you please inform the public and the Press that I have favourably considered your request." And that telegram will evoke tremendous enthusiasm, the seat will be saved for the Government, and the local member will have an everlasting claim on the people on the grounds that "he was the man who secured the railway station and the bridge across river."

That is one of the iniquitous features of nationalisation as it occurs to us. Then we have another equally unfortunate phase of national expenditure. The Government decides to carry out what might be regarded as a national work. It may be the construction of a road or bridge or a great railway station or a post office. It may so happen that the work is conveniently started in an electorate where the Government is not politically in strength. The work will be started, perhaps, twelve months before the election. Thousands of men will be employed, they will receive most favourable treatment from the Government, and they will understand that in the event of the Government candidate losing the election it is quite possible that the work may have to be stopped. This serves as a great inducement to these men to discreetly consider the direction in which they are going to cast their vote.

That is where the practice of nationalisation of roads, railways, bridges and harbours is going to land you, and that is where the same policy landed us. Parliamentary parties will be able to buy constituencies with public moneys instead of party funds, and a more harmful and vicious change I cannot imagine. That is why I regard it as so essential that these great development schemes should not be retarded or polluted by political control. Private control may have some disadvantages, but it does not pervert your political control as nationalisation most surely will.

Private capital will always be found to finance a scheme which it can be shown will pay interest, but development will be arrested enormously if the future of development rests with the State. To begin with, the State will not pay for brains. It prefers mediocrity at half the price. It gets mediocre results

accordingly. But it is embarrassed by a hundred and one other difficulties which make the exercise of normal business functions impossible.

Now, for instance, can a Department be successfully run which has a Free Trade cotton-spinner at its head for one year and a High Protection boot-maker for another. There is not that consistent driving power with a fixed object in view which holds private interest steadily on its course.

Let me observe here that these remarks are entirely directed against State monopoly, and not against State competition, which is on an entirely different basis.

May I add also that I regard those contemplated changes with such apprehension that I believe the Government would be well advised to have the Commission visit every part of the Empire to study every experiment which has been made.

Although this Commission has been set up primarily to deal with the question of coal mines in Great Britain, may I be permitted to draw the attention of its members to an aspect which arises in connection with this matter, which it would be fatal to overlook.

Great Britain is not a self-contained country. She is dependent upon the markets of the world for her prosperity. To escape the evils of long hours, low wages, unemployment and hunger, it is necessary that Great Britain should manufacture millions of pounds' worth of goods which must be sold in the open markets of the world in competition with the products of other nations. In the manufacture of these goods the various industries concerned would be dependent very largely upon the output and cost of coal in Great Britain. Any unreasonable—and I emphasise the word unreasonable—increase in the cost of coal might have a seriously detrimental effect upon the whole trade of the country, and bring about these very evils which we are anxious to avoid.

It might be quite unnecessary for me to do so, but I feel it necessary to attract the attention of the Commission to this very important point, because of its influence upon the prosperity or otherwise of every industry within the realm.

It must not be lost sight of also that decisions arrived at here might be of very far-reaching consequence, because the overseas Dominions which supply you with a large proportion of your foodstuffs are, to a considerable extent, dependent upon you for the manufactured goods which you send in exchange, and, if the cost of these should become unreasonable, the Dominions will find it necessary to transfer their trade to other markets, the loss of which could not be contemplated by Great Britain without the greatest anxiety."

24,562. *Mr. Sidney Webb*: Our time is now very short, so you will excuse me if I do not enter into some of the controversial matters. It is not that I do not appreciate your criticisms. Perhaps you will tell the Commission something about your experience of New Zealand. You suggest a number of statutory reforms which you think will go far to meet the claims and difficulties which have given rise to unrest?—Yes.

24,563. To turn to the question of nationalisation. New Zealand has had a good deal of experience in nationalisation?—Yes.

24,564. You yourself have been in charge as Minister of a number of these departments?—Yes.

24,565. Especially the nationalisation of insurance?—Yes.

24,566. New Zealand has had a State Insurance Department for a good many years; altogether more than 20 years?—I think nearer 40 years.

24,567. That, of course, is important with regard to life insurance, because until you have been running a certain time you probably do not know quite where you are?—Yes.

24,568. As far as I know, the financial experience of the New Zealand State Insurance Department has been very successful?—Yes.

24,569. Could you give us any idea of the proportion of the life insurance business it does in competition with other companies?—I cannot give you the exact figures. The most powerful company we

30 May, 1919.]

THE HON. FRANCIS MARION BATES FISHER.

[Continued.]

have in Australasia is the Australasian Mutual Provident Society in New Zealand, because that ranks first, and the New Zealand State Government Insurance ranks second. Roughly speaking, its proportion of the total business is about one-sixth.

24,570. From the New Zealand Year Book I see that the total amount insured in New Zealand is £42,000,000, and the State Insurance Department has insured altogether nearly £12,800,000?—It is larger than I supposed.

24,571. It is more than one-quarter and nearly one-third?—Yes.

24,572. Has that worked smoothly?—That has worked quite smoothly.

24,573. Its rates must compare fairly with other companies or it could not do business?—I think perhaps it might help you in your enquiries in regard to these institutions if I point out that we have drawn a wide distinction in the term nationalisation between State monopoly and State competition. We are really State competitors. In State Fire, in State Life, in State Accident Insurance we compete with most companies.

24,574. That makes it all the more interesting. You are tested therefore by competition?—Yes.

24,575. What has been the experience of New Zealand in these departments?—In State competition it has been fairly satisfactory.

24,576. The State Department, as we know, increases steadily in life insurance?—Without displacing private companies or capital.

24,577. It has been doing a progressive amount of business?—Yes.

24,578. What has been the financial result? I do not say anything about the security, which, of course, is good. It has not been any charge on the taxes?—No, I do not think it has; certainly not in my time.

24,579. The balance sheet shows a considerable balance of assets?—Yes.

24,580. With regard to accident insurance, New Zealand has been doing that for nearly 20 years?—Yes.

24,581. There you do accident insurance in competition with the Accident Insurance Companies?—Quite so.

24,582. Have you any idea what proportion of the total New Zealand business has fallen to the State Department?—No; but it is very small.

24,583. Is it not very large?—That is very small.

24,584. You had a special object in establishing it?—The object of all these things in truth was with both the State Life, State Fire and Accident to prevent any ring or combination inflating prices. That is why the general principle with us has been adopted of State competition rather than monopoly.

24,585. You have wished the State to go into the business in order to prevent the capitalist companies forming a combination against the consumer?—Quite so.

24,586. According to reputation the effect of that State competition has been, as it has been put to us, to reduce the premiums charged?—I think it has in a great many cases.

24,587. You have a New Zealand Government Fire Insurance Office?—Yes.

24,588. Which is also acting in competition?—Yes.

24,589. There you get a substantial part of the business?—Very small. It is a very small proportion of the total business, but it has effected its purpose.

24,590. It is a steadily increasing business?—Yes, it is steadily increasing.

24,591. It has reduced the rates that were being charged?—Yes.

24,592. Similarly the experience in State coal mines?—That is not so satisfactory.

24,593. How about the effect on prices?—It has stabilised the price to some extent.

24,594. When you say stabilised, that means it has prevented a combination of capitalist coal companies from raising the price?—To a certain extent it has done it, not on a strictly competitive line. The State Coal Mines Department is not run on ordinary business lines, therefore it does not bear a quite fair comparison with the normal private business.

24,595. That may be your experience, but how about the fact? It is said it caused the price of coal to the consumer to fall?—It did, there is no doubt about that.

24,596. Therefore the people of New Zealand think they have a great advantage that is not to be measured by the profit the State makes?—No. The people of New Zealand, curiously enough, have never asked for an extension of that State Coal Mine purchase. We are satisfied in all these things to set up as competitors, so, as I have said, to prevent a ring or combination, but not to monopolise.

24,597. I do not want to push it in any further than you are stating it to us. Accepting that view of the New Zealand Government which the New Zealand people have expressed at repeated elections, it does mean the setting up as State Departments, even State Mines, has been financially beneficial to New Zealand?—Yes, financially beneficial to the consumer.

24,598. Is there anybody else in New Zealand?—There is the State itself. They are not set up as merely profitable ventures for the State.

24,599. Therefore they are not to be tested by the amount of profit they make every year. The advantage lies in the reduction in price they cause?—A great deal of the advantage.

24,600. As a matter of fact, the New Zealand State Mine Department does not make a loss?—In some of the mines.

24,601. We know that of English mines. The balance sheet is the test?—It is an open question as to whether the balance sheet is the test; that is if the balance sheet is rigged on the same lines as the private concerns. That is the whole point.

24,602. I would not suggest the State Government did rig its balance sheets on the lines of private concerns?—There is no reason to suggest it; the fact is it is done.

24,603. It is run on the same lines as private concerns?—I say it is not. A private concern pays Income Tax rates and harbour dues.

24,604. Private concerns do not charge Income Tax as part of their expenses?—Surely it charges Income Tax against its expenses?

24,605. No. Income Tax does not form part of the expenses of carrying on the concern?—You suggest the company pays Income Tax out of its private funds and does not enter that up as against the business.

24,606. We say the shareholders pay the Income Tax. Income Tax is not part of the expenses of the business. It is not levied or assessed until you work out what the profit is?—It has to be paid out of the profit of the business. The point in dispute is this: In a private concern you would have to pay Income Tax, which is a considerable item, and in a State concern you do not.

24,607. When you state what the profit of a concern is you do not first deduct the Income Tax. You cannot assess the Income Tax until you arrive at what the profit is. Keep your mind on the profit. It is not a question whether the State Coal Mines Department makes as much profit as a capitalist colliery, but the question is whether the State Coal Mines Department is any charge on the taxes?—No.

24,608. The State Coal Mines Department forgoes some of the profits it might make in its effort to keep the coal prices down?—That is so.

24,609. There are other enterprises in New Zealand, but not in the nature of commercial ventures. I say nothing about the pension system, and military pensions and old age pensions, as that does not come into this scheme. You have not found it difficult, apparently, in New Zealand to carry on this concern, even with the drawback that is often urged against the Civil Service. You have taken steps, have you not, to protect the Civil Service from political influence?—Yes.

24,610. You have done that pretty successfully?—Yes, I think so.

24,611. Apparently with regard to your State enterprise whatever may be the capacity of your Civil Servants, tested by the result they seem to do pretty well?—As competitors, yes.

24,612. That is testing them pretty highly?—I think it is quite a fair test.

30 May, 1919.]

THE HON. FRANCIS MARION BATES FISHER.

[Continued.]

24,613. Is there any suggestion that State enterprise in New Zealand should be given up? Is there any party in the State that proposes, having taken over certain coal mines and certain insurance operations, that these State enterprises should be abandoned?—No. There has been a strong feeling that they should be run on strictly business lines, which is not being entirely done.

24,614. Do you mean it is suggested the Coal Mines Department should make as much profit as it can and charge the consumers unnecessarily high prices?—No.

24,615. Would not that be commercial lines?—No; we suggest with a concern of that nature the proper method of continuing its business is to levy upon itself the same charge that private enterprise has to do before you can get a comparison.

24,616. Does it not do that?—No.

24,617. Will you give us some instances?—Take the State coal business which is set up; it pays no rates.

24,618. It pays no local rates?—It pays no local rates and it pays no harbour dues.

24,619. As a matter of fact, the local rates are very low in New Zealand?—No, they are not; on the contrary, they are very high.

24,620. All things are relative?—If they are low from a competitive point of view it does not seem fair to levy that charge on one business and not on another because it belongs to the State.

24,621. What does it amount to in money?—I do not know.

24,622. In price per ton?—I could not say; it would be a very considerable item.

24,623. You say very considerable. Do you mean absolutely considerable? Would it add 6d. a ton to the price?—I cannot tell you that.

24,624. I suggest it is only a question of pence?—I do not agree with your suggestion; I am unaware of the figure.

24,625. The other question is the income tax, but we will not go into that?—Take a private insurance company setting up in business. It has to deposit £50,000 in cash with the Government.

24,626. Surely, not in cash; it is allowed to get the interest from that?—It does not.

24,627. It actually forgoes that amount?—Yes.

24,628. That is certainly a distinction. That means to say the State Insurance Company might have for fairness to add £2,500 a year to its expenses?—That is so.

24,629. Even allowing for £2,500 a year, that would still leave the State Insurance department very profitable?—Yes.

24,630. Now, about inspection of the mines. Could you tell the Commission anything in your recollection as to the state of mining inspection in New Zealand?—I do not know much about the details of mining inspection. There is a Mines Department and there are inspectors in every part of the country. There are elaborate enquiries into every kind and form of accident that takes place. Then reports are made to Parliament, and I think I might say with truth we have a Mines Amendment Bill almost every year; so you see we are making things better and better every year.

24,631. You take a great deal of care to prevent accidents in New Zealand?—Yes.

24,632. You think your system of mine inspection is fairly successful?—I think it is very good.

24,633. Your total production is not very large?—It is insignificant.

24,634. Your accidents are very few, indeed?—Very few.

24,635. I am told in some years you do not have a single fatality?—That is quite likely; they are very careful, indeed.

24,636. You have a system of miners' pensions?—Yes.

24,637. Do you happen to remember anything about that that is of interest to us?—The system arises out of my own personal visit to the mines. I visited them; I went down them, and I spent some days underground, and I came to the conclusion it was necessary to make provision for miner's phthisis. In consequences of which I made provision that a man who at a comparatively early stage in life became

afflicted with that disease is provided for by the State.

24,638. That does not apply to the coal miners, but only miners suffering from miners' disease in the gold mines?—No, coal mines very largely.

24,639. Coal miners disabled in this particular cause are to have a right to a pension from the State?—Yes.

24,640. That is done out of State funds?—Yes.

24,641. Not a charge upon the industry?—Yes.

24,642. How much is that?—I cannot tell you what the amount is.

24,643. You have a Coalminers' Relief Fund?—Yes.

24,644. That is a provision for the miners who suffer from accidents and their dependents?—Yes.

24,645. Is it right to say that is not provided out of State funds, but by a special charge on the coal?—I think that is entirely collected from coal.

24,646. It is a halfpenny a ton or something of that sort?—Yes, entirely on the coal.

24,647. Out of that fund which is a charge on the industry you have elaborate provisions in addition with regard to workmen's compensation?—Yes.

24,648. For the relief of the families of those who suffer from accidents?—Yes.

24,649. *Mr. Arthur Balfour*: You have no industry nationalised in New Zealand?—Yes, we have a monopoly of railways.

24,650. Taking any other productive industry outside transport, do you think if totally nationalised it would be possible to keep State ownership separate from political control?—No, I do not think it would be possible.

24,651. Look at your proof with regard to the résumé you have given of the New Zealand Acts. I see the main principle is the publicity?—Yes.

24,652. To make public in a strike the views of both sides so as to influence public opinion?—That was done following the strike in 1913, when was passed an Act called the Industrial Disputes and Investigation Act, which is outlined in this précis of evidence. There you see a strike is illegal unless the steps set out to be taken in the Act are complied with.

24,653. In the year 1917 what was the total output of coal for New Zealand?—I could not say.

24,654. It was 2,000,000 tons?—Yes. Then these figures have been knocked to pieces by war conditions.

24,655. This is 1917?—Yes.

24,656. What proportion of that was the output of the State mines?—Very, very small. The proportion of State production was very, very small indeed.

24,657. 260,000 tons?—Very small.

24,658. I have the manager's report in front of me?—It was very small, I know, and there was no desire to make them larger.

24,659. There are only two collieries, the Point Elizabeth and the Liverpool Mines?—Yes.

24,660. Do you know the number of days lost on account of strikes at the Point Elizabeth Colliery?—I could not tell you the figure. I can say this, that if there should be any idea in the minds of the members of this Commission that nationalisation or State ownership is going to prevent strikes, I feel perfectly convinced it is not so.

24,661. I have the manager's report, and it says that out of 260 possible days 48 days were lost by strikes.

Mr. Sidney Webb: How does that compare with other mines?

24,662. *Mr. Arthur Balfour*: Some was for want of shipping. How does that compare with the other collieries? Did they have strikes on a similar scale?—When they start the strike they naturally enough all go the same way.

24,663. Were the strikes owing to grievances at a particular colliery or sympathetic strikes?—The big strike was entirely a sympathetic strike.

24,664. Take the Liverpool Colliery. I see they lost 72½ days out of 270?—Yes.

24,665. Nationalisation is not going to prevent strikes or stoppages?—No, I should not think so;

30 May, 1919.]

THE HON. FRANCIS MARION BATES FISHER.

[Continued.]

we have not found it so. I was Minister of Marine in 1913 when the big strike took place, and in the Marine Department itself, which was well equipped, the men were very well paid and looked after; but they were, I think, almost the first to come out.

24,666. Did it originate in a State ship or private ship?—It did not originate on a ship at all. It originated by some carpenters going on strike, and these followed.

24,667. *Sir L. Chiozza Money*: Private?—Yes.

24,668. *Mr. Arthur Balfour*: Then they came out in sympathy?—They followed a series of sympathetic strikes.

24,669. *Sir L. Chiozza Money*: And it was very proper?—Sir Leo has interjected the remark "And it was very proper."

24,670. *Mr. Arthur Balfour*: I am examining you, so you need not take any notice of Sir Leo's remarks. The fact that workmen work for the State does not cause the spirit of uplifting in them which has been mentioned to us at this Commission?—No, I think experience is against that entirely—entirely against it. If I may point it out, we find one of the difficulties about Government monopoly is this—the Government in our country has taken over the monopoly of the waterways; that is, the water power of the country—that political differences come in and you can never get the Government to start a movement that would be started by private capital, if it had the capital, because the Government is so afraid of raising political differences that it does not know where to start. One year they take a vote to start in one place and the next year they take a vote to start in another place.

24,671. You cannot divorce political influence?—To my mind it stifles enterprise and initiative altogether.

24,672. Have you attempted to nationalise land in New Zealand?—Yes; there was the late Coleridge scheme.

24,673. What was the result of that?—The result to nationalise land was a failure and broke down.

24,674. How did it break down?—It broke down because the holders of land which the State had an interest in were so bothered and pestered by frequent inspections and the usual inspections to inspect the inspectors that they came to the conclusion they would be better working under a freehold system than under leaseholds from the Crown. That led to a movement which in 1912 practically swept the country and put the present Ministry in New Zealand into power.

24,675. That has ended the question of nationalisation of land?—That has ended the question of nationalisation of land.

24,676. Have they attempted to nationalise banks in New Zealand?—Not to nationalise. We have taken an interest in the Bank of New Zealand, and the State provides about half the capital and nominates the Chairman of the Bank and a number of the shareholders, but the Bank is run entirely as a private concern, and the rights of the shareholders in the Bank are preserved. That is the only attempt we have made.

24,677. Have you any knowledge of Queensland?—I have not any personal knowledge of Queensland.

24,678. In comparison with New Zealand?—I have followed their movements with some considerable interest. It has not gone far enough to form an opinion upon it.

24,679. Do you know any Colony or Dominion that has attempted to export anything made in nationalised factories?—No, none. I think if we had to compete in the markets of the world under this system of State ownership we never should have made so much headway. That is my impression.

24,680. With regard to income, the fact does remain if you nationalise important industries, a certain sum of money has to be collected for taxation?—Yes.

24,681. As that portion of the industry does not contribute to taxation, some other portion has to a greater extent?—Yes.

24,682. Or the people have?—Yes.

24,683. *Sir Leo Chiozza Money*: Was the Lord Coleridge Power Scheme a success?—It has been in operation for two years. It is rather difficult to say whether it is a success or not.

24,684. The Government claims it is a success?—I have heard many gentlemen claim it, but it has never been admitted.

24,685. Are you opposed to the system of the Government?—Yes, I am.

24,686. Do you think what the Government says is true?—That I cannot tell. It is a little bit early, and what you have to recognise is the fact that we have had the monopoly of these water rights in New Zealand in the hands of the Government for the past 20 years, and it has taken all that time to get one scheme that has only been in operation for two years.

24,687. Will you tell me whether you think you represent the views of the New Zealand Government as now established?—I think I do. I was a member of it for three years.

24,688. Yet you differ from what they say themselves?—I say it is early to say with regard to a large scheme that has not been in operation for two years. I do not call that a great success after 20 years' monopolised water rights of the country.

24,689. Do you think the railways are successful?—I do not.

24,690. You think that the claims made that they are successful are entirely wrong?—I do.

24,691. Why?—I do not think the nationalisation we have in New Zealand is by any means satisfactory, and I am perfectly certain that if anybody goes to that country and travels on the railways they will not want to travel upon them again.

24,692. Are their fares higher than the fares here?—Much.

24,693. How much?—Considerably higher.

24,694. What do you charge on your suburban lines in Christchurch, say?—Do you want me to compare it with your 50 per cent. rate?

24,695. Whichever you please?—It is abnormal. I am not going to compare our rates there with a 50 per cent. war rate here.

24,696. Take the penny parliamentary fare forced upon the railways by Act of Parliament?—I do not know what the penny parliamentary fare or rate is.

24,697. Penny a mile forced upon the railway by an Act of Parliament?—Ours would work out at 1d. or 2d. a mile.

Chairman: We are much obliged to you, Mr. Fisher.

(The Witness withdrew.)

Mr. JOSEPH HAVELOCK WILSON, C.B.E., M.P., Sworn and Examined.

24,698. *Chairman*: Mr. Havelock Wilson speaks with regard to the seamen and firemen. He says:

"(1) I am founder and President of the National Sailors' and Fireman's Union of Great Britain and Ireland.

(2) The present Seaman's Union was founded in 1887. Previous to that I had been a member of local seamen's organisations.

(3) I have had experience of Trades Unions in the United States of America, Australia, New Zealand,

France, Belgium, Holland, Germany, Denmark, Sweden, and Norway—that is to say that I have devoted considerable time to the organising of Trades Unions in the countries mentioned.

(4) I attend to-day to give evidence against the nationalisation of mines or the nationalisation of any industry as I believe it would mean a great injury to the best interests of the workmen and the interests of the country generally.

(5) I have had many opportunities of judging the effect of State Control and I have formed the opinion

30 May, 1919.]

MR. JOSEPH HAVELOCK WILSON, C.B.E., M.P.

[Continued.]

that such State Control has not been to the benefit of the workers.

(6) State Control would result in:—

- (a) Employment of large numbers of high officials on petty duties.
- (b) Continual change of officials from one department to another.
- (c) Restriction on freedom of action.
- (d) Protracted discussion of matters which could be settled in a few hours.
- (e) Control on top of control.
- (f) No incentive to initiative.
- (g) Political wire pulling to influence appointments on the management and directorial staffs.

(7) *Foreign Trade*.—Nationalisation would cripple export of coal because in buying and selling coal quick decisions have to be made. It would be impossible for a Government Department to deal with these matters in the same way as they would be dealt with by private individuals.

(8) Loss of our foreign trade in coal would have a very serious effect on our shipping trade especially in the face of the keen competition which may be expected from America in the near future.

(9) The State could not be expected to keep unprofitable collieries going especially where the output could only be used for exporting abroad. Many thousands would thus be thrown on the unemployment list.

(10) The elimination of private incentive to maintain our position in the world's trade and open up new markets abroad would inevitably lead to serious unemployment and broken time at many collieries with the result that the weekly earnings of the workers would be lowered to the starvation point, while others would be on unemployed donation.

(11) Joint Control (as advocated under Mr. Straker's scheme) would result in chaos.

(12) The high cost of production inevitable under such a scheme of nationalisation as proposed would make it impossible to retain a share of the world's trade for iron and steel, shipbuilding and reconstruction work generally.

(13) The State services such as the post office, telegraphs, telephones, have not been a financial success. It means low wages to many workers employed and in the case of the telephone substantial reductions of wages were made from those employed.

(14) The cost of installation of the telephone has increased, longer periods elapse before the work can be completed and the service is inferior to what it was in the old Telephone Company's days.

(15) Labour Exchanges have been a costly failure and no real benefit to the workers. I am pleased to state that I was the only member of Parliament who opposed their establishment. They are now cost-

ing over £1,000,000 a year. The same system of Labour Exchanges was established for seamen over 60 years ago. The inevitable result was that the only place where a seaman could not obtain employment was at the Labour Exchanges established by the Government for the seamen's benefit.

(16) State interference with the liberty and action of the seaman has been a failure and brought him within measurable distance of slavery. But for his determination to combine he would have been a slave to-day.

(17) At the present time there are State officials who have in mind schemes, which if they dared to bring them before Parliament would inevitably end in the slavery of the seaman. For this and other reasons I am a determined opponent of the nationalisation of industries or with the undue interference of State officials in matters relating to employers and employees."

Do you wish to add anything to that?—Not one word.

Chairman: We shall pay great attention to what you say. Is there any gentleman on my right who desires to ask any question? (No reply.) Is there any gentleman on my left?

24,699. *Sir L. Chiozza Money*: I have one or two questions. I notice you say in the case of the Stato Telephone system a substantial reduction in wages was made?—That is true.

24,700. Are you aware that the annual increase given to the National Telephone Company's servants in pay and pensions is £410,500 a year?—I am not talking of pensions, I am talking of wages.

24,701. Are you aware the increase of wages is £158,000 a year?—It did not go to the actual workman I know. I will give you a case in point. I know telephone men who were getting £4 10s. and £5 a week under the old company who are only getting £3 10s. a week to-day including the war bonus.

24,702. Are you aware it is true, taking the National Telephone Company's servants as a whole, they are getting £158,000 a year more?—That does not concern me a bit. I am more particularly concerned about the actual workman. I do know and I state the officials do manage somehow or other to wriggle a good increase in wages, but I am talking of the actual workers.

24,703. You deny this thing which is stated to be a fact?—I do not deny that. I do not know anything about that. I tell you what is my actual knowledge—what I know myself.

24,704. You do not contradict this fact?—I know nothing about it; I cannot contradict it.

24,705. Then I will not ask you any more questions, you know nothing about what you have put in your paper.

(The Witness withdrew.)

Mr. WILLIAM CASH, Sworn and Examined.

24,706. *Chairman*: I will ask Mr. Sidney Webb on my left, and Sir Arthur Duckham on my right, to be good enough to ask any questions which they may deem to be appropriate. Mr. William Cash speaks as to various undertakings; Gas Companies; Water Companies; the Metropolitan Water Board; the Port of London Authority, and he places before the Commission his views as to nationalisation. Mr. Cash says:

"Qualification.

I am a Fellow of the Institute of Chartered Accountants and a Member of the Council of the Institute of Chartered Accountants and senior partner in the firm of Cash, Stone & Co., carrying on business at 90, Cannon Street, London, E.C.

I have had a general experience of accountancy extending over 30 years, but in particular I have had experience in connection with gas and water undertakings in several and various capacities.

I am very familiar with the statute law governing the supply of gas, water, and have some knowledge of electric light and tramways legislation, and the practice of Parliament generally in Private Bill legislation.

I am a member of the Executive of the National Gas Council and a representative of employers on the Gas Industrial Council just recently formed.

From my close connection with the gas industry I am deeply concerned in the problems now being considered by the Coal Industry Commission, particularly as the decisions of the Commission may affect the supply of coal on which the gas industry depends.

Regulated Monopolies.

I am not, however, commissioned by the gas industry to speak on their behalf, nor am I expressing the views of any other organised body of persons.

30 May, 1919.]

MR. WILLIAM CASH.

[Continued.]

I have considered the question of nationalisation of the coal industry and I venture to put forward such information as I possess in the hope that it may be worthy of consideration by the Committee as a solution of the problem of what conditions should be applied to the conduct of the industry in future in the interest of the community, the miners, and the coalowners.

I am of opinion that a parallel case exists between the supply of water, gas and electricity and the supply of coal. Each of these deals with a necessity of modern life produced within the United Kingdom.

The Legislature has already recognised this so far as the three first are concerned and has provided that they shall be dealt with on the lines of a regulated monopoly.

The supply of all three commodities is in the hands of both companies and local authorities, but many of the undertakings now conducted by the latter were commenced by private undertakers and have been subsequently transferred to the local authorities by purchase on terms sanctioned by Parliament.

I should propose to furnish greater detail with regard to gas because I venture to think the conditions existing with regard to gas will be the most helpful if the Commission should be of opinion that similar conditions might be applied to the coal industry."

I do not think it is necessary for this Commission to read some parts of your proof which is simply an analysis of Acts of Parliament and which, I expect, some members of the Commission have been familiar with for a large number of years. You review the Companies Clauses Consolidation Act; the Water Works Clauses Act, 1847; and you deal with the Gas Acts. Then you deal with the appropriation of profits under the Gas Works Clauses Act, 1847, which I will read:

"Appropriation of Profits.

Under the provisions of the Gas Works Clauses Act, 1847, the profit to be divided among the shareholders was limited to 10 per cent. on the paid-up capital, with power to make up any deficiency of dividend out of future profits, and with the obligation to accumulate as a reserve fund any surplus profits to an amount not exceeding one-tenth of the nominal capital.

This reserve fund is available to meet any extraordinary claim or demand, and to make up any deficiency in the prescribed dividend.

After the reserve fund is full the undertakers must apply any surplus profits in the reduction of the price of gas.

Powers for loan capital or borrowings on mortgage have been given for many years to the extent of one-fourth, or in later cases one-third, of the paid-up capital.

Combined with a maximum dividend to the shareholder, each special Act contains a maximum price to be charged for the gas supplied.

Sliding Scale.

Companies constituted with the foregoing provisions are generally known and described as maximum dividend companies. In 1875 a system of sliding scale in the price of gas and dividend was first introduced in London, and since then has been very widely adopted. The basis of the principle is that a reduction or increase in the price of gas is followed by an increase or reduction in the dividend payable. The consumer and the shareholder become in a sense partners in the business, and an inducement is thereby offered to the company to conduct their business on the most approved and up-to-date lines to ensure the best working results."

Then you deal with Auction Clauses; Standard Price; Reserve Fund; Special Purposes Fund; Limitation of "Carry Forward"; and Conversion of Loan Capital. Then you say:

"The Consumer as a Partner.

To sum up the financial provisions. These proceed, as I have endeavoured to show, on the lines that the consumer is to have the commodity at the cheapest

price possible, but he is to be treated as a partner, sharing surplus profits and bearing his proportion of additional cost due to adverse circumstances, such as a rise in the price of coal or wages, the shareholder being allowed to accumulate reasonable reserves for the protection of his dividends or interest.

Co-Partnership.

I now desire to draw your attention to a most important extension of the principle of partnership that has been brought into operation in recent years, whereby the workpeople and staff of many of the larger companies have been given a share in the prosperity of the undertakings.

The plan was first introduced in gas companies by the late Sir George Livesey in 1890 among the employees of the South Metropolitan Company. The terms vary in different companies, but the broad basis is identical. The employees receive a bonus calculated by way of percentage on the individual wages paid, and rising or falling by, say, $\frac{1}{2}$ or $\frac{1}{4}$ per cent. for each decrease or increase of one penny in the price of gas ruling during the twelve months current. This bonus is placed to the credit of the employee, and is used in whole or part for the acquisition of stock or shares in the undertaking. Co-partners are admitted after a period of probation, and sign an agreement of service.

The results have been seriously affected by the war. In 1913, 33 companies divided £140,107, the lowest percentage being 4 per cent., and the highest 8 per cent."

Then you tell us of the educational work that is done in the Gas Companies and the Industrial Committees. Then we come to the coal industry as a regulated monopoly. Will you read that, Mr. Cash?

Witness:

"Coal Industry as a Regulated Monopoly.

With the above outline before me, it seems to me that similar arrangement could be applied to the coal industry. Coal is a national and universal necessity. It is like gas, in a sense, similarly qualified, a monopoly.

I venture with some diffidence to suggest in outline the principles that might be applied, but I ought to say that I have no extensive or intimate knowledge in detail of the coal trade.

A general Act of Parliament might provide that no person or body of persons should engage in coal mining for the sale of coal without the authority of an order to be granted in the manner hereinafter described. This principal Act would also contain certain provisions governing procedure generally.

It would not be possible for Parliament under the present methods of Private Bill Legislation to institute the necessary enquiries to settle the conditions applicable to each colliery undertaking. I should accordingly suggest the setting up of coal commissioners, who would settle the terms of the order to be granted to each undertaking."

Then I refer to the Williamson Report. These notes were written before the introduction into Parliament of the Electric Lighting Bill.

24,707. *Chairman:* You may assume the Commission has heard of that.

Witness: I thought I might pass over that paragraph.

"Based on these two standards, every reduction in the price realised for the coal would entitle the undertaking to distribute to the proprietors and the workpeople out of profits or reserve so far as available a relatively increased dividend.

Conversely every increase in the price realised above the standard would involve a relative reduction in the dividend and bonus. I am unable to suggest the amount of the relative slide without fuller knowledge of the conditions ruling in the trade. I do suggest, however, that the basis should be framed so as to provide a real inducement to reduce prices.

Further regulations would fix the limits of the reserves, for (a) equalisation of dividends, (b) acci-

30 May, 1919.]

MR. WILLIAM CASH.

[Continued.]

dents, (c) special renewals, and (d) amortisation, of leaseholds or property of a wasting character.

I further suggest that a proportion of the profits also dependant on the price of coal realised should be allocated as a bonus on co-partnership lines to the workpeople and officials payable as a percentage on wages and salaries paid. All this would tend to unite the management and the workpeople in a common object, to reduce costs, to reduce the selling price, and increase the profits. There would thus be created a true co-partnership between the proprietors, the workpeople and the public.

Accounts in a standardised form would be obligatory, and should contain statistical information relating to the quantity of coal raised, wagons owned, and any other information necessary. As a guide for principles involved, I might mention the forms prescribed for gas companies, electric light companies, and the most recent form of railway accounts, as laid down under the Railway Companies (Accounts and Returns) Act, 1911.

The main heads would *inter alia* state the amount of wages paid, the cost of materials used, cost of repairs and upkeep, administration rents, and repairs of cottage properties, and royalties.

Coal statistics should show tons of coal raised and coal applied for colliery use and supplied free to workpeople or others. The coal industry having a simple and convenient unit of tons lends itself admirably to statistical record in the matter of costs and easy comparison of working results.

These accounts should be filed with the Coal Commissioners and should also be available for inspection by all persons interested.

Royalties.

It occurs to me that the Commissioners might be given plenary powers to fix all future royalties in respect of coal not at present the subject of development."

That was written before the last Report of Mr. Leslie Scott's Commission, of which you are conversant. Then "Re-incorporation of Undertakings."

24,708. *Chairman*: We need not trouble about that. You can go to nationalisation.

Witness:

"Nationalisation.

My personal opinion would not be in favour of nationalisation, but procedure on the above lines would materially assist subsequent action for nationalisation if that were decided on hereafter. The accounts suggested above would be of great assistance, as they would afford all the necessary information as to profits, costs, etc., and the regulation of the industry would limit the expansion of profits to an undue extent.

Moreover, in my opinion, the formation of works committees, the sharing in profits, the acquisition of shares in the undertaking, and the knowledge of working results would, I should hope and believe, go a long way to meet the present suspicion and dissatisfaction felt by the workpeople.

In the case of a few gas companies Parliament has sanctioned the creation of benefit funds for workpeople, limiting the amount so expended to a sum calculated on the sale of gas. Special provisions have also been made in certain Private Acts simplifying the transfer and transmission, on death, of workmen's share holdings, and in a Bill now before Parliament leave is asked to expend money in housing schemes.

A few companies have provisions for working men directors where profit-sharing schemes are in operation. Issue of capital direct to workpeople has also been recognised."

24,709. *Chairman*: We need not trouble about the next. "Future Capital." Go to the next page, "Municipalisation compared with Nationalisation."

Witness:

"Municipalisation compared with Nationalisation.

I have had a very considerable experience of public utility undertaking conducted by municipal authorities. Speaking quite generally, I do not think they

are so efficiently conducted as privately-owned concerns. Some local authorities provide notable exceptions. There is not the same opportunity of obtaining special recognition of exceptional services. These remarks do not apply wholly to nationalisation, but they would do in part. In Government Departments, for example, it is always difficult to get at the head or the man in a position to settle anything finally, and there is a tendency in my experience to avoid responsibility for fear of making a mistake or incurring censure.

I am sure that the shareholders' meeting and the rate of dividend is a spur to the higher and responsible officials in private undertakings of all kinds. There can be no similar review of operations under a Government or bureaucratic control.

Then, under national control all competition would be eliminated and this, in my judgment, would be most disastrous.

Coal Distribution in Retail.

It is obvious that the scheme of control I have indicated could not easily be applied to the distributing section of the coal trade.

Unprofitable Coalfields.

If on grounds of national importance it is deemed necessary to develop and work certain coalfields which would not be paying propositions on a commercial basis, it appears to me that this would have to be done by the State, but under the direction of the Coal Commissioners on terms under an order settled by them. It appears to me that it might be possible to raise a Development Fund by a levy at a rate per ton on coal raised within defined areas for expenditure on development."

24,710. *Chairman*: What do you mean by development there?—Development of coal which on account of its expensive character or difficulty of development would not be in the ordinary course developed by private enterprise.

24,711. A sort of rate in aid?—A sort of rate in aid. To take a parallel case there is a rate in aid levied not for development but for subsidence as in the Brno Subsidence Act, where there is a levy up to 3d. a thousand gallons of brine pumped.

24,712. Then you set out your experience of transfer of undertakings and the Metropolitan Water Board?—That was a considerable transfer in 1902 which affected the eight Metropolitan Companies and involved a large sum of money amounting to £47,000,000, and included in that £47,000,000 was a very large sum for compensation to directors; expense of arbitration and costs generally the particulars of which I can give if they are of any interest to the Commission.

24,713. Then you deal with the Port of London Authority.

"Port of London Authority.

The other case to which I allude is that of the Port of London Authority which took over the London Docks under the Port of London Act of 1908.

In this case terms of purchase were agreed and inserted in the Act, the total sums payable being £22,350,000.

The terms included compensation to the directors of the three dock companies amounting to a sum of £127,600, payable in A Port Stock, and also compensation to officers under certain circumstances and conditions."

24,714. *Sir Arthur Duckham*: You state here that you are of opinion that a parallel case exists between the supply of water, gas, electricity and the supply of coal. Do you think that the fact that the supply of water, gas and electricity is more or less kept in one area affects the position?—That is to say, there is an area defined for each undertaking?

24,715. Yes—a monopoly area?—I do not see why that is essential to any scheme for regulation or control.

30 May, 1919.]

MR. WILLIAM CASH.

[Continued.]

24,716. The question of price would enter there?—No. My suggestion would be that in fixing a standard price for each coal undertaking, of course regard would be had by the authority settling the terms of the Order to the circumstances in connection with each undertaking on its past history, just as is done in fact, and has been done for many years, when a gas company has come to Parliament for incorporation.

24,717. Would there be any trouble with a colliery producing five or six different classes of coal?—I think regard would have to be had to that, and probably you would go on the average.

24,718. You might take the average cost of the colliery?—Yes. I suggest the standard should be based on the price realised.

24,719. To carry that further, you do get varying conditions in a colliery. You may get part of a colliery which is working and giving you cheap production; then you may come to a fault, and the price may have to go up. That would mean the standard price?—Personally, I should be very sorry to see a standard price which is subject to continual variations, because I think that would destroy a great deal of the incentive.

24,720. I believe you have had considerable trouble during the war from the price of gas being fixed at a standard, and then circumstances coming along which altered the equity of the standard price?—The basis in the past, of course, has been that all ordinary every day ups and downs—even such a thing as a coal strike, putting a strain on a Gas Company—have been cheerfully borne by the gas companies, and have affected the price, that is, the consumer, have affected the shareholder, that is to say, the dividend, and have affected the workman where there has been co-partnership. There have now been cases where entirely abnormal circumstances have arisen, due to the war, which were never contemplated when the standard was fixed; but I do not think that has destroyed the basis of the scheme, which I claim has undoubtedly worked well in the past.

24,721. You might wish to change the basis?—Under exceptional or entirely abnormal circumstances, but not otherwise.

24,722. The ideal that you put before us is that the capitalist on the financial side and the workpeople and the consumer are all partners?—Yes. I might say this, that I wrote these notes before the coal-owners' scheme was laid before this Commission, and the essential difference between that scheme which is somewhat on these lines and the scheme here is that I bring in a third party, namely, the consumers. In other words, the commercial result of the operations carried on by the individual undertaking brings in all three as partners.

24,723. Do you think it is essential to bring in all three?—Personally, I have been concerned in gas companies, who are large buyers of coal, and I am more concerned in the consumers' position than in the colliery owners'.

24,724. Putting it on the worst basis, it is a good thing to bring them all in?—In my view, yes, because what the consumer wants is cheap coal and plenty of it.

24,725. With regard to the bonus, you do not wish to make any special statement as to coal. It would want some special working out. I refer to the percentage of bonus. You have not thought that question out?—No. Of course, I could give you illustrations as to the proportion in the gas industry—it varies considerably in different companies—as to the amount that goes to the shareholder and the amount that goes to the owner. Of course, the relative proportion between wages and capital would have to be borne in mind.

24,726. What is your opinion where the workmen have a direct interest in the profits of a concern as to making the working man a director?—It has been done in two or three cases in the gas world. The South Metropolitan Company, who started the co-partnership, have two working men directors sitting on their Board, and the South Suburban Company

also, who followed them shortly afterwards, and they speak very highly indeed of it as being a great advantage. They also work very closely with their Co-partnership Committee, which meets fortnightly, and with their directors; and although at the present moment the bonus has been seriously depleted owing to the rise in cost they are very enthusiastic as to the advantages which they gain from co-operation and from consultation with their men. I am in two companies, of which I have the honour to be a director, where we have co-partnership schemes, and our experiences are the same.

24,727. If it were possible, would you welcome a workman on the Board?—Yes. If the workpeople become substantial shareholders in an undertaking they are entitled to representation on the Board.

24,728. If the workmen are profit-sharers they are interested in the finances of the Company. Does not that entitle them to become directors?—That is what I intended to indicate.

24,729. Not necessarily as shareholders but as profit-sharers?—I think they ought to have a voice in consultation with the management on general questions of the conduct of the business.

24,730. With regard to this question you put at the end, speaking of the Port of London Authority and the Metropolitan Water Board—and I do not want you to answer this question if you do not wish to—if there was an amalgamation of these coal companies or any unification in any way, would you say that there should be general compensation to the directors?—The practice of Parliament has been where they have allowed transfer to Local Authorities of gas and water undertakings, that compensation has been given almost invariably to the directors.

24,731. They have recognised the vested interest of the director?—Yes.

24,732. *Mr. Sidney Webb*: You put coal to some extent on a parallel with water, gas and electricity?—Yes.

24,733. May I take it from that, without going too deeply into it, that you suggest that it is reasonable and desirable that coal should no longer remain uncontrolled?—I say I think there is a case for control as distinguished from nationalisation, on the ground that it is a monopoly, or practically a monopoly, and a necessity.

24,734. That is to say, that free competition does not avail in normal times to protect the consumer sufficiently. That must be the inference, must it not?—I am in favour of competition as between one undertaking and another, and I am perfectly prepared, provided the consumer gets his fair share of the profits that are made, to allow competition to continue, and would do all I could to increase it.

24,735. But not free competition?—Free competition between one undertaking and another.

24,736. You mean competition being subject to a standard price?—I should like to see a standard price which would give an inducement to everybody concerned to reduce prices.

24,737. That is hardly freedom?—It is not complete freedom.

24,738. Assuming that we could apply the Gas Clauses or some such system to coal—I do not want to discuss the Gas Clauses, because I agree with you that they have been very successful—but let us consider how we could apply them to coal. First of all, the standard price—we have had it given in evidence that collieries produce such a number of different qualities of coal and each colliery produces its own set of qualities—would there be a difficulty in that?—I see no greater difficulty there than in fixing the standard price for gas companies. The standard price for gas companies varies in almost every undertaking throughout the Kingdom. The particular circumstances of every gas undertaking, whether they are supplied by rail-borne coal or sea-borne coal, or whether they are close to a coalfield or otherwise, would give rise to just the same difficulty.

24,739. At any rate, there is one price for each concern?—Yes.

30 May, 1919.]

MR. WILLIAM CASH.

[Continued.]

24,740. Apparently there would have to be a number of different prices for the different qualities of coal?—Certainly—just as Parliament has to go into the question every time it fixes the standard.

24,741. Is it quite the same question? Apparently there is only one price for each gas concern?—Yes.

24,742. You would not suggest that there should be one price for each colliery concern?—Yes, a standard price for each concern.

24,743. Do you mean if we take a particular colliery? Take the Ashington Colliery in Northumberland, would there be one price or six prices?—One price for the Ashington Colliery.

24,744. Are you sure about that? because the kind of coal which the colliery produces varies from something which is only worth a few shillings to something that is worth a pound or two?—Just as in a gas company you may have a quantity of gas sold in large quantities and some in small, some for heating, some for lighting. I agree it is all one particular quality of gas and that the position is not quite parallel, but I do not see any difficulty in taking the various prices of the Ashington Colliery Company and fixing a standard price for that colliery.

24,745. That is to say, having arrived at the average, which we will consider is 15s. a ton, you would say that that particular colliery would be allowed to charge as a standard price 15s. for every ton that is sold—good, bad or indifferent?—Yes.

24,746. How would that be uniform in a particular coalfield?—The colliery next door might have gone to a far greater capital expenditure, for example, in sinking its shaft; it might be selling a different class of coal or the same class of coal; and what might be a fair standard price for one colliery might not be a fair price for the one next to it.

24,747. You suggest that each concern should have a standard price worked out upon its output on some sort of average?—Yes.

24,748. You lay great stress on the share of the consumer?—Yes.

24,749. Otherwise it might be a partnership against the community: but is it not really a difficult matter, because, in the case of gas, practically all the gas is delivered direct to the consumer for the consumer's use industrially or domestically; but in the case of coal, as to a large part of the coal the colliery owner does not know where it goes: it passes through half a dozen hands. Who in that case would get the consumer's share?—The colliery would be selling its coal either through agents or direct to somebody, and they would be getting a certain price which would be the realised price at that colliery.

24,750. My point is that when you come to make up the accounts at the end of the year, the consumer would get some of the benefit, if the colliery wished to declare a larger dividend, by a reduction for the ensuing year of the standard price?—The consumer of that particular coal, then, would get the advantage, and the tendency over the whole industry would be to reduce the price all round. They would be selling in competition, and each would be trying to reduce the price as far as he could, certainly to his own consumers.

24,751. The consumers who got their supply from that particular colliery which had reduced its price below the standard would get the benefit, whether

they themselves were actual consumers or whether they were only middlemen?—Supposing they were middlemen, they would be in a position to buy cheaper to pass on to the consumer.

24,752. They would be in a position to pass it on?—Yes.

24,753. They would receive something for the benefit of the consumer, and you say they would be in a position to pass it on by lower prices?—Yes.

24,754. Have you any assurance that they would pass it on?—I think if I go, for one of my gas companies, to buy 50,000 tons of coal, and they say to me, "I am preparing to supply you from so-and-so colliery; my price from that colliery is so much," he would pass it on to me, adding his middleman's profit.

24,755. Supposing you were going for 5 cwt. would you have the same assurance that you would get terms of an equivalent advantage?—I think so, because, although the colliery is not selling in terms of 5 cwt., not all the 5 cwt. would add up.

24,756. After all, the majority of the consumers of coal do not buy 50,000 tons. Carry your mind to the labourer's wife at Plumstead who buys from the hawker: could you indicate to the Commission what sort of certainty there would be that that consumer—I mean the labourer's wife at Plumstead—would get the advantage which the colliery owner handed over to one or other of these middlemen?—If you want to carry that right through to the logical conclusion, you would have to control the retailer and the distributor as well as the collieries themselves.

24,757. We should have to convince Parliament that this benefit was going to the consumer, meaning the labourer's wife at Plumstead? It is bound to go to the consumer, unless the middleman is not passing on the reduction in price which would undoubtedly be effected.

24,758. Do you suggest to the Commission that we may rely on the middleman passing on that reduction of price?—Personally, I should be rather in favour of some regulations with regard to the retail trade whereby the retailer should be bound to state how his price is made up.

24,759. *Chairman:* Need we consider the retail trader?—Not in detail.

24,760. *Mr. Sidney Webb:* I see your system of control would not be applicable to the distributor?—No.

24,761. With regard to the control of the price at the colliery, it involves, does it not, that the colliery owner would not be free to obtain his capital, as he now does, when he likes: he would have to obtain his capital distinctly, as the gas companies do, under the auction clauses or something like that?—I do not think that is essential to the scheme.

24,762. That is what I am very anxious to know. If the price is to be reduced in proportion to the dividends paid, it would probably suit the colliery owner not to pay a dividend: as one big colliery owner explained to us, the dividend declared was only 1 per cent. for many years, but the whole of a large part of the profit was put into development. Would you not have to stop that hole if you were going to consider the consumer?—I do not think so, any more than a gas company, who rather than distribute the whole of the dividend to which it was entitled, might put part of it to reserve.

(The Witness withdrew.)

(Adjourned to Tuesday next at half-past 10.)

3 June, 1919.]

MR. HAROLD COX.

[Continued.]

SECOND STAGE—TWENTY-THIRD DAY.

TUESDAY, 3RD JUNE, 1919.

PRESENT :

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. R. W. COOPER.

MR. ROBERT SMILLIE.

SIR ARTHUR DUCKHAM.

MR. HERBERT SMITH.

MR. FRANK HODGES.

MR. R. H. TAWNEY.

SIR LEO CHIOZZA MONEY.

MR. SIDNEY WEBB.

SIR ADAM NIMMO.

MR. EVAN WILLIAMS.

SIR ARTHUR LOWES DICKINSON, }
 SIR RICHARD A. S. REDMAYNE, } (*Assessors*).

MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

Chairman: Gentlemen, I am very sorry to say that our colleague, Mr. Balfour, will not be present to-day. I had a letter from him yesterday in which he said: "My horse fell with me on Saturday night. I got rather badly damaged about the head and face. I was quite hoping to come to the Commission to-morrow, but the doctor seeing me this morning,

after some persuasion, has promised I may come up on Wednesday at the earliest." I hope we shall have the pleasure of seeing him in his usual health to-morrow.

Mr. Harold Cox, who gave us the advantage of his views some weeks ago, desires to make a further statement upon something that Sir Leo Money said.

MR. HAROLD COX, Recalled.

Chairman: This is what Mr. Harold Cox desires to say: "On May 27th Sir Leo Chiozza Money stated before the Commission that I had misrepresented his views in a pamphlet on the coal question written by me." That pamphlet is a pamphlet called "The Coal Industry: The Dangers of Nationalisation." I have already received several copies of it from several sources. I have read one copy carefully and marked it. "He had previously written to me on the matter and I had given him my reply. But as he has publicly accused me in my absence of unfairness I ask leave briefly to state the facts. After giving evidence before this Commission I wrote a pamphlet mainly based on my evidence, which has been published by Messrs. Longmans, Green and Co." That is the pamphlet I have just spoken of. "In that pamphlet I quoted the actual words of the Report of the Public Retrenchment Committee, which Sir Leo and I both signed. It is true, as he states, that the Report was in the nature of a compromise. It contained many passages which I would rather have omitted, or have expressed otherwise. But I do not propose to repudiate my signature. The passage which I quoted was a simple statement of indisputable fact—namely, that 'of the numerous services managed by the Post Office hardly one shows any profit except the Letter Post.' This statement was prefaced in the Report with the words: 'We have, however, been impressed by the fact that.' These words I also quoted. Apparently therein lies my whole offence. Frankly, it did not occur to me that Sir Leo Chiozza Money would regard it as unfair of me to remind him that once in his life he had been impressed with facts inconsistent with his theories. For this unintended offence I willingly apologise." Sir Leo, do you desire to ask any questions?

Sir L. Chiozza Money: I should like to ask Mr. Cox whether he wishes us to understand that he repeats the terms of that letter.

24,763. *Chairman*: (*To the Witness*.) Do you repeat the terms of the letter which I have read?—Yes.

24,764. *Sir L. Chiozza Money*: (*To the Witness*.) The one which has just been read?—Yes, I adhere to that.

24,765. May I ask you whether it is the fact that not only myself but Mr. J. H. Thomas, Mr. Acland, and, I think, some other members of the Committee in question, namely, the Committee on Retrenchment, not only differed from the Report in many particulars but differed from it on some points fundamentally?—I should imagine in that case they would not have signed it.

24,766. Forgive me! Do you not remember that a special appeal was made to us by the Chairman, because it was time of war, to sign the Report, because there were so many things in it which we thought ought to be done by His Majesty's Government at once to secure retrenchment, and therefore to put aside even our strong objections, and to sign the Report? Is that not so?—Quite so. I signed it on those terms myself, and I do not propose to repudiate my signature. Apparently you propose to repudiate yours.

24,767. Forgive me! You are avoiding the point. Is it not further the fact that not only did we come to that amiable agreement, which was a wise agreement in view of the fact that we were at war, but we put in the report these words, so that each of us was protected from the suggestion that we had unanimously signed it: "We have decided, after discussion, to adopt the procedure of Select Committees, and not to publish any Minority Reports or individual reservations"?—Quite so.

24,768. Those words are in the Report?—Yes.

24,769. Do you not think therefore that it would be very unfair of anyone, in view of that published repudiation of unanimity, to represent that any one of us, either yourself or myself, or any other member of the Committee, signed that Report unanimously?—No, I do not. I think when a statement of fact is quoted above my signature I should adhere to that statement, and I expect other people to do the same.

3 June, 1919.]

MR. HAROLD COX.

[Continued.]

24,770. Really you do not do yourself justice if you contend that. I will read the words to you again?—I have them in my head.

24,771. Let me read them again—you do not seem to like them. “We have decided, after discussion, to adopt the procedure of Select Committees, and not to publish any Minority Reports or individual reservations.” Does not that prove that there were minority reports or individual reservations?—Yes.

24,772. Do you not know that your attack on education, for example, on that Committee, and which you repeated before this Commission was strongly repudiated by Mr. Aeland, Mr. J. H. Thomas and myself and other members of the Committee? Do you not know that?—Yes, I know all that.

24,773. Is it not very unfair to suggest that the Committee as a whole came to a unanimous conclusion?—No, I think not.

24,774. Although the Committee has said it was not unanimous, you think it is fair to represent that it was unanimous?—It was unanimous on the main issues.

24,775. I will put it again: Although the Committee not only privately but publicly said it was not unanimous, and that the Report was only signed because it was in time of war, and we wanted to get on with the war and do certain things, you think it fair to represent that that Committee was unanimous. Will you give me a plain answer to that?—Yes. The whole of the Committee signed a unanimous Report. It is unanimously signed and I cannot get beyond that.

24,776. Even although there is a reservation in it showing it was not unanimous?—I am subject to exactly the same reservation as you. There were lots of things in the Report I did not like.

24,777. I grant you were entitled to say that in the Report, but you do not say it. You say: “In 1916 the Committee on Public Retrenchment, of which Sir Leo Chiozza Money and Mr. J. H. Thomas were members, reported unanimously with regard to the Post Office as follows?”—Yes.

24,778. I suggest to you it was your duty as a fair-minded man to put in the fact that the Committee did not come to any unanimous recommendation on the point, and that they only signed it with a reservation showing it was not unanimous?—No, I do not think so. I disagree with you.

24,779. You do not think it would have been fair to tell your readers that?—I disagree with you. I think it is an accurate statement of fact.

24,780. I suggest to you that you yourself have admitted it is inaccurate?—I signed the Report knowing that there were things I did not like, but I am willing to stand by my signature.

24,781. You are entitled to speak for yourself. I asked you whether in reflecting upon another member of that Committee you are entitled to hide in the pamphlet which you have published the fact that the Committee itself stated that it was not unanimous?—Will you tell me what you object to in the statement I made?

24,782. The statement is inaccurate in the first place?—Which part of it?

24,783. You are trying to draw a red herring across the trail of the point at issue, which is whether you were entitled to say the Report was unanimous?—No. You have selected a particular passage in my pamphlet for criticism, and I want to know what the objection to that particular passage is.

24,784. The objection is that you said it was unanimous when it was not unanimous?—What is the objection to that particular passage which I quoted?

24,785. Excuse me! You come here to justify your letter. I suggest you are not justifying it, but sitting there in that seat and facing me, and within a yard of me you are unable to justify the suggestion that it was unanimous?—No; I adhere to it entirely.

24,786. Do you suggest it was unanimous?—The Report was unanimously signed.

24,787. Was there or was there not a reservation?—Many of us had reservations.

24,788. Was there or was there not a reservation?—We probably all had reservations.

24,789. Was there or was there not a reservation?—I have answered you several times. I am not going to answer you again on the same point.

24,790. You will not say whether there was or was not a reservation?—We all had reservations.

24,791. It was a published reservation in the report. Why wriggle with the question?—You have just read it.

24,792. You do not want to say yes, because you know the next question condemns you?—I can never anticipate your questions.

24,793. I suggest you have admitted you have done a thing which you ought not to have done?—I do not admit it in the least.

24,794. Having got you so far, I will take you on the point in fact. You say, “Hardly one shows any profit, except the Letter Post.” That was untrue. The Telephone Service showed a profit—a large commercial profit?—I said “hardly one.”

24,795. There were only three main services: the Post, the Telegraphs, and the Telephones?—No, there is the Parcel Post.

24,796. No, by “Post” I include Parcel Post. There are three great branches of the Post Office, the Postal Service?—No.

24,797. The Postal Service, the Telegraph Service, and the Telephone Service?—I will wait until you have finished.

24,798. It is your duty to wait until I have finished. If you like to divide the post into letter post and parcel post, that makes four?—But there are a lot of other things: There are money order distributions and so on.

24,799. Do you suggest that is run at a loss?—It was.

24,800. Do you know that it is now?—The Retrenchment Committee put up the prices.

24,801. We put them up for war purposes?—Because it was run at a loss.

24,802. I suggest to you with regard to the three main branches of the Post Office, Post, Telegraph and Telephone, two were run at a profit?—I divide the Post Office much more numerously.

24,803. If we take the Postal Service, it is not run at a profit?—No.

24,804. At the time you speak of, was it not run at a profit?—At the time, and the report says, “Except the Letter Post.”

24,805. Were not the Telephones run at a profit?—At a profit just covering cost.

24,806. They were run at 4 per cent. profit after allowing interest?—Just covering cost.

24,807. No; they had raised wages and pensions by £400,000 a year, and yet were showing a profit?—My recollection is that at the time they were just covering cost.

24,808. I suggest to you that the figures which have been submitted by the Post Office itself show that after raising pensions and wages to the National Telephone Company's staff by £400,000 a year they showed a profit?—I adhere to my statement. That was the statement of the Committee which we had signed—“hardly one shows a profit except the Letter Post.”

24,809. Are you aware that during the war they have not raised the telephone charges except for the trifles recommended by the Retrenchment Committee itself. Are you aware of that, and that in spite of that the accounts practically balance? They have not raised the charges. They are not receiving any more for the telephones?—Many subscribers are being charged more.

24,810. Are you aware the charges are so small and chiefly those recommended by our Committee, that they hardly affect the question of revenue?—What I

3 June, 1919.]

MR. HAROLD COX.

[Continued.]

say is, that the total Post Office is now run at a loss of three millions estimated.

24,811. You prefer to answer another question to that which I ask you. I asked about the telephones, and you talk about the Post Office. We are on the telephones?—Go ahead.

24,812. I suggest in spite of the fact that the telephone charges were hardly raised, yet the accounts practically square?—I have not looked into this year's estimate.

24,813. Can you name any commercial concern of which that is true, namely, that where the charges have not been raised the accounts almost square?—I do not see that that is relevant.

24,814. Does it not show the extraordinary economy of the Telephone Service, seeing that commercial concerns have raised their prices as a rule about 100 per cent., and the Telephone Department has not?—I have not checked your figures up to date, so that I cannot answer.

24,815. I suggest to you that your pamphlet requires a great deal of revision?—Will you suggest any other passages I could revise?

24,816. Yes; I suggested to you many passages in my former cross-examination. I am dealing with the Post Office. I will now ask you one other question. May I ask who publishes this pamphlet?—Messrs. Longmans, Green & Co.

24,817. Are you acquainted with the law relating to the reprinting of evidence given before Royal Commissions?—No, I do not know anything about the law.

24,818. You have a right to reprint evidence, but do you think it right to reprint evidence and put in interpolations not stated to be such in the pamphlet?—I stated exactly what the pamphlet is: "The following pages are based upon the evidence given by me before the Coal Commission, with further material added and necessary corrections."

24,819. Do you not think you ought to show to your readers what is the further matter which is added?—Why? I say it is "based upon the evidence."

24,820. Why do you use the name of a Commissioner and suggest he said something which he did not say?—Where is that?

24,821. The passage which we have been talking about, in which you mention my name and suggest the report was signed unanimously when it was not unanimous?—It was signed unanimously.

24,822. No, it was signed with a reservation which showed that the signatures were only put there because it was time of war?—I have not been in the habit of signing my name with a mental reservation. I do not understand people who do that.

24,823. But you have said that in that chair, that you signed it with a mental reservation?—Yes, but I adhere to my signature. When I sign anything I hold myself bound.

24,824. That is not the same statement which you just made. I suggest to you that you know very well, after discussion of this very point we are discussing now, that we agreed that, as it was time of war, and only for that reason, we should put our signatures to the report, although we did not all of us agree to it, in order to get on with the war. Is that not a fair and proper and true statement of what occurred?—You have already said that, and I have made my answer.

24,825. And you have to agree that what I say is true?—No.

Chairman: (To the Witness.) Is there anything else you want to say?

Witness: Sir Leo has challenged me about other alterations. I should like to point out that I have altered this pamphlet in one or two respects, and especially in regard to the Fabian Society's pamphlet.

When I gave my evidence I was under the impression that that pamphlet was issued in 1916, and I criticised it on that basis, and Mr. Sidney Webb cross-examined me on that assumption, frequently quoting the year 1916. Subsequently, on going to a Socialist bookshop, this pamphlet was pushed into my hands as a thing just out. I have now ascertained that it was re-issued in 1919 and the statements it contains—

Mr. Sidney Webb: But it is not true.

Witness: The pamphlet was re-issued in 1919.

24,826. *Mr. R. W. Cooper:* Is that the fact?—Yes, that is the fact. The statements it contains are absolutely inconsistent with the reports to which Mr. Sidney Webb has put his name, and therefore I altered my pamphlet, making it appear clearly that I thought his conduct in the matter was not strictly honest.

Sir L. Chiozza Money: With regard to the evidence given before this Commission, may I appeal to you, sir, as to whether it is competent for a member of the public, Mr. Harold Cox or anyone else, to print the evidence given before this Commission, save in the form in which it was given before this Commission *verbatim*, word for word? Of course, he is entitled in an addendum, or even in footnotes, to say this, that or the other by way of additions, but I suggest the evidence given before this Commission, if it is reprinted and purports to be that evidence, ought to be printed as it was given here, and that it is not fair to introduce statements attributed to members of the Commission themselves.

Chairman: I think you are right. I have no doubt it is most important that the evidence, if it is printed at all, should be accurately printed. I am sure no one desires to print inaccurate evidence.

Mr. R. H. Tawney: Is Mr. Harold Cox giving evidence over again? I should like to know. He has made a highly controversial statement just now under the guise of a personal explanation. Is he giving a personal explanation or fresh evidence?

Chairman: He is not going to do either.

Mr. R. H. Tawney: We are very much obliged for that.

Chairman: (To the Witness.) We are very much obliged. I think you and Sir Leo have settled your difficulties.

Sir L. Chiozza Money: Yes, very satisfactorily.

Mr. Sidney Webb: As a matter of fact that particular pamphlet which was referred to was not written by me but issued under my editorship. It is not under my control. So far as I am aware, it has not been re-issued in a new edition, but I assume what has happened is that copies sufficient to supply the demand have gone on being printed from the plates. I think Mr. Harold Cox knows sufficient of the printing trade to understand that that is not a re-issue. As a matter of fact, so far as I know, there is nothing in that pamphlet inconsistent with any report that I have signed, except only of course all the figures given are necessarily out of date and they must be out of date, but it remains, so far as I know, consistent with anything I have signed. At any rate, I am the guardian of my own honour.

Chairman: It is quite safe in your hands.

Witness: May I just point out—

Chairman: No. I think we must finish now. It is just as well to be accurate even on questions which are, in my opinion, entirely irrelevant and immaterial to any question which this Commission has to decide.

Witness: With regard to your ruling about the evidence, may I say this? Sir Leo implied that I was presenting this as a reprint of my evidence. It is not so.

Chairman: Thank you very much.

(The Witness withdrew.)

3 June, 1919.]

MR. GEORGE ROSE.

[Continued.]

Mr. GEORGE ROSE, Sworn and Examined.

24,827. *Chairman*: I believe you are the Chairman of the National Council of Coal Traders and the Railborne Coal Factors and Wholesale Merchants' Association?—Yes.

24,828. I think you speak as to the distribution part of our enquiry?—Yes.

24,829. Will you now be good enough to read your *résumé*?—Yes.

“ NATIONALISATION OF COAL MINES.

Nationalisation or Government control of any kind destroys individual effort and initiative, creates a feeling of irresponsibility, and tends to the dilatory conduct of affairs, no one being willing to accept the responsibility for a prompt and definite decision so imperative to the efficient working of such an important industry, or, in fact, any industry.

Government or bureaucratic control means that influence or seniority and not ability are too often the reasons for appointment or the basis of promotion; consequently the incentive to the capable man is lacking, and the average official develops into a machine with a running capacity of so many revolutions per day; a desire to postpone or shelve any unpleasant matter which may arise requiring a prompt decision or effective handling, and an enormous appetite for returns and statements of little, if any, practical value.

In the course of two years the Controller of Coal Mines has issued nearly 100 instructions, orders and forms, and many more would have been issued but for the fact that the late Sir Guy Calthrop, Bart., agreed to consult the National Council of Coal Traders before issuing further forms or orders, many of those issued having proved impracticable or impossible, others having to be materially altered. The cost incurred and the labour involved has been out of proportion to the results obtained, and while possibly necessary during a period of war are undesirable and unnecessary under normal conditions.

Government departmental procedure is too cumbersome for the conduct of a commercial enterprise. In a case of interest to the coal trade, in which three Government departments considered their interests involved, it took four months and about 20 committee meetings (involving one to two days' loss to 15 or 20 men at each meeting) to settle a matter which two business men would have agreed upon in half-an-hour.

This has been a general experience. I cite only one instance.

It is submitted that the duplication of work, the mass of returns and Statements required, and the great delays which occur in settling the basis of procedure on comparatively simple matters have proved a great cost to the community.

It is agreed that the control of coal prices served a useful purpose in preventing any attempt to profiteer on the part of a small minority and in calming public opinion during the period of war (when anyone who sold anything was accused of being a profiteer); but the same is not necessary or desirable in peace times, when competition and the natural desire to develop business will again bring about the most efficient and economical working of the entire industry more quickly than any system of Government supervision, which, in my opinion, tends to hamper the individual effort. At the same time I agree that until such time as the supply is equal to the demand some moderate system of control in respect of prices and profits should be continued.

I contend that the most powerful incentive to 99 per cent. of the human race is the possibility and desire to improve their condition, make money and to progress. Healthy competition provides a most efficient check and at the same time stimulates effort to the benefit of all.

No trade has in the past worked under more severely competitive conditions, and I know of no trade which

shows so small a return on the outlay, as the coal distributing trade.

The factor or wholesale merchant incurs, on an average, an outlay of over 30s. (with the natural consequent risks) to earn a net 4d., or about 1 per cent.

It is estimated that the distributive services rendered by factors, including their profit (if charged at the maximum rate), results in a charge of about 2d. per ton on the whole of the household coal consumed in Great Britain. The maximum rates are not charged in all cases.

The cost of the Government Department in supervising this distribution is estimated to be three times the amount above named, notwithstanding the fact that most of the high officers and many of the staff have given their services free of cost to the control.

- (a) The Controller, most of the Heads of Departments and many of the staff at Holborn Viaduct;
- (b) The District Coal and Coke Supplies Committees in each of the producing areas;
- (c) The Local Fuel Committees in each Town, Urban, or Rural Council;
- (d) The Supervisors and Overseers in each locality;

are, I believe, unpaid.”

I desire to make a small amendment in relation to (d). Supervisors and overseers are, I understand, allowed in one case out of pocket expenses, and in the other case the Borough Overseers, who are generally the engineers, or some officer of the Borough Council, have, I believe, a small honorarium.

“ If these Committees and Officials were permanent, and paid a reasonable remuneration, the expenses would, of course, be enormously increased, and I submit no Official Department (lacking the incentive the trader has) could do anything else but considerably increase the cost to the consumer. Someone must pay the cost, and generally the “someone” is the consumer.

A prominent part of the factors' or wholesale merchants' business is the supplying of industrial concerns throughout the country with their requirements of steam coal and slack, and the supplying of gas, electricity and other public utility works. This has been done efficiently and at a very low cost as a natural result of the keen competition for this class of trade, and the expert knowledge of the factor has at all times been placed at the disposal of the consumer.

No method of Government control or centralised distribution could possibly be more economical, and to suggest that the consumer has not obtained in pre-war days the coal most suitable to his requirements at the lowest possible cost is only casting a slur upon his intelligence.

For the last two years it is admitted that the consumer has suffered severely by being compelled to use coal of an unsuitable character, frequently at increased prices.

It is agreed that while the demand from foreign markets is excessive, and export prices are much higher than those for the home markets, some system of restricting exports and retaining in this country sufficient coal to meet all requirements is perhaps necessary. This should be quite a simple matter. But as soon as the output of coal is equal to the demand, if freedom of distribution and the right to bargain take the place of the existing or any other control, the competition which will follow will bring about a speedy return to conditions under which the consumer will be able to secure his supplies at a minimum distributing cost.

The securing of a slightly lower price by State control is considered by some to be possible. If the cost of the control is taken into consideration this will prove to be fallacious.

3 June, 1919.]

MR. GEORGE ROSE.

[Continued.]

Others claim centralisation to be the solution. I contend that any apparent small saving effected by means of centralisation or amalgamation (both of which methods tend to the creation of monopolies or trusts) will be more than lost by the lack of competition, and the consumer will consequently suffer.

It is fair to assume that the consumer of coal—more especially the user of large tonnages—obtained in pre-war days the class of fuel most suitable and economical for his purpose.

The working of the Transport Order, 1917, caused great confusion and dislocation, and even admitting that some saving in train mileage may have resulted from its operations, it is claimed that the loss to the manufacturer and consumer much outweighed the saving in transport. Manufacturers, gas companies, &c., &c., are anxiously awaiting for, and will welcome the time when they can again secure the fuel which they have by experience found best for their uses.

DISTRIBUTION.

The operations of a factor cheapen the cost to the consumer.

There are, it is estimated, 27,000 to 28,000 retail distributors of coal in the United Kingdom. Of these less than 2,000 have railway tolls accounts, and some 25,000 are, therefore, not able to buy their requirements direct from the colliery companies.

If these traders were compelled to attend markets to buy their small requirements, the waste of time and energy would be enormous. Approximately, 25,000 retailers are mainly dependent on factors for their supplies, and as these men often work personally in a business they have built up, and have very small over-head charges, they profit by paying the small additional cost due to factors' charges, and make a reasonable living even in competition with the large retail traders.

It should be understood that in country districts many of the coal merchants are, primarily, millers, corn and cake merchants, or farmers, and that they utilise men and horses in their spare time to deliver coal. Their coal trade forms a subsidiary business which is worked at a minimum cost to the consumer. The factor is responsible for practically all supplies of coal to this class of retail distributor, and in the past has kept the trader regularly supplied with suitable qualities for his small but varied trade.

The factor, with 100 to 200 qualities of coal on his sales list and a representative covering each area, by selling all the requirements of the traders in that area at one cost of travelling, &c., must save both colliery companies and retail traders a very large sum, otherwise the system must have died a natural death long since, whereas the fact is that this method of distributing coal up to 1914 was certainly on the increase.

The collieries (both small and large and certainly the most progressive and best-paying) have found that by placing a large percentage of their output in the hands of factors for distribution they have saved trouble and expense, and they are to-day in favour of a continuance of the present system.

In slack seasons the smaller traders are frequently financed by the factors until the winter season's consumption permits them to be fully employed and to recoup their summer losses. This is not a procedure which would appeal to the colliery proprietors or to a Government Department.

The method of distributing coal through the medium of a factor has been in existence for over 50 years, and for more than 20 years has developed on sound, progressive and competitive lines.

In practice, a factor or wholesale merchant purchases from the producer (the colliery company) a large tonnage of the various qualities raised by the company from one or more of its pits over a period of 6, 12, 18, or 24 months, ensuring thereby to a great extent the continuity of working without regard to the prevailing state of the markets.

The factor has been of material assistance to collieries in providing rolling stock for the conveyance of a large proportion of the output.

The existence of the factor has frequently prevented a colliery from the necessity of dumping large stocks, or incurring, as alternatives, the cost of placing coal on the pit banks or stopping the pit.

The elimination of the middle man is frequently urged, but is impracticable. In all large industries he has proved his use by long practice—meat, corn, produce of all kinds, clothing and coal.

The coal factor performs as necessary a function as—

The wholesale co-operative societies;

The wholesale miller;

The meat salesman;

The potato merchant;

or any other wholesale distributors.

The wholesale co-operative societies have, since they entered the coal trade, adopted our methods, and buy and distribute to the retail societies upon practically the same margin as the ordinary coal factors, and presumably find this to be the best and most economical method. They run no risk of bad debts (supplying only their own retail societies); give no extended credit or financial help; run no risk of market fluctuations, and therefore should show a favourable comparison. In actual practice, however, their figures do not show any substantial difference from those of the coal factor, although no contribution is made by them to the revenue by means of income tax, &c.)

24,830. *Mr. Sidney Webb: (To the Witness.)* I think you lay great stress, do you not, upon the expense of the Government control at present?—At present, yes.

24,831. Is that not rather in the nature of control of private enterprise? You have two sets of officers?—That is true.

24,832. Of course, you would not suggest if your business, for instance, were taken over by the State that the State would require officers to look after your business?—I think as a matter of actual practice that is generally the procedure which the State adopts.

24,833. You suggest, first of all, that the control of private enterprise by the State is expensive, and if the State superseded that control by doing the business, it would be equally expensive?—I should think it would be much more expensive.

23,834. Is the control worth the money? Do you suggest we should do better without the control?—I have never suggested that the control should be done away with altogether. I believe that there is a good deal of use in the control of prices and profits, and I think that some control should still be exercised over the export trade, at any rate while prices for export are so much above the present prices for home consumption.

24,835. You say some control should continue to be exercised over the export trade. I was thinking more particularly of the home trade. Do you suggest we could do away with the control over the home trade?—I suggest in relation to that that half a dozen competent men could keep a watchful eye upon prices and profits, and that that would be a benefit not only to the trade but to the general public.

24,836. But if they kept a watchful eye, do you mean to say that they should be able to control prices?—Yes.

24,837. It would not be merely a watchful eye, but genuine control?—They should have power to control prices until such time as there is a sufficiency of coal.

24,838. You point out that the factor is extremely useful in distribution, but chiefly, is it not, because there are so many retail distributors? You point out that these 25,000 retail distributors are dependent upon the factors. Does that not rather mean that the factor is necessary because there are so many small retail distributors?—Yes, in a way, but not entirely. I agree that is so to an extent.

24,839. If it were possible to diminish the number of retail distributors, the factor would become less necessary, would he not?—Yes, but at the same time I think it would be infinitely worse for the consumer,

3 June, 1919.]

MR. GEORGE ROSE.

[Continued.]

because the competition of these retail distributors is the one thing which keeps the price down to the general public.

24,840. There is another thing, is there not, and that is the co-operative society which also keeps the price down?—I have never known the co-operative society sell under the price of the ordinary merchant.

24,841. I am glad to have that testimony. They do not undercut?—They claim to charge the same prices as the ordinary dealer.

24,842. They do?—Yes.

24,843. And you point out that they actually proceed on the same basis and the same margin as the ordinary factor in their wholesale work?—Yes, practically.

24,844. But you know, do you not, that we have had it in evidence that they are able to give back to the purchaser something varying between 2s. and 5s. per ton in the price of coal?—I know it has been given in evidence, and I have gone to great pains to try and get that evidence supported, but it is not supported from their own balance sheets.

24,845. But surely it is supported from their balance sheets to the effect that they actually do pay it on the total purchases of the customer but not on coal.

24,846. But they do actually pay it on coal?—May I substantiate my statement by putting in a few figures?

24,847. If you please?—I did not intend to put in these figures at all, but the average distribution of the co-operative societies in the Metropolitan area is 11d. in the pound.

24,848. Do you mean the cost of distribution?—No, the average return.

24,849. The dividend?—Yes, dividend. It is 11d. in the pound.

24,850. How much would that be on a ton of coal?—Approximately 2s. Their average profits on drapery, boots and clothing—all uncontrolled—are in the neighbourhood of 15 per cent. or slightly over.

24,851. *Mr. R. H. Tawney*: Is that dividend again?—No, that is their net profit; they do not distribute their dividends separately.

24,852. *Mr. Sidney Webb*: Would you give us the net profit on food which is much the most important part of their sales?—They show a loss on their bread, some of them.

24,853. That is a loss?—Yes. I am going to try and draw a comparison. On coal, which is the only thing I am here to talk about, their net profit is under 4½ per cent., so that I think I am right in saying that the distribution or dividend of the co-operative societies is not made out of coal.

24,854. You pointed out that the average dividend is 11d. in the pound?—Yes.

24,855. That is under 5 per cent?—Yes.

24,856. And you state that the profit that they make on coal is over 4 per cent?—Yes.

24,857. I am not accepting those figures as accurate, but at any rate the difference is not very great?—The difference is very great when you take into consideration the fact that on their three largest departments, drapery, boots and clothing, they are making over 15 per cent.

24,858. Do you suggest that those are the three largest departments?—They are the three largest departments shown in the co-operative figures I have here.

24,859. Surely food is much larger than those?—No, not in money turnover, which I am speaking of.

24,860. Not to go into unnecessary details, do you tell the Commission that your researches have demonstrated that in London the co-operative societies are making a profit on their coal business of 4½ per cent.?—That is an approximate figure which is quite near enough for discussion.

24,861. That of course represents, does it not, practically 2s. a ton?—There or thereabouts.

24,862. Therefore apparently the co-operative societies, on your own figures which I am accepting for the moment, are able to do their distributor's

business, so far as the consumer is concerned, at 2s. per ton cheaper than the London retail trade?—Yes, but I should like to modify that statement to some extent, if I may, because I find some of the London co-operative societies actually lose money on the distribution of coal, although they sell at the same price as the ordinary merchant. Edmonton is a case in point where they lose 6d. a ton on the whole of the year's turnover.

24,863. If we take an average of all the societies, we cannot then go back to individual societies. It must follow some have made more?—Yes, it must follow some have made more.

24,864. Taking it altogether, your evidence, without taking it too far, is that the co-operative system of distribution in respect of the work which they actually do—which is not all London and not all kinds of coal—represents, so far as we can get it, a saving of something like 2s. a ton?—It means that the co-operative societies are making 4 per cent. on their coal and the trader is making somewhere about the same.

24,865. Not quite somewhere about the same?—It is not excessive at any rate.

24,866. Supposing we could improve on the co-operative societies and get a unified distribution by using the factors and the present people in the trade, do you see any chance of reducing the price of distribution?—Candidly I do not see a chance of reducing the cost of distribution, except by one of two means: one is the elimination of the present small profit of traders handling the coal; and the other is by cutting down the wages and salaries paid to the men who do the work, and that I do not agree with.

24,867. Is there not another possible source that has been given in evidence? The cost of establishment charges, apart from labour and profit, is something like ¾d. per ton on the entire London tonnage?—You are discussing the retail side of the trade. I am not particularly conversant with it.

24,868. *Mr. Evan Williams*: You said to Mr. Webb something with regard to who should be eliminated from the trade at present to effect a reduction in cost?—I do not consider anybody could be eliminated. I consider the present cost of transport, which has grown up and in which there has been the keenest competition for years, has brought about the low cost of distribution that obtains to-day.

24,869. Are you speaking of the distribution of the coal from the colliery to the merchants?—To the smaller retail merchants.

24,870. You do not consider that under any other form of control a less staff or less material or less capital would be employed than at present?—My opinion is if we eliminated the present keen competition that exists and put it into the hands of one body or group of committees the overlapping of work would increase the cost and not reduce it.

24,871. You say there would be more people employed under centralised control than at present?—Yes, I think so.

24,872. We have had it said the experience of the Ministry of Munitions and other Departments during the war is very encouraging in the direction of instituting a State control after the war in other directions?—The case I mention here is a case where the Ministry of Munitions was one body interested with the Railway Executive and the Coal Controller, and it took them four months to do a thing that you and I or any business man would settle in one afternoon. That does not tend to economy in work. Of course, we shall have the other Government Departments working in opposition if they consider their interests are involved.

24,873. Do you do business in anthracite coal?—No, very little. As Chairman of the Committee I had a good deal of trouble with the District Committee in South Wales after the introduction of the Transport Order.

24,874. Are you aware for a time the anthracite collieries were losing time and were working three or four days a week and the Coal Controller refused to release anthracite coal from the Rationing Order?—That is so.

3 June, 1919.]

MR. GEORGE ROSE.

[Continued.]

- 24,875. In spite of great pressure from the colliery owners and everybody concerned?—I believe eventually, owing to the pressure put upon him, he did release it.
- 24,876. He released it from small areas in the anthracite district?—Yes, it took a long time to bring it about.
- 24,877. You say the securing of a slightly lower price by State control is considered to be possible. I think if there is any lower price to be got from the consumer it will have to be paid by the taxpayer?—I do not consider it is possible to do it. I know it is considered by some people that State control will reduce it. I certainly do not consider that.
- 24,878. If you say there is no unnecessary expense at present, the lower price must be paid by the taxpayer?—Undoubtedly. I point out to you that the firms in the trade for the last 20 years have been trying by every means in their power to reduce the cost of distributing the coal, for the simple reason that if I can show an additional halfpenny saving in my cost I am making many hundreds a year extra profit, and that is what we were all struggling for up to the time when this control was put upon us.
- 24,879. What was the gross addition to the colliery price the middleman was estimated to work upon before the war?—Taking the whole business on an average?
- 24,880. Yes?—It varied according to the class of business. If I gave an average figure, I should say 10d. to 1s. 1d.
- 24,881. That is the total addition from the colliery price to the price at which the factor sold to the retail merchant?—Yes, that includes all his expenses in travelling about the country and all his office expenses, overhead charges, and everything else. The actual cost of that distribution was in the nature of 5½d. a ton average. The net profit was in the neighbourhood of 5d.
- 24,882. That is a clear profit?—A clear profit of 5d. per ton.
- 24,883. In comparison with the Co-operative Society the factor paid income tax?—Yes.
- 24,884. The Co-operative Society pays none?—The Co-operative Society pays no income tax. Their figures are very much the same as our own if you take the London area, but are lower in the North and at Manchester. The amount charged by the Co-operative Societies in the years 1916, 1917 and 1918 were rather in excess of the 11d. I have already mentioned.
- 24,885. I do not know if it has ever been done, but have you any idea of the difference it would make to the return which the Co-operative Societies make to their members if they paid income tax?—Upon the present basis if we make 4d. a ton net, our 4d. is 2¼d. The Co-operative 4d. is 4d.
- 24,886. There would be a very material difference to the return to the consumers?—If we paid no income tax we could afford to reduce our selling price by 1½d. a ton.
- 24,887. *Chairman*: There are two or three questions I desire to ask you. With regard to the figure you have got on the second page under distribution, you have estimated there are 27,000 or 28,000 distributors of coal in the United Kingdom. How do you form the estimate; are there any tables?—The estimate was arrived at by figures prepared by the Coal Merchants' Associations in the various areas of the country where it was thought advisable to get in touch with all the retail distributors. It includes quite small traders.
- 24,888. Does that include every retail distributor who takes part from the time it is delivered at the railway siding; that is, after the railway has done its part, down to the man who goes round the streets of London selling 1 cwt. at a time?—It would not include the dealers, as we term them. Dealers are men who go round the streets with cwt. on a trolley.
- 24,889. How many of these are there?—There must be a good many of them.
- 24,890. That is not an answer to my question. Is it 10, 20 or 10,000 or 20,000?—It would be many; I would not commit myself to a figure there.
- 24,891. Would it be as many as 27,000?—No; I should not think it would be more than 5,000 or 6,000. I should not like to commit myself.
- 24,892. I do not want you to commit yourself. I want to know the people who handle the coal?—I think 5,000 or 6,000 would be a reasonable estimate.
- 24,893. Tell me, if you can, the hands through which, say, 1 cwt. of coal passes before it is delivered to the consumer in some small street in Stepney. I suppose you know Stepney?—I do.
- 24,894. You have often seen the carts going about with a bell and people coming out of their houses and buying quite a small quantity. Will you put yourself into the position of a man, say, in Oxford Street, Stepney, or one of those streets there buying 1 cwt., and he gets 1 cwt. delivered into his cellar from the cart. How many hands has that 1 cwt. gone through from the time it has left the railway siding?—By the number of hands it has passed through do I understand the number of profits or the number of people who have made a profit out of it?
- 24,895. The number of people who have made a profit out of it?—In the great majority of cases, only two.
- 24,896. Who are they?—The factor and the small merchant at the station. Of course, he has to pay his men for the delivery of the coal a certain fixed wage; but, as a rule, the coal comes from the colliery—
- 24,897. Just indicate the process?—As a rule the coal comes from the colliery to the factor; then to George Rayner, a small merchant at Bethnal Green Station, who probably goes out with his trolley himself and probably has two boys working another two. Those are the only profits on that transaction. Another class of procedure is where it goes from the colliery to the larger merchant at that depot; that larger merchant will sell to a small dealer who has no accommodation on the railway; he loads it into the dealer's van and the dealer's van goes round the streets.
- 24,898. That makes three profits?—It only makes two; from the colliery to the merchant and from the merchant on to the dealer's trolley; then from the dealer's trolley into the cellar.
- 24,899. Why is there no factor in that case?—Most of the larger merchants obtain their supplies direct from the collieries. Of course, there is a percentage where there is another change of hands. A certain percentage would come from the factor to the merchant and from the merchant to the dealer, so we get three changes.
- 24,900. I understand you as a distributor say there is no saving to be made on the distribution end?—I have been trying for the last 20 years to effect economies in the working of my business, and I believe a good many other people have been trying to do the same.
- 24,901. Everybody seems to think the economy can be effected on somebody else's part.
- Mr. R. A. Tawney*: Would you mind asking him how many factors there are?
- 24,902. *Chairman*: How many factors are there?—It is very difficult to say how many factors there are, because 90 per cent. of the factors have also retail businesses. I do not suppose there are more than 200 factors in the country who are factors pure and simple.
- 24,903. *Mr. R. H. Tawney*: How do you reconcile the statement that factors have also retail businesses with the other statement that factors are necessary in order to distribute coal to the retail merchants?—They are necessary to the small retail merchants.
- 24,904. Is it only the factor that acts as the intermediary?—No; there are considerably over 1,000 members of my Association all doing factoring business; but, in addition to being factors, they are retail distributors.
- 24,905. Can you give us the total number of factors of whatever kind?—In round figures, 1,500.
- 24,906. Do those include both the factors pure and simple and merchants?—They include factors who have merchanting businesses or merchants who have factors' businesses. They include also factors who have a shipping business and factors who do a large bunker trade at the various ports.

3 June, 1919.]

MR. GEORGE ROSE.

[Continued.]

24,907. What is the relation of these 1,500 factors to the retail distribution of coal. The reason I ask you this is that I understand from your *précis* one of the functions of the factor is to keep the retail distributor supplied?—Yes.

24,908. I understand from what you say now that a large proportion of these factors are themselves retail distributors?—That is quite right.

24,909. If the factor is himself a retail distributor how can it be one of his principal functions to keep the retail distributor going?—You see there are factors who are merchants and there are factors who are not merchants. The factors who are merchants buy largely on their own account for their own depots. They also buy a considerable tonnage which is free for distribution to other smaller traders. Take a case in point. A firm having five or six depots of its own will buy considerably more coal than is required for those few depots, and by means of travellers covering a considerable area of the country, they will sell the balance at a reasonable profit to the smaller dealers in neighbouring towns or down the line.

24,910. There seems to be two systems, in fact I think there are more. There is one system under which the colliery supplies the factor, and the factor is himself a distributor who distributes it to the consumer?—In many cases.

24,911. That is the normal case, I gather?—That is quite a normal case.

24,912. Then there is the case of a factor buying from the colliery who does not distribute to the consumer but to a merchant who distributes it to the consumer?—Yes, or dealer.

24,913. In one case you have a link more in the chain than in the other?—Yes.

24,914. What is the reason for that?—It is a basis upon which the business has grown up for many years and it has proved on the whole very satisfactory. Take a man who wants 50 tons a week. It does not pay him to go to five collieries and buy a truck of coal from five different collieries. For the purpose of carrying on his business he wants one truck of Steam, one truck of Brights, one truck of something else and one truck of Nuts.

24,915. Under the one system of conducting the business you seem to get rid of the retailer; you provide the consumer yourself?—The wholesale man and the retail man combined.

24,916. When you do that is it quite reasonable to come to us and express great solicitude for the small distributor and say you are necessary because you keep the small distributor in existence?—I believe in the competition of the small distributor.

24,917. You tell us in a great many cases you do not deal with him?—I believe in the competition of the small distributor who has nothing like the expense of the large distributor who works a little business of his own and works it well at the lowest possible cost. It is the small distributor rather than the large distributor who has kept the low price of coal ruling in this country.

24,918. Would it be possible to apply universally the system you apply to a large part of your trade; that is to say, have only one link in the chain instead of two?—It might be possible, but I do not think it would be desirable.

24,919. *Chairman*: Tell me something about how the poor people in London will get their coal next winter. Do you say the present system is the best in the world and cannot be improved?—There is only one way the people in the country will get their coal—

24,920. Never mind about the country. I want to know about the poor people in London who went without coal last winter, and who shivered last winter?—The present methods of distribution are sufficient to handle the whole of the coal which the controller, or the miners, or the mine owners can let us have.

24,921. At what price?—I do not think there has been any question with regard to increased price unless it starts at the pit head.

24,922. Give me a sort of idea of what is going to happen. There are millions of people interested in this question. If you will forgive my saying so, and quite rightly from your point of view, you are giving us good evidence, but you are a practical man, and you can give us some idea of what is going to happen next winter?—If the output of coal increases as it is hoped by 10 per cent. or 12 per cent., I do not think there should be any difficulty in letting every person in the east end of London or the south end of London, or in any other poor district of London, have all the coal they want.

24,923. They want to know about the question of price?—The price is fixed to-day, and as far as I am aware there is no suggestion that that price should be advanced. I have heard no suggestion put forward from the trade side as to an increased price being paid for coal. We are working practically on the same margin of profit (both sides of the distributing, from the wholesale and retail) as in pre-war times. I do not think there is any desire or attempt on the part of the merchants or distributors to make any more profit.

24,924. Do you think the distribution could be better effected if the districts were in one sort of central hand?—I do not.

24,925. Why not?—I am not in favour of centralisation. It does away with competition which is the best basis of business that I know of, and it leads to looseness and lack of control.

24,926. What does "looseness" mean?—You do not get the same personal supervision in the conduct of a great combination of business.

24,927. We want to get coal. We do not care about personal supervision?—Is not personal supervision a matter of great importance?

24,928. I dare say it is, but I want coal?—I am sure we all do.

24,929. Did any London borough distribute coal last year?—I believe certain London boroughs held small reserves of coal.

24,930. You surely know?—I do not know. The retail part of the business is not a thing I am prepared to discuss in very great detail. You are coming to the retail distribution of coal, and I understand you will be having evidence on that point from the retailers.

24,931. How long have you been in the trade?—Some 32 years.

24,932. Do not you know anything about the retail part of it?—Yes; I am not sufficiently acquainted with the detailed actions that exist in certain boroughs to discuss this.

24,933. The public want to know how much coal they are going to get and what price it will be. Can you help us?—The figures which have evidently been put recently before the Controller seem to convey to my mind the reduction in hours will suggest a reduction in the output of coal.

24,934. What does it convey to your mind?—It conveys to my mind, if the output is reduced there must be reduced consumption. That is why I suggest the control should still remain operative with regard to the export coal.

24,935. You think the control of coal is an excellent thing?—In certain respects, in relation to the profit, price and export trade, the control is necessary to-day.

24,936. With regard to the price, profit and export trade, you think there ought to be control?—Yes.

24,937. Altogether, or only for a period?—When the demand is met by an increased output, the necessity would automatically cease.

24,938. With regard to the inland trade, is there any difference between the inland trade and the export trade as far as control is concerned?—In relation to prices?

24,939. In relation to the three things you mentioned?—In relation to price and profits, the control has been in operation since 1917.

24,940. You think it ought to continue?—For the time being, I think so.

3 June, 1919.]

MR. GEORGE ROSE.

[Continued.]

24,941. What does "for the time being" mean? Suppose you had to advise, would you advise control being continued for three years?—No, I should not.

24,942. What period?—I should advise it being continued over next winter, because there is one fear in the minds of many of us that the output will fall in July of this year, and if the output falls, you cannot avoid a certain minority of traders from trying to take advantage of the reduction of supplies and putting prices higher. I am very anxious that prices should not be put higher and it is for that reason I suggest the control of prices should continue for the ensuing winter.

24,943. *Sir Adam Nimmo*: There is one question I should like to ask about the storage of coal. Do you know it has been suggested that large quantities of coal might be stored in convenient centres in order to provide continuity of employment at the collieries? Do you consider that a feasible question?—I do not consider it feasible, and it must add enormously to the cost of handling the coal, because storing is a most expensive procedure.

24,944. What is your experience of the cost of laying down and lifting coal?—Do you mean in increased cost?

24,945. Yes, in increased cost?—I should consider it varies according to the quality and condition of the coal, that is to say, whether hard or soft coal, and it would vary from 3s. 3d. to 5s. 6d. or 6s. to 5s. 6d., certainly.

24,946. Would there not be a very considerable loss in the breakage of the coal by storage?—The storage of house coal, which is soft coal, would involve a loss of 15 per cent. to 18 per cent. in slack alone. If soft coals are put on the ground and left for a period of six months the weathering of the coal and the breakage in handling it represents some 17 per cent.

24,947. You do not consider the storage of coal in such quantities as is suggested would be a practical success at all?—In large quantities, no.

Chairman: We are much obliged to you for the evidence you have given.

(*The Witness withdrew.*)

MR. EDWARD SAMUEL WILLIAMS, Sworn and Examined.

Chairman: This witness and the next witness speak on behalf of the colliery managers. It is in the recollection of the Commission and the Press that we had one witness, Mr. Gibson from Scotland, last week. Now we are calling a similar witness from Wales and Mr. Muschamp from England. May I remind the gentlemen of the Commission we have a very great body of evidence still to call, and, although no doubt we shall read with great attention, and consider most carefully, the view that these witnesses are going to place before us, I doubt if there are many witnesses to whom you will desire to put questions. This is the *précis* of Mr. Edward Samuel Williams:—

"Draft *précis* of the evidence of E. S. Williams, of Hendrederwen, Abertridwr, Glamorgan, who states that he is general manager of the Windsor Collieries, Abertridwr, President of the National Association of Colliery Managers 1918-19, has had 39 years' experience of coal mining and was selected by the National Association of Colliery Managers to give evidence on its behalf.

The N.A.C.M. has about 1,600 members and branches in every coalfield.

It has been the recognised channel for presenting the corporate views of colliery managers for over 30 years before the following:—

Home Office.

H.M. Inspectors of Mines.

Mining Association or the Local Coal Owners' Association.

Royal Commissions and Departmental Committees.

Industrial Congress.

Coal Controller.

The National Association of Colliery Managers has not considered any complete scheme of nationalisation or joint control, and I have been instructed not to express on their behalf any opinion regarding the same until definite proposals regarding details in which we are specially interested have been fully discussed. It appears, however, that in certain quarters it is seriously suggested that representatives of the Miners' Federation should take an active part in the technical management of the mine."

As you are not going to express any opinion we need not trouble you with very much more of your proof. Then you say:—

"At present, even the owner of a mine required to be under the control of a manager cannot take part in the technical management of a mine unless he is qualified to be a manager himself consequently it cannot be correct for a committee or any body of persons to assume such powers unless they are all similarly qualified and also take responsibility jointly with the manager.

May we here ask what further use there would be for the Home Office Examination for certificates of competency for managers or undermanagers under these conditions.

In the interests of safety and efficiency, discipline is absolutely essential in the working of coal mines, it is therefore imperative that one man should have sole charge and direction of the work, and the possibility of appealing to a Joint Committee would undermine all sense of responsibility and destroy discipline.

Our experience is that Pit Committees in the past have often asserted the right of preventing men from carrying out urgent and necessary work and as a result working places have had to be stopped in order to make them safe later."

24,948. Have you ever worked at a colliery where there has been a Pit Committee?—What I understand here by Pit Committee is a Committee that would be at every colliery.

24,949. You say: "Our experience is that Pit Committees in the past," and so on. The question is, have you ever worked at a colliery where there has been a Pit Committee?—Yes.

24,950. Which colliery was that?—There is what I understand as a Pit Committee at every colliery—a workmen's committee.

24,951. Is there one at Windsor?—Yes.

24,952. How long has it been there?—From the start of the colliery.

24,953. How often does it meet?—Weekly.

24,954. How is it elected?—Annually.

24,955. Who elects it?—The workmen employed.

24,956. How many members are there upon it?—Twelve.

24,957. Do they meet the manager every week?—No, only when they have a grievance.

24,958. That is your idea of a Pit Committee?—That is my idea of a Pit Committee.

24,959. You think of it in a different sense to which I do?—I anticipated that.

24,960. You go on:—

"At present colliery managers are responsible to the State for the safety of the mine and carrying out the various requirements of the Coal Mines Act and regulations which has always received premier consideration by them, and their responsibility to their owners has been primarily for efficiency and economy. Any interference in his statutory duties by the owners would not be tolerated by the colliery managers, who would be supported by the Association.

Further, such an introduction of the principle of joint or dual control would violate the provision of the Coal Mines Act as already referred to. For the same reason as we now resent it, we shall still object under any new system that may be introduced.

Any dual control of this kind would in our opinion be unworkable, and would be analogous to a suggestion

3 June, 1919.]

MR. EDWARD SAMUEL WILLIAMS.

[Continued.]

that a ship at sea would be navigated under the joint control of a committee of the crew, with representatives of the owners.

We are disposed to think that sufficient importance has not been attached to the technical training, knowledge, experience and duties of the colliery managers.

Our experience has been that workmen are not disposed to take any part in assisting the management in any matter except when the object is some personal gain."

24,961. Do you ever get hints from workmen that are valuable?—Yes, I have received very valuable suggestions from old workmen.

24,962. Do you think they are the object of personal gain?—I do not get official suggestions—not any useful suggestions from men collectively.

24,963. "Even if the system was workable and workmen were so disposed, the number of suitable men who have studied the scientific and technical side of their calling is practically negligible, and our experience therefore negatives the finding of the Commission on the point.

If these Committees were set up they would no doubt be composed of biased men with extreme political views but without any technical knowledge of the art of mining."

I think some gentlemen who expressed political views knew a lot about mining, but I follow what you mean:—

"I have been especially instructed to make one point clear, namely, that if it is seriously proposed to introduce joint management the Association has passed a unanimous resolution to the effect that in their opinion a Colliery Manager's position would become intolerable and that it would also become absolutely impossible to carry out their obligations, and further, they think it useless to attempt it.

On any Committees, Boards of Control or Councils that may be set up as the result of this enquiry, we shall insist that Colliery Managers must be adequately represented.

Colliery Managers have been harassed very considerably during the last few years by threats of stoppages for the most trivial matters that we beg to suggest that the Government should insist that no stoppage should take place until every means of conciliation had been exhausted, and then only after a proper ballot of the workmen on the lines of the Ballot Act has been taken. We are inclined to favour compulsory arbitration: what is right in principle in international matters should also be right in the industrial world. Our experience has been that most of those troubles owe their origin to an organised minority, who attend all the meetings which are generally very badly attended by the rank and file.

From an intimate acquaintance with the workmen generally we think they are more often misrepresented than represented.

We feel at the same time that any scheme would have much to commend it which would eliminate the bitter hostility displayed at labour meetings or remove the determination existing in some places to

make colliery undertakings unremunerative or less productive or to remove prejudice against labour-saving appliances, provided the authority of the Colliery Manager is unimpaired."

24,964. Do you want to add anything to your *précis*?—Only this, the point you laid special emphasis upon that I have been instructed not to express any opinion regarding nationalisation. The word that should be emphasised, if I may say so, is "to express on their behalf." That does not preclude me.

24,965. That does not shut you out?—No.

24,966. What is your view?—My view is that it will not be an improvement on present conditions.

24,967. Why do you say that?—I do not think, speaking first of all from the position of the colliery manager, that his status would be improved under nationalisation.

24,968. You say it will not be improved. Do you think it will be weakened?—I think so. May I say why?

24,969. Yes, certainly?—Because our experience of the recent control has been that we have not been sufficiently recognised. When we have pleaded for an appointment, thinking at any rate we were sufficiently important, we have on one or two occasions been refused.

24,970. Did you ask the owners to assist you to get that?—Subsequently.

24,971. What happened?—We were also refused subsequently, and were told that it was presumed that we had nothing to add to what the owners had already stated.

24,972. What did the owners think about that; did they agree to that?—I think so. I think they thought that although there were points which we might put forward on our behalf they thought that at any rate we were sufficiently important to have recognition.

24,973. You did get recognition?—Yes.

24,974. Are you going on to tell us your own views about nationalisation? Would you like me to help you?—Thank you.

24,975. What do you think about nationalisation of minerals? Are you in favour of that or against it?—Before expressing an opinion I should like to be more fully conversant with all the arguments for and against which are not in my possession at the moment, but on paper there would be much to commend it.

24,976. We have finished with nationalisation of minerals. Now with regard to increase of industry. Is there much unrest in the coalfield in South Wales?—Yes, there is much unrest.

24,977. What is your remedy for that?—I do not think nationalisation would be the remedy.

24,978. I did not ask you what was not the remedy, but what was the remedy?—That is a very, very difficult question to answer.

Chairman: Then I will not ask you to answer it: I want to help you because you have no one here Mr. Williams has put his views before you very clearly. They are very controversial, but he is perfectly entitled to his opinions. Does anybody want to ask him any questions? (*No reply.*) We are much obliged to you for the assistance you have given us.

(*The Witness withdrew.*)

MR. PERCIVAL MUSCHAMP, Sworn and Examined.

Chairman: This is Mr. Percival Muschamp, who speaks on behalf of the colliery managers of England. We have had Mr. Gibson from Scotland and Mr. Williams from Wales. Mr. Muschamp says he has been engaged as a mining agent of the New Hucknall Colliery Co., Ltd.

"I have been engaged 36 years in mining—as student, surveyor, deputy, under-manager, manager, agent and general manager—am the President-elect of the National Association of Colliery Managers for the year 1919–1920, and have been chosen to give evidence before you on their behalf."

24,979. Then you say, as Mr. Williams was good enough to tell us: "The Association covers the whole of the United Kingdom and has a membership of 1,525 colliery managers." Does this Association include the Scottish mine managers?—No.

24,980. The first part of your *précis* is headed—

"*Objection to the Commission as Constituted.*"

We maintain that a subject of such vital importance as the nationalisation of coal mines, which, once embarked on, would make it almost impossible to revert to private ownership, should have been investigated

3 June, 1919.]

MR. PERCIVAL MUSCHAMP.

[Continued.]

by a Commission constituted of impartial men not connected with the coal trade. For example, a Bench of Judges would have come to the Commission with open minds, and made their report on the merits of the case from the evidence put before them for final approval by Parliament.

The N.A.C.M. feel that the members of the Commission nominated by the Miners' Federation and some other members had all made up their minds in favour of nationalisation before any evidence was heard.

On the owners' side the members are prejudiced against nationalisation.

The N.A.C.M. judge from Clause 9 in the Interim Report that certain other members appointed by the Government are also to some extent prejudiced.

Although it was clearly laid down that the Interim Report to be presented by March 20th should deal only with the questions of wages and hours, two reports out of the three presented express opinions with regard to nationalisation.

Under these circumstances the managers maintain that this Commission is not a fit and proper one to deal with a matter of such great moment to the nation."

You are quite entitled to your opinion. I am not sure how far all the members will accept that. You put forward your views and the reasons for them. Then you deal with the Chairman's report and ask quite a lot of questions about that. I am not saying they are not very material and proper questions, but I am afraid I am not here to answer them. Then at the bottom you say:—

"We welcome the assistance of the men in so far as this is provided for by the Whitley Report. But dual control, as we understand it, goes much further than this, and includes interference with managerial responsibility under the Act.

The men who are competent to assist in the management, and who have qualified by securing undermanagers' or deputies' certificates, are already doing so. In no industry is the opportunity more readily given than to the working miner who qualifies to take an active part in the mine management."

Then you have a lot of observations on the next page. I am not at all saying they are not most valuable, and in one paragraph you agree with Mr. Williams as to the position of a manager of a mine being analogous to that of a captain of a ship.

"Practically every colliery worker has the facilities (but few take advantage of them) for being educated and trained to manage a mine, and can if he passes the necessary examination become a manager, and so become the "great national asset" mentioned. It is as much open for the son of a collier to obtain a colliery manager's certificate as it is for the son of an owner.

We fail to see therefore that there is any great 'national asset' here at present, and the remark is evidently made by those who have very little experience of the coal trade.

It is the universal feeling amongst colliery managers that they would be unable to undertake the great responsibilities placed upon them by the Coal Mines Acts if they are to be subject to pressure or influence of any kind either by the owners or workmen whilst discharging their duties.

Any such control by the workmen might endanger the safety of the men in the mine and also the mine if conditions which the manager considered necessary to enforce were by reason of any joint control disregarded.

The position of a manager of a mine is analogous to that of a captain of a ship, and a committee of workmen having a voice in the control of the mine would resemble a committee of the crew partly controlling the navigation of the ship.

Any such control or interference with the manager would absolutely destroy the general discipline of the mine, which discipline is essential for the safe working of the mine and for obtaining a proper output.

It is frequently necessary for a manager to provide at once certain equipment, or to take certain measures involving expense in order to provide for the safety of the men working in the pit, and any delay in making this provision which might be caused by submitting the proposal to any Board of Control might have serious results.

The essence of good management is frequently prompt decision and settlements as regards inside management.

It is impossible to manage a colliery on the lines of a Government office, because the conditions in each district vary so much that centralisation is impossible. The manager knows better than anyone else what is particularly necessary in his pit.

There is, as things are at present, every inducement for a colliery manager to continue his studies in matters of colliery science in order that he may obtain promotion in his profession, and it is certainly in the interest of good management that a manager should have the stimulus afforded by promotion to a better-paid and more important appointment as a reward of his good management. Any system of promotion by seniority or length of service, or rule, would result frequently in the least-efficient managers filling the most important positions.

Para. 15.—We should wish to know what is meant by this. If it is intended to interfere in any way with the manager's statutory duties and responsibilities under the Coal Mines Act, we should definitely decline to work under such conditions. There can only be one manager of a mine, the same as there can only be one captain of a ship. Even the owner or agent of a mine, required to be under the control of a manager, cannot take any part in the technical management unless he is qualified to be a manager himself, consequently it is not at present legal for a committee to assume such powers unless they are all qualified to become managers and take the responsibility jointly with the manager.

A great deal has been said that the output could be increased by the introduction of more machinery. Much has been done, and many British collieries are, so far as lay-out, plant, and management are concerned, models of efficiency having regard to the conditions of seams, roofs, &c., and more could be done with machinery if the men received it in a more friendly way."

Then you make a lot of observations on the evidence given before the Commission and you criticise Mr. Sidney Webb, Mr. Motram, Mr. Frank Hodges and Sir Richard Redmayne. You say with regard to Sir Richard Redmayne: "We do agree with Sir Richard Redmayne where he said in his evidence that the function of a manager was to manage, and that he would not do anything to lessen the responsibility of management because he thought danger lay in that direction and that 'too many cooks spoil the broth.'" I am going to read the whole of your remarks upon nationalisation because we want to see what you say about nationalisation, and we need not very much trouble about what you say with regard to the individual members of the Committee:—

"Remarks on Nationalisation.

Colliery managers view with grave concern managing mines under the control of the State. The State has never yet proved its capability of managing a business successfully.

The management by Government Departments is always very much of the 'penny wise and pound foolish' method. Incentive and ambition are killed by the soul-destroying methods of Government management."

What do you mean by "Killed by the soul-destroying methods of Government management"?—The individuality.

24,981. "The stupendous waste and mismanagement by the big spending departments during the war would tend to prove that a great industry like the coal trade would be absolutely ruined if it came under Government control.

3 June, 1919.]

MR. PERCIVAL MUSCHAMP.

[Continued.]

The position of the colliery manager between the Government on the one side and the Miners' Federation on the other would be a most invidious one. They are determined by every means in their power to make their position an absolutely unassailable one, so that they may carry out their duties under the Mines Act without fear or favour from one side or the other. As a body they have quietly gone about their duties in the past, satisfied for the most part with the position between their employers and themselves; but in view of the circumstances which have now arisen at the dictation of the Miners' Federation, who would appear to be determined to try and control the coal trade, the managers are equally determined that they will not be controlled by the Miners' Federation, and in any changes proposed by the Government or the Miners' Federation it will be necessary to carry the managers, as represented by the National Association of Colliery Managers, with them. We wish to make this perfectly clear.

Our attitude is purely one of defence against being brought under the domination of the labour movement, as described by Mr. Frank Hodges in a speech at Mansfield on the 4th May, 1919, when he said:—

'The purpose of the labour movement was to dominate the whole world and every institution in the world, and to capture all institutions of power. If Parliament were the strongest institution in the country—which it was not—then labour ought to possess that institution.'

Mr. Smillie has rather suggested to the managers that they will be better off under nationalisation than they are at present. The managers wish to assure Mr. Smillie that they are quite capable of looking after their own affairs, and will neither look for nor require any assistance from him with regard to their financial interests.

Whoever may be the future employers, we shall serve faithfully and loyally, and do our best in the interests of the country to make the mines pay, even against the avowed wishes of Mr. Sidney Webb, provided our position is a tenable one, i.e., our status and interests must be safeguarded in such a way that our Statutory duties can be performed free from outside influence without fear or favour, which would be impossible under any system of dual or joint control as we understand the meaning of the term.

In the scheme of nationalisation produced by Mr. William Straker, Secretary of the Northumberland Miners' Association, the joint control of the mines is part of the scheme. We maintain that joint control is impossible under the Mines Acts, and altogether impracticable for the reasons already stated.

It might be asked what we would suggest in place of nationalisation. Our reply would be that we would prefer the evils we know of sooner than fly to those unknown.'

What are the evils you know of?—That is an expression; it is a quotation.

24,982. I think I have heard of it: "Under the difficult conditions always attached to mining, nationalisation cannot be other than a great liability to the nation. Also, we do not believe that the general body of miners want nationalisation. They appear to know little or nothing about it, or what it means." Why do you believe that the general body of miners do not want nationalisation?—Because we have had ample opportunity of discussing the matter with the miners. This is gathered from the managers of England, not only my own views.

24,983. I know that. I wanted to know the grounds for saying that. You have talked with certain men and you have found they are against it?—Yes.

24,984. "Those who favour it probably think that the Government would be more 'squeezeable' with regard to wages than private owners.

The National Association of Colliery Managers are of opinion that the mines would be much less

efficiently managed under State control than they are as at present controlled.

Although we consider that nationalisation would be against the interests of the whole country, we do not say that we should not work under it, provided there were no joint control, and that we had every facility for protecting our interests.

Attitude of the National Association of Colliery Managers.

The position of the managers in this enquiry seems to have been quite lost sight of. It is not our intention, however, that this shall continue to be the case. On the contrary, we intend to press our claims in as strong a way as the Miners' Federation have pressed theirs, and while we have no intention whatever of attempting to hold the whole community up, as the Miners' Federation has done, at the same time we shall use every legitimate means at our disposal to defend our interests and status, which we consider are in great jeopardy.

The National Association of Colliery Managers would object to any change in the relationship between H.M. Inspectors of Mines and the managers, that is to say, they would strongly oppose any proposal which placed them under the control of the inspectors, who cannot have the same intimate knowledge of local conditions as the manager.

If Parliament does decide to take over the coal mines, then the National Association of Colliery Managers will insist upon adequate representation upon all committees or councils that may be formed for the purpose of controlling the industry."

What does "adequate" mean?—Fair representation in their position.

24,985. Supposing for the sake of example, and I only take it for the sake of example, there was a Council of 10, as put out in Mr. Straker's scheme. How many colliery managers would you say should be on that?—There would be two representations, I take it, the Government on the one side and the men on the other.

24,986. That is what is suggested?—We should make a third. We claim we should have one-third of the representation.

24,987. That is to say, if there were 15 there would be 5 appointed by the Miners' Federation, 5 colliery managers, and 5 appointed by the Government?—Yes.

24,988. That is what you mean by "adequate"?—Yes.

24,989. "They will require an opportunity of discussing financial proposals as to their salaries and position, and also of securing that adequate compensation shall be paid to any who lose their positions through re-arrangement or who might be moved to lower grades of responsibility or whose positions would be seriously affected by any re-arrangement of management, and they will require that control shall be vested in the hands of thoroughly practical mining men, apart from H.M. Inspectors of Mines.

Proposed Scheme of Provident Fund.

I wish to make a personal suggestion that a general scheme of a provident fund might be considered, whereby all workers would benefit alike on the basis of earnings, and particularly so when they were no longer able to work. The scheme I have in mind is one in which the miners would contribute on their earnings, say 2 per cent. (with possibly increased contributions for present workers over the age of say 30-35 years), to which could be added a similar contribution from the colliery. This money could be handed over to the Government at the end of each year, and interest on the combined contributions at the rate of 5 per cent. per annum allowed. Members to contribute up to the age of 60 years, at which they could be allowed to deal with the whole of the accumulated money but still continue working if their physical condition allowed of it. The accumulated money would also be available for their next-of-kin in the case of death by illness or accident prior to that age, and also in the cases of men leaving the industry for other means of employ-

3 June, 1919.]

MR. PERCIVAL MUSCHAMP.

[Continued.]

ment through ill-health or accident, or in case they wished to retire sooner than at the age specified."

I think there are Provident Funds working in some parts of the coalfield?—Yes, there are, but not on such an extensive scale as this one.

24,990. I have gone through your scheme with great interest, but I am not sure whether you mean to make it compulsory or not?—I had not considered that. I think probably it would be better to start it in a voluntary way. The advantage of it would be so obvious that I think the men would naturally come into it.

24,991. I quite understand. I gather your present fund is for not only old age but ill-health as well?—No, only for a lump sum to be paid at the age when the age is reached. I might mention here that there is a blank for a figure in the next paragraph. It should be £1,626 6s. 1d.

24,992. "I have worked out the figures of a scheme of this description, and find that commencing at the age of 13 at the rate of 2 per cent. contribution from workman and employer and allowing an average £100 per annum at the age of 17, and £250 per annum above that age, this would amount to £1,626 6s. 1d.

The cost to the colliery would only amount, roughly, at 1 per cent., to about 1½d. per ton, and at 2 per cent. about 3d. per ton.

There is no question of actuarial soundness or unsoundness about a scheme of this description, as the employers' contribution would be chargeable against working cost, the same as wages are, and the benefits are individual and not collective.

A scheme of this description would be a great boon to all employees, with something for them to fall back on in their later years, and relieve them and their associations of their old age pension schemes."

Then follows your schedule:—

"Schedule at 2 per cent.

Age.				£	s.	d.		£	s.	d.		£	s.	d.	
13	...	2	...	2	0	2	0	...	4	2	0	...	4	2	0

Assume, for the sake of argument, that after a man has got to the age of 40 and then he determines to give up the coal mining and to go to some other industry or some other occupation, what provision do you make, if any, with regard to his share of the provident fund? Does he by relinquishing the industry lose all his benefits?—No, he could draw what was on his card.

24,993. Pro rata?—Yes, whatever stood on his card at the age of 40.

24,994. You would allow anybody to withdraw at any time?—The idea of the scheme would be to keep men as free agents as possible right through and not to confine them to one colliery; to have cards, say,

on an insurance system, so that the men could move about.

24,995. Sir L. Chiozza Money: Would you prefer that system to a definite pension such as given to the National Telephone engineers?—This is a scheme in which the man contributes a definite amount. I am not thoroughly acquainted with the one Sir Leo mentions.

24,996. You do not know about the Government pension scheme?—No.

24,997. Do you contemplate handing over the £1,626 at the age of 60?—That is detail that could be settled under conditions. I have not attempted to elaborate it at all.

3 June, 1919.]

MR. PERCIVAL MUSCHAMP.

[Continued.]

24,998. It is simply a skeleton of the scheme?—Yes.

24,999. *Chairman*: I rather gather you speak not only for the Association, but you agree with the view you express there yourself?—Yes.

25,000. You have strong views; you are perfectly entitled to have them.

25,001. *Mr. Robert Smilie*: I think you say in the beginning of your *précis* that you are speaking for the whole of the United Kingdom?—Yes, we have a membership of 1,525. I take it you are referring to Scotland. There is a small branch in Scotland that we are not speaking for.

25,002. What do you call the United Kingdom?—England, Scotland and Wales.

25,003. You are speaking for England, Scotland and Wales?—Yes.

25,004. I understood you to say in answer to the *Chairman* that you were not speaking for the Scottish Mine Managers?—We have some members in Scotland, apart from the mine managers, and we are speaking for them.

25,005. Do you represent the under-managers?—No.

25,006. You do not put in any claim on behalf of the under-managers for representation in any joint committee in the event of any nationalisation?—No, we have not any under-managers at present members of our Association.

25,007. But there are under-managers in the country and in practically every mine?—Certainly.

25,008. Men who hold certificates?—Yes, both first and second class.

25,009. You do not propose that those men should have any representation on any committee in the event of the mines being nationalised?—We are not proposing one way or the other. I am only representing the National Association of Colliery Managers, and it is for the Under-Managers' Association to represent their own interests.

25,010. You make a claim that you should have one-third on a national committee?—Yes.

25,011. It is obvious, if the under-managers or the colliery deputies or the engine winders or any other distinct organisation is to get any representation, then the Miners' Federation, representing nearly one million mine workers, would have less representation than the colliery managers?—I think the colliery under-managers and deputies can be quite well represented by the managers in that respect, because the manager is the responsible party.

25,012. You are of opinion that you can speak for the under-managers?—I am not speaking for them.

25,013. You say they would be well represented by the managers?—Yes.

25,014. Let me put this to you: would you believe me if I told you that I have had a very large number of letters from the Secretary of the Scottish Under-Managers' Association, which practically represents the management of every colliery in Scotland, asking my assistance and the assistance of the Miners' Federation to get them advances in wages?—If you told me so I should not doubt it.

25,015. Would you believe that we had to threaten a strike of the miners at two collieries in Scotland before we secured to the under-managers the bonus?—If you told me so, I have no reason to doubt what you say.

25,016. Do you know the Secretary of the Scottish Colliery Under-Managers' Association?—No, I do not.

25,017. Are you sure that you are speaking for the whole of the managers when you say they do not want any assistance from anybody, and that they can do their own business perfectly well?—For the members of our Association.

25,018. Would you be surprised to know that I and the miners are on the very best and friendly terms, not only with the managers but with the general managers in the Scottish coalfield?—No, I should not be surprised to hear that.

25,019. I am not going to be so impertinent with you as you and your members have been with me. I might have told you that in dealing with your pension scheme, you might leave the miners to mind

their own business and that they did not want your assistance, but I am not going to say that?—This is a personal matter brought forward. It was not brought forward on behalf of the Association.

25,020. I thought you were speaking on behalf of the Association?—If you would read the last paragraph carefully again, you would see that it is not on behalf of the Association.

25,021. You say, I would advise the miners that it would be a wise thing if there were a pension scheme?—This includes managers.

25,022. I would like on behalf of the miners to thank you or the colliery managers for any suggestion you make rather than tell you to mind your own business?—I did not mean it in that way and I am sorry if you have taken it in the wrong way.

25,023. That is how the Press would take it and that is how the public would take it, that it is a case of telling me and the organisation to mind our own business. I am glad to know that you are able to look after your business, but I think that many of your members must know that on many occasions I have endeavoured to assist the colliery managers, certified managers, second and first class managers, in this country, to place them in a position in which they have been absolutely free from influence on either side to carry on their very difficult duties. Would you believe me when I say that I have endeavoured to secure for them the full rights of carrying out their difficult duties in the best way they could?—I have no reason to doubt it, but you are also suggesting dual control, are you not?

25,024. Yes, certainly: if the mines are to be nationalised we are suggesting dual control, but I have never suggested, and do not intend to suggest, that the manager, who is responsible for the safety of the mine, should have the control of the mine taken out of his hands?—I am very glad to hear that, and thank you for it.

25,025. I say that under the law he is responsible. You have no right to hold a man responsible for the management of a mine unless he is entitled to carry it out, but under certain conditions we are desirous that we should be allowed to advise the manager of many things. I want to put it to you that at the present time there are many things taking place in mines in Great Britain every day which the manager does not know of, and if he did know of them would endeavour to put them right?—That is quite possible.

25,026. Has it been your experience or the experience of your members that your manager, who is really responsible for the management of the mine, is kept in close touch with all that he should know?—I think so. I think that a manager is kept in close touch with all the conditions that he should know.

25,027. You are very desirous that those under the manager, right down to the firemen and shot firer, ought to keep the manager in the fullest touch with everything going on in the mine?—Yes.

25,028. And as to the state of the mine as far as safety is concerned?—Yes.

25,029. *Mr. Herbert Smith*: Am I right in saying that you were the agent at the Bentinck Colliery when that cage accident took place?—Yes.

25,030. Did you consider we were interfering with the management of the mine when we pointed out how those nine men ought not to have been killed?—I do not think you did point out how those nine men's lives could have been saved.

25,031. The first thing we found was that there was a defective spring at the top holding the guide rope?—No, I disagree with you.

25,032. That was admitted in Court by the manager?—Yes, but it was not the cause of the accident.

25,033. Your engineer admitted a defective spring. The next thing was that it was admitted that your guide ropes were not properly put to prevent the cages catching: you had no buffer ropes between the two cages?—No, we had not, but they were not considered necessary at that time.

25,034. The next thing was, it was admitted by your manager that a gate opening outwards was a danger?—Yes, we thought that was the cause.

25,035. That is something we did not agree with?—No, you did not.

3 June, 1919.]

MR. PERCIVAL MUSCHAMP.

[Continued.]

25,036. The next thing was, it was admitted that the construction of the cages was wrong at the bottom of the cage and you should remodel it?—No, I cannot agree there. Mr. Chairman, might I ask, are these questions relevant to my presence here at all?

25,037. *Chairman*: Do you object to answering them?—I do not object, but we had a very painful inquiry over the accident, and I am just asking whether it is good taste, or whether there is any necessity, after a public inquiry had been held, that we should go through another?

Chairman: No, I do not think it is, but I rather understood you to say that you had not got many good suggestions from workmen, and you did not understand that that was of much value. Now I understand Mr. Herbert Smith is trying to illustrate by one or two examples the contrary view.

Sir Adam Nimmo: Was it not Mr. Evan Williams who said that?

25,038. *Chairman*: Do you agree that from time to time you do get most valuable suggestions from the workmen?—Yes, we certainly admit that, and we are very glad to have them.

Sir Leo Chiozza Money: It is also very relevant to know whether these mines are in such a condition as to save life. It seems that this mine that was being referred to was not in a good condition, and seems to be very relevant to our inquiry.

25,039. *Mr. Herbert Smith*: In your *précis* you say the National Association of Colliery Managers would be less efficiently managed under State control than they are at present controlled?—Yes.

25,040. Then you say in another part that you will have no interference with your duties as manager?—Under the Mines Act.

25,041. We want to take no responsibility from you at all, but we do want to prevent another disaster like that of Bentinck?—You want to take none of the responsibility, but some of the control.

25,042. But we want to put on record that we object to this and that, and to discuss it with you, and that there should be some consideration for discussion, not like in the absentee business. I want to put to you that you willingly accept all propositions that I put down as necessary for the safety of the pit, namely, first, that there should be more guide-ropes to each cage, there should be two double buffer ropes in between the cages, your door should open inwards to the cage instead of outwards, and your cage bottom should be differently constructed so that the iron bars should be underneath the woodwork

(The Witness withdrew.)

Chairman: I should like to make an announcement with regard to the next class of witness we are going to call, that is witnesses on behalf of the consumers. We have received from time to time during the last month a very large number of resolutions passed by various Chambers of Commerce and various institutions representing, may I say, the employers' side of this question. I will read a typical one. I have here, for example, the York Chamber of Commerce, a letter dated May 28th, addressed to me: "My lord, The Coal Commission. I am instructed by this Chamber, which represents the whole of the Employers' Association and traders in this city, to forward you the following resolution: That in the opinion of this Chamber, nationalisation would constitute a great disaster to the nation upon the following grounds," then it sets out the grounds. Then we have had a great number of resolutions to a similar effect, for instance, from the Hull Chamber of Commerce and Shipping, one from Newcastle and Gateshead. I have here one from the National Gas Council, then there is one from the Huddersfield Council, one from the Swansea Incorporated Royal Metal Exchange. Here is one from the Leeds and District Woollen and

instead of on top of the woodwork. You accepted all those proposals. Now I am not a certified man, but I have had some practical experience, and I may tell you that we went through your books, and when you talk about being properly managed, we found in your books for three years that the examination at three collieries of the cages, pulley wheels, and ropes were done on the average in one hour or less. Is that efficient management?—We consider that the examination was properly made.

25,043. So that you would consider that it is possible to examine six cages, six pulley ropes and three shafts, and to do all the necessary examination with two men in one hour?—No, I do not think that was stated.

25,044. As a matter of fact you had three men, and they all worked together. We went through your report book for ten years and you never exceeded one hour on your special examination at the week-ends?—I do not accept that one hour.

25,045. We went through your books and marked them, and we asked your managers, because you did not come in, you were simply a spectator at that colliery, and your colliery manager admitted that we had gone through those books for ten years and we found that there had not been over one hour spent in inspecting those shafts and those cages?—I do not agree with that.

25,046. You would not agree with an examination that only took that time?—No, I do not think it is long enough.

25,047. If you had been in the box, we could have dealt with you. I was present and ready to be called. Do you not know that, if you represent colliery managers, the employers, after the Workmen's Compensation Act, are refusing and objecting to money being collected in colliery offices at the mines for benevolent schemes?—From my own experience, I do not know that that is so.

25,048. Do you know that it is so in Yorkshire?—I do not.

25,049. You are representing colliery managers from Yorkshire?—Yes, but that is a matter that I do not know.

25,050. Do you not know that employers, before the Workmen's Compensation Act, agreed to make stoppages from men's wages in case of accident and sickness for the Miners' Permanent Relief, and as soon as the Workmen's Compensation Act came along, they refused to collect any more money at 95 per cent. of the pits?—I do not know that. We collected it in Nottingham.

Worsted Manufacturers' Association. Now it was obviously quite impossible, much as we should desire to do it, to call simply one gentleman from every one of these bodies because, long before we had examined them, I think the Commission probably would have come to an end, so that what we have done is this: We have communicated with the headquarters of all these Chambers of Trade, namely, the Association of British Chambers of Commerce, and we have asked that Association to be good enough to nominate witnesses whom they thought would be able to put before us the views of the various consumers. I think we were right in doing that because, after all, the Association of British Chambers of Commerce naturally know more about this question than individual Chambers of Commerce who represent the views, very important ones, no doubt, of their own locality. The Association of British Chambers of Commerce desire to send a witness, one from London, one from Leeds, one from Glasgow, and one from Birmingham. Those witnesses are here to-day, and I propose now to call the first of them, that is the witness on behalf of the Leeds Chamber of Commerce.

Sir JOHN McLAREN, K.B.E., Sworn and Examined.

Chairman: This is the *précis* of the evidence of Sir John McLaren, K.B.E. Sir John is the President of the Leeds Chamber of Commerce, Member of

Council of Association of British Chambers of Commerce, Chairman of Leeds Engineering Employers' Federation, Chairman of late Board of Management

3 June, 1919.]

SIR JOHN McLAREN, K.B.E.

[Continued.]

of the National Ordnance Factory, Leeds. I will ask our Secretary, Mr. McNair, to be good enough to read Sir John McLaren's proof.

Secretary:

"Resolutions of Leeds Chamber with regard to representation of consumers.

"That the Coal Commission at present sitting is not a body fairly qualified on the question to report on the future management of collieries nor on the question of nationalisation.

This question ought not to be settled in the interests of either minors or owners but in the national interest and a Commission appointed to take evidence and report should consist of a majority of coal consumers and traders."

Passed 29th April, 1919.

"That evidence be offered by the Leeds Chamber from the consumers point of view against nationalisation of mines and that Sir John McLaren be requested to give such evidence."

Passed 19th May, 1919.

I support the resolutions on behalf of the Leeds Chamber as representing consumers apart from either colliery owners or miners or theorists and contend that the consumers' interests have not been sufficiently placed before the Commission.

I am also authorised to speak on behalf of the Association of British Chambers of Commerce.

In importance the interests of the consumers far outweigh those of either owners or miners.

It has been emphasised here that coal is in the same category as water and air, being a necessary of life.

I therefore assert that coal is the life-blood of commerce, and a primo necessity of the domestic consumer.

The interests of the Royalty owners, colliery proprietors and miners are trifling compared to the interests of the public at large.

The former (without distinction between the three) are frankly out for all they can get, and the consumer must pay every time, though he has no voice in the management of the pits, nor in fixing rates of wages, or settling prices of coal—in other words he stands to be shot at or blackmailed.

Before the war coal was dear enough, but was obtainable.

Since the war prices have gone up enormously, namely:—

(July figures, 1914) Slack from 9s. 9d. per ton to 24s. 3d. per ton.

(July figures, 1914) Furnace Coal 14s. 6d. per ton to 23s. 9d. per ton.

(July figures, 1914) Gas coko 15s. 8d. per ton to 34s. 8d. per ton.

These prices are out of all proportion to increased wages and other costs of production.

Had the extra wages and cost of production only been added, the colliery owner would have secured his pre-war profit, and the cost to the consumer would have been very much less than the figures I have given.

Royalties have not increased, and in any case from two-thirds to three-fourths are returned in taxation and, from the consumer's point of view, sixpence per ton is neither here nor there.

The excessive rise in price of coal has had a disastrous effect on the trade of the country—not only has it increased the cost of production all round but it has particularly increased the cost of production of steel and iron because in these trades a very large weight of coal is required per ton of finished steel.

This has induced the abnormal rise in the price of pig iron steel plates, etc., equal in some cases to three or four times the pre-war price.

The consequence is that in addition to high wages in industry we have to pay excessively high prices for our material so that the cost of the finished product is put up to such a height that foreign manufacturers can undersell us and foreign customers will not purchase our goods. At the present moment steel for shipbuilding is £2 per ton cheaper in America than here which makes a difference of £5,000 on a single vessel of 2,500 tons displacement.

I quote letters from:—

Caccialanza (Italy)
Goizueta (Spain)
Topping (Argentine)
Gibson, Battlo (Australia)
W. A. McLaren & Co. (New Zealand)
Moore (Fuego Development)

to prove that the high prices restrict British trade.

On the other hand Americans are reducing their prices. This is probably accounted for by the enormous profits American manufacturers were making during the war which left them a margin to cut a big slice off their price and still have a satisfactory remaining profit.

English consumers view with dismay the prospect of nationalising coal mines because:—

- (a) They are convinced that it would result in higher prices with its resulting restraint of business and hardship to the working classes.
- (b) The Government being a democratically elected body are handicapped in their efficient administration by the menace of political wire pullers whose interests may be diametrically opposed to those of the coal consumer.
- (c) The Government have in no case except the Post Office (in which they have a monopoly) succeeded in working any enterprise at a profit. On the contrary we have in the last few days heard of the enormous losses on the railways in spite of 50 per cent increase of fares and obvious depreciation in permanent way and rolling stock.
- (d) Common prudence dictates that in any scheme of nationalisation a commencement should be made (if at all) on a small scale.
- (e) Recent experience has proved the incapacity and ineptness of the official mind to deal in a business way with the most ordinary business matters.
- (f) The experiment of nationalising the mines is far too big and its issues too vitally important to the country at large to be undertaken by a national department until it had shown its capacity.

National or municipal ownership should be confined to undertakings which are themselves in the nature of monopolies and which protect or serve the health or well being of the community as a whole, for instance, sanitation schemes, supply of water and the like.

I am opposed generally to anything which tends to create a monopoly as being against the interests of the public who are best served by competition.

Nationalisation under any circumstances should not be considered from the point of view of any section whether of employers or employees, but only from that of the community as a whole, and that is the point made by the resolution of the Leeds Chamber. It is moreover fraught with difficulties:—

- (a) Creation of huge monopolies.
- (b) Danger of stoppage by combination of workers.
- (c) Dissipation of profit by undue increase of working cost or by undue reduction of selling price.
- (d) Danger of routine working caused by loss of incentive.
- (e) Impossibility of the development of works which may be undertaken by private companies with hope of gain but would be impracticable of sanction by Government.
- (f) Certain loss of revenue from taxation.

Consumers are suspicious that the owners might on terms agree to nationalisation which would be very bad for both large and small consumers—not only for those using large quantities of coal, but particularly for working people who buy small quantities.

3 June, 1919.]

SIR JOHN McLAREN, K.B.E.

[Continued.]

So long as the owners are upon their mettle, trading with their own capital, and trying to make money, there will be competition from which both the large and small coal consumer will benefit. We do not want this competition eliminated.

Competition is the very essence of life. It is seen in the world of nature and our past history has been a continuous struggle against monopolies.

With respect to the political aspect it is evident that if the Government take over the control of mines they would be at the mercy of every Trade Union, because the Government is considered "fair game" and joint action would be taken by the various societies on every trifling point.

As an instance of the political complications which might arise the Miners' Federation at Cardiff on 19th May, passed a resolution refusing to pay Income Tax so as to compel the Government to raise the exemption limit to £250. This was on the motion of an M.P., Mr. Vernon Hartshorn.

Nationalisation of mines must be followed by nationalization of other industries. Miners would probably get benefits therefrom which would be resented by other workers who would naturally combine to bring about similar results in their trades. It would lead to an enormous increase of bureaucracy until eventually all were working for the State and individual liberty and freedom would be at an end and conscription of labour would be the result. It is a huge experiment and if it did, as in my opinion it would, fail, the difficulty of retracing our steps would end in national disaster.

Past experience of nationalization is against its extension. Profits made by private trading disappear and the working of the telegraph and telephone systems by the State is proof thereof.

The evidence as to the benefits of nationalization in our Dominions is very misleading. I am intimately acquainted with certain branches of Australian and New Zealand Trade and can give instances in support of my statement.

In any case nationalization in Australia has done no good and their labour troubles there are more acute than they are here.

The argument of Sir C. Money—that National Shell Factories were very successful—is incorrect. Some were and some were not. The Government could command the services of the best men in the country and where the factories were successful it was because business men were on the Board of Management and Government control was reduced to a minimum.

In the manufacture of shell bags, Woolwich was completely beaten by private contractors both in price and output.

The most ordinary observation shows that the elimination of personality and of the incentive of self interest is not for the benefit of the community as a whole."

25,051. *Chairman*: Do you wish to add anything to your *précis*?—Yes, I should like to say a few words. I would strongly emphasise the demurrer that we as a Chamber put in against the matter being settled without the consumers being more considered than they have been. We also think that undue prominence has been given to the question of nationalisation in this enquiry, because, although nationalisation is mentioned in the terms of reference, it is only in an incidental way in Clause F, and we think that if such an important matter were to be dealt with seriously it should be dealt with by an independent inquiry, on which the consumers, who are the parties chiefly concerned, after all, should be adequately represented. The Yorkshire district, from which I come, depends entirely on the fuel, and it is most important that that fuel should be as cheap as possible. We have a large industrial population dependent upon the manufactures in which coal enters so largely, and we fear that the result of nationalisation—to come back to that subject—would be very unfortunate, as we feel certain that the output per man would decrease, that the price would go up, and the cost of administration would be very high and not very efficient. We point out to you, sir, and to the

Commission, that no evidence has really been given of successful nationalisation on any large scale. Those examples that have been given, referring to Australia and New Zealand, are only on a very small scale, and even on the testimony of the witnesses themselves they were not very successful. The feeling of the Chambers of Commerce—I speak not only for Leeds, but for the Association of British Chambers of Commerce—is that this is a very huge experiment that should not be entered upon lightly, if at all. They are of opinion that it should not be entered upon at all. That is all I have to say.

Chairman: I am very much obliged to you, Sir John.

25,052. *Sir Arthur Duckham*: From the consumer's point of view, you want to be safeguarded as to price and quality?—Yes.

25,053. Do you feel that you are safeguarded best by a competitive system of selling coal to you?—By a competitive system of production and selling.

25,054. Your feeling is that if the competitive system were done away with you might suffer?—Yes.

25,055. And you are likely to suffer in quality as much as in price?—Yes.

25,056. I know you have had a lot of experience in the national shell factories. Did the workmen work as well for the private employers as they did in those factories, or *vice versa*? Was there any difference in the way the men worked in the two factories?—I am bound to say and pleased to say that in our shell factories everybody worked well.

25,057. There is one other question, and that is this. You are speaking to the Commission on the high price of coal, but have the Chambers of Commerce taken any steps to improve the use of coal?—I am afraid not.

25,058. There is a great waste of coal. Have the Chambers of Commerce tackled that at all?—No. It is scarcely for the Chambers of Commerce. It is more for the engineering and scientific societies.

25,059. I presume you do agree that the price of coal must go up?—Yes.

25,060. You have no hopes of it going down?—Rather.

25,061. But not going down to as cheap as it was before the war?—I do not suppose that it will ever be in my time as cheap as it was before the war, but it will be a great disaster to the country if it does not go down.

25,062. But there is a great waste in the use of coal?—Yes—and in domestic use.

25,063. And industrially?—Yes, I agree.

25,064. Do you not think your Chambers of Commerce could assist in that way by getting your people to pay more attention to it?—I am afraid they could not do so much good as the Institution of Civil Engineers.

25,065. I am a member of that body, and I fail to see how it can possibly be of use?—I think it is more a question for the scientific societies than for the commercial community.

25,066. If you reduced your consumption by half?—Then we should have so much more to burn and to sell.

25,067. *Mr. R. W. Cooper*: You tell us you are intimately acquainted with certain branches of the Australian and New Zealand trade?—Yes.

25,068. Can you give instances in support of your statement with regard to nationalisation?—Yes.

25,069. Would you mind touching on that for the moment and telling us what you mean?—Of course, I have read with some interest the proceedings of this Commission, and I noticed one or two gentlemen gave evidence with regard to the nationalisation of industry in Australia and New Zealand. Now, so far as that information gave the impression that Government management or nationalisation of industry in Australia and New Zealand was successful, I mean to say it was wrong. It did not convey the right impression.

25,070. *Chairman*: We want you to give instances. Can you do so?—Yes, I will give them.

25,071. Would you like to come after lunch again, so that you may have an opportunity in the mean-

3 June, 1919.]

SIR JOHN MCLAREN, K.B.E.

[Continued.]

while of finding your instances?—I thought I had them all ready, but if my cross-examination is to be adjourned it will be more convenient after lunch.

25,072. *Sir L. Chiozza Money*: I wanted to ask with regard to the last paragraph but two. I am sure you want to be perfectly fair in evidence that you give us, and I see that you quite properly say that some of the national sholl factories were successful, but may I ask is it net true that all the national sholl factories, except those that were deliberately stopped when America came into the war, were successful in production and nearly all produced their goods more cheaply than private manufacturers? Is not that the evidence of His Majesty's Auditor-General?—I should certainly agree that the factories were successful.

25,073. *Mr. R. H. Tawney*: Have you any practical suggestion to make to us?—With regard to what?

25,074. With regard to the futuro of the coal mining industry. Have you any proposal to put before us?—I have not come prepared with a scheme. I view with dismay the nationalising of the mines.

25,075. Yes, I appreciate that?—But I think if it were a question of administration and half a dozen good men were to put their heads together they could produce a better scheme than I could—practical men, I mean.

25,076. I understand you are a practical man, and you have come here and given us very interesting evidence against nationalisation. I have read it, but I can find no single positive constructive suggestion from beginning to end. I do not want to do you any injustice. Is that the case?—Yes, I agree.

(The Witness withdrew.)

Mr. GEORGE HENRY WRIGHT, Sworn and Examined.

25,081. *Chairman*: I think you are the Secretary of the Birmingham Chamber of Commerce?—That is so.

25,082. I think the Birmingham Chamber of Commerce represents over 3,000 commercial firms in the Birmingham district, including all the largest industrial users of coal?—Yes.

25,083. It is definitely opposed to the nationalisation of coal mines?—That is so.

25,084. How did you ascertain that the Birmingham Chamber of Commerce was definitely opposed to the nationalisation of coal mines?—Through the Council of the Chamber of Commerce, who are the voice of the commercial community of Birmingham.

25,085. How many members are there on the Council?—The Council is an elected body, elected by the members, and it consists of about 50 members.

25,086. When did they meet to discuss this question?—The last occasion when they met was Monday of last week.

25,087. Was there a resolution with regard to it placed before them? Did they pass a resolution?—A resolution was passed to the effect "that the Chambers of Commerce, the Federation, and other industrial bodies be urged to hold general meetings of their members to consider resolutions against the nationalisation of the coal or any other industry until adequate opportunity is given for the views of the industrial and general consumers to be heard. It was then decided to call a general meeting of the Chamber in order to get confirmation of a resolution against nationalisation."

25,088. Have you ever had that confirmation?—We have not yet had the confirmation as the meeting has not yet been held.

25,089. Because what you say is, the Birmingham Chamber of Commerce is definitely opposed to the nationalisation of coal mines?—Perfectly true. The Council has the power to express the view of the Chamber.

25,090. I want you to read the resolution that you came to?—Unfortunately the particular resolution that was passed on Monday has not been handed to me, but a resolution was passed against nationalisation.

25,077. Have you any proposal to make?—My proposal is that things should go on as they are, due regard being paid to the evidence that has been given, which ought to be of some practical use, surely.

25,078. *Chairman*: Will you tell us what you mean by "things should go on as they are with due regard to some of the evidence that has been given"? What does that mean?—I mean the royalty owners should remain the proprietors of their royalties; that the colliery owners, as existing at present, should be left in possession of their mines; that the miners should work harmoniously with the employers, and that they would be assisted in doing so by mutually, and without prejudice, going through the evidence that was given here and try to find a *modus vivendi*. That is my view.

25,079. *Mr. R. H. Tawney*: Supposing the evidence that was given here were to lead us to nationalisation?—I think it would be a disaster to the country.

25,080. You have told us to follow the evidence. I do not want to press you. I merely want to get out whether you had any suggestion to make. Can you add anything to your evidence?—I cannot add anything more to my evidence.

Chairman: Have you found the instances you were going to give us about Australia and New Zealand with regard to what Mr. Cooper was asking you? I do not want to embarrass you. I see you have a great number of papers there, so I will call another witness, and while he is giving his evidence you can find the examples that you want to refer us to.

25,091. How many members were present?—There were 15 to 20 members present.

25,092. 15 out of 50?—That is so.

25,093. *Mr. R. H. Tawney*: Who moved the resolution?—The resolution was moved by the Vice-President of the Chamber, and seconded by another member of the Council.

25,094. *Chairman*: Was it carried unanimously?—Yes.

25,095. Was there a long discussion about it?—A short discussion.

25,096. Will you kindly tell us the terms of it?—I am afraid I shall have to send on the actual resolution.

Mr. R. H. Tawney: I think we may have similar resolutions from other Chambers of Commerce.

Chairman: I simply wanted to know what the resolution was. Now I will read your *précis*:

"There may be certain services of a public character which it is more or less desirable should be operated by National Authority, e.g., the Postal Service, but it cannot be said that even here the State has distinguished itself, either in rendering a good service at an economic price or in satisfying the public.

During the past four and a half years the commercial and industrial communities of the country have had many opportunities of judging the effect of national control. As to the four years we were at war, it would be reasonable to make allowances for the defects and examples of inefficiency which resulted partly from the need for sudden and sometimes great improvisations. The armistice has, however, been signed over six months and it is still found that in the case of services owned or controlled by the State there is a want of elasticity and a lack of response to the needs of the public.

Private undertakings anticipate the demand, prepare to meet it, and do everything that is possible to satisfy it. Competition creates and develops enterprise; private enterprise produces new and improved methods and processes. Nationalisation introduces the dead hand of the State, enterprise disappears, and the nation suffers. For many years the Dominion of Canada was flooded with American trade papers and magazines and periodicals, whilst the distribution of English publications was insignificant. The reason

3 June, 1919.]

Mr. GEORGE HENRY WRIGHT.

[Continued.]

was to be found in the very low postal rates fixed by the United States."

Sir L. Chiozza Money: Does not that mean fixed by the American Government?

Chairman: That criticism is obvious.

"Some years of agitation were necessary before the British Post Office could be induced to move, and the effect of this neglect was most detrimental to British trade and damaging to British prestige, as the Canadians got their English news mainly through American publications, and it was consequently coloured by American sentiment and political views."

25,097. Is the American Post Office a private concern?—Not so far as I know.

25,098. It simply means that the public concern in America did better than the public concern in England?—That is so.

25,099. You are praising the public concern in America for doing that. What Sir Leo wants to draw your attention to is this, that while you are saying that the English Public Post Office did not do so well as the American Public Post Office it still has to be remembered that the American Post Office is run by the Government.

"No one could say that even before the war our telegraph service was cheap, and yet under State control it could only be run at a heavy loss, for which the Postmaster-General recouped himself by high postal charges.

Under the National Telephone Co., Ltd., notwithstanding restrictions imposed by the Postal Authorities, we had a comparatively cheap telephone service, which was rapidly developing in usefulness and efficiency."

Sir L. Chiozza Money: Do you mind asking, Sir, whether the National Telephone Service has increased the charges?

25,100. *Chairman:* You have heard Sir Leo's question. Will you answer it?—Before the Post Office took over the service of the National Telephone Company the Postmaster-General got the flat rates changed into measured rates, and the effect of that was to increase the charges to telephone users very considerably.

25,101. *Sir L. Chiozza Money:* To some telephone users?—To a great number.

Sir L. Chiozza Money: It also gave great benefits to other telephone users.

25,102. *Chairman:* Sir Leo will no doubt ask you about that, as it is a matter which he has given great attention to.

"When it was taken over by the Government, it became more expensive, its efficiency was certainly not greater but probably less, and the treatment of the public was much less considerate. There is no need to speak of the service during the war, but six months have elapsed since the armistice, and if regard be had to the present conditions, then it seems likely that we shall have to wait a long time before even the pre-war standard of efficiency and rate of development is reached.

In the opinion of the Birmingham Chamber of Commerce, whilst private enterprise creates development, State ownership or control produces official stagnation."

Mr. Hodges wants to know if that has been embodied in a resolution?—No; this proof has been approved by the Committee on behalf of the Council.

"Before the war, traders had many complaints against the railway companies, but, after all, the railway companies had to try to pay their way and make a profit. We have seen the results of Government control during the war and the effect of the removal of economic pressure, even although the controlling body—the Railway Executive—is a body of railway men, and not of Government officials. Relieved of the necessity of paying their way, huge losses have been lightly incurred, although railway fares have been largely increased, and many services in themselves of an unremunerative character, withdrawn or curtailed. Experience since the armistice does not justify any hope."

25,103. You have said that several times. Do you think that in the last six months everything ought to have improved and have become on the pre-war basis?—We think the rate of return to the normal should have been much more rapid than it has been.

"Decisions are made, rules are laid down, regulations put into force, and no deviation can be made from these by one jot or one tittle, even though the heavens fall."

25,104. Do the Committee approve of that?—The Committee have approved of that.

"A generation or two ago it used to be said of the British manufacturer that his great fault was the adoption of a "Take it or leave it" attitude in his foreign trade. He had enjoyed a predominance in overseas markets, and upon this he acted with the utmost independence. This was not his attitude during the decade preceding the war. He had for a long time realised that he must oblige his customers. That, however, is what the State has never yet shown any apparent inclination to do in regard to public services. In practice, national service connotes rules and regulations bound up with red tape.

It is not desired to make any criticisms upon the difficult question of coal control during the latter half of the war beyond this, that the Chamber feels that many hardships and anomalies which have been created through the operation of the control would have been avoided if the great bulk of the coal available for private, industrial and domestic use had been left free for distribution through the usual channels. If, for instance, coalfield A could only barely supply the needs of industrial district B, then it seemed absurd to send large stocks of emergency coal from A to C, and then have to supply B with emergency coal from D, a coalfield remote from B. And yet this is what apparently happened under the Coal Control Scheme. As in the case of other commodities which were rigidly controlled by the State, the moment the control became effective the supply of the commodities became scarce.

It may be said that coal is a necessity for every citizen and should, therefore, be in the hands of the State. But bread is also, and so also is meat. Some grounds may be alleged in favour of the nationalisation of the Postal Service, because although the service may be run uneconomically, it nevertheless deals with something to which the same conditions apply all over the country. This does not apply to coal mines and coal supplies. The coal mined is of varying quality; the cost of mining varies according to the conditions in the particular coalfield; the difficulties, engineering and other, in one coalfield are not the same as in another. There is competition, the laws of supply and demand operate, and engineering and commercial enterprise are essential to successful trading. Whilst competition has been the principal factor in producing improved methods and machinery, it has also not been unmindful of the need for protecting the lives and limbs of the workers. No one is more solicitous for the comfort and safety of the workpeople than the private employer. No one is readier to meet the need of the public than the private trader. Nothing is so slow to move as the State Department."

25,105. Mr. Herbert Smith desires to know whether coalowners are affiliated to the Chamber of Commerce?—We have a few coal merchants who are members of the Chamber.

25,106. Are those colliery proprietors?—We may have one or two colliery proprietors, but not more.

Chairman:

"The Birmingham Chamber of Commerce objects to the nationalisation of coal mines on the following grounds:—

- (1) It would result in less efficient exploitation of the coal resources of the country and deprive the State of the benefits of competition.
- (2) The lack of initiative and enterprise in a State Department would delay the adoption of better methods.
- (3) The cost of production would be greatly increased.

3 June, 1919.]

MR. GEORGE HENRY WRIGHT.

[Continued.]

- (4) The export trade would be seriously affected and the national interests would suffer.
- (5) The coal miner would be no better, and probably would be much worse off.
- (6) State ownership could not eliminate industrial unrest.
- (7) It would be disastrous for the control of the coal mines of the country to be under the direct influence of party politicians, as they would be if they were nationalised."

Does any gentleman wish to ask Mr. Wright any questions?

25,107. *Mr. R. H. Tawney*: I want to ask the same questions as I asked before. The first is this. What proposals do you make? What do you want us to do?—The proposals which I should suggest are those, that at the earliest possible moment the coal industry should be allowed to resume its normal freedom, and that every possible effort should be made to create better relations between the employers and the employed.

25,108. How?—By negotiation.

25,109. What kind of negotiations?—I should suggest through the means of Whitley Councils.

25,110. Am I to understand your proposal to be that we should simply return to the state of things which existed before the war and which in fact exists now?—Undoubtedly, return to full private ownership.

25,111. You think the relations between the master and the workmen and the public and the coal trade are entirely satisfactory?—I do not suggest that the relations between employers and employed were entirely satisfactory before the war. What I do suggest is that it should be possible for those relations to become more satisfactory.

25,112. It is easy to criticise, but what I want to know is what you propose. Can you help us in any way? I do not want to put words into your mouth. If you have not a plan, say so?—That is the suggestion that I make—by Whitley Councils, negotiations between employer and employed, with the view of obtaining better results.

25,113. Thank you. Your first suggestion is to go on as before, but to add to that a Whitley Council. That is your proposal?—That is your way of putting it.

25,114. Put it in your own way. I thought you said restore the old conditions. Let us have it in your own way?—What I said is on the notes. I could not repeat the words exactly, though, perhaps, I could paraphrase them. It was that the industry should be allowed to resume its normal freedom at the earliest possible moment, and that steps should be taken by employers and employed to bring about better relations than existed before the war.

25,115. You have nothing to add to that?—I have nothing to add.

25,116. In the course of your evidence I think you said that the Birmingham Chamber of Commerce had been asked to pass a resolution on the subject of nationalisation?—That is so.

25,117. Whom were you asked by?—By our members. If I may tell you exactly what took place, we attended a conference with the Engineering and National Employers' Federation—a conference between the representatives of the Chamber of Commerce and that body.

25,118. The Engineering and National Employers' Federation?—Sir Allan Smith is the chairman. The Engineering and National Employers' Federation is the new name for it. It was then decided that we would invite the Chambers of Commerce and commercial bodies in various parts of the Midlands to hold meetings of their members to pass resolutions against nationalisation. The matter was then brought, on Monday last, before the Council of our Chamber, when approval was given to this evidence being presented to this Commission, and a resolution against nationalisation was passed.

25,119. I want to be sure that I have the steps accurately. The first initiative was taken at a conference between the Birmingham Chamber of Com-

merce and the Engineering Employers' Federation?—The Engineering and National Employers' Federation.

25,120. Who summoned the conference?—The conference was summoned by the Coal Association.

25,121. Then the first conference at which the initiative was taken on the question of nationalisation was summoned by the Coal Association?—Yes.

25,122. It was the Coal Association which put the matter in train, as it were?—As a matter of fact, a Committee of the Chamber was already preparing this proof before that conference was called.

25,123. I only want to get the history of it. The first step in the history of this independent manifesto of opinion on the part of the Birmingham business men is the Coal Association?—No.

25,124. I understood you to say so?—I said the resolution which was passed on Monday suggested action amongst other Chambers of Commerce. This proof was sent to your Commission before the conference was convened by the Coal Association, which proves that the Chamber of Commerce had already decided to give evidence, if possible, before this Commission.

25,125. When was the conference summoned by the Coal Association?—It took place about a fortnight ago.

25,126. Did the Coal Association send invitations on its own initiative?—They sent out invitations after consultation with me.

25,127. They were in touch with you first?—We naturally came into touch before we commenced.

25,128. Was that before you sent in your *précis*?—No, that was after.

25,129. Did the Coal Commission invite the Engineering Employers' Federation?—I cannot explain to you the relations between the Coal Association and the Engineering Employers' Federation.

25,130. Are you aware that the Coal Association took similar action with the Chamber of Commerce?—I have no knowledge at all.

Mr. R. H. Tawney: This is very interesting. I wish you had told us this in your original evidence, because I think we might have considered it differently. However, I thank you for what you have told us now.

25,131. *Sir Leo Chiozza Money*: Does this *précis* represent the opinion of a sort of committee, or did you write it yourself?—Perhaps it would be well if I explained the method by which the Chamber of Commerce works.

25,132. I only want to know who wrote this document?—As secretary of the Chamber of Commerce, I was the author of the original draft.

25,133. Then it was amended?—Yes.

25,134. Your belief is that the telephones are under the control of inefficient people?—I say that the telephone service that we get to-day is not so good as it would have been had it remained in the hands of the National Telephone Company.

25,135. Are you aware that the late chief of the National Telephone Company has been called in to advise the American telephones?—I am not aware of that.

25,136. Do you know that people come from all parts of the world to see the details of our technical system because it is considered to be the best in the world?—That is quite possible.

25,137. You say that the railway executive is a body of railwaymen and not of Government officials, and you say decisions are made and rules are laid down and regulations are put into force, and no deviation can be made from these by one jot or one tittle, even though the heavens fall. You know that the railway executive consists of business men?—Perfectly.

25,138. Then you are blaming business men for putting into force regulations as to which no deviation could be made, even though the heavens fall?—What I am showing is that when the people are acting for the State, then their actions are not quite the same as they would be when they are acting for private owners.

25,139. You wish us to believe that the Birmingham Chamber of Commerce thinks that when the most talented railwaymen in this country become railway managers, they suddenly lose their senses and put

3 June, 1919.]

MR. GEORGE HENRY WRIGHT.

into force regulations which are not for the good of the undertaking?—I say regulations are put into force quite unnecessarily which seriously harass the public.

25,140. As soon as a man enters a Government office, you think he becomes inefficient. Do you know that the Coal Controller has been a business man?—I know that.

25,141. Do you know that the late lamented Coal Controller and his successor were both business men of high calibre?—I know that quite well.

25,142. You say they have done all these foolish things?—I know also that the action of the Coal Controller has seriously embarrassed manufacturers in the use of coal in Birmingham.

25,143. Do you know that if it had not been for the Coal Controller many a household would have been without coal during the past winter?—We have had in Birmingham many a household without coal during last winter.

25,144. Do you know that many coal experts sitting where you are have said if they had their way they would not abolish the Coal Control?—Probably so.

25,145. Was it not the case that as soon as we got sugar rationed we were able to obtain sugar, whereas we could not get it before?—Probably. That was certainly not the case with tin plates.

25,146. Now take tea: Is it not a fact that it was getting so scarce that you could hardly buy it at a shop, but as soon as the Government organised the control it fell to 2s. 4d. a pound?—You are only taking particular articles.

25,147. I am suggesting to you that you have been hardly fair in what you have said with regard to control. Do you not rather think that this document of the Birmingham Chamber of Commerce requires a

great deal of revision?—No. I am speaking of a considerable number of articles whereas you have only been dealing with two.

25,148. Have you not already agreed that a great many of these statements admit of qualification?—No, I do not think so.

25,149. *Mr. Robert Smillie*: Have you had any communications with Mr. Philip Gee, the Secretary or Director of the Coal Association?—No.

25,150. Do you know whether or not the Coal Association is a new Association?—I do not know anything at all about them except that they were introduced to us under good auspices—the National Engineering Employers' Federation.

25,151. Do you know any of the Committee of the Coal Association?—No.

25,152. You know that the Coal Association is largely responsible for the calling of conferences on this matter. Are you aware that that Association came into being within the last few weeks for the purpose of opposing nationalisation of mines?—That may be.

25,153. *Sir Adam Nimmo*: Is it your view that what you have stated in your evidence is the united view of the employers in your district?—That undoubtedly is the case.

25,154. You were asked to suggest a remedy for the future. I take it that your view is that whatever the remedy is to be, nationalisation is no remedy?—Perfectly.

25,155. And your view is, I take it, from what you have expressed that if a remedy has to be found, it must be found along the line of private enterprise?—Yes.

25,156. *Chairman*: Perhaps you will let us have that resolution?—Yes.

(The Witness withdrew.)

Sir JOHN McLAREN, K.B.E., Further Examined.

25,157. *Chairman*: Have you now found those instances?—Yes. I should like to call your attention to the date when the resolution of the Leeds Chamber of Commerce was passed. The first resolution mentioned on the *précis* was passed on the 29th of April.

25,158. "That the Coal Commission at present sitting is not a body fairly qualified on the question to report on the future management of collieries nor on the question of nationalisation." That is April the 29th?—Yes.

25,159. How many were present there?—I could not tell you. It was a full monthly meeting, the usual average attending.

25,160. How many members are there at the Leeds Chamber of Commerce?—About 800 members.

25,161. How many passed this resolution on the 29th?—We had a council of 26 at that time, and there is generally an attendance of about 20.

25,162. Was it the council that passed this, or the full 800?—It was the council.

25,163. Do you remember how many were present?—No, but it was a full meeting. There would be certainly not less than 20. There might be 23. We never got quite a full meeting. A question was asked of the last witness with regard to the inspiration of the resolution.

25,164. *Mr. R. H. Tawney*: Not only asked, but answered by the last witness?—I want you to quite understand, upon my personal assurance, in fact, on my oath, that as the Chairman of the Leeds County Council this was raised long before ever we heard of the Coal Association, and, as a matter of fact, the Coal Association had never any word or any suggestion either in our resolution or in my evidence. The evidence is mine and the resolution is the resolution of the Chambers on the motion of a private member who put it up.

Mr. R. H. Tawney: Of course I entirely accept what you say.

25,165. *Chairman*: Can you tell us how many coal owners are members of the Leeds Chamber of Commerce?—I could not tell you. Out of the 800 members there are probably a dozen coal owners.

25,166. How many are on the council?—None, and there were none present at this meeting.

25,167. If they were not members, they would not be present. Now will you kindly tell me the instances that you were going to give us?—If I might have one or two minutes, there is one fact that I omitted that I should like to mention—

Chairman: Very well; we will adjourn now, and you shall tell us at 3 o'clock.

(Adjourned for a short time.)

Mr. Robert Smillie: Sir, before the examination of the witnesses is resumed, I want to ask your permission to call attention to some questions I put to Mr. Thomas Henry Bailey, beginning at question 16,949 of the shorthand notes. I need not read the questions, but they are questions with regard to the Duke of Buccleuch being responsible for the shutting down of certain collieries in Midlothian in 1880, after Mr. Gladstone was returned to Parliament. I believe the trend of my question was to lead to the belief that the Duke of Buccleuch threatened to shut down the collieries in the event of Mr. Gladstone being returned. As a matter of fact they were shut down, but my attention has been called

to the fact that Mr. Morrison who was then agent for the Duke of Buccleuch points out that the Duke of Buccleuch was not then the owner of those collieries, but had leased them to the Marquis of Midlothian, and the Duke of Buccleuch was not responsible for the closing down of those mines. I take this opportunity of withdrawing that statement. I would like to add that it is still believed amongst the miners and the older hands there that the collieries up to the time of being closed down were called "the Duke's collieries." I think it is my duty to withdraw the statement because I do not want any inference to be drawn from an incorrect statement of fact.

3 June, 1919.]

SIR JOHN McLAREN, K.B.E.

[Continued.]

Mr. T. H. Bailey: Sir, if you will allow me to say so, Mr. Smillie is referring to my evidence, and may I thank him for saying what he has?

Chairman: Yes. Mr. Bailey wants to thank Mr. Smillie for the very generous way in which he has withdrawn what was evidently a misapprehension, and I am sure it is satisfactory to everyone. I am much obliged to Mr. Bailey for saying so.

25,163. *Chairman:* (To the Witness.) Now, Sir John, will you give us those instances which Mr. Cooper wanted you to give us?—Yes. I may say that I have considerable knowledge of the Australian trade. We are large exporters and in fact 90 per cent. of our output in normal times is exported. In normal times Australia used to be a very good market. I have not personally visited Australia, but my partner, who is my brother, has been there and we are constantly in touch with Australian business people. From what one knows of the attempts at nationalisation in Australia, one feels that the evidence that has been given here is calculated to leave a wrong impression. As a matter of fact the State Governments cannot and do not show up as well as contractors or outside firms can do. There are no doubt a few examples on a small scale of success, but many are failures. There was a remark made about coal mining in Australia and it was stated that it had not proved a failure. Well I do not know what mines the witness referred to, but, so far as I know, there is no State in Australia that does own a coal mine. They are all owned by companies and I should like to know how that witness supported his statement. But, even if a single mine in any of the Dominions should be run with success, it does not prove the case for nationalisation. There was a mine about fourteen years ago near Ipswich, which I believe is in New South Wales, which was started on the co-operative system. That is not on all-fours with nationalisation, but that was not a success and it was very soon closed down. In New Zealand we were also doing a good business and we were in constant touch. The only mine I know of that was ever run by the Government was a certain mine on the west coast.

25,169. *Mr. Frank Hodges:* What was the name of it?—I do not know. It was in the Greymouth district. There are several mines there. They could only make that pay by charging a special price to their State railways; that is to say, the State railways paid exceptionally high prices for their coal; so that, although the experiment appeared to be a success, it was only at the expense of another Government department, and I never heard of any second attempt being made in New Zealand. The New South Wales Government started a number of State enterprises such as timber yards, and brick works, and State trawlers, and one thing and another.

25,170. *Chairman:* What do you mean by "one thing and another"?—State trawlers, for instance.

25,171. That is not "one thing and another." You said they started "State trawlers and one thing and another"?—I can only give you three specific instances.

Mr. R. W. Cooper: Subject to your judgment, Sir, I do not know that I want to add this.

Chairman: We have had the evidence from Sir Charles Wado, the Prime Minister, who has gone fully into it.

Mr. R. W. Cooper: Yes, and given us full particulars.

Witness: I will not pursue that any further; but, before I leave the Chair, I should like to call attention to one or two points with respect to the present condition.

25,172. *Chairman:* The present condition of what?—Of trade, and owing to the cost mainly of coal. I would state a local case which exists in Leeds at present. One of our largest coal merchants there, whose business is to supply household coal to domestic consumers, complained within the last day or two that he was totally unable to get supplies, and that he could not supply all his customers, and many of them were very much inconvenienced for want of coal. So badly were they fixed that

they had to borrow from one another owing to the impossibility of getting a suitable supply from the pits. I just mention that in passing. I would like to tell you that our foreign trade is at a standstill because we are obliged to ask twice and more than twice the pre-war price for our engines. Now I will give you evidence from half-a-dozen places briefly. We received this year an order from Italy for ten engines of the latest design. When our customers heard the price they would be called upon to pay for those engines they immediately said: "We cannot possibly think of taking the whole of the ten engines, but we are bound to have two," and the order was reduced from ten to two which the customer was urgently compelled to have.

25,173. *Mr. Robert Smillie:* Could it be an order before they know the price?—Well, the order was an out-and-out order and they expected an increase in price, but when they heard it was twice, or over twice, the usual price the order was reduced from ten to two.

25,174. *Chairman:* Was it an enquiry?—No, it was an order. It was the usual season's order that we get from our foreign agents. In Spain, where we have done a good business, our agents told us that they had orders that they could send us for twenty-three engines—thirteen sets of steam ploughing tackle and ten engines for transport. The value of those engines was nearly £60,000, but for the very same reason that order was held up. It was never a specific order as it was in the previous case, but it was from our agents to whom we are in the habit of supplying yearly a considerable number of engines. In the Argentine, before the war, we could always depend upon twenty engines in a season, amounting to £25,000 in value. We were told that we could not have any order this year, although there were 2,500,000 tons of wheat and linseed to be moved. In Australia our people wrote us to say it was no use expecting orders from Australia. I will read the very words. "The present outlook for the sale of traction engines in New South Wales is anything but bright, nor can we see any likelihood of any early improvement."

25,175. *Sir L. Chiozza Money:* Is this because the mines have been nationalised?—No. I am trying to persuade you that it would be a mistake to nationalise the mines. From Australia we are £12,000 short this year. In New Zealand the conditions are the same. As long as the prices were ordinary they were taking about six engines a year, to the value of £12,000 a year.

25,176. *Chairman:* You have been very kind in giving us a number of illustrations which are, no doubt, most valuable illustrations, and we will call them premises. Now, will you give us your deductions which you say we ought to draw from those premises?—I do not know whether it is the proper function of this Commission, but I want to show that in consequence of the extraordinarily high wages, not only in coal-mining but in other industries, we are unable to employ the number of people we ordinarily do employ. At this moment we are only employing about half the number of men, because, although the orders are there waiting for us, we cannot get them.

25,177. I thought you said you got such a few orders—only two instead of ten?—That was in one isolated case, but we have not a single order from Spain or from Australia.

25,178. Which is it: that you have very few orders and do not want many men, or you have a great many orders and cannot get the men to execute them?—No, that is not it. We cannot get the orders because we are asking such high prices, and we cannot ask lower prices because wages in our trade and the mining trade are so high that it stops the trade.

25,179. *Sir L. Chiozza Money:* Are wages lower in America?—I do not know, but I was not referring to America.

25,180. Why are you losing the orders? Who is taking the orders?—In Spain they are going on with the mules. They are not availing themselves of the machinery they used to buy from England.

(The Witness withdrew.)

3 June, 1919.]

MR. FREDERICK CROMBIE GARDINER.

[Continued.]

Mr. FREDERICK CROMBIE GARDINER, Sworn and Examined.

25,181. *Chairman*: I believe you are the President of the Glasgow Chamber of Commerce?—Yes.

25,182. Do you appear as a witness at the request of the directors?—Yes.

25,183. You say in your *précis* that the membership of the Chamber is nearly 2,000 and that all the important industries in the West of Scotland are included in the membership?—Yes.

25,184. Then you say: "Glasgow and District has probably a more varied range of trades than any other similar area in the country. It is impossible to enumerate these in detail, but I may mention production of Iron and Steel, Shipbuilding, Engineering, Tube and Pipe Making, Iron and Brass Founding, Textiles, Turkey Red Dyeing, Paper Making, Chemical trade, &c. I have been connected with shipping for over forty years, and many years ago my firm exported coal. Of shipping I can speak from long experience, and one which covered almost every trade in the world. I cannot claim to have an intimate knowledge of the details of coal mining, or of the multifarious manufacturing and merchants' businesses, which are carried on in the West of Scotland. In my representative capacity, however, I have endeavoured to ascertain the attitude towards nationalisation of the coal trade, of the business interests which the Chamber represents." How have you ascertained their attitude?—Perhaps I should explain that the Special Committee was appointed to consider this matter and that Committee, of which I was Chairman, have done all in their power to ascertain the opinions of many different bodies.

25,185. Would you kindly answer the question more shortly. No doubt that was the machinery, but I ask you, how you did it? Did you write and get resolutions?—I was about to say that we had ten different bodies, associated or affiliated, connected with this Chamber who sent in resolutions, which I am going to put in, strongly opposing nationalisation, and the directors also passed a resolution last Friday. It was impossible to hold the meetings before because there was no time.

25,186. How many directors have you?—I think about 50.

25,187. How many were present when they passed the resolution?—About 25. May I give you the names of the various Associations that passed resolutions?

25,188. Certainly?—Resolutions were passed by the Glasgow Ship Owners' Association, the Clyde Steamship Owners' Association, the Scottish Steel Makers' Association, the Scottish Bar Iron Association, the Clyde Ship Builders' Association, the West of Scotland Iron and Steel Founders' Association, the National Light Castings Association, the North-West Engineering Trades Employers' Association, the Scottish Iron Masters' Association and the Manufacturers' Section of the Chamber. Those Associations sent in resolutions opposed to nationalisation. We thereupon had a meeting and passed a resolution of our own.

25,189. What was the resolution of your own?—"That the directors of the Chamber of Commerce and manufacturers in the City of Glasgow representing the trades and industries of Glasgow and the West of Scotland are strongly opposed to nationalisation of coal mines. They are of opinion that the nationalisation of the mines would raise the price of coal and decrease the output, which would seriously affect both the home and the export trade, increasing the cost of commodities and creating unemployment. An adequate and cheap supply of coal is essential, and the directors are convinced that this can best be obtained under the incentive of private ownership."

25,190. Can you tell me how many were present when that resolution was passed?—Twenty-four members.

25,191. Was it passed unanimously?—Yes.

25,192. Then you go on to say in your proof: "In my representative capacity, however, I have endeavoured to ascertain the attitude towards nationalisation of the coal trade, of the business interests

which the Chamber represents. The matter has been the subject of discussion by the directors and has been considered by a Special Committee." How long did it take the Special Committee to consider it; how many meetings did they have?—We had a Special Committee appointed, if my memory serves me right, when you were engaged in your first session. We found it impossible in the time that was at our disposal to get the evidence together for that session of the Commission and we sent you a letter of protest. I brought the matter up again and the Committee has sat repeatedly.

25,193. What does that mean, please?—We got intimation that we were expected to give evidence about Wednesday of the week before last.

25,194. *Mr. Frank Hodges*: From whom?—From the Associated Chamber of Commerce. Two days or so had been wasted. We were informed that it must be within seven days. It allowed us five days in which to prepare our evidence, revise it, submit it to meetings and all that sort of thing.

25,195. *Chairman*: Forgive me, but I am not in the least degree criticising you?—All I want to show is the difficulties in which you were placed.

25,196. All I asked you was quite a short question. You say it had been considered by a Special Committee. All I wanted to know was how many meetings of the Committee you had?—About four or five.

25,197. That is all I wanted to know, and it is quite a short answer?—Yes, but it has been impossible to do the matter justice in the time.

25,198. They decided against the principle?—Absolutely against nationalisation.

25,199. But you did not have sufficient time at your disposal to do it justice?—To do our evidence justice.

"It has also been considered by Associations affiliated to the Chamber, representing many of the important industries, and I have discussed it personally with many representative business men. The result is, I am satisfied that the possibility of the coal trade being nationalised is regarded in business circles on the West of Scotland with apprehension and alarm. For practically all our trades coal, sufficient in quantity of best quality available, and at the lowest competitive price, is essential, and that whether used directly or indirectly.

A large portion of our trade is export, and is carried on in competition with U.S.A., Japan, India, &c. U.S.A. and Japan have not been crippled by the war; they have been stimulated.

To burden our industries with dear coal will handicap our manufacturers in competing abroad, and it is believed will shut them out of various markets. This may force them, however, unwillingly, to endeavour to find relief in reducing the wages of their own workers. It should be borne in mind that in Japan and India much lower wages rule, and in the U.S.A. unrestricted production prevails.

Since we have to sell abroad at world prices, an excessive reward exacted for coal used for the production of any article can only be met, when profits disappear, by depressing the reward to other labour.

That our industries can continue to pay the present price of coal and compete successfully is more than doubtful. In the Coal Conservation Committee's Report, page 61, we read: "There is the greater necessity for every means being devised and used, which is likely to lead to a reduction in cost, if the home industries are to be provided with coal at a price at which their position can be maintained, if our foreign markets are to be preserved." And again, page 65: "It is only by increased production per head of the persons employed that our trade position can be maintained and improved conditions of employment can be secured, and this ought to be recognised by workmen as well as employers."

In a work called "Things that Matter," by Sir Leo Chiozza Money, we find "British Industry is

3 June, 1919.]

MR. FREDERICK CROMBIE GARDINER.

[Continued.]

founded upon the possession not merely of coal, but of cheap coal."

Again, "The only possible result of price maintenance is to restrict output, limit consumption, and decrease wealth." Further, "What is Staffordshire built on?" "The answer is, of course—coal. Without coal Staffordshire would be a poor agricultural community like Wiltshire or Ireland." With these statements I agree. You have already made certain recommendations, and the Government has adopted them. If the effect should be to reduce output and raise the price of coal, as is generally feared, then you are legislating a considerable portion of the population out of employment. As you are aware, according to Sir Auckland Geddes's statement in the House of Commons on 10th May, the output per person continues to show a decrease. You may make what paper provisions you please, but whatever these may be, or whatever form of Government may exist, we must export and we must sell at the world's prices. The alternative is bankruptcy and starvation.

The action of the large trades unions since the date of the Armistice seems to indicate an entire ignorance of, or disregard for, the extraordinary artificiality of this country's position as a manufacturing centre. The country is singularly destitute of raw materials. It possesses still some considerable quantity of iron ore, but not nearly enough for its requirements. Of almost everything else used in textile or metal manufacture we have to import every ounce of the raw material. This position applies more or less to every civilised nation, but in an infinitely greater degree to us than to any other, as a great mass of our population is directly dependent for its existence on the section of our manufacture which *must* be exported in order to buy the food which we cannot produce ourselves. Our great resource was cheap coal. The coal is still there, but the cheapness has gone.

I submit the position is a very serious one, and the question is one for all consumers and for the whole nation. If coal is to go to a higher price, or even if it remains at the present price it seems clear that the Government, to prevent shutting down, will require to subsidise numerous industries, which is in effect subsidising the miners and maintaining them in a privileged position at the cost of the rest of the community.

Further, when freights become normal some of our industries without tariff protection will be unable to meet foreign competition. Already foreign manufactures—articles which in the past we have made ourselves—are being offered in this country at prices with which we cannot compete.

Privileges.—Since the introduction of the Eight Hours Bill miners have become a privileged class. The recommendations of your Commission have enhanced that privilege by further reduction of working hours, while maintaining the standard of wages. These privileges must be paid for by the community at large, by the greatly increased cost of coal for domestic use, and for manufacture. The employment of a great section of population engaged in manufacturing industry is already rendered precarious by increased working costs. The enhanced cost of coal will doubtless lead to its restricted use for domestic purposes; but whether that restriction will not affect prejudicially the comfort and health of the poorer classes of the community is a serious problem. Increased cost will also promote further efforts to effect the more scientific use of coal for industrial purposes. That will be all to the good, but they are required to *maintain* (if that be otherwise possible) the manufacturing position of the nation, and should not be applied to a section of the nation only—the miners.

It seems an extraordinary circumstance that our trades unions do not appear to realise the position of matters. Europe for four and a half years has been feverishly employed in destroying wealth, and since the close of the War trades unionists have been, I

think, too ready to make our products more costly by diminished working hours, in combination with increased wages.

Another consideration that should make coal miners pause is the development that has gone on throughout the War of the competing power producer—oil. It threatened coal before the War, and coal is now providing the opportunity for the easy supremacy of oil, but more pronouncedly in areas that have hitherto imported coal.

Export.—On all hands a smaller output of coal is anticipated. Clearly home requirements for domestic use, and also for manufacturers, for the home and export trade, must be supplied first. These will probably be expanding requirements. Thus, reduction of output involves smaller exports of coal—higher prices will also militate against exports not only of coal but also of manufactures. Mr. Wobb, in his evidence, stated he was averse from a Miners' Housing Fund being provided by a tax on coal, even of only one penny per ton—one of his reasons being "it would also by so much tend to diminish our export trade."

Passing from the question of the effect of price on export, and looking at it from output point of view, it is interesting to compare the exports of coal for the first four months of 1914 and 1919. According to the Board of Trade returns, the totals, including coal, &c., shipped for bunkers are:—

1914.....	30,339,757
1919.....	15,994,144

We have enormous leeway to make up. That this reduction is not due to lack of transport is a matter I deal with later, as also its effect on shipping and the course of trade. Confining one's view to coal as an export it is manifest that unless output is improved we shall suffer permanent loss of a large part of our export coal trade. I need not dwell on the effect on France (with its shattered coal mines), Italy and other countries urgently in need of coal.

Exchange.—The balance of trade continues to run against this country. Failure to provide adequate exports, visible and invisible, to pay for imports, and to pay for our obligations abroad, can only end in bankruptcy. Coal, the only native product of large volume and value among our exports, has been an important factor in paying for imports. To pass measures which may restrict that export is a perilous proceeding. On the broader view, the damage which a higher price of coal may inflict on our general exports, and consequently on Exchange, is incalculable.

Transport.—I take it to be generally admitted that cheaper transport is essential in order to recover a full measure of sound commercial prosperity.

Of internal transport I only say this, if our railways are to pay expenses, higher rates appear to be inevitable, and this is in some measure due to dearer coal.

Shipping.—As coal enters into the cost of practically everything in ship and engine construction, dear coal involves a higher original cost, and, apart from the question of return on the higher capital, heavy additional charges for depreciation and insurance have to be met. In operating steamers the price of coal here and at the coaling stations is of vital moment. Since your first report, bunkers have risen in the Tyne from 32s. to 60s. per ton. The Glasgow price is not yet fixed.

While you may placate one section of the community by so legislating as to compel dearer coal, you penalise all other sections. The artificial position of this country cannot be too strongly insisted on—a large part of the population lives by manufacture, founded on raw material brought from abroad. Cheap transport of this raw material and of our foodstuffs and other requirements is essential, but, apart from the higher price of coal, which will directly burden transport, there are some less obvious consequences of reduced output to which I invite your attention. In normal times there is a large movement of bulk cargo

3 June, 1919.]

MR. FREDERICK CROMBIE GARDINER.

[Continued.]

to the United Kingdom and Continent, mainly carried in tramp steamers. These steamers, depend on coal from the United Kingdom for their outward employment; obviously the first claim on our coal is for the home trade. Assuming our industries are continued, any reduction in output will fall upon the export trade exclusively, and a large amount of tonnage must proceed outward in ballast, either to the homeward loading port or via the States, loading coal there. The shipowner works out his profit on the round completed voyage, and as a considerably increased proportion of the tonnage must proceed outward in ballast, homeward freights must rise. The homeward freight must bear the burden of the outward ballast trip. It follows that we are devising for ourselves a method of increasing the cost of raw materials and foodstuffs. We are deliberately placing the equivalent of a heavy import duty on the very essentials of our existence. At the present time the scarcity of coal at Glasgow, and the consequent absence of outward freights to suitable destinations, has put up ore freights by several shillings per ton, relatively to Cardiff, where more coal is available for export. This fact supports the broader argument I have advanced.

It is common knowledge that shipping has been seriously reduced during the war. Despite that fact we find continual delay to steamers waiting for coal. The steamers in the Welsh coal ports, excluding steamers in dry dock, were:—

1914.	25th	March	370
1919.	7th	„	476
1914.	6th	May	375
1919.	9th	„	601

This means that owing to shortness of coal many steamers—despite the tonnage stringency—are continuously idle. Further reduction in coal will accentuate this evil. Before passing from shipping let me remind you that the development of oil must have an important bearing on the course of trade. The war has kept back this development, but it has begun, and dear coal will give it an impetus—oiling installations are being arranged at the principal coaling stations. As coal becomes higher more foreign railways and steamers will use oil more largely, and less coal will be required, to the detriment of outward freight, and consequent raising of homeward freight.

I have dealt at some length with shipping because I have long experience in it. There are other probable effects, which consideration for your time precludes my touching. They lead to the conclusion that, with less coal available and coal at higher prices, in normal times we shall have relatively higher homeward freights than in the past.

General.—I have dwelt on these matters before dealing with nationalisation, because I find the opinion universally held that nationalisation involves still dearer coal. Many of our members are struggling—despite high wages, heavy charges and dearer coal—to recover or retain their trade. Coal is an element in the cost of almost everything used in manufacture. The effect of an increase in the price is cumulative and it directly affects wages. We look with great apprehension to the possibility of still dearer coal. Let me remind you that in your Interim Report you recommend that “subject to the economic position of the industry at the end of 1920” the hours are to be reduced to six. I respectfully submit that not the economic position of the industry, but the effect on the whole economic life of the country, should be the governing factor.

There is another matter of some importance to the West of Scotland. The output of ironstone in Scotland is small, but it is of importance in the manufacture of Scotch foundry iron. I am informed that with the higher costs this output will practically cease, except for some ironstone worked along with coal.

Nationalisation.—I come now to the problem you have set yourselves. The issue appears to me to be a plain one—whether skill, initiative, enterprise and thrift are to be regarded as criminal and to be penalised, or that they should be replaced by an

defined system of socialism. The qualities I have named have built up the industries and commerce of this country, and so far as I have been able to judge they have been present in a notable degree in coal mining.

I desire to mention one important fact showing, as I think, the readiness of coal masters to adopt electricity. I am Chairman of the Clyde Valley Electric Power Company. Between 1908 and 1919 we have contracted to supply sixty collieries with electricity. The circumstances of the war prevented its more rapid adoption. It is right to add many coal masters erect plants of their own, believing that by burning unsaleable coal they can produce cheaper than we can supply. From whence has this demand come? Not from the industrial and commercial classes, nor from the middle classes, but surely from the miners—from the profit-desiring instinct of the miners—quite legitimate in its own place, but not when it undermines the industrial prosperity of the rest of the community. That the industry could have reached its high state of development in Government hands I do not believe. I quote some apposite words of Sir Thomas Royden, spoken in connection with shipping. “The atmosphere of a Government Department does not encourage the growth of original ideas. The officials are chosen for their administrative, not for their inventive powers; and the magnitude of the trade, of necessity, produces an administration of routine. And beyond all this, the Government has no attraction for the men of great and even daring original thought, to whom we owe so much for the progress of the last sixty years.” Again, Sir Joseph Maclay was recently reported to have said: “They might have as much Government supervision as they liked, but they should not have Government control. He was quite certain that any man who understood his business and had had experience during the war of Government Departments, would desire nothing more than a quick and speedy relaxation. If the country was to succeed it would not be by Government control. It stifled enterprise and energy, and reduced the standard all over, rather than raised it.” With these opinions, and from my own experience, I entirely agree. Unhappily you cannot nationalise brains; the best brains will find fresh fields and pastures new. The notion that in ordinary times in the lower walks of the public services you find manifestation of self-sacrificing devotion is not in accordance with my experience.

So far as I am aware no business of the magnitude and complexity of coal mining in this country has been conducted by any Government. One naturally turns to our own Government services. I refrain from troubling you with the Post Office, Telegraph and Telephone Services save to point out the Chancellor of the Exchequer Budgets for a deficiency of £250,000 for the current year. If you will refer to the accounts of the Government telephones for the first complete year after they were taken over by the Government, the ratio of expenditure to gross revenue went up with a bound as compared with the last year of the National Telephone Company—the increase being nearly 27 per cent.

I cannot suggest any plan of nationalisation of coal mining. I cannot support any scheme which would in my opinion, undermine the industrial and commercial prosperity of the country. I am also utterly opposed to dual control. Judging from my experience, in my own business, it would in a short time produce bankruptcy. I have read in the Press reports of the schemes submitted to you. In my opinion to attempt to run this difficult business from Whitehall, along with Committees throughout the country, and with dual control would result in the maximum of friction combined with the minimum of efficiency. They all appear to me to afford inadequate protection to the consumer. Competition has given him that in the past. Lord Gainford’s plan appears to afford an equitable adjustment of the conflicting claims of the coal owners and miners. It satisfies all reasonable demands of the miners. Dual control

3 June, 1919.]

MR. FREDERICK CROMBIE GARDINER.

[Continued.]

is withheld since the coal owners rightly believe it is impossible, but speaking as I am for a large body of consumers I confess that I look with misgiving on any of these artificial arrangements, and would much rather continue a system which has conduced so strikingly to the prosperity of the whole country.

Let me urge you in considering these experiments on the fabric of British trade to remember Lecky's words: "Two things may here be said. One is, that in an overcrowded country like England, whose prosperity rests much less on great national resources than on the continuance of a precarious and highly artificial commercial and manufacturing supremacy, any revolution which may lead to a migration of capital or the destruction of credit is more than commonly dangerous. The other is that this class of questions is ominously one in which consequences that are obscure, intricate, indirect and remote are often, in the long run, more important than those which are obvious and immediate."

Mr. Webb's Fabian pamphlet is, I understand, in evidence, and I desire to submit some comments upon it.

Broken Time.—The miners are to have "absolute continuity and regularity of employment." It is stated that the aggregate national requirements are known and continuous throughout the year. To which it can only be replied they are not known and are not continuous. The ebb and flow of trade cannot be foreseen by any Minister of Mines, nor can he make constant the demand for house coal.

We are told that "at particular ports at particular times ships wait idly for cargoes, meanwhile coal accumulates elsewhere in heaps because there is for the moment insufficient tonnage at the disposal of a particular firm at a particular port." "At one or other ports to which supplies could be diverted by telegraph there would always be tonnage available."

The main causes of gluts at loading ports, whether of steamers or of coals, are entirely beyond any Minister's control. The bulk of the tonnage to load coal shifts to the coal ports in ballast. If there are prolonged gales the steamers cannot shift in ballast and a glut of coal occurs. When the weather moderates large numbers arrive together; then you have a glut of steamers. To remedy this the Minister of Mines would also require to be Clerk of the Weather. The diversion of coals to suitable adjacent ports is a common occurrence in Scotland. I cannot suppose it to be suggested that coals are to be sent, say, from Tyne to Cardiff. Further, in particular states of the market, say, when there is an urgent demand for tonnage for cotton or grain, steamers proceed in ballast and coal accumulates. When other remedies fail we are to fall back on national stores in universally accessible places. It is suggested that we store a year's internal requirements, say 200,000,000 tons, at a cost of, say, £200 millions, involving £10 million of interest. Mr. Webb states: "We are told each handling involves a loss of 10 per cent." Thus two handlings mean £40 million. Add to this cost of storage, depreciation, possible extra carriage, insurance and other charges, say 2s. per ton, £20 million, and we have a total of £50 million, subject to some reduction if the whole quantity were not turned over in a year. Call it £25 million, equal to about twice the profit of coal mining for a year. Truly an idealist arrangement, but not ideal.

Where the universally accessible places are to be found is not disclosed. How is it possible to store coal for an iron and steel works using 1,000 tons per day?

Strikes.—From the cloud of words dealing with the conditions of employment it is difficult to extract any comfort for the consumer. At the last, Parliament is to decide the standard rate. We are face to face with the miners *v.* the nation. A difficulty is not being removed; it is only being postponed. In the pamphlet we read, "and whilst they would be virtually guaranteed (apart from national calamity) against any reduction in their present average earnings, they

would have full opportunity to urge upon the public opinion of the community their claim to progressive increases with every advance in the common standard of life." Whether this is applicable now I am not aware, but clearly it implies creating a "separate class whose interests are not necessarily identical with those of the community as a whole." It is interesting to turn to the Victorian State Coal Mines Official Report for 1918. The output was 332,866 tons. The approximate loss of output owing to strikes was 43,125 tons.

Consumers.—In the pamphlet we read, "it is therefore suggested that the Government Coal Department should organise the whole service—itsself delivering the coal required for the Government Departments, for export, and for industrial purposes, at prices no higher than were being paid prior to the war." In his evidence Mr. Webb says: "If I were the Minister I should be extremely careful and hold out no expectation of reduction in price." When asked "If it is found that the present high price will have an injurious effect upon industry generally, what will the Minister do?" he replied, "I really cannot foresee, but I do not imagine any particular industry will get cheaper coal." If the first course is adopted it would appear to involve financial ruin to the State; if his later prognostication is correct black is the outlook for British industry. There is a comforting sop to the domestic consumer. Coal into his cellar at 20s. per ton, wherever he may reside, an all-round freight of 2s. is assumed (more than, Mr. Webb says, was paid in 1913, but it is not stated as more than was paid for household coal, which is here alone in question), which in present conditions would obviously involve a serious loss to the railways. If any attempt at sale of household coal throughout the country at a flat price is attempted it plainly penalises those near coalfields for the benefit of those in remote districts. There is no suggestion that the benefits of cheap country produce, &c., enjoyed in the country should be transported to such places as Glasgow at 2s. per ton.

These are some of the features of one of the schemes which is recommended to take the place of a system which has successfully developed the mining resources of the country, and under which industries have grown and flourished.

I refrain from further examination of this document and from describing it in appropriate words."

25,200. Is there anything you would like to add to this *précis* which you have been good enough to read to us?—I should like to add one fact which came under my notice since that was drawn up. I put in a copy of an American paper called "The Black Diamond," from which you will find that the price of coal in Pittsburg, as recorded here on April 26th, for slack for industrials was 1.60 dollars. I made enquiry, and I am informed that the corresponding price in Scotland for coal for the same purpose at this time is 23s. 9d. I suggest to you that is a burden that our industries cannot support.

25,201. *Sir L. Chiozza Money*: What is your remedy for that?—I presume we will come to that later.

25,202. What is your own remedy? How would you bring down the figure if you had to do it your own way?—I should proceed to do it by getting the maximum production and not by legislating for shorter hours.

25,203. How would you get the maximum production?—By allowing labour, if it were willing, to work such hours as it thinks proper.

25,204. Do you mean it should work all day and all night?—I am individually against the legislative limitation of any adult male's hours.

26,205. Would you give women employees any time also?—With regard to women and children's labour, which in the past we know was open to great abuse, I differentiate.

25,206. You cut them out, but let the men work as long as they like?—Yes.

26,207. You think that would make the difference?—I do not say it would make the difference, but it ought to help to make the difference.

3 June, 1919.]

MR. FREDERICK CROMBIE GARDINER.

[Continued.]

25,208. *Chairman*: Do you wish to add anything else? You told us the Pittsburg price was 1·60 dollars against 23s. 9d. Is there anything else you desire to add?—No. The names of these associations that moved the resolutions are already on the notes, I take it?

Chairman: Yes.

25,209. *Sir L. Chiozza Money*: Do you know the hours are limited in America?—By law?

25,210. Yes?—I do not know that.

25,211. Do you know they earn bigger wages than our men?—That may be.

25,212. *Mr. Robert Smillie*: Do you say you have been informed that slack (small coal) is 23s. 9d. in Glasgow?—I am informed that small coal or this American coal—

25,213. Will you not read that? You read "small coal" from that?—I read "slack."

23,214. Yes, slack. Have you been informed that slack is being sold at the Scottish collieries at 23s. 9d. a ton?—I may have to correct myself. When I am giving my own information, as you will understand, I am on much safer ground than information I have gathered.

25,215. But you have given evidence that you have been informed that the price of slack coal is 23s. 9d. in Scotland?—The evidence which I have, and which may require to be corrected, is in these terms: "Price at blast furnaces. They are competing at from 24s. to 25s. for coal purchases, and the price they are allowed to charge by the Coal Controller to their own furnaces for their own coal is 23s. 9d."

25,216. I want to put it to you that you have compared the American Pittsburg prices for slack with what you say is the same class of coal in Scotland, where you say the price is 23s. 9d., and I want to put it to you that it is not slack which is put into the furnaces?—I do not say the same coal, but similar coal.

25,217. What is "similar"? What do you mean by "similar"?—Not identical.

25,218. *Mr. R. H. Tawney*: Do you mean the same quality?—Serving the same purpose.

25,219. *Mr. Robert Smillie*: You read from that paper there that slack at Pittsburg for manufacturing purposes is a certain price, and you say coal of a similar quality, you are informed, is sold in Scotland at 23s. 9d. Is that true?—I do not wish to overstate the matter in the least.

25,220. But you have overstated it?—I am quite willing to correct myself if I am wrong in the matter. There are the whole of the prices which I put in. I will read you the Scottish prices if you like.

25,221. For slack?—The price of unwashed dross ranged from 18s. 4d. to 22s.; washed singles, 21s. to 22s.; washed doubles, 22s. 6d. to 23s.; round coal 23s. 6d. to 24s. 7d.

25,222. What is slack in Scotland?—I do not know what slack is in Scotland. It is not a phrase which is used in Scotland, so far as I have been accustomed.

25,223. Slack in Scotland is unwashed dross?—Very well.

25,224. You quote it there at 18s.?—18s. 4d. to 22s. Correct it, then, to 18s. 4d. to 22s.

25,225. For unwashed dross?—Yes.

25,226. Is that at the pit?—I have no information. I should say that is at the works.

25,227. You have stated here that similar slack to what is sold at Pittsburg is sold in Scotland at 23s. 9d.?—You are only making a verbal point. I have given you correct information myself. I am not a coal expert, but I am giving you the information as it comes to me.

25,228. Who informed you the slack at 23s. 9d. is similar to the coal sold at Pittsburg for 1·60 dollars?—I was not informed—

25,229. But you said you were informed?—I was informed the coal used in blast furnaces is 23s. 9d.

25,230. Will you take it from me that they do not put any slack into blast furnaces, and that there is no slack which goes into blast furnaces?—Where?

25,231. In Scotland or in America.

25,232. *Chairman*: Just answer the question. Do not ask questions yourself?—Well, it is not a question in a sense; it is a statement.

25,233. *Mr. Smillie* is asking you whether you will accept it from him that no slack goes into the furnaces in Scotland. If you will not accept it from him, say so?—I have no knowledge of it.

Chairman: Then say so.

25,234. *Mr. Robert Smillie*: Will you just repeat that? For the same quality as sold in Pittsburg 23s. 9d. is paid at the Scottish collieries?—I have already accepted your correction to the extent that I should give the price of unwashed dross as the same as Pittsburg slack, and I do not know what more you want.

25,235. It is well that should be corrected. There is a considerable difference?—I want to give you absolutely correct information so far as I have it, because I am here for that purpose.

25,236. On the first page of your *précis* you say: "It should be borne in mind that in Japan and India much lower wages rule." Are you suggesting now that the wages of the Scottish miners should be reduced because in Japan and India much lower wages rule?—No, but we have to look at it in this way, that cheap coal has been an element, and a very important element, in enabling us to compete with other countries where labour is much cheaper.

25,237. If you have been competing at the expense of the lives of the men and workers, do you want that to continue?—No, not if we have been doing it, but I do not admit it, of course.

25,238. Is it not the fact that the industry which you belong to is prepared to accept any kind of men if they get them cheap enough—I mean the shipping industry?—No, by no means.

25,239. Have not the British seamen had to fight you again and again to prevent you putting Chinamen and Lascars on the ships, because they are cheap and do not come under the rules and wages obtaining with regard to British seamen?—You are wrongly informed. Chinamen are not cheaper than British crews. I have submitted conclusive evidence that Chinese firemen are as dear as English firemen, and, secondly, that a Lascar crew is not cheaper than an English crew.

25,240. *Sir L. Chiozza Money*: Why do you use them?—Because it is perfectly inhuman to use white firemen in the tropics or the run on the Indian coast. I have tried it over and over again.

25,241. *Mr. Robert Smillie*: Supposing *Mr. Havelock Wilson* says they are cheaper, and the shippers desire to have them because they are cheaper, that would not be true?—It is not in accordance with our actual experience for which I can produce figures; it is inaccurate.

25,242. Then why do you fight the seamen or the firemen, as the shipping industry fight them again and again, in order to get coloured men or Chinamen on board ships?—I have never fought to get coloured men on board ships.

25,243. The shipping companies of this country have?—I have employed Chinese firemen because, in my opinion, it was inhuman to expect white men to work in the stoke-hole in the tropics.

25,244. You rather blame the miners in your *précis* for their action in trying to get the mines nationalised?—I think it is a mistake, very much so from the nation's point of view. I think it is undermining our industrial supremacy.

25,245. I think you said the workers of the country are not paying sufficient attention to the state of the country with regard to reduced hours and higher wages?—I think they do not regard fully the fact that this country is in a totally artificial position. We have no security; we might say no true export, in a sense, but coal. We have to bring the raw material, iron, jute and cotton and we have to deal with them and export them. The existence of the people depends upon that. That again depends upon coal, or some of it does, certainly, at a moderate price in relation to the price of coal elsewhere. I do think that these factors are not sufficiently weighed by the mass of the people in this country.

25,246. Have we not had artificial conditions for four or five years?—This country has always been in an artificial condition with this mass of human being crowded into this island and it is in a precarious position.

3 June, 1919.]

MR. FREDERICK CROMBIE GARDINER.

[Continued.]

25,247. Has not your firm and shipping firms generally taken advantage of the nation during the past four years to amass immense fortunes out of the misfortune of the country?—If His Majesty's Government appoints a judicial Commission to inquire into the conduct of my firm I shall be willing to submit my firm's conduct for any such Commission to inquire into. I am not here to discuss my conduct. I have rendered all the assistance to the country I can during the war.

25,248. Will you give assistance to get a Commission appointed to inquire into the profits of shipping?—No.

25,249. Are you afraid of such a Commission taking place?—No.

25,250. Is it not true you have amassed a fortune out of profiteering during the war?—It is true that I gave very clear and sound advice to His Majesty's Government in 1915 as to how shipping should be dealt with. It is true that I gave 14 months of my time to His Majesty in co-operating in the war. Had my advice been taken I think much money would have been saved.

25,251. You are here to blame the miners for carrying on an agitation for the nationalisation of the mines. I put it to you the general feeling in Glasgow is that your firm has made immense sums of money out of the war, which means out of the food of the people of this country?—I have only to reply, and, as I have said, I will submit myself and my conduct of my affairs to any Judicial Commission appointed for such purposes. I repudiate at once the statement you have made.

25,252. You are not desirous of having a Commission, especially a Commission with —?—I am not afraid of any Commission on the conduct of my business, not the very slightest.

25,253. Is it possible to get cheaper coal without reducing wages, do you think? I mean the dear coal of which you are complaining is not there under nationalisation. You say since the control was taken off bunker coal it has gone up in the Tyne from 32s. to 60s. Is not that because the control has been taken off prices?—Certainly. If an article is scarce and there is a big demand for it and the article is not controlled the price will rise.

25,254. Are you anxious control should be taken off coal at the present time?—I think in the particular circumstances of the time I would say no.

25,255. Why?—Because the particular circumstances of the war have created an artificial position and controls have been compelled owing to that fact to adopt many special measures for dealing with the immediate difficulty, and this is one of them.

25,256. You are here pleading for the continuation of private ownership of the mines?—Certainly.

25,257. Are you aware that if the controlled price for coal used in industries and for domestic purposes in this country was taken off the probability is the coal would go up 10s. or 15s. a ton?—I do not think that is relevant.

25,258. *Chairman*: Forgive me, Mr. Smillie is not asking if it is relevant or not, but if you are aware of it. If you are not aware of it, say so?—How can I be aware of it?

25,259. Then say so?—It is a matter of opinion.

25,260. *Sir L. Chiozza Money*: Is it your opinion?—If you ask me my opinion, as I have said, if there is a good demand and it is scarce the price will rise.

25,261. *Mr. Robert Smillie*: If the mines were nationalised and there was a great scarcity and acute demand for coal would the price rise in the same way as under private ownership?—I cannot say what would happen under nationalisation.

25,262. Then why are you here opposing nationalisation, because you do not know what will happen under it? What right have you to come and oppose a thing if you do not know what will happen?—We believe that the proper working of the coal mines can only be done in private hands, and the competition of private producers in the past has fully safeguarded

the consumer. How can I tell if there will be safeguards under nationalisation?

25,263. Do not you know the consumer is not safeguarded but by Government control?—The consumer has been safeguarded in normal times. You want to base an argument on abnormal times.

25,264. I put it the price to the consumer would go up 15s., 16s., or 20s. a ton. Is it not because the Government is provoking the people who want to get their full right to prevent them bleeding the people of this country to the extent of 10s. or 15s. a ton?—Price will rise if there is a big demand for it, and the supply is not there.

25,265. It would not rise if the mines were nationalised. The mere demand for it, or it being scarce, would not mean it would rise under those conditions. It could only rise now because the owners are making a profit out of it?—There has been full protection for the consumer in ordinary times in the past under the competitive system. I have seen no plan that will give the consumer protection in normal times under nationalisation.

25,266. Is it not the fact that in pre-war times when coal got scarce it immediately went up 5s., 10s., or 15s. a ton?—I have had millions of tons of coal in my time and I have been always able—

25,267. Answer that question. Is it not a fact in pre-war times as soon as there was a scarcity of coal the price went up?—That is exactly what I have said. When there is a scarcity of any article and there is a demand the price rises.

25,268. If the mines were a nationalised property I say the price would not rise?—I know no reason to believe that. Why?

25,269. Because it would be based on what it took to produce and not what the nation would make out of it. We do not urge nationalisation for the nation to make a profit out of it. It is because it is in the hands of private owners and profits are made out of it that coal rises when it is scarce. Coal is of no more value really when it is scarce than when it is plentiful, and yet when it is scarce under private ownership it immediately goes up in price?—Certainly.

25,270. That is so?—Everything does.

25,271. And the price of coal might go up when it is scarce without wages going up at all?—I should think you would have something to say about that.

25,272. I expect we should ask that higher wages should follow the price of coal?—Certainly, quite right.

25,273. *Mr. R. A. Tawney*: Have you any proposal or suggestion to put before the Commission for dealing with the coal industry?—No.

25,274. You have no proposal?—You have got yourselves into a difficulty and you ask me to extricate you from it.

25,275. I am not saying I expect you to extricate us. You are assuming too much. I want to know what kind of suggestion you have to make?—You have destroyed the private coal owners of the country; you have meted out to them less than Jeddart justice; you have hanged them and not even tried them afterwards.

25,276. We have destroyed, did you say?—The basis of operations in the past let me say, if you wish me to be more careful in my language.

25,277. I desire you to be careful in your language?—Then I will use careful language. You have meted out to the industry, that is to say, the coal owners, something less than justice. You have handed them your scheme and you ask me to help you to do something.

25,278. You are under a misapprehension. It is not out of anxiety on my account that I ask you to help me. It is out of anxiety on your own account that I am giving you an opportunity?—Do not have any anxiety on my account.

25,279. Allow me to put my questions in my own way. I am giving you an opportunity of saying if you have any positive or constructive suggestion to offer. If not, say so?—It is in evidence I have no proposal to make.

25,280. Do you think the present system satisfactory?—I think the present system has been a very beneficial one to the country and is, so far as my knowledge goes, satisfactory.

3 June, 1919.]

MR. FREDERICK CROMBIE GARDINER.

[Continued.]

25,281. Then would it be true that the recommendation or the advice you give to the Commission is to leave things as they are and not attempt to make any change?—I am not prepared to suggest any alteration in the past operations.

25,282. You are not prepared to suggest any alteration?—No.

25,283. *Sir L. Chiozza Money*: You would not take the control off at once?—I think the present circumstances preclude that.

25,284. When would you take the control off?—That I cannot tell. It is impossible for anyone to say.

25,285. The only remedy you propose is the one you suggested previously to work the men as long as any of them would care to work?—What we have to get is the largest possible production.

25,286. Kindly answer my question. Is that the only suggestion?—I am answering your question if you will only allow me.

25,287. Is that your only suggestion that the men might work as long as they care to work and cancel the limitation of hours?—It largely depends no doubt upon the number of men and their power of production. If you prevent or restrict them, or if they restrict themselves, your production suffers.

25,288. So far as you are concerned we are to report to His Majesty's Government that the remedy for the coal situation is to cancel all limitation of hours for adult males and work them as long as they care to work. Is that the report to make?—I have not recommended you to report anything. I have no recommendation to make to you.

25,289. That is the only suggestion you have made to us. Is there any other suggestion you would like to make?—I have no suggestion.

25,290. *Sir Adam Nimmo*: I notice you make some general reference to certain effects of Government control, and you quote statements by Sir Thomas Royden and Sir Joseph Maclay. I understand you to say you have had personal experience of the working of a Government Department?—Yes, I was 14 months in the Transport Department.

25,291. *Sir Leo Chiozza Money*: The Ministry of Shipping?—Yes, Advisory Committee.

25,292. *Sir Adam Nimmo*: You refer to your own experience in your *précis*. Would you care to expound your view upon that point?—My experience in the Ministry of Shipping convinced me that a Government body would be utterly incapable of carrying forward any commercial enterprise in a satisfactory and efficient way. In a business such as our own, any shipowner of moderate ability could, I might say, pick up a fortune amongst Government officials' feet.

25,293. *Sir Leo Chiozza Money*: You say pick up a fortune. This interests me; I was there?—I am aware you were there. You arrived about ten days after me.

25,294. You did not pick it up at my feet?—You misunderstand me. I said my experience in the Transport Department convinced me that a body of Government officials were quite incapable of managing shipping commercially to compete with a private shipowner, and that one might almost go as far as to say that in a normal time of competition a private owner would pick up a fortune among the feet of Government officials.

25,295. You do not think it is true we cancelled the profits of shipowners?—It is true. I cancelled very large profits of shipowners.

25,296. *Sir Adam Nimmo*: Do you suggest you cannot expect to find the officials in a Government department you would find in a private enterprise?—I think it is highly improbable. The Government will not pay for brains. I say nothing about my friends at the Ministry of Shipping, some of whom were extremely capable officials. The Government is a penny wise and pound foolish. It is slow; it is almost incapable of an instant decision; its routine, its circumlocution and other things conduce to stagnation; I admit in times of war there are other influences at work and, no doubt, the people work with greater zeal than at a normal time.

25,297. I take it you are not deprecating the men, but it is the system?—Yes.

25,298. Under which these men work?—The system would in ordinary commercial life and in a time of depression lead to bankruptcy in a very short time.

25,299. Do you think we can take a parallel between what has taken place under Government control during the war and what we might expect under nationalisation in normal times?—I should say the experience during the war, and certainly my own experience in the office, convinces me, and I think the people should be convinced, that management of a large and intricate business like coal-mining would never be capably and efficiently conducted by any Government Department.

25,300. *Sir L. Chiozza Money*: Will you ask the witness a question for me? Is he aware, after the reverse in March, owing to the excellent transport arrangements we were able to throw across the Channel an enormous number of troops in days and weeks and to bring an American army across the Atlantic in a way which was never dreamed of?—I was not in the Ministry in those days.

25,301. Ah?—I wish you would allow me to answer the questions and not make these observations.

25,302. These are matters of great importance?—I was not in the Ministry in those days. I am aware what was done with regard to throwing the troops across. I am aware what was done about the American troops. I am aware that ships were torn off their routes, to the enormous prejudice of British trade. I say that that particular operation was, as far as I have the facts before me without full knowledge, well done.

25,303. *Sir Adam Nimmo*: I suppose you come here, having experience of Government Departments, to say that you are apprehensive of the result that will happen to the country if the coal mines are nationalised?—I speak only in my own individual opinion. As regards being in a Government Office and my experience convinces me that a Government Department is incapable of managing any commercial undertaking, either to manage shipping or to manage coal mines, and it would be against the national interests.

25,304. Did I understand from the previous answer you gave that you thought coal mines would be one of the most difficult things to deal with under a national scheme?—I think coal-mining would be an enormously difficult business to operate under any nationalisation scheme.

25,305. You were asked certain questions by Mr. Smillie with regard to the price of American coal to their industrial works. I take it what you had in view, irrespective of any difference in price that might be in doubt, was there was an enormous difference still left between the price of coal to the industry in America and the price of coal to the industry here?—That is the point. It was not a shilling or two shillings either way. The difference is so enormous. Whether the Scotch price is 18s. or 22s. is immaterial.

25,306. There was still a wide gap between the two prices?—Yes, showing the extent to which our industries are burdened by the very high price of coal.

25,307. The low price in America is much in favour of the American manufacturer?—To the extent, of course, we are losing our position in neutral markets, and within a short time, when trade becomes normal, our markets will be very largely invaded by American manufacturers unless we exclude them by tariff or by duties.

25,308. You speak very strongly in favour of the continuation of private enterprise in the mines. May I take it you speak for the whole of the manufacturing industries in the west of Scotland?—I speak for the Chamber, and as far as in my power I tried to ascertain their views and the opinions of the Chamber of Commerce, but if confirmation of my mandate is required I am perfectly agreeable to call a special meeting to confirm the resolution if you so

3 June, 1919.]

MR. FREDERICK CROMBIE GARDINER.

[Continued.]

desire, because I am quite sure we shall get a unanimous vote.

25,309. *Mr. R. W. Cooper:* You refer on page 3 near the bottom of the second column to the Victorian State Coal Mines Report?—Yes.

25,310. Have you got that?—Yes, I have confirmation of all these matters.

25,311. Is that the official publication?—Yes, it is the official publication.

25,312. May I have it?—Yes. (*Same handed to Mr. Cooper.*)

25,313. You tell us that the price of bunker coal has risen very seriously. Is that in consequence of the recent Order of the Coal Controller?—I am not sure how that has arisen. The matter is in confusion, I am informed. I cannot speak with knowledge.

25,314. *Chairman:* You have nobody to represent you upon the Commission. You have been asked a number of questions by these gentlemen. Do you wish to say anything more arising out of those questions? If you do, will you tell us what you desire to say, and we shall be glad to listen to it?—It may be a repetition.

25,315. *Chairman:* Never mind, tell us what it is?—My own view is that this country, as Sir Leo has told us, is practically founded on cheap coal. If the cheap coal is withdrawn—I use the words that I used at the Glasgow Chamber of Commerce the other day, and I do not think words of exaggeration—it means industrial suicide. You have to face the emigration of millions of people from this island because people cannot be kept alive. If you withdraw the export of

coal and tie up our shipping, apart altogether from the export question, I do not know whether you can get food brought here and the raw material brought here. Certainly the raw material is not at a price at which we can sell in competition. In view of the artificial position of this country it is essential that we do get that raw material at a price which will enable our manufacturers to compete abroad. We are, at the moment, borrowing money here, there, and everywhere. The day of reckoning must come, and I wish to press that, however it is to be obtained, cheap coal is essential, and unless we obtain it we are running a great peril. I only want to say finally that I am not here, I hope, with any narrow capitalist view. I am here to represent the consumer and I am here to represent the great industrial industry of the West of Scotland, and, in doing so, I think I am speaking in the best interests of the vast mass of the working people of this country. I have no feeling against the miner. I say this: He ought to get the maximum wage with a minimum number of hours compatible with the prosperity of the whole country, but it must be compatible with the prosperity of the whole country, and my apprehension is that his claims are being pressed to such a degree that this wider interest that is the very existence of this country is being imperilled, and I feel very keenly about it.

Chairman: We are very much obliged to you for placing your views so clearly before us.

25,316. *Mr. R. W. Cooper:* May I have this copy of the Victorian State Coal Mines Report?—Yes, I am prepared to put it in.

(*The Witness withdrew.*)

Chairman: There is a gentleman I now propose to call out of his proper order because he wishes to get away.

Mr. JOSEPH SHAW, Sworn and Examined.

Chairman: Mr. Shaw's evidence is with regard to the export trade from the Humber. You will recollect we had a witness from South Wales with regard to the export trade there; we have had Sir Daniel Stevenson with regard to the export trade in Glasgow; we have had Mr. Greenor with regard to the export trade in Newcastle and Mr. Shaw speaks on behalf of the Humber Coal Exporters' and Shippers' Association. Mr. Shaw says:—

"I am the managing director of Messrs. Michael Whitaker, Limited, carrying on business in a large way as coal exporters, with branches and depots abroad.

I am chairman of the Humber Coal Exporters' and Shippers' Association, and I am duly authorised to speak on their behalf.

The observations comprised in my statement are based upon pre-war data, because abnormal war conditions afford no criterion as to the true position of the trade.

The association comprises the coal exporters in the Humber District, their ports of shipment being chiefly the Humber Ports of Hull, Grimsby, Immingham and Goole, and in a lesser degree Boston and King's Lynn on the Wash. There are also other small loading places.

The volume of coal exported from the Humber Ports alone in 1913, the last pre-war year, is as follows:—

	Tons.
Hull	4,728,787
Grimsby (including Immingham)	2,984,187
Goole	1,326,377
Total	9,039,351

25,317. I have introduced you, Mr. Shaw, to the Commission. Will you kindly read the remainder of your proof?

Witness: "There are only two coal areas of magnitude in England, viz., the North East Coast of Tyne

area and the Humber area. The Humber area comprises the Yorkshire collieries (particularly in West and South Yorkshire), and the collieries in Derbyshire, Nottinghamshire, &c., for which area the Humber is the natural exporting outlet.

The Humber area is increasing in magnitude and importance because of the sinking of new pits gradually nearer and nearer to the ports of shipment, collieries having been established in recent years east of Doncaster and at Thorne, north of the Humber, whilst similar collieries are being established south of the Humber. Many of these pits have been sunk avowedly with the object of catering for the export trade. The coal area thus defined is the chief coal producing area in the United Kingdom; it differs from all other British areas in that the collieries are a considerable distance from the ports of shipment.

In the Humber area there are not only very material differences in the quality and class of the coals, but also in their analytical characteristics and, what is of great importance to a foreign consumer, their size, the reason being that whilst coals are sold in England by the ton, they are often sold by the foreign importers abroad by measure, and in such cases preference is given to those coals which give the best results in out-measure. Moreover different classes of coals from different collieries suit the particular requirements of individual foreign consumers, who in many cases ask for a mixture from different collieries to produce the results they require. For the retention and development of trade it is extremely important that the individual requirements of each foreign consumer should be met in every respect.

The Humber Ports being the natural export outlet for this coal area are correspondingly the natural ports of shipment for the various countries where the classes of coal are required. Until comparatively recent years, the coal was shipped chiefly to Scandinavia, the Baltic, and near European countries, but owing to the magnitude and development of the industry and the increase of facilities for shipment the area of distribution has been largely extended to other countries.

3 June, 1919.]

MR. JOSEPH SHAW.

[Continued.]

Competition against the coal shipped from the Humber area emanated, in pre-war days, chiefly from the German collieries in Westphalia and Silesia, whilst the Belgian, French, and Spanish collieries competed locally with the coals which were exported from the Humber to those countries. In pre-war days there was a little competition from America, but this is likely to increase in existing conditions.

A coal exporter occupies a special position and forms an integral link between the producer and the ultimate consumer. His relations vary with the conditions of transit both by sea and land, and he is in no sense a broker drawing a commission between the producer and the consumer.

A coal exporter must be in close touch with stocks and market conditions of coal for export. He must also be in very intimate touch, not only with the pulse of the general trade requirements in each foreign country, but with the requirements of each individual consumer in each country in which he has established connections, and which are regularly visited by him.

A coal exporter contracts with the collieries or the colliery selling agents as a principal, and he is himself responsible to the colliery for the payment of the coals sold by them. The collieries sell the coals and receive payment for delivery substantially in the vicinity of the colliery—certainly in England. On the other hand the coal exporter needs to be in touch with shipping conditions; he must charter tonnage and make the necessary shipping arrangements; and he sells the coals to the foreign importer on varying terms. Sometimes they are sold by him free on board in England (known as "F.O.B. terms"); sometimes on terms which provide for cost, freight, and insurance (known as "C.I.F. terms") and sometimes on terms in which he undertakes the entire risk of carriage, either to foreign port or to the consumers' works (known as "delivered terms"). Moreover, he must make all financial arrangements varying with the different conditions upon which the sales are effected by him, and he accepts all the risks incident to this method of business, from which the collieries are relieved.

The coal exporter occupies a threefold position. With regard to the collieries, he runs the risk of getting the coals to the sea-board in order to fit in with the ship room engaged for the purpose of export, and apart from being personally responsible to the collieries for the price of the coals, he relieves them from any responsibility with regard to delay in transit, or with regard to shipment and destination.

In the next place the coal exporter has the responsibility to the shipowner whose ships are chartered to carry the coals, and the coal exporter also faces the responsibility of the timely arrival of the coals and the ships to load them, being exposed to the danger of demurrage and loss on both sides.

In the third place, the coal exporter takes risks with the foreign importer, which is no light matter. Apart from financial risks, if coals are rejected on arrival at their destination they are at once saddled with the taint of rejection in a foreign country, and are correspondingly difficult to dispose of."

25,318. What is the percentage of rejection in your experience?—The rejection is very small, although I have known rejections that have been very costly. I can refer to a case in 1911 when I had two cargoes of 5,000 tons thrown on my hands in Italy. The refusal of those two cargoes cost my firm eventually £14,000.

25,319. Did you sue in the Italian courts?—No law suit ensued from that. I had to take that coal into my hands it having been condemned as unmercantile, unworthy.

25,320. Condemned by the Chamber of Commerce?—By the President of the Chamber of Commerce. I had to take over a business which was a great mistake for me and which cost us £14,000, and we were very glad to close up.

25,321. *Mr. R. W. Cooper*: Was it on a falling or rising market?—That was three years before the war.

25,322. Were prices rising or falling then?—I cannot tell you now whether the prices were rising or falling. It does not matter what the market was. That coal was unmercantile.

25,323. You told us the rejection took place in Italy?—It was normal times. Anyhow, the reason why the coal was rejected was because of the fact that a small amount of coal had been put in by the colliery company that had been picked up from the ground, that had previously been on fire, and therefore they condemned the whole cargo.

25,324. *Chairman*: Was it rejected because it was not up to sample or calorific power?—It was not a question of calorific power at all. The coal when it got into the hot sun in Italy in June or July practically turned white.

25,325. Had you a guarantee from the colliery?—No, that is where a coal exporter gets no guarantee. The coal exporter relieves the colliery of all risks. He pays for his coal at the pit mouth or free on board, and he has finished the responsibility which then begins with the coal exporter.

"This threefold position is more accentuated in the Humber area than on the Tyne, where the many collieries have their own loading appliances or staithes. In fact in past years, particularly 1907, the coal exporters of the Humber incurred serious financial losses because of delays on the railways, congestion of traffic at the ports, detention of steamers, and similar causes, while the collieries having relieved themselves of their output at the pithead were free from any such responsibility."

25,326. You say the coal turned white?—Yes, it turned a greyish colour.

25,327. *Mr. Evan Williams*: Was that because of the coal picked up from the bank?—This coal had been on fire and it was small coal. As it was taken out of the ship of course all the bad coal ran amongst the good coal and condemned the good coal, and with the hot sun. I do not know the reason of it; this coal undoubtedly turned to a greyish white colour.

25,328. Even the coal that had not been on fire?—The whole of the coal looked like it. I should be very pleased to give to this Commission a report on that coal.

25,329. *Chairman*: I was not for the moment doubting you; it is a curious thing?—I attributed it to the hot country after the coal had got out. It was condemned in the ship because they saw the nature of the coal at the very top of the holds. The President of the Chamber of Commerce asked for it to be discharged, and as it was waiting for days to discharge the ship the hot boiling sun on this cargo had some effect.

25,330. *Mr. Herbert Smith*: What was it?—Principally South Yorkshire.

25,331. There was Silkstone in it?—A great deal of Silkstone being in it.

25,332. That explains it—being inferior.

Chairman: It does turn white.

Mr. Herbert Smith: Yes, it shows a white face.

Witness:—"The foregoing observations are in the nature of an introduction the understanding of which is essential before proceeding to the two points upon which the Commission invite views.

The first point suggested by the Commission is the probable effect of the nationalisation of mines and minerals upon the coal export trade.

It is difficult to foretell the probable effect of nationalisation because so much depends upon circumstances.

(a) If the nationalisation of mines resulted in an increased output and a reduction in establishment costs and sale prices, coupled with elasticity and freedom of action, similar or greater than that which prevails in normal peace times, as between the producer on the one hand and the coal exporter on the other, the coal exporting trade could be carried on successfully.

(b) If, however, the proposed nationalisation led to a decreased output with the inevitable increase in costs, and restricted free bargaining between the producers and the

3 June, 1919.]

MR. JOSEPH SHAW.

[Continued.]

coal exporters, the coal exporting trade would be seriously crippled, and competition from America and Germany, and in a lesser degree from Belgium and France, would be directly encouraged.

With regard to (a), the nationalisation of collieries should not be allowed to entail and suppression or restriction of the present commercial management of the collieries. Each colliery has its own peculiarities not only in the cost and circumstances of production, but in the grading of its coals and their adaptability for certain purposes. There is a great variety of method not only in the working of the coals but in their handling, washing, screening, etc.¹

25,333. Do you mix much in the Humber?—Yes, we mix quite a lot: "And instances could be given where coals from one colliery are excellently suited for purposes of a foreign consumer who will not look at coals produced in the same vicinity and from the same seam. This could not be overcome by standardisation, which could only apply to grading, quality being unalterable.

The second point suggested is the best method of working the coal export trade if nationalisation were decided upon.

The answer to this question has been somewhat anticipated in answering the first point. If nationalisation be decided upon, the best method of working the coal export trade would be to follow as closely as possible the methods existing in normal peace circumstances, viz.:—To allow each colliery to manage its own affairs, with the consequent rivalry between the various collieries; to allow each colliery to conduct its own sales in competition with its fellows in the open market; to allow the coal exporter the same opportunity as in the past of acquiring the various grades and qualities of coals, leaving him responsible to the producer for the price of the coal, either at the pit mouth, or at the port of shipment, but in any case in the country of origin.

The coal exporter should continue, as in normal peace times, to arrange the necessary tonnage for the export of the coals. He should also be allowed to continue his present connections and to make his own chartering arrangements with shipowners, and financial and other arrangements with buyers overseas, with absolute freedom to extend and develop markets.

The State could not, as such, enter into the position of the coal exporter with regard to individual foreign connections."

25,334. As far as risk is concerned, you would recommend the risk should still remain on the exporters?—I do: "The foreign connections of coal exporters are built up at considerable expense and much depends upon the personality of the individual coal exporter. Moreover, the requirements of each individual foreign importer and consumer have to be considered. Prices frequently have to be worked out in the currency of the country of destination and correspondence carried on in foreign languages and a general personal interest taken in the affairs of the foreign importer and consumer. In short, coal exporters have to seek and maintain their business; it does not come to them."

25,335. Assume, for the sake of argument, your system was adopted, would it be possible under it for all the exporters of a particular area to combine in a ring and put up the price enormously to the foreign buyer. Say, for example, you could get coal, for the sake of argument, at 25s. at the pithead and you agreed to take all the output and charge the foreign consumer 40s. I am putting hypothetical figures?—It would not be possible.

25,336. Why not?—Take the Humber. The majority of coal exporters, probably 50 per cent. of the Humber exporters have also offices in Newcastle, and also in other places. You are speaking of one particular district.

25,337. Yes?—They have offices in Newcastle, Cardiff and Glasgow. My firm have at each of those places. We in the Humber and those in charge of the particular office in the Humber are naturally interested in the development of the coal shipped from

the Humber. Consequently an amalgamation of the firms of the Humber to push Yorkshire coal in preference to Scotch coal where there may be no amalgamation would be detrimental to that firm; but I may say that during the war I personally advocated to the coal exporters of the Humber that they should pool the profits because of the fact that the export trade of the Humber was reduced and was gradually getting lower and lower and we had our own standing charges. Some firms who had never shipped to France but previously had shipped to Scandinavian ports were not allowed to ship to France. I suggested we should pool the business and pool the expenses during the control, but the Humber coal exporters were deadily opposed to any such thing; they would prefer their own standing charges and run the risk of doing any business rather than be associated with a neighbour.

25,338. You say pool the expenses. I do not want to ask you about your particular business. Are the expenses of the exporter very great per ton? Is there any sort of thing you could tell us?—I have no data before me.

25,339. It depends upon the volume of your business?—That is quite true. I think from the interviews I have had and various meetings I should not be very far wrong if I said that in normal peace times the average profit of an exporter—the gross profit—was something in the neighbourhood of 6d. per ton, and the net profit would be something like 3d. per ton, certainly not exceeding 3d. if you took the whole of the coal exporting trade.

25,340. That depends upon the volume?—Yes.

25,341. Should I be right in thinking the expense is about 3d. per ton?—You are assuming quite correctly. That is the English expenses.

25,342. In that 3d. per ton do you allow any insurance for bad debts?—Naturally if you are getting a net profit you are taking everything into consideration.

25,343. Every now and again you get let in or you think you do by some foreigner?—Very often.

25,344. Is there any sort of fixed ratio of that in your experience? Do you allow any sort of sum to compensate you for that?—No, as a rule you have to assume what sort of a profit you are going to get. It is the most speculative business in the Kingdom to-day. I am speaking of normal times. I can give you an instance. Take the Russian market. In October or November the Russian merchants as well as the Russian manufacturers and the railway companies and gas companies set about to buy their coal for the following season starting in May. An exporter gets a telegram in the afternoon or evening in October or November. That exporter does not wait to ask the colliery what his price is, because why? He knows the colliery would not quote him for trade to start in the following May. He cannot go to the shipowner and ask him what his freight is in the following May, because the shipowners will say, "How do we know what our back cargo is going to be like in May; we must wait until nearer the time"; but the exporter in order to get trade for the country and to enable the miners to work full time has to take upon himself to act instantly. He does not wait two days; he does not have to come to London to ask for a price; he instantly wires his agent who has his reply the next morning in St. Petersburg, and he has got that business or lost it before 12 o'clock the next day. Therefore the exporter must be fully conversant with the markets not only at home, but abroad. He must be fully conversant with the freights and with the prices of coal, and he works entirely on averages. Therefore he does not know what profit he is going to have or what loss he is going to sustain, but, as I stated, taking an average profit and average loss, because a coal exporter is no fool, and he does not care to lose if he knows it.

25,345. I rather gathered that?—I believe I am correct in saying, taking the average, the profit is 6d. per ton. "The result is that everyone connected with the coal export trade is personally interested from every point of view, and particularly financially, because his success depends upon his work, trading ability, personal influence, and personal effort. This would be lacking if the coal exporters were merely officials. This point may be

3 June, 1919.]

MR. JOSEPH SHAW.

[Continued.]

emphasised because the business of a coal exporter is carried on at all hours of the day and night, so much being dependent upon prompt attention to all matters affecting his business, and such attention could not be expected if the great incentive to personal work and personal effort were removed."

25,346. *Mr. Herbert Smith*: Am I right in saying you are Mr. Whitaker's managing director?—Yes.

25,347. How many years has he been exporting?—20 years to my knowledge.

25,348. He used to be an ordinary merchant?—Yes. What has that to do with it?

25,349. Never mind what it has to do with it. You are a witness and I am asking you questions and you have to answer. You are being so good to the miners I want to see how much good there is in it. Do you know a gentleman called Woodruff, an exporter?—I knew him before he died.

25,350. Do you know in 1893 he was not a very rich man?—I must correct myself. You asked me if I knew Woodruff as an exporter. I reply "No" as an exporter; I knew the late Arthur Woodroffe as a coal factor.

25,351. And exporter?—Not a foreign exporter.

25,352. Do you know David Williams?—Yes.

25,353. An exporter?—Yes.

25,354. Would you be surprised to know that I know a man who in a few years made thousands out of this business?—I should not be surprised at all.

25,355. Like Whitaker has done?—I must challenge you on that. Mr. President, may I answer?

25,356. *Chairman*: Certainly?—He has challenged me, he says "Like Whitaker has done." Whitaker's is a limited company. During the past nine years the average dividends of Whitaker, Ltd., have been 4.17 per cent.

25,357. *Mr. Herbert Smith*: You have issued balance sheets I suppose?—We have issued balance sheets in accordance with those figures, and those figures are given here on oath.

25,358. How much had you in it when you started?—You have made a statement "Like Whitaker has done." Michael Whitaker, Ltd., have paid to their preference shareholders 6 per cent. all the time, and the average dividend of ordinary shares has been 4.17 per cent. since its formation. I cannot go better than that. Further, their reserve is £20,000—I am going to be candid with you—but facing them is this fact, that in Germany, in Mannheim, they have depots there which stand at close upon £30,000, and which, as far as they are concerned, may be all swept into the sea.

25,359. That is owing to the war?—That is owing to the war. When you challenge me about my own firm I can speak.

25,360. According to you, your object in view was getting work for miners, and you take all these risks. I want to show you that, as far as I know, exporters make tremendous profits, and I come from Yorkshire?—I know you do. An exporter is interested in the miners, and he is interested in the miners working full days, because by the colliery working full days he knows there is more coal for him to export and more coal for him to offer. That is where his interest is. I am interested in miners. I have lived with them since a boy. I was brought up at the very bottom of the colliery and I have lived with them.

25,361. What do you mean by bottom of the colliery?—A weigh clerk. I used to go down the pit every day.

25,362. You would not call that the bottom of the colliery?—I reckon that 5s. 9d. a week is about as low as you can get in a colliery.

25,363. That is some years since?—Yes.

25,364. I started at 10d. a day down a pit?—Perhaps you were better off then than to-day.

25,365. Perhaps worse?—I am not sure I was not better off in those days than to-day from a peace of mind point of view.

25,366. May we take it you have settled opinions with regard to nationalisation?—I have no settled opinions with regard to nationalisation.

25,367. All you ask for is to make exporters secure?—I am here to prove on any question of export that no Government could do it.

25,368. Do you say you hope you will be allowed to go on as you are?—Yes, conditionally that you give the exporter the same freedom of action with the colliery, and that is a big if. Under nationalisation it is almost impossible. If you are going to withdraw the means of the exporter being in touch and getting quick decisions from the colliery, it is then I say the coal exporter is going to suffer, and suffer very seriously.

25,369. Will you admit that coal control has been a necessity during the war?—I do admit it.

25,370. Do you admit it still ought to continue?—I admit the control should continue until the supply approaches somewhere the demand.

25,371. As I take your paper, all you are afraid of is that the output will go down?—I am personally convinced of that.

25,372. Records do not prove that?—What records do you refer to?

25,373. Take February, 1919?—The exporter, do you mean?

25,374. The output of coal?—Take it at the very commencement, if you like. Take 1913. The total output was, say, 285,000,000 tons. I put it to you as a miners' leader that in 1919 you have more men in the mines than you had in 1913 and that the anticipated output for this year will not exceed 216,000,000 tons.

25,375. I put it to you as a coal exporter that you had 200,000 men coming back somewhat incapacitated from the war, and that is more than you had in 1913?—I agree with you; I must attribute it to that.

25,376. You remember 350,000 went from the mines to the war?—I do.

25,377. You also know that Yorkshire miners alone have had about 5,000 killed in the war?—I quite understand that, but the men are there to-day in greater numbers.

25,378. The men are not there to-day?—There are more men there to-day than in 1913.

25,379. They are not there to-day in the same physical capacity that they were before the war?—The fact remains there is 70,000,000 tons output less this year anticipated than in 1913.

25,380. When you talk about anticipation you have to realise, and I will tell you that I know a pit that had more men in it in 1916 than in 1918 and they got 87,000 tons more in 1917 than in 1918. Can you answer me that question?—There were less men in 1917 and there were 87,000 tons more than in 1918?—I can only answer it in this way, that those men worked. There are a lot of men to-day who are not necessarily men that have been to the front and come back. There are a lot of men to-day, and in Yorkshire, too, that are not working and do not care twopence about the interests of the country and whether the poor people have coal or not. The President this morning put a case to a witness as to the poor of London being short of coal. I know what my answer would have been. My answer would have been, tell the miners who get the coal to produce the coal and work six days a week, and then his fellow creatures, the poor in London, would get their supply, and the distributor will see that he gets it.

25,381. Let me put this to you: Where do you get the information from that he will not work?—I know the miners.

25,382. My reply would be this: that since the control has been taking place the colliery owner has been indifferent and the miner has been getting less coal than he could, that is from the pit and not at Hull for the exporter?—I mean in the trade generally.

25,383. You make a statement that a man does not care what state the country is in and he refuses to work?—I say he is not working at the same capacity.

25,384. Do you know there has been a mines manager, an expert from Yorkshire, in that chair who has admitted that if a man works four days a week he works all he can in deep mines in Yorkshire?—It depends upon the mine.

25,385. I am talking about deep mines?—Such as the Yorkshire Main?

5 June, 1919.

MR. JOSEPH SHAW.

[Continued.]

25,386. I am talking about deep mines?—The President might not understand what the deep mines mean.

25,387. *Sir Leo Chiozza Money*: Why should we not understand what deep mines mean? You are a coal exporter?—You have not had experience. You had better tell them there are not many deep mines.

25,388. *Mr. Herbert Smith*: Where do you get your authority from that the miner does not care about the people and does not work?—In my conversation with the miners and going about in the trade.

25,389. Where has your conversation taken place?—In many places. I am not going to tell you.

25,390. You have made a damaging statement that ought to be proved or withdrawn?—I shall certainly not withdraw it or tell you.

25,391. Where did you get your authority from?—I shall not tell you that.

25,392. I will tell you there are four collieries in Yorkshire where the men have been asking to give notice because they could not get supplied with sufficient tubs?—This is entirely off the subject of exportation. If you refer to Waterloo Main Colliery at Leeds, will you tell me if for three months at Waterloo the men were giving the best to the country with the number of men in the mine and the quantity they turned out?

25,393. Now you have named Waterloo Main. My reply is if it rests with me I should withdraw every man from Waterloo Main until conditions were made to enable men to make respectable wages?—All right. I should like the Commission to understand a little with regard to the work of exporters. Some people are under the impression that an exporter when he has delivered the coal, say, in Antwerp or Rotterdam his services are at an end. The exporter in many instances is the actual distributor abroad. I will tell you two instances to show you the value of an exporter and what the Government could not do. I was in Frankfurt one day, this was in normal times. There I met the zinc magnate. He said: "My works are situated here and situated there and I consume nothing but German coal; I cannot buy your coal from England; I do not know the quality of the coal. I expect you may profess to send me

and supply certain coal, but what I want is entirely different; are you prepared to sell me steam?" "Certainly; I will sell you steam." "I know how much steam I want; I want to know what it is going to cost me." I took that order for a place in Northern Belgium for 70,000 tons per year at a price guaranteed delivered into the works, not at the port of Antwerp or Rotterdam on a delivered weight on the weight guaranteed into the works and not put on to the ship at Hull. On the result of the analysis and for every point in excess of that guaranteed and the same in calorific power lost I was fined 2½d. per ton. I put it to you that no Government and no committee would ever dare to have taken an order of that description, but if it had not been for the exporter, in this case myself, who had been willing to undertake that, then that trade would have gone to Germany, and at that particular time it was for Yorkshire slacks who were wanting orders very, very badly.

25,394. *Mr. R. W. Cooper*: Might I ask were you delivering coal at works inland in Germany before the commencement of the war?—Yes, we had our own depot at Rosenberg; we had our own depot at Rogonoburg, Worms and Mannheim.

25,395. You were delivering there to German buyers?—We opened a depot in Mannheim in order to capture the Swiss trade. It was no use our trying to do business with Switzerland and passing it through several hands. But we erected screening and electric discharging plant in Mannheim. We chartered and bought lighters to run from Rotterdam to Mannheim. We had our steamers running from Hull and Goole direct to Rotterdam. We had a clean sweep to Mannheim and into Switzerland. I believe I am not exaggerating in saying I was the first man to sell British gas coal in Switzerland and that had previously been German coal.

25,396. Was any money owing to you by German buyers at the outbreak of war?—Nearly £30,000 or £40,000.

25,397. That you have not yet recovered?—No.

25,398. *Chairman*: Did you tranship at Rotterdam?—At Rotterdam for Mannheim into lighters. *Chairman*: We are very much obliged to you.

(The Witness withdrew.)

Mr. ALFRED BROOKS, Affirmed and Examined.

25,399. *Chairman*: We have had a representative from Leeds, Birmingham and Glasgow. This is the evidence of Mr. Alfred Brooks, who is a member of the London Chamber of Commerce, Chairman of the Gravesend and Dartford Chamber of Commerce, member of the Council of the London Waterside Manufacturers' Association, Chairman of the Incorporated Association of Kent and Essex Authorities Owners and Traders, member of the Medway Conservancy.

Director of the following companies:—Associated Portland Cement Manufacturers (1900), Ltd. (a Managing Director); British Portland Cement Manufacturers, Ltd.; Tolhurst's Cement Works, Ltd. (Chairman); Trechmann, Weekes & Co., Ltd. (Acting Chairman); Stone Court Chalk, Pier and Land Co., Ltd. (Chairman).

He says:

"The London Chamber of Commerce having been invited to offer a witness on behalf of the coal users of the London Area, requested the London Waterside Manufacturers' Association, as representing the largest consumers of coal in their area, to nominate a witness, and that body at a General Meeting held on May 26th, 1919, unanimously passed the following resolutions:—

Proposed by Mr. Alfred Brooks (Associated Portland Cement Manufacturers (1900), Ltd.; seconded by Mr. W. Varco Williams (Messrs. Samuel Williams & Sons, Ltd.)—

That this meeting strongly protests against any proposals for the nationalisation of coal

mines, fearing that any form of State control of mines will increase the price of coal and seriously hamper the industries of the country in competition with foreign manufacturers in home and oversea markets.

Proposed by Mr. F. McLeod (South Metropolitan Gas Co.); seconded by Mr. E. Workman (Messrs. Doulton & Co., Ltd.)—

That the Coal Commission should make no report until due consideration has been given to the views of industries which are affected as consumers of coal. The appearance of comparatively few witnesses who represent consumers is not regarded as adequate to ascertain the effect on the industries of the nation of the proposal to nationalise mines.

Proposed by Mr. W. Varco Williams; seconded by Mr. F. C. Hill (Messrs. Locke, Lancaster, and W. W. & R. Johnson & Sons, Ltd.)—

That the inquiry held by the Coal Commission into this subject has been entirely inadequate, and that its report should not be accepted and acted upon by the Government until sufficient steps have been taken to ascertain the effect of nationalisation on the manufacturing industries.

And nominated Mr. Alfred Brooks to tender evidence on their behalf."

Could you tell me how many were present at the general meeting when those resolutions were passed?—It was a meeting summoned at very short notice. I did not count, but I should think there were about 30 there.

3 June, 1919.]

MR. ALFRED BROOKS.

[Continued.]

25,400. Out of a total of how many?—About 110 members we have altogether. I have a list here which I was able to tear out of an old report. Owing to the war, we have not kept up our registration and so on.

25,401. *Chairman:* This is the London and Waterside Manufacturers' Association, and it includes a very large number of well-known names: the Anglo-Continental Guano Company, Messrs. Armstrong, the Associated Portland Cement Company, Messrs. Baldwin, Messrs. Barclay, Perkins & Co., Messrs. Brunner Mond & Co., Messrs. J. & J. Colman, *The Daily Telegraph* Paper Mills, Messrs. Dorman, Long & Co., Messrs. Doultons, Messrs. Farmiloe?—Practically all the leading firms in London, you may say, who have waterside premises.

25,402. Anyone who has had the good fortune to go down the Thames could see those names any day. Mr. Brooks proffers the following statement showing what an important body the London Waterside Manufacturers' Association is. Now, will you kindly read your *précis* to the Commission?—May I say that this statement that follows is a matter that was inserted by the Secretary of the Waterside Manufacturers' Association, and he has taken certain statements which he puts into my mouth from evidence which I have given in other places. It is a little inconsistent, because it is not quite up to date with my own statement which is written further on.

25,403. *Chairman:* If you will kindly read it we will remember that.

"The manufacturers conducting industries at premises situated on the banks of the River Thames and on some tributary waterways in London formed themselves into a voluntary Association in the year 1902, and subsequently became incorporated in 1905. The aggregate capital invested in these industries is about 100 millions sterling. The industries are various, and they include the companies engaged in the business of gas supply. The manufacture of cement is in some ways the largest industry on the Thames and the Medway, one of the two companies with which I am connected (which itself is an amalgamation of 26 firms and companies), employs nearly 10,000 hands."

Those figures have been reduced in more recent years by great labour-saving appliances.

"The frontage of our premises on the river is about 8-9 miles. Several townships are dependent on the conduct and prosperity of the industry, and coal is an important integral factor in our cost. I apprehend, and I am of opinion that other large manufacturing consumers will also apprehend, that State control will tend to reduce the hours of labour and increase the cost of coal. That apprehension on the part of our own company and other manufacturing consumers may cause them to take the precaution of contracting ahead on an unusual scale. The gas companies will probably do the same, because coal is practically their only raw material, and the position of shipping companies in this connection is obvious. With this competition for supply under the fear of limitation of output, the effect on the price becomes obvious.

Owing to shortness of time it has been impossible to collect full information from all their members, but witness will hand in a statement showing what particulars have been collected."

There, I may say, we have got in a considerable amount of evidence from our members, but I find, roughly, that the consumption of the waterside manufacturers amounts to about five million tons per annum; of that, the gas companies use about three million tons, the cement companies about 1½ million tons, and the others, I suppose, round about the difference. I could give you the various returns.

25,404. I think that is sufficient. It puts the position very clearly:

"Witness also proffers a letter from the Secretary of the London Chamber of Commerce, under date 31st May, 1919, as following:—

"The policy of the Council of the London Chamber of Commerce and of the Chamber generally has always been against nationalisation of trading and industrial

undertakings and as regards the coal mines the delegates of the London Chamber to the annual meeting of the Association of British Chambers of Commerce on the 15th and 16th April, 1919, under authority given by the Council supported the following resolution which was passed by the Association:—

This Association is of opinion that nationalisation of the coal industry is not the best remedy for the alleged present wasteful methods of working or distributing but that efforts should be directed to economies and better management without introducing the new elements of waste that are certain to arise under nationalisation.

Note.—The Association of British Chambers of Commerce includes all the Chambers of Commerce in the British Isles. The Association arranges meetings at which delegates from all Chambers are present quarterly.

Witness can only speak personally of the cement trade."

Then I proceed to give the details with regard to the cement trade, and I set out the facts there, so that you may see that I am qualified to speak.

"The capital of the cement companies with which I am connected is as follows:—

A. P. C. M., Ltd., Issued Capital	£8,351,895
B. P. C. M. and Allied Works	4,758,837
	£13,110,722

It is estimated that the total capital invested in the cement trade in the United Kingdom is about £15,000,000, so that the witness is thoroughly competent to speak for the trade as a whole.

The total annual capacity of the various works throughout the country is as follows:—"

(a) This was taken from a return which was taken for the Government at the time they were controlling the trade. We were controlled by the Army Council. I should like to say, with reference to those figures, that that first figure, 1,200,000 tons for the A.P.C.M., Ltd. Works, was a figure prepared by myself. I took a conservative view, thinking the Government required to know what, if they supplied the materials and labour, we could produce at the time; consequently, I put the figures quite on a conservative basis. I know that the other figures have not been prepared quite in the same way; so that this is a Government return, 3,630,000 tons; and I go on to say that it was distributed as follows:—

	Tons.
"Thames and Medway Area	2,000,000
South Wales	500,000
North-East Coast	280,000
Midlands	350,000
Eastern Counties	100,000
Scotland	100,000
Ireland and Miscellaneous	300,000
Total	3,630,000

That is the estimated capacity. I think it is rather over-estimated. I think if you said 3,500,000 tons, it might be nearer the mark. Then I give the actual tons produced. (b) I have there set out the figures, that you may see that the deduction that I make from them is reasonable: "It will be seen from these figures that in normal times the actual manufacture, on an average, represents 90 per cent. of the total capacity of the works." If you take the A.P.C.M. figures in the pre-war time, it ranges about 1,100,000 tons to a little over, out of the capacity given here on this return of 1,200,000; so that 90 per cent. is well within the figure. And if you take the pre-war figures for the two companies, the A.P.C.M. and the B.P.C.M. and allied works, you get 1,300,000 and 1,200,000 tons out of 1,500,000 tons, so that, taking the two companies, 90 per cent. is a fair figure.

25,405. I am afraid we cannot go into the details of these figures. We can quite see them in your proof. I will read on:

"It will be seen from these figures that in normal times the actual manufacture on average represents 90 per cent. of the total capacity of the works,

3 June, 1919.]

MR. ALFRED BROOKS.

[Continued.]

The consumption of coal per ton of cement manufactured averages 10 cwts., consequently the cement trade in normal years use 1,633,000 tons of fuel per annum."

That is over 1½ million tons of fuel. Then you set out the average price of coal free alongside works: for the year 1906, 11s. 7d.; 1908, 14s. 1d.; 1910, 12s. 6d.; 1912, 12s. 9d.; 1914, 15s. 2d. Is that the average for the whole year?—It is the average for the whole year.

25,406. Then it has gone up enormously since the war: 1915, 21s. 5d.; 1916, 26s.; 1917, 24s. 8d.; 1918, 28s. 9d.; and to April, 1919, 33s. 9d. Now will you read on?—

"The average price for the seven years ending 1912 was 12s. 8d., or for the nine pre-war years 13s. 4d. per ton and showed but comparatively small variations, not amounting to more than 2s. per ton of cement from the highest to the lowest, whereas the present price of 33s. 9d. means an additional cost of 20s. 5d. per ton of coal, or 10s. 2½d. per ton of cement over the average cost of the nine pre-war years. The greatly enhanced prices we are now paying for coal are for qualities very greatly inferior to those purchased by us in pre-war times. The average calorific of the coal we used in our kilns were then well over 7,000, whereas now we have been compelled by the coal Controller to take large quantities of coal varying from 4,800 to 5,800 calorifics.

It may be said that it is not material to the manufacturer what price he pays for his coal provided all his competitors are in the same position as he and can pass it on in the price to the consumer. This, however, is not the position of the cement trade in the London area—that is, the Thames and Medway works. This is the original cradle of the industry and about five-eighths of the total manufactured is produced here. Owing to the increased cost of freight these works find it increasingly difficult to compete with works nearer the point of consumption, and any further increase in the price of coal cannot be passed on to the full extent. Moreover, the export trade is almost entirely done from the London area. The figures of this trade taken from the Customs returns are as follows:—"

Then I set those figures out:

(c) "Prior to the war it will be seen that the exports varied from about 600,000 tons to 750,000 tons per annum, or about one-third of the total production of the London Area.

The export trade has always been carried on in very keen competition with foreign makers, and the export price was seldom as good as that for the home trade. The export of cement was prohibited altogether last year by the War Office when they placed the cement trade under control, and we are consequently very much handicapped in regaining markets in which we were formerly supreme; for though it is true that for some time to come we may be relieved of the competition of German and Belgian manufacturers, these must eventually resume their trade, and any action now taken by our Government which may result in increased cost of coal will very seriously interfere with the export trade in cement. Scandinavian, American and Japanese cements are now competing very strenuously with us for our 1d and chief markets—India and the East, Argentine, Brazil and South America generally. An increased cost of over 10s. per ton of cement for fuel alone is a very serious item, and seeing that the Government themselves express the view that national control is not likely to produce the best results—

"It was perfectly true that if he were asked whether he was in favour of private enterprise or industry carried on under national control, he should answer that his belief was that in normal circumstances and in the case of most industries they would always get better results out of private enterprise than out of national."—Sir R. Horno (Minister of Labour), House of Commons, May 29th, 1918—

we greatly fear there, will ensue higher prices for coal.

The great increase in wages now paid has increased the cost of production by 6s. per ton, so that for coal and wages alone we get a combined increased cost of 16s. per ton. If to this increase a further increase in the cost of coal is to be added, in my opinion there is very little prospect of our regaining the export trade in cement. Should I prove to be correct, one-third of the factories on the Thames and Medway will have to close down.

The total number of men employed in the trade is estimated at about 12,000, over 7,000 of whom are employed in the Thames and Medway Area, 2,500 of whom would be thrown out of work if the export trade were lost.

Another very important feature from a national point of view is that cement is one of the chief heavy cargoes exported from the Port of London, and is mainly relied on by the shipowners for the necessary stiffen of their ships, and it would be a very serious matter for them if this traffic were lost.

In pre-war years the chief coals used by the cement trade, apart from that used for power purposes, were the Durham slack coals of high quality. Our experience of the action of the Coal Controller has shown us the very great danger of the most important requirements of manufacturers being entirely overruled by officials who merely consider the general convenience of their Department and can be very little influenced by the views of manufacturers as to the necessities of their own business. Other slack coals we have found cannot be used with the same advantage and production has been very greatly interfered with by the forcing upon us of coal quite unsuitable for our burning processes.

When some years ago an export duty was levied on coal, we found that the falling off in export of coal resulting from such duty lessened the supply of high quality slacks, and we suffered accordingly. We notice that very grave fears have been expressed by a number of witnesses before the Commission as to the effect on the export trade of nationalisation, and we strongly urge the Commission to hesitate before committing the country to so risky an experiment. If trade is once lost our experience is that it is almost impossible to regain it on a remunerative basis. The 20 years' experience of my company shows most clearly that to carry on an essential industry on too narrow a margin of profit is one of the most difficult undertakings that a body of men can be committed to, being neither good for their shareholders nor their employees, and so not helpful to the community."

Chairman: I am very much obliged to you.

25,407. Mr. R. H. Tawney: I see from one of those resolutions which was passed that you criticise the Commission on the ground that too few witnesses have been called representing consumers. Do you know how many witnesses have been called representing consumers?—No, I do not. You must remember that that was last Monday week.

25,408. If you say too few witnesses have been called it is relevant to know how many have been called?—I believe at the time we passed the resolution none had been called.

25,409. Perhaps you will take it from me that you have been misinformed?—Quite so. I am not responsible for that statement.

25,410. Then part of the resolution falls to the ground and with it the inference based upon it. You say further that any form of State control would increase the price of coal. Do you suggest that the action of the Coal Controller has increased the price of coal?—Very materially to us.

25,411. Are you not aware that the general body of evidence which we have received has been that, whatever the defects of the Coal Controller, he has prevented the price of coal rising as high as it would otherwise have risen?—I know that that has been stated here, but I can give you a case, if you wish it, in which the Coal Controller acted in a way that the coalowners themselves would never have acted.

25,412. I should think that is very likely?—May I give you the case?

3 June, 1919.]

MR. ALFRED BROOKS.

[Continued.]

25,413. Yes, please do?—Because of the difficulties arising from the war some months ago they commandeered the better class small coal which we had contracted for in order that the public utility companies, the gas and electric light companies might have it. The Coal Controller told us that we were to have heaps of slack that had been lying for years at the pits, coal that had been wrought long before the present high rate of wages had come into force, and which obviously had only cost the colliery companies a comparatively small sum. He insisted that we should pay the full price—I think it was 37s. 6d.—for that slack that had been growing cabbages and weeds and what not for years—that we should take that and try and make cement with it.

25,414. You do not dispute the general statement that the Coal Controller has kept down the price of coal?—I agree; these have been abnormal times altogether.

25,415. As to these resolutions, had you any evidence before you as to the effects of nationalisation? What kind of evidence were the resolutions based upon?—They are based upon the opinion which we have formed upon a matter of very great national importance.

25,416. Quite so. I only want to know if you can help us. You have expressed an opinion, and clearly the worth of the opinion must depend partly on the evidence on which it is based. Have you any evidence on the subject, or had the body which passed the resolutions any evidence before it?—Probably every business man in this country is endeavouring to form a just opinion upon the facts that have come out in connection with this enquiry.

25,417. That is to say, the evidence you have had was the report of this enquiry in the Press?—Yes.

25,418. Is that the only evidence you had?—Beyond the telephones and the telegraphs, what evidence have we in this country as to what nationalisation can do?

25,419. Quite so. I want to suggest that this resolution was not exactly a scientific conclusion based upon an exhaustive study of the evidence. What do you rely upon in ordinary times to keep the price of coal down if State Control is removed?—I think the figures that I have put in show that practically the natural play of circumstances kept coal, as far as we were concerned, at a pretty steady price. From 1906 to 1912 you scarcely got a fluctuation amounting to 2s., and it is not till 1913, when we had the coal strike, or, at any rate, we had a very disturbing period with port strikes, and one thing and another, which to a certain extent increased our cost then.

25,420. Do I understand that in ordinary times you rely on free competition to keep the price down?—Quite so.

25,421. You, I think, are a member of a combination, are you not?—My company has acquired a good many concerns.

25,422. I only use the description which is given of it in the report of the recent Government Committee, which speaks of combinations of companies carrying on trade in tobacco, wall-papers, salt, and cement as being powerful combinations which are effective to control output and prices. Am I to understand that, while you practice combination, you desire that coal should be supplied on the terms of free competition?—I do not object to any amalgamation of collieries if it will tend to mean efficiently supplying the public. I do not think that the national control of them is going to effect that object.

25,423. You have advised us that free competition is the ideal, but I suggest to you that example is more effective than precept, and as your concern is officially described to be a powerful combination in a position effectively to control prices, is it quite reasonable for you to rely on free competition to supply you with cheap coal?—You have given me a very long question to say Yes or No to. I say that I do not agree with the official statement of our position. Our experience has been that unless you can control the whole trade, you cannot control prices, and there is a sufficient

amount of trade that is not controlled by us to give you very effective competition.

25,424. What proportion of the trade do you control?—According to this Government return, apparently we control 2,700,000 tons out of 3,600,000 tons; or, as I think it should be, about 3,500,000 tons.

25,425. Roughly, two-thirds?—Yes.

25,426. Can you tell us the kind of reason which led to that consolidation or combination?—There was the excessive competition in times of depression that rendered the trade unremunerative.

25,427. Did you find that it made it more remunerative—do you find combination of advantage in any way?—The experience of my company has not been very encouraging.

25,428. Do you wish to return to free competition?—I think personally I should have been better off if I had not sold my concern to the company.

25,429. Still combination goes on; there is nothing to prevent it breaking up?—If we have absolutely parted with it, lock, stock and barrel?

25,430. But combination still continues, does it not?—The company is a solvent concern, and therefore it has no reason to distribute its assets.

25,431. Would it not be true to say that combination of that kind makes possible certain technical economies?—Yes.

25,432. Has it not occurred to you that if that partial unification which has been achieved in your industry has these technical advantages, a similar unification in the coal trade would have somewhat similar advantages?—Possibly.

25,433. If we follow the precedent of this combination, are we to conclude that on the whole it would be a good thing if we had greater unification in the coal trade?—As long as you have those in the conduct of the industry directly interested in its success, I think you will secure the best results.

25,434. At the same time, if you get unification, you obviously get what is described as increased power over prices; I do not say absolute power to fix prices?—It depends. You cannot get over the laws of supply and demand. If there is a greater demand than there is supply, you have a very powerful lead. If there is a greater supply than there is a demand, the man who is hawking a small quantity really fixes the price.

25,435. I suggest that combination is one of the ways of regulating the law of supply and demand?—It may to a certain extent, but it does not effectively.

25,436. Suppose you desired to realise these technical economies in the coal trade, how is the consumer to be protected? He is not protected by free competition any longer. Does it not point to some kind of State control?—No, I do not think so.

25,437. Are you prepared to see a combination in the coal trade without creating any apparatus to protect the consumer?—I think that if the amalgamation in the coal trade is such that they have a personal interest in the prosperity of the country that they would not inordinately increase the prices.

25,438. Is it the ordinary experience that monopolies put the interest of the consumer first?—Many monopolies have succeeded in greatly reducing the price to the consumer.

25,439. The question is whether they have at the same time reduced it as much as the economies that they have realised enabled them to do?—They have probably given a cheaper supply to the public than if it had been a Government department.

25,440. What I want to get at is what is the kind of moral that we are to draw from the business with which you are associated. I suggest to you that in your business you have found combination profitable. I suggest to you that that shows that a similar unification might be desirable in the coal trade, and that, if that is so, it is necessary to create some machinery to protect the consumer against paying extortionate prices?—I think that the consumer will take care of himself if he is dealing with private concerns.

25,441. Do you think the small householder in the East End of London would be protected?—No; I agree with that.

25,442. After all, you represent a pretty powerful class of consumers; but what about the six million consumers of household coal in London?—My way of

3 June, 1919.

MR. ALFRED BROOKS.

[Continued.]

dealing with that would be, I would allow the Corporations to supply coal.

25,443. Then what you suggest is that, so far as the household consumer is concerned, a public authority should intervene to buy coal in bulk and distribute it as cheaply as possible?—Yes.

25,444. *Sir Adam Nimmo*: I notice that you gave your price in 1919 as 33s. 9d.?—Yes.

25,445. In the month of April?—Yes.

25,446. Where did your coal come from before the war?—For our Thames and Medway supplies it came chiefly from Durham; we had a little from Yorkshire.

25,447. Do you know what the charges were on that coal delivered at your works, take it in 1906?—The freight, I think, used to be round about 2s. 3d. to 2s. 10d.

25,448. Where have you been getting your coal in 1919?—It is all rail-borne coal practically now; we have to take whatever is sent to us. I really do not know where it does come from.

25,449. Do you know the charges on that coal?—No.

25,450. I suppose the charges would be considerably more than on the coal you received in 1906?—Yes.

25,451. The coal that you are receiving in 1919 is sent you by the instructions of the Coal Controller?—Yes.

25,452. And is not so suitable?—No; we have had to take a very low quality of duffs, which in some cases are almost impossible to burn in our kilns. We have had as much as 28 per cent. of ash and 14 per

(The Witness withdrew.)

Mr. FREDERICK MILLS, Sworn and Examined.

25,459. *Chairman*: Mr. Frederick Mills is the director of one of those composite companies producing both coal and steel and iron, a very large company, and his *précis* is as follows:—

“Frederick Mills proves that he is Managing Director of the Ebbw Vale Steel, Iron, and Coal Company, Ltd.; of John Lancaster and Company, Ltd.; of Powell’s Tillery Steam Coal Company, Ltd., and a Director of the Newport-Abercarn Black Vein Steam Coal Company, Limited; a member of the Institute of Civil Engineers; of the Mechanical Engineers, and a Member of Council of the Iron and Steel Institute, and has been at Ebbw Vale over 20 years, the first 11 as General Manager, and the last 9 as Managing Director of the Company.

That the Ebbw Vale’s Company’s operations commenced about 1780, consisted of the manufacture of pig iron and bar iron from native iron ore and coal; that the operation has been practically continuous ever since; that they now give employment to approximately 13,808 men, and with the subsidiary companies, of 20,108 men, and that the total wages paid by the three associated companies during the year ended March 31st, 1919, were £3,739,829.

That the area of the whole mineral estate amounts to 14,335 acres, of which 3,316 is freehold and 11,019 leasehold. That the surface area of the company’s and of its two subsidiary companies estates amounts to 5,610 acres, 3,378 acres of which are freehold and 2,232 are leasehold.

That the total coal output in 1914 was, for the Ebbw Vale Company, 1,976,035 tons, and in 1919 was:—

	Tons.
Ebbw Vale Company	1,591,993
John Lancaster and Company	481,322
Powell’s Tillery Company ...	716,812

That the output of coke for the year ended 31st March, 1919, was 313,393 tons, and of pig iron 237,272 tons; and that new pit sinkings, coke oven and blast furnace construction has been, and is, in process for some years past, and when the present schemes are completed it is estimated they will provide a

	Tons.
Coal output of	4,700,000
Coke output of	575,000
Pig Iron output of	450,000

cent. of water in the coals that have been sent to us. 25,453. So you will be very anxious to get back to pre-war days as far as the quality of your coal is concerned?—If that is possible.

25,454. How do you expect to get back your export trade? I notice that in 1918 it was very much reduced?—It was about this time last year that the War Office decided to stop the export of cement.

25,455. I see in 1917 your figures were about half what they were?—During the war they were getting less and less. They could not allow us to use ships for the export of cement.

25,456. Do you see your way to get your export trade restored as long as the present level of prices remains?—No.

25,457. You cannot control your export price for cement?—We have to compete with America, Japan and Scandinavia. Scandinavia is probably in the same position as we are. As far as America is concerned, we believe their coal supplies are well under £1 as against our 33s., so that they have a very decided advantage, and that probably helps them in freight as well.

25,458. You have had some experience of Government control in coal; do you think you could draw any conclusions as to what would happen under nationalisation from your experience?—I think the circumstances were so abnormal that it would not be quite fair to make any deduction from that, but we have had experience of Government control of the cement trade, and I should be very sorry to have to carry on an industry long under such restrictions.

(The Witness withdrew.)

That the Company owns and works 2,000 acres of freehold ironstone in Northamptonshire, about to be used at Ebbw Vale.

That the present capital of the company is £4,150,000 divided into £1,200,000 Debentures; £1,200,000 Preference, and £1,750,000 Ordinary shares. That £2,582,095 has been spent on development in the last five years (in addition to large sums previously) and that an amount exceeding £1,500,000 remains to be spent on the schemes now in hand.

Proves that the whole return on the capital of the Ebbw Vale Company averaged 3½ per cent. over 50 years, that for 20 of those years only an average of ½ per cent. was paid, and that stagnation and low wages resulted.

That the subsidiary industries at Ebbw Vale embrace galvanized steel sheets, weldless steel tubes, weldless steel couplings, coke oven and blast furnace bye-products, iron and steel castings, and engineering works. That part of the development consists of a large central electric generating station run on waste gases from blast furnaces and coking ovens; that the steel mills, several collieries, and other works are independent of steam boilers for power purposes. That a ring main extending over 15 miles by 5 is in course of completion for the ultimate purpose of providing electric power for all collieries and works in the area.

That the Ebbw Vale Company’s present and future requirements of coal at their works and collieries are as under:—

	Present requirements per week.	Future requirements per week.
	Tons.	Tons.
Collieries	1,460 ...	1,460
Coke Ovens	13,300 ...	20,000
Iron and Steel Works ...	2,300 ...	2,800
Sheet Mills	230 ...	230
Tube Works	55 ...	55
Electrical Generating Station	1,200 ...	1,200
Locomotives	270 ...	270
House Coal	1,000 ...	1,000
Sundry Departments ...	230 ...	230
	20,545 ...	27,245
Per annum	1,027,250 ...	1,362,250

3 June, 1919.]

MR. FREDERICK MILLS.

[Continued.]

These figures are based upon normal conditions and fifty working weeks per annum, and are in terms of Dry Coal.

That the collieries and works are inextricably interlaced both in site, in traffic, in power, and distribution of supplies and output.

That he is opposed absolutely to nationalisation as he understands the term, or to any scheme of dual control that will remove the last word from himself as Managing Director.

He puts in records of the proceedings of a conference held on December 23rd, 1918, and of subsequent meetings, and that he has (on behalf of the Board) invited a prominent Trades Union leader to join the Board as an ordinary Director, with all the rights and privileges thereof.

That he believes that "Labour Unrest," existing before the war, and now intensified, is due to excusable and preventible ignorance on the part of the workpeople, and to their want of appreciation of the part played in industry of a dividend upon capital."

I will now circulate these addenda that I have to Mr. Mills's proof. The first memorandum is a memorandum prepared in connection with an invitation of a Labour representative to join the Board of the Ebbw Vale Company, which is dated the 18th of February, 1918. I want you to explain that. You set out there the reasons why you extended that invitation to him?—They are all set out in the document.

25,460. The document contains the reasons?—Yes.

25,461. I will ask the gentlemen of the Commission to look at that. It begins:

"Labour unrest was greatly in evidence before the war, and is deep seated.

The present turmoil is mostly due to mismanagement, unavoidable perhaps, but still mismanagement. There are at least four departments of the State endeavouring, largely in conflict with each other, to deal with this one problem.

Labour's chief complaint is, shortly, that it does not receive a fair share of the products of our industrial system, and for want of a better reason blames Capital."

I want you to be kind enough to tell the gentlemen of the Commission quite shortly, because they will read this later on, the gist of your argument there?—Perhaps I might read it. It is quite short.

25,462. Very well. I have read as far as paragraph 3?—"There is much loose talk about Capital as a system, not only in the Labour world, but also in other circles not directly brought into touch with the relationship between Capital and Labour.

Capital is credit—the promise to pay; it cannot long remain stagnant; therefore, if Capital is productive, there follows progress; if not, then disaster.

Capital is not necessary in any country; there are countries where there is little or no capital, but in them there are no comforts and no social development.

If therefore these be desired, the capitalistic system alone can produce them. History, both ancient and modern, records no instance of progress without it, and where, as has frequently happened, capital has been destroyed, it has had to be reorganised.

Remedies for labour unrest have been suggested and, in some cases, tried, in order to obtain for labour a direct interest in the capitalistic system, notably profit-sharing, doomed to failure because, firstly, the units of labour are not like shares—fixtures; and secondly, it is not possible to share losses.

I suggest the only real remedy is for labour to become capitalists also, and take a share in management.

It is easier than it seems. The capital of industrial companies is usually divided into debentures, preference, and ordinary shares. The debentures do not carry any voting power at general meetings, but the preference shares usually carry a modified voting power, such as one vote for every five shares held.

The voting power is, as a rule, held by the holders of the ordinary shares.

In the case of a company with, for the sake of argument, £100,000 each debentures, preference and ordinary shares, £60/70,000 holding in the company gives control of everything, and seeing that hanks, as a rule, are willing to lend 50/75 per cent. of the market value of the shares, it would be possible for a person, or an entity, to control such a company for the sum of, say, £40,000.

It is part of my scheme, however, that labour should not, to begin with, seek to control any company, but should take a financial interest in many, where the directors are prepared to invite a representative of labour to sit with them on the board of management.

In this way, I think, for comparatively a small amount of money, labour can obtain a direct insight behind the scenes, would know of the difficulties and possibilities, and, in short, would be able to exercise, I hope, a wise supervision of affairs which at present they only see from one side of the table.

There are workmen on our books earning £500 or £600—that was written in October last—"a year who have little or nothing to shew for it. Many men in other walks of life with that income are shareholders in public companies.

The ordinary share capital of the Ebbw Vale Company is £850,000; the wages paid last financial year amounted to £1,750,000, and the interest and dividends paid (5 per cent. debentures, 6 per cent. preference, and 15 per cent. ordinary) amounted to £173,000, or, roughly, one tenth, which, if added to the wages paid, equals 2s. in the pound.

The Ebbw Vale Company's case is fairly typical of the industries where labour is the largest item in the cost, and where the amount per annum is about the same as the entire capital—such companies are numerous, and their output is usually of a national and essential character. I suggest this type for experiment rather than any of the following:—

Railways.

Example.—Ordinary Capital ...	£37,000,000
Wages	7,500,000

Gas.

Example.—Ordinary Capital ...	£16,000,000
Wages	1,500,000

Finance.

Example.—Ordinary Capital ...	£2,000,000
Wages; represented by a few clerks and the charwoman.	

The process I suggest is the formation of an investment fund by the trades unions, on the lines of investment trust companies, where each member contributes his savings to the common fund and receives his dividends (if any) in proportion. The trades unions would nominate a member, or members, on the board of management.

To make a start, labour must reverse its policy. If labour employed the same vigour of a few years ago when it counselled the capture of councils and other governing bodies, it would soon capture the control of industry, and then we should have the whole public opinion and interest in this country deprecating waste, thriftlessness, insobriety and sloakness, whilst the conditions of employment, housing and temperance would receive greater attention and make for progress and efficiency.

Efficiency will be of the greatest importance after the war, and there is nothing inconsistent with efficiency in high wages and shorter hours, rather otherwise. We cannot boycott the products of our present enemies for ever; the word 'Peace' cannot contain such an element, and if it did there are a thousand ways of avoiding it; the greater their necessities, the greater their effort.

Speaking for myself I am willing to try this new plan—the war has shown that labour is capable of taking a share in the government of the country. On shell factory and other boards I have found labour to be capable and efficient, and I do not fear it would be equally so in industry against world-wide competition."

3 June, 1919.]

MR. FREDERICK MILLS.

[Continued.]

Since then, our capital has been materially increased, and I have worked out exactly how the control of the Ebbw Vale Company could be secured by the workers, if they cared to do it. I have had the figures printed, and to sum up, the control of the company could be obtained if each of the 13,808 men at present employed invested or purchased 72 ordinary shares in the company. The ordinary shares are £1 apiece to-day. They would have to pay more than £1 for them—call it £100 per man—which would secure the control of the company by the whole of the workers. They could then elect their own management and take all the profits and pay such wages as they like to pay. That is, in short, my solution for labour unrest, and I think it is one well worth trying. At all events, we have gone so far as to invite, as my *précis* says, a very prominent trade union leader to come on to our board as an ordinary director with all the rights and privileges thereof, and I am now awaiting his consent. I ought to say, perhaps, that this document which I have just read was drawn up in February of last year and accompanied my letter of invitation to the gentleman in question, but at that time he was not in a position to accept the office. The invitation has since been repeated, and, as I say, we now await his consent.

25,463. *Mr. R. W. Cooper*: What is your qualification for a directorship in your company?—3,000 shares.

25,464. Of £1 each?—Yes.

25,465. *Chairman*: Now will you come to your next memorandum on labour unrest?—Yes. In regard to this memorandum, I included it, hoping, rather, that it might have been circulated beforehand. It is a copy of an article I wrote last October, and it contains my views, but they are very largely a repetition of the document I have just read. I will read it, if you wish, and it will not take very long to read it.

25,466. *Chairman*: Very well, will you read it?

“ Much has been written on this subject, but very little that is really convincing to the man working for weekly wages, which in pre-war days were often precarious and not infrequently inadequate; there was little provision for enforced idleness arising from ill health, and for natural or premature old age. On the other hand there were large numbers of men in constant employment earning wages far in excess of the incomes of many of the lower middle classes, who, having the initiative of saving and investing, saved and invested, whereas the working men had neither been taught nor encouraged to do either. Many of them could have worked more regularly and earned more if they had been taught the value of thrift.

Mr. W. H. Mallock has repeatedly shown by the evidence of Government Returns how comparatively small is the return on capital and how many times it is “turnd over” in the payment of wages, and yet hardly anything else is preached by labour organisers that the doctrine that capitalists are avaricious and that labour is entitled to a larger share of the proceeds of industry.

During the war this doctrine has been pushed for all it was worth, so much so, that, in order to maintain industrial peace at home, Government has been compelled to grant increase after increase to the wages in essential industries until we have arrived at the position that all essential commodities are now subsidised, that is to say, their cost is greater than the selling price.

Now these things are possible, and indeed imperative, during a great war, but they cannot stand the light of the fierce post-war conditions that will certainly arise. The problem before us is how to meet them.

One post-war condition is certain; labour will resist any reduction of their war-time wages, which in this country are now roundly what they were in America before the war. The writer is of opinion that there is no need to reduce wages from their present standard, always provided they are accompanied by an efficiency corresponding with it. Yes, ‘there’s the rub.’

All employers will agree that there is no more remarkable result of war-time conditions than the loss of efficiency—in its broadest sense, and arising out of lost time, slacking, substitution, and other causes—and unless our pre-war efficiency is restored, aye, improved upon, certain disaster awaits us, industrially.

Now, it would be folly to rely upon the return of our gallant sailors and soldiers to their normal employment, many of the very best—in every sense of the word—being the first to volunteer, have paid by death and mutilation the penalty of patriotism.

They—God rest them that are gone and sustain them that are left—are not available. The requirements of an army do not afford a training suited to industrial life—(the writer is aware that expression is contrary to that held by many people *before* the war); in any event, millions of men are to return to civilian life conscious that they stood between us and the deluge for ‘a bob a day,’ and they will want a taste of the good things their friends who stayed at home have been enjoying.

Another post-war condition is equally certain; whether this country obtains an indemnity or no, the war has got to be paid for, and that can only be done by an enormous increase of profitable industry, far and away beyond pre-war figures.

It can be done, but only if the working classes are convinced it is to their advantage to earn every penny of the unreduced war level wages which can also be paid in the process. Millions of men firmly believe ‘that by their sweat, the rich become richer, and the poor become poorer’; and it is of little use to tell them ‘they don’t.’

The result not only desired, but vitally necessary, can only be obtained if capital and labour work in complete harmony for a common purpose. How then is this atmosphere to be obtained?

First of all it is necessary that a few postulates be stated and, what is more important, accepted:—

- (1) Mankind without capital is incapable of procuring for itself more than bare necessities to maintain life, and these precariously.
- (2) There are countries to-day possessing boundless mineral and other resources which, for want of capital, support a sparse population in primitive manner, from hand to mouth.
- (3) It is not necessary for mankind to live in other than primitive manner, but if it be thought desirable, then it is only possible by the introduction and expansion of remunerative capital.
- (4) History affords no instance of material progress except by the introduction of capital.
- (5) History *does* afford instances of disaster where capital is destroyed or rendered unremunerative.
- (6) Unless capital is reasonably remunerated it must perish.
- (7) The State possessing no incentive to initiate, can foster but not create capital.

Labour must assimilate capitalism into its blood. Trades unions must invest in the share capital of our industries and be represented on the boards of management.

Labour has shown in this war that it is capable of directing industries. Labour must be better educated; the educational system must be completely overhauled; teachers must be selected because they knew something and can teach it; they must be better paid; schools must be more hygienic, and classes smaller; games and physical culture must be encouraged, and, above all, children must be taught to be obedient, to be honourable, and to be thrifty.

In the workshop, the workers should never be penalised because they earn too much money; piece-rates should *never* be reduced; workers should be encouraged to *earn* the largest penny, and be taught how to invest their savings. How many working-men, until the introduction of war bonds, knew what to do with their first five or ten pounds of surplus earnings?

3 June, 1919.]

MR. FREDERICK MILLS.

[Continued.]

There is no half-way house, profit sharing is useless in most industries; all capital has come from small beginnings, capital being merely the surplus saved after outgoings of all sorts are met; if profitably invested, it makes for expansion and progress; if squandered on unnecessary objects, it is lost.

The cure then is for working men to invest their surplus earnings in the industries of their country, preferably their own industry. In one company of my acquaintance there are ten thousand shareholders with an average holding of £400, many of them living at addresses which indicate that they themselves are working men, and there are fifteen thousand work-people; it is not beyond the dreams of possibility that the workpeople should own the capital of the company—an average of about £260—and thus secure every penny of the proceeds of their own industry.

How seldom, however, do we find workmen owning shares in the company they work for? They are not encouraged to do so either by Trades Union leaders or by company directors.

The writer firmly believes that this plan should be tested; many industries, those employing large numbers of hands in proportion to the capital employed, lend themselves to it. Here is an opportunity for a group of wealthy men to start an industry by advancing, say, four-fifths of the capital, to be redeemed over a period by a fixed percentage of the wages earned; with such an incentive, can it be doubted that it soon would be redeemed?

Such a trial would at all events indicate whether working men truly want the share the capitalist now gets, and work for it, or merely wants to dwell in idle comfort at someone else's expense!

The writer is prepared to take a hand in testing the worth of his belief that the working classes are not vicious, but merely ignorant of the way out of industrial strife."

25,467. *Mr. Frank Hodges*: I will not ask for the name of the gentleman whom you invite to sit on your directorate, but I think I know him and I can anticipate the answer which you will get. With regard to this very interesting document, part of which I appear to have read before somewhere, is this not an extract out of a paper which you read before a society at Newport?—Yes, in 1913. Some of it is very much the same. My views have not changed.

25,468. I thought I was familiar with the contents. You have recently had a strike at the Ebbw Vale Collieries, have you not?—Yes.

25,469. How long did it last?—Three weeks.

25,470. What was the output of coal lost in those three weeks?—I suppose 50,000 to 60,000 tons.

25,471. How did it come about that you had a strike lasting for three weeks involving that loss of coal?—I do not understand your question quite. Do you mean what was the strike about?

25,472. What was the cause?—I do not know.

25,473. Suppose I put it to you that the cause was your desire to cut piecework rates, what would your answer be?—That is not correct.

25,474. Suppose the miners' leaders for the district were to say that, would that still be incorrect?—He did not say so to me.

25,475. What was the strike about?—It is most difficult for me to tell you, because I asked several of the leaders, and until the conference we held we got no reason at all. Then it was alleged to be the shortage of rails and pit wood, both of which, I believe, were quite beside the mark. In point of fact, it was one of those strikes to which I always object. It was not engineered by the miners' leaders at all, but it was one of the strikes that is run by one of the sub-luminaries. In this case a man rejoicing in the name of "Rowley Jones," and one who happens to be what the Americans call a coloured gentleman, got the whole of the 5,000 or 6,000 miners by the heels and induced them to come out on strike for no earthly reason. They came out without notice, without my knowledge and without the knowledge of the miners' leaders.

25,476. Then I should despair of the intelligence of the Ebbw Vale miners and all the miners, if that

were the case. It is generally assumed the Ebbw Vale miners are a very intelligent class of men?—I think sometimes if you promise a man the moon he is disposed to say, "Well, let us have a try for it."

25,477. Well, let us be serious about it. Do you think those men struck for three weeks without some sort of a grievance?—I know they struck without the knowledge and consent of their own leaders.

25,478. Do you think they would have held out for three weeks if there was nothing in their grievance?—I do.

25,479. It is very customary for men to strike without the consent of their leaders. That is one of the problems which we have to face?—Yes. I am out to support the miners' leaders.

25,480. Do you say these men struck without a cause?—Without a cause, or a reasonable cause.

25,481. You said without a cause?—There was no cause given at all.

25,482. And they went back to work without having done anything?—Absolutely.

25,483. Without having an interview?—No; they had an interview with me, and I have a report of it here.

25,484. What are the considerations upon which they resumed work?—May I read it to you?

25,485. I should like to hear it if it will not detain the Commission too long?—It appears in these Minutes*, which I hope have been circulated.

25,486. What are they; are they shorthand notes of the proceedings?—Yes. This was at the Ebbw Vale Company's offices.

25,487. *Chairman*: We have not seen them.

Witness: They have been sent out.

25,488. *Mr. Frank Hodges*: Are they endorsed by the signature of the workmen's representative as being accurate and correct?—Yes.

25,489. Are the signatures attached to them?—No.

25,490. Why not?—They can be if you wish. They were sent to the miners' agent, Mr. Evan Davies, before they were printed, and he reported them as correct.

25,491. Were they signed?—I cannot tell you whether the letter was signed.

25,492. That is very important if you are going to put anything in evidence?—I think you will have to take it from me that the miners' agent agreed that this was correct.

25,493. I should like to see Mr. Evan Davies sitting where you are, or side by side with you, and then I could accept them?—I have no objection to that. I am trying to pick up the particular point in the Minutes. Mr. Evan Davies at one part in the proceedings said the strike was a mistake: the men came out without his knowledge and consent, and they returned unconditionally. That is the purport of this document.

25,494. Of course I should like to read it through?—Quite so.

25,495. *Mr. Frank Hodges*: Sir, are these Minutes being circulated?

Chairman: Yes. I have not seen them until this minute myself. What Mr. Evan Davies says is at page 7.

Mr. Frank Hodges: It is very difficult to pick up the sense because Mr. Mills in a preceding paragraph says: "We are not on this side without guilt too." May I make a suggestion, Sir?

Chairman: Yes.

Mr. Frank Hodges: Might we have time to read through this report, and if there is any matter any of us wish to call special attention to, Mr. Mills might be recalled on this particular subject. It was a strike of considerable importance.

25,496. *Chairman*: Yes. (*To the Witness*.) Will you be in London to-morrow?—I am entirely at the disposal of the Commission at any time.

Chairman: Then we will do that, certainly. We will recall Mr. Mills to-morrow and perhaps you might postpone your cross-examination, Mr. Hodges.

Mr. Frank Hodges: Yes.

(*The Witness withdrew.*)

*See Appendix 74.

3 June, 1919.]

MR. ALFRED SIMEON TALLIS.

[Continued.]

Mr. ALFRED SIMEON TALLIS, Sworn and Examined.

25,497. *Chairman*: You are a well-known South Wales Colliery Director and you speak with regard to housing in South Wales. I think you are the Chairman of the Monmouthshire and South Wales Coal Owners' Association; Managing Director of the Tredegar Iron and Coal Company, Limited, the Oakdale Navigation Collieries, Limited, and the Markham Steam Coal Company, Limited, and Chairman of Directors of the Abercromway Gardou Villages Association, Limited and the Oakdale Village Estate, Limited?—Yes.

25,498. Will you kindly read your *précis*?

"Whilst I contend that the responsibility for the provision of houses does not rest upon the owners of collieries in any larger degree than it does upon the owners in any other industry, or corporate body, whether privately or publicly owned, but is eminently the duty of the public authorities or the State, it seems desirable that in view of certain evidence given before the Commission in regard to the housing of colliery workmen, that examples should be given of what has been done by very many colliery companies to meet the shortage of houses, particularly in the newer districts which have been developed in recent years by the sinking of new collieries, and where there was a shortage of housing accommodation.

For some years prior to 1910 there was pronounced activity in the building of workmen's houses in the South Wales area by speculative builders, building societies and workmen's building clubs, and from these sources, assisted to some small extent by the colliery owners, the necessary housing accommodation was forthcoming.

For some reason which it is difficult to assign during 1911, 1912 and 1913, these sources of building operations fell off seriously, and in the newer colliery districts which were developed subsequent to 1910, the colliery companies undertook the building of houses for their workmen on a much larger scale than was formerly the case.

Whilst I have a general knowledge of the housing conditions in the mining area of South Wales, it seems desirable that I should deal more particularly with the provision of housing accommodation with which I am closely connected, but which may be considered as being typical of very many of the colliery districts in South Wales.

The number of workmen employed at the collieries and works for which I am responsible is 10,250.

The number of houses owned by my companies is 720, made up as follows:—

Houses with 1 room—None.

Houses with 2 rooms—7, or 1 per cent.

Houses with 3 rooms—None.

Houses with 4 and more rooms—713, or 99 per cent.

Houses with bathrooms supplied with hot and cold water—459, or 63 per cent.

At the Oakdale and Markham Villages, in the Sirhowy Valley, at least three bedrooms and a bathroom are provided in each house.

In addition to their own actual building operations, many colliery companies have financed building societies and clubs composed of their workmen by means of loans at a low rate of interest.

It is of interest to note that in the town of Tredegar, which comprises some 25,000 inhabitants, occupying 3,370 houses, and which is typical of many South Wales mining towns, of 1,355 houses built upon the Tredegar Company's freehold estate, the ownership is as follows:—

Workmen, their widows and families—1,019, or 76 per cent. of the whole.

Tradesmen, *i.e.*, Grocers, Drapers, &c.—236, or 17 per cent. of the whole.

Other persons—90, or 7 per cent. of the whole.

This district is typical of the other portions of the town, and, speaking with a close personal knowledge, I estimate that at least 60 per cent. of the houses are owned by workmen, their widows and families. This equally applies to most of the mining districts in

South Wales, and in the case of the Rhondda Valleys, Carmarthenshire and the Western portion of Glamorganshire, the percentage of houses owned by workmen, I estimate to be in the neighbourhood of 70 per cent.

I find from Returns obtained from 163 colliery companies in South Wales, the following:—

Total houses owned or leased by colliery companies:—

With 1 room—Nil.

With 2 rooms—153

With 3 rooms—706

With 4 rooms or more—14,075

Total—14,939.

Owned or built by colliery workmen:—

With 1 room—Nil.

With 2 rooms—30

With 3 rooms—22

With 4 or more rooms—12,233

Total—12,335."

25,499. Will you tell me which of those houses built by workmen were built by means of Building Societies, or Building Clubs?—Either through Building Societies or purchased by themselves direct.

25,500. Do they build so many cottages new under the Building Societies?—I am sorry to say, No.

25,501. What is the reason of that?—Largely the increased cost of the houses which I deal with to some extent later on.

25,502. How long has that Building Club system been going out of use?—I refer to 1911, 1912, and 1913. It is from that time, shortly after the Budget of 1910, that that system of building seems to have dropped out. The speculative builder seems to have disappeared at that time. It is difficult to assign a reason for it.

25,503. While you are on this, are many of those houses built upon land which the landowner has a right to let down?—Yes, the majority of the land would be in that position.

25,504. The position would be that a man might build a house, and there might be a subsidence, and it might get cracks in the walls, and he would not be entitled to compensation?—In many cases that would be so.

25,505. Do you think that has anything to do with the people not building their own houses?—No, I do not think there has been sufficient reason for that.

25,506. What is your view with regard to that system? We have had some evidence with regard to it here, and I have the report of the debate in the House of Commons. What is your view on that question?—What ought to be done, if anything, to remedy it?—I am in agreement that the loss should not necessarily fall upon the owner of the house.

25,507. Who ought it to fall on?—It is somewhat difficult to answer that. The coal is obtained in the national interest. It might be said that the landlord gets a certain amount out of the royalties, and he might be called upon to pay a share; the company who work it might be called upon to pay a share; and I think either the County or the district itself should also be called upon to pay a share.

25,508. *Mr. R. W. Cooper*: Do your mining leases not contain a covenant on the part of the colliery also to pay compensation for damage caused to buildings?—No, our mining leases do not. They give us full power to let down without being responsible.

25,509. And is there a similar condition prevailing as between the owner of the surface and the person to whom the site is either sold or leased?—Yes, on our own freehold property we always consider we have a moral obligation to fulfil and we have always done the repairs to any house which has been damaged. We keep a staff for that purpose.

25,510. Is that state of affairs taken into consideration in fixing the price of the site?—I think not.

25,511. *Chairman*: I have here the official report in the House, which took place on 13th May. *Mr. Raffan* made a speech which, no doubt, you read?—I am afraid I have not done so.

3 June, 1919.]

MR. ALFRED SIMEON TALLIS.

[Continued.]

25,512. You think, at any rate, there ought to be some alteration there?—I do not think that a workman can be called upon to invest and purchase his house if afterwards that is subject to be damaged and he gets no redress.

25,513. Now will you kindly continue with your *précis*?—“The two villages of Oakdale and Markham, which are now being developed by the companies with which I am connected, will, when completed, consist of 700 and 500 houses respectively, with schools, cottages hospital, institute, places of worship and other public buildings, and I produce photographs and plans of the layout, showing the accommodation” (*producing photographs*).

25,514. We will pass those photographs round and the members of the Commission will look at them. Here is one which is called “Markham Garden Village”?—That is built on the site of a rather precipitous hill.

25,515. Then there is “Markham Colliery; view from the village.” Is this the London & North Western line?—Yes.

25,516. The next is the “General view of Markham Village” and the next is “Markham Garden Village lay out”?—That is a very difficult site owing to its steepness and therefore a proper system of laying out can hardly be adopted as regards open spaces.

25,517. You are rather confined by nature there?—Yes, very confined.

25,518. The next are photographs of Oakdale Village—View from South Entrance.” There is the hotel shown?—Yes; I might remark, if I may, in connection with the hotel which, I think, is a good feature, that in the two villages that we have we own an hotel in each village, and, so far, have been successful in keeping out other hotels. We run them on the trust principle; that is to say, the capital is found by the company to erect them and we pay the monopoly value for the houses that we build under the Licensing Order. We pay five per cent. for the capital, and the profits beyond that go to the village in the form of donations to the institutes, hospitals or any other form which may be decided upon in the village. The company really retain simply the five per cent. interest on the money.

25,519. Is it tied?—No; the manager is appointed at a fixed salary and gets a bonus on temperance, but nothing on alcohol.

25,520. Temperance and eatables?—Yes.

25,521. *Mr. Cooper*: When you say “we,” do you mean the Public House Trust Company?—No, our own company, the Tredegar Company.

25,522. *Chairman*: Then there are further photographs of Oakdale Village?—Yes. Some of those photographs were taken before the roads were actually finished.

25,523. What Urban District Council are those in?—Mynyddisllyn.

25,524. Then there are plans of various houses, type A and type F. What are they?—It is a type that we know from the architect. He has simply to letter the plans according to the various types we adopt.

25,525. Do you set out the rentals of them?—Yes.

25,526. What sort of renewals are they?—I deal with them later on in my *précis*. We find the houses which we were able to build for £248 in pre-war days now cost £545, an increase of 120 per cent. in cost.

25,527. Will you now proceed with your *précis*?

“In my opinion the rents of the future must be increased owing to the high cost of building, and when it is considered that in most of the workmen’s houses, there are on an average three wage earners, whose wages average £3 15s. 0d. to £4 0s. 0d. per week each, making a total of £15 to £16 per week, or £700 to £800 per annum going into the house, it will be realised that the workmen can well afford to pay a higher rent for the better accommodation now afforded.

The method of fixing the rents in these villages is worth mentioning, and is a system which could be extended with advantage to the public authorities, tenants and owners. The rent is divided into two

parts, one part, which is a fixed amount, being just sufficient to pay the ground rent, and a reasonable interest on the cost of the houses, and which in the majority of cases amounts to 5s. 9d. per week, the other part is made up of the rates and taxes levied by the local authorities, and is therefore varied in accordance with the taxation payable and, at present, amounts to about 2s. 6d. per week, making a combined rental of 8s. 3d. per week. For convenience, the rates are collected from the tenants by the company as levied by the authorities and the system has the advantage of encouraging the tenants to take a keen interest in the appointment of representatives on public bodies, seeing that they directly pay the rates that are levied.

May I direct the attention of the Commission to the absolute stoppage of building operations by Colliery Companies, which has been brought about by the uncertainty which exists as to the future of the coal trade, and therefore the natural unwillingness of investors to spend fresh capital either on building cottages or in any other direction with the existing uncertainty as to the return they will obtain. In our own case, we have applied for and obtained the sanction of the Local Government Board, for a loan of £103,000 for the purpose of further developing the Oakdale and Markham villages referred to above, and we are unable to proceed with our schemes until some assurance is given us by the Government as to the future. This position is deplorable, having regard to the present great scarcity of houses in the districts I particularly refer to as well as many other districts in the South Wales Coalfield.”

Chairman: That is a most interesting *précis* and we are very much obliged to you for it.

25,528. *Mr. Frank Hodges*: (*To the Witness*.) I see this diagram which you hand in, or this statistical table, is signed by Mr. Finlay A. Gibson?—Yes, Mr. Gibson will prove that.

25,529. I was going to ask you, do you swear to the accuracy of this return?—I think Mr. Gibson would be better able to answer that.

25,530. *Chairman*: I will call Mr. Finlay Gibson to-morrow to prove that?—That is the table of the houses I gave.

Chairman: Yes, Mr. Frank Hodges is quite right.

25,531. *Mr. Frank Hodges*: (*To the Witness*.) In your *précis* you say:

“Whilst I have a general knowledge of the housing conditions in the mining area of South Wales, it seems desirable that I should deal more particularly with the provision of housing accommodation with which I am closely connected, but which may be considered as being typical of very many of the colliery districts in South Wales.”

That is the town of Tredegar.

25,532. What other districts did you have in mind when you made that general statement?—I have a general knowledge of the Rhondda and Merthyr districts, Aberdare and the Rhymuey valleys.

25,533. Do you think the housing in the Rhondda district compares with the Markham garden village?—I do not refer to Markham, but Tredegar with a population of 25,000 people.

25,534. Do you consider the housing conditions in Tredegar satisfactory?—There are houses in Tredegar—particularly the newer houses—which are very good. The District Council themselves have a scheme for putting up another 500 houses there.

25,535. Do you know in Tredegar proper that you have the houses of the old iron companies of a century or 150 years ago still in being and people still living in them on the hills?—I know that the District Council of Tredegar, out of 3,300 houses there condemned 129, so that in the view of the District Council and the County authorities the whole of the remaining houses are habitable and fit for occupation.

25,536. That conclusion does not necessarily follow by any means: because you only condemn 129 it does not follow that the rest are in perfect sanitary condition. That may be a matter of expediency for the sanitary inspector?—That is the report of the medical officer of the County.

3 June, 1919.]

MR. ALFRED SIMEON TALLIS.

[Continued.]

25,537. It is a fact that you have in Tredegar proper, which is perhaps the leading industrial village in Monmouthshire, still a number of very old houses that were built for the iron workers a century ago?—Yes. I should say that there are not so many as there were formerly. A good many have been built recently.

25,538. I agree they are lessening, and I hope they are lessening since I was there last. I will not question you any further on that, as long as I have it on the Shorthand Notes that that condition still exists there. Do you not think this practice of colliery companies putting up houses and lending the money to their workmen tends to restrict the field in which the workman can get work? Have you not in practice found it rather nails them down to the particular colliery which is lending them the money?—No, I do not think so. I think it is certainly in the direction of a settled population. Naturally a man takes a greater interest in the town in which he has his own house and also, if you like to take it from the company's selfish point of view, greater interest in the company for whom he works, and I think that is a thing to be fostered.

25,539. There are miners who take the view that because they live in a house which is owned by the colliery company that the colliery company exercises greater authority over them than they do over the men who live in other people's houses?—In this case the man is living in his own house. I might mention in connection with the Oakdale and Markham villages, we have a scheme by which any workman can purchase his house. He pays a deposit for a house, the purchase price of which is £300 say. I have a sample of the agreement here in which a man purchases his house for £300. He pays instalments. He obtains an agreement for lease forthwith, and he is then responsible for the repairs to his house. The house is his own subject to continuing to pay instalments, which he continues to do for 16 years. In the case of this house the price it was sold at was £300, and he pays £1 19s. 6d. per month. There are provisions that in the event of serious accident that might befall him, or any serious illness, the money is refunded to him if he wishes. He is not absolutely tied to his bargain.

25,540. What if he leaves the colliery?—If he leaves the colliery he is not entitled to get the money refunded, but we make rules whereby he can sell his share.

25,541. So that does have the effect undoubtedly of keeping him there. It has the effect, as you say, of stabilising him?—Yes, that is one of our objects.

25,542. I quite appreciate that?—It is one of the objects, because a man who is prepared to build or buy his own house is our best workman whom we want to keep, naturally, if we can.

25,543. *Mr. Evan Williams*: Do you think there is anything detrimental from the workmen's point of view in that?—No, I think it is the reverse. My experience is that it is quite the reverse. Those men are the most settled men we have, and they are the ones who take an interest in the village and the surroundings.

25,544. And such a man is a better member of the community?—Yes, he is absolutely a better member of the community.

25,545. And the colliery companies do encourage their workmen to build their houses as much as possible, do they not?—Yes, that has been very largely so; but I am afraid with the present high cost it will be very difficult in the future.

25,546. Do you know whether there is any element which discourages the men building their own houses in the way of industrial unrest?—At present there is a decided opinion on the part of very many of the workmen that the houses should be provided by the State, and with some very extreme people that they should get them rent free. But it is only a few, I think, that take that extreme view. But there is decidedly that feeling that the time is coming when the State or local authorities should provide them with houses at low rents, and that has prevented building to some extent.

25,547. I see from this return it shows quite clearly that the number of married employees is just about one per house?—Yes, that is about what it would be.

25,548. It is quite clear from your evidence that the owners where they have built houses themselves have kept quite abreast, if not in advance of the time, for this class of work?—Yes, and let them at lower rents than the workmen let their own houses at.

25,549. Lower than the workmen let a house which they build themselves?—Yes.

25,550. There are workmen who own more than the house they live in themselves?—Oh yes.

25,551. *Mr. R. W. Cooper*: Do you sell the houses out and out as freehold to the workmen?—No.

25,552. Free from any ground rent?—No. We are in some cases commuting the leaseholds.

25,553. Take this price of £248. What is the size of house which you built for that in pre-war days?—That would be a house with a good living room, parlour, scullery, pantry, small bathroom and three bedrooms.

25,554. Did you find the Finance Act of 1910 had any effect upon the building of houses?—We think so. We know that the houses ceased to be built within 12 months after that time. The houses that were then being built were finished, and then they stopped building.

25,555. *Mr. Herbert Smith*: Do you make these houses a condition of employment at your pit?—No, not generally, but the village is not far from the pit. We do find some of our tenants work with other pits.

25,556. Do you stop the rent at the office or collect it from them like ordinary people?—We stop it at the office; they prefer it.

25,557. *Mr. R. W. Cooper*: Does the £248 include the value of the site?—No, only the building.

25,558. Does it include drainage and sewerage?—No.

Chairman: Gentlemen, that concludes the evidence to-day.

(Adjourned to to-morrow morning at 11 o'clock.)

SECOND STAGE—TWENTY-FOURTH DAY.

WEDNESDAY, 4TH JUNE, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

SIR ADAM NIMMO.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH.

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB

MR. EVAN WILLIAMS.

SIR RICHARD A. S. REDMAYNE,

SIR ARTHUR LOWES DICKINSON,

} (*Assessors*).MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

Mr. Evan Williams: Sir, before the witness is called, I should like to ask when we are likely to get some of the Returns we have asked for, particularly in connection with the costs of coal control. You will remember that about five weeks ago, the first week when we sat in this stage of the proceedings, I made an application for a Return showing the whole of the costs of the coal control. We have heard nothing of it since. I think it is very important to get that in before the evidence is completed. There are also other Returns with regard to output per person, and the number of men employed.

Chairman: With regard to those Returns which Mr. Evan Williams has been good enough to ask for, the first was a Return showing the cost of the Coal Control. That has actually been prepared; it is now in course of being printed, and it will be here to-

morrow morning, I hope, and will be dealt with by Sir Richard Redmayne when he gives evidence. With regard to the other Returns showing the alleged diminution of output in the last five or six months, I saw the Coal Controller last night. I was a very considerable time with him, and very careful tables have been prepared showing the diminution of output and all the facts bearing on it. I requested that those tables should be printed last night, and I have had a message from the Coal Controller to say that they will be here at half-past twelve to-day. The matter is of such importance that at half-past twelve I propose to circulate those Returns in order that the Commission and the public may see exactly what they are. I will draw attention to them to-day, and Sir Richard Redmayne will deal with such causes as he thinks are applicable to the diminution of output when he gives his evidence.

Rt. Hon. RICHARD BURDON, VISCOUNT HALDANE, Sworn and Examined.

25,559. *Chairman:* Lord Haldane, I think that you were Lord Chancellor, and that you were Minister of War from 1905 to 1912?—Yes.

25,560. I am afraid I must ask you one or two questions about that in order to lead up to the question that I desire to ask you. I think that during that time you had very considerable experience of, and were responsible for, the reorganisation of a great State Department?—That was so.

25,561. Am I right in thinking that during that time you organised the Territorial Forces of the Crown, and that also you provided for a very speedy mobilisation of our Forces in the event of the nation being called upon to go to war?—That was so.

25,562. I think, as a result of your efforts, a very speedy mobilisation of our Forces was effected when war was declared against Germany?—Yes. The thing we concentrated upon was extreme rapidity of mobilisation and concentration in the place of assembly, and that we carried out.

25,563. I suppose it is no longer a secret, but war was declared on Tuesday, August 4th, 1914, and I think within a matter of twelve or fourteen hours, under the scheme of mobilisation which you had prepared, some of our troops were already in France?—

Yes, within a very short time: within a very few hours troops were in France.

25,564. How long was it before the whole of the British Expeditionary Force was placed in the Field at the appointed place?—On Monday, 3rd August, 1914, at the request of the Prime Minister, I, as Lord Chancellor, went back to the War Office and mobilised the machine with which I was familiar. That was done at 11 o'clock upon Monday, August 3rd, and the giving of the orders took only a few minutes; everything was prepared years before.

25,565. How long was it before the whole of the Expeditionary Force was able to be placed in France?—The whole of the Expeditionary Force was ready to transport to France on the spot. It was ready, I should think, within 48 hours. The War Council which was held decided that four infantry divisions and a cavalry division should go at once, and that a fifth division should follow in a week, and then another division should follow a little later. That was carried out, as the War Council directed, by the War Office.

25,566. The reason I am putting those questions is to show that you had great experience in organising a branch of the State. The problem we have

4 June, 1919.]

RT. HON. RICHARD BURDON, VISCOUNT HALDANE.

[Continued.]

before us is, if nationalisation should be decided upon, whether the present Civil Service, or some remodelling of the present Civil Service, would be in a position successfully to cope with the problems that would face them if the coal industry were run nationally?—Yes. I should like to confine my evidence simply to the question to which you have referred. I do not feel that I have any qualification for speaking on the wide question which is before this Commission, of whether there should be nationalisation, or whether there should not. What I should like to say something about, if you will allow me, is the question of whether it is possible to train a body of Civil Servants fit for rapid and efficient administration.

25,567. I have not had a *précis* from you because time has been rather short, but I should be much obliged to you if you would now take up that subject, and place your views before the Commission?—When I came to the War Office there had been a very valuable committee, called the Esher Committee, which, amongst other revolutionary changes in the War Office which they recommended, advised the separation of, what is called in the Army, administration, from strategy and tactics—from the work which is allocated to generals in the Field and to the General Staff. That separation had become well recognised in Continental armies, and had led to extremely rapid and efficient mobilisation arrangements for those armies. We had studied them. I had been a short time in office, and we resolved to give as complete effect as we could to the recommendation of the Esher Committee. I do not say that we ever rose to the ideal which I should like to have seen reached, but we got as far as we could with the money and the men we had. The principle was this: the commander in the Field must not only have his troops ready, but all their auxiliary services ready—transport, the supply, the medical services, and the provision of men by the Adjutant-General—because that is just as much a matter of administration as the provision of material. All those things must be so ready that he is able to put his hand upon them. If I may refer the Commission to it, Field Service Regulations, Part 2 (a little volume which is on sale by the Government), contains the scheme we established in its practical working for an Army in the Field. The Commission will find all the details there and how the thing was worked out. The difficulty we found was this: It had never been the idea of the older authorities in the British Army to make that separation in recent times. I say “in recent times” because the Duke of Wellington had a great grip of it, and carried it out as efficiently as it could be done in those days. For a long time after his period, and until the War Office was all brought together under Lord Cardwell, the Departments had been separate, but they had been very badly separated. For instance, the Ordnance Board was at one part of the town, the Horse Guards was at another, and the War Office was something separate, and it was all supplied, not according to Services, but according to different groups of men in authority. What we endeavoured to do was to draw the line of demarcation separating the Services quite sharply—firstly, the service of directing operations in the Field, and of course the enormous amount of work that has to be done by a General Staff in thinking out and preparing for those operations; and, secondly, the preparation of the administrative machinery and material which was required to be under the hand of a Commander-in-Chief in order that he might make himself efficient. Of course, the same principle applied in peace to the War Office, which had to have all these things ready in case mobilisation was called for. If they were ready, and everything had been prepared long beforehand, then you had only to touch a button and things sprang into their places as they did on the Continent. Now the way in which we carried it out I think I have indicated: it was by separating the service of administration, in its various branches from the other services. I will not trouble this Commission with the details of other matters such as the Army Medical Service, which was splendidly organised by Sir Alfred Keogh on the very principles I am speaking of, nor all the things done

by the Territorial Associations, who had the principles of administration handed over to them. I prefer to take the Regular Army, just to show how the thing was sought to be done. We found that the idea prevailing was that anybody who had shown himself eminent in the Field could administer. That seemed to us to be a mistake. A man may be a magnificent leader of troops and yet be very bad at working out schemes in the Quartermaster-General's Department for provision ahead. In the same way the expert who was good in organising Artillery dispositions in the Field might be no good at working out the patterns of the guns and the chemistry of the munitions at Woolwich, or wherever matters had to be worked out. We sought to develop a type of administrative officer to an extent which was new in the Army. I want to say at once, we succeeded only to a very limited extent because time was short, and money was shorter for the Army in those days. The General Staff, which deals with the other side, had its magnificent Staff College at Camberley, where it put those officers who were to deal with strategy and tactics through a very searching course of training, and had a very fine school; but there was no school for teaching administrative officers, and in my view it was as essential to teach administration as it was to teach strategy and tactics.

That brings me at once to what I am dealing with. In the Army some of these administrative things are just as difficult and just as complicated as any that occur in ordinary civilian business. They require qualities which the ordinary Civil Servant is not trained to develop. They require, to begin with, a great deal of initiative. No doubt it is true, in peace time especially, that every officer looks to his superior; but we encouraged, as far as we could, the principle of allocating responsibility and encouraging initiative, telling a man what he had to do in general terms, having first made sure that he was competent to do it, and then showing that we held him responsible for doing it and for doing it for the least money possible and in the swiftest and most effective fashion. That was an ideal which we did not succeed in wholly living up to, but it was a principle which seemed to me to work out effectively. There is no doubt in that period some extraordinarily efficient military administrators were trained up. I hope this Commission will not think by “military administrative officers” I mean the kind of people who have come in, justly or unjustly, for a good deal of criticism before the public lately. Those are mainly men not trained for the purpose. I am speaking of the young men we took and then put through a special course of training. The thing we found was that in this, as in everything else, education is of vital importance, and then special education coming upon the top of a sufficiently generally educated mind. We had no school and we had no staff college in which to train our administrators, and there was not the least prospect in those days of Parliament giving us money for one. But we had another thing to hand: We took the London School of Economics, with which some of the members of this Commission are familiar. I myself approached the London School of Economics, and with the very great assistance which I had from a member of the Commission, Mr. Sidney Webb, I induced them to take in hand the task of training 40 administrative officers for us in each year. Courses were designed, and they were taught things which they never could have learned in the Army. I think it will be found if you enquire from others that that training was of enormous advantage in France. There these young officers were serving—officers on whom was placed enormous responsibility and also a great deal of necessity for devising initiative for themselves. Englishmen, if they have any aptitude for it, are particularly good at getting out of tight places, and these officers, trained as they were to deal with all sorts of problems, in France and Flanders showed very great capacity in doing so. In Mesopotamia it was the same. One of the officers with whom I worked partly on the administration side—I do not think he was trained in the way I have described, but he had the aptitude of which I have spoken—was the late General Maude, who achieved great things in

4 June, 1919.]

RT. HON. RICHARD BURDON, VISCOUNT HALDANE.

[Continued.]

Mesopotamia by what he had learned and felt himself capable of doing. What we did was this. In the Quartermaster-General's Department, for instance, stores had to be considered; contracts for them had to be placed; transport of them on the outbreak of war—and even in time of peace also—had to be arranged for, and all those things these skilled and young administrative officers had to carry out. They worked under Sir John Cowans, who was then Quartermaster-General, and who was in the Quartermaster-General's Department for several years, and he had great aptitude for getting on with men and taking a grip of things in this kind of way. So far as it was done, it was very well done. I am not defending all the things brought out recently before the public, but they were done by men not trained in that school, and they had not a fair chance in work for which they had not trained. I am talking of work which members of the Commission know took place in Franco, and which made fast mobility and concentration of our armies there of such valuable effect in the later stages, and also, to a much greater degree than is generally known, in the earlier stages of the war. That was the secret of the ability to mobilise the Expeditionary Force with the rapidity we did, and of the fashion in which all the details of that mobilisation came to be worked out years before the date of mobilisation arrived.

25,568. Do you think the class of men to whom you have been good enough to direct our attention is a class of men who possess the qualities of courage and of taking initiative?—Yes. I am very glad you have given me an opportunity to speak about that. There are some men who have it not in them to take initiative or assume responsibility, and they never will. I think, as a rule, in the civilian business world these men fail as they fail in the army. In the business world the other men come to the top, and are picked out and chosen and put to their work. That is not so usual in a service. It is more difficult in the Civil Service where people come in according to rules and succeed to places very largely according to seniority. In the army and navy, where selection obtains to a considerable extent, and ought to obtain to a still greater extent, it is much easier. You pick a man because he is particularly good at the sort of work you want him for. You ask him to devote himself to administration, and, if he does, you may get a man just as valuable and just as good as you will find in the business world. It is quite true he has not got what is the great impulse in the business world, namely, the desire to make a fortune for himself, but he has another motive, which, in my experience, is equally potent with the best class of men, namely, the desire to distinguish himself in the service of the State. If he thinks he will be recognised because of his public spirit and his devotion to his duty, that public spirit and devotion to duty will make him do anything: there is no sacrifice of himself he will not make. Of course, I am talking of the best type of men such as the men I came across and saw in the army. That class of man, I believe, exists in far greater number in the two services than has been supposed at the present time. I am only taking them as illustrations of sources from which you can draw. I am not suggesting to this Commission that they should nationalise under the army and navy, but I am only saying why I think there is a source which is neglected from which public servants might be drawn. You get these men and they have been trained to a sense that they must be responsible even with their own lives for the attainment of the object which you entrust to them to accomplish. If they are properly trained, they are trained not to look to this or that detail of regulations, but rather to accomplish a purpose such as, for instance, getting stores to a certain point on the battlefield within a certain time at all costs, and that induces a sense of self-reliance and initiative which, I think, has developed into as fine a skill and training as you can find anywhere. Everything depends upon taking the right men and training and encouraging them in the right way.

25,569. In your experience, how did that class of officer get on with the men with whom he had to deal and with whom he had to work?—Just the same way

as a good regimental officer gets on with them. A really good regimental officer is the friend of his men. They come to love him if he is the right kind of man, and a man who, when they advance, goes at their head and takes the risk, and will not let them take a risk which he will not take. I have known that kind of officer often go away ahead of his men at great inconvenience and some danger to himself to find quarters where his men might rest, and he himself has refused to take anything for himself or have a bed even allocated to him until he has seen every man under his command had his sleeping place and had his rations. That is the man I speak of—the officer who thinks of his men first and himself second.

25,570. We appear then to have created a sort of new class of (I will call them for the moment) officials for want of a better term. What is the future of those men if they have to remain in the army or in the navy?—I will come to that in a moment, but I wish to say we did not create them: they were there, but undeveloped. Splendid material was there, but the nation had never thought of training them in the right way. They had trained the commanding officer, but they had never trained the administrator who was really just as necessary to them. What happened was this. According to army tradition, the real fighting in the field, the strategy, the tactics, and the execution of the strategy and tactics were the important things, and everyone who took to administration was rather looked down upon—they would not have said they looked down upon them, but they were looked down upon. Therefore naturally every young officer gravitated in the direction where he would be more thought of and where he could win more honour and apparently devote himself in a more practical way to his country's service. The result was that that class of man was very little developed and very little drawn upon. They were there and they are there now. Then the individual came up, but I always used to feel we could have got ten times as many if we had given them encouragement. If promotion had been not by seniority but by selection, and by distribution of duty, and the holding responsible men who were carrying out not regulations letter by letter, but carrying out a great duty in which we relied upon their initiative, and if there had been that system of training, it would have given us ten times as many of these officers as we possessed. I want to say now that I do not think the State recognises the extent to which not only in the Army and the Navy, but outside the Army and the Navy, there are young men in whom those qualities can be brought out—the quality of initiative and the quality of devotion to duty, which are as powerful a motive as the motive of business men if they are only developed in the right atmosphere.

25,571. Should I be right in saying that, in your opinion, there is a class of man who combines the strongest sense of public duty with the greatest energy and capacity for initiative?—In my opinion there is a large class.

25,572. And that is a class that cannot only be trained in the future but which, in your view, is to hand at present?—They are to hand at present. I have spoken of the Army because I know the Army and perhaps because I love it, but it is certainly equally true of the Navy. If I may say so, the Navy has given even less attention to this question than we tried to do in the Army.

25,573. Speaking of that class, with regard to the coal industry, do you think it would be necessary, if one drew or selected from that class in the sort of way you have been good enough to tell us, to give these men some special training to fit them for the coal industry in the event of it being necessary?—I think so, and, if I may, I will just put the steps which I think would be necessary. My idea for the Army and Navy is that young men should not go into them too early. With regard to the age of entry in the Navy (it is low enough in the Army now, but too early in the Navy at the present so far as I can judge) I should like to see it begin at 17 or 18 years. I believe that is quite early enough, when a young man has a general education. That

4 June, 1919.]

RT. HON. RICHARD BURDON, VISCOUNT HALDANE.

[Continued.]

would give an opportunity for the son of the working man just as for the son of the duke to go into these services. It will all depend upon whether he feels it in him, and whether he is chosen on indications which satisfy those who have to make the selection. At that age he will have gone in with an amount of education which he does not get at the present time. I do not believe in special schools, because they are never so good as the schools which give a broad general basis on which to develop the mind. He would then go in, and his first years of course would be thorough education in his duty, naval or military. A little later he would specialise more and more in those duties. He would go into the field and go on board ship—whatever might happen—and then I should like, if he has aptitude for what I may call general staff duties as distinguished from others, to see him trained for those. If he is the sort of young officer that has it in him and if he has the aptitude for the other side equally, then encourage him to train for the administrative side. That administrative side would have to be organised and developed and recognised to an extent which it has not been up to now. Then when he was 25 or 26 he might feel, "Well, I have great aptitude for administration. I have distinguished myself so far as I have gone. But it is peace time and the Army and Navy do not seem likely to want me. I have a better chance if I can serve the State in another Department." Then I should like to see the State, having kept a watch over that class of officer and selecting the best of them, put them through a special course of training. I am not sure I know anything much better than the kind of atmosphere we had in the London School of Economics. It was purely civilian and free from militarism, and it was very good. There they were trained in making contracts and in local government, in the law of administration, in railway management and a variety of other things which they could choose, or all of which they could take. A comparatively short course of that develops enormously and very rapidly the capacity of a really first-rate man already trained in his own profession. He becomes very capable and apt as an administrator. I have seen it over and over again in officers of that kind who later in life have gone into civilian administration, and they are very good indeed. Then there is something else to be seen to. It is not at present the business of the London School of Economics to teach initiative. Initiative is a matter of the spirit and a matter of temperament. Like courage and temperament, initiative can be developed. I should like to see a school of the State teach the necessity of that and the necessity of a man relying upon himself and making his own decisions. I should like to see encouraged what the best officer already knows by instinct, the absolute necessity of treating his men as equals, getting on with them, understanding them, and making their concerns his, and working with them in such a fashion that, although he was their guide, philosopher and friend and their commander, yet when it came to a moment of decision, while they felt it was their own spirit which was embodied in him, in taking the initiative in what he was doing, he was not taking an arbitrary initiative, but an initiative based on knowledge. As you see, I put education in a very wide and broad sense as the foundation of the question whether you can train administrators for the service of the State.

25,574. I rather gather what you say is that, in your view, there is a supply of men which has hitherto been rather untapped which could be made use of should it be desirable, or should the occasion arise?—I still have very friendly relations, although they are purely unofficial, with the Army, and dozens of young officers come to me and ask, "Could you give us any suggestion or help as to how we can get into civilian life? We feel we are good at it." I have known them to be of very great mechanical skill and of very good, but the difficulty is that there is no place for great business ability in the work which they have then now, nor is it a recognised thing that you should at a certain point in your career choose a civilian career under the State alternative to your career which has hitherto obtained in the Army or Navy.

25,575. *Mr. Sidney Webb:* On another point perhaps you could help us. Assuming that any such proposal as the nationalisation of mines were carried out, could you help us with regard to the proper relation to Parliament? For instance, how could we keep it clear from what is called political influence?—I see the point of that, and I will try to answer. To my mind, the future of the question of nationalisation and its success or failure depend upon the possibility of good management. Take the coal industry. You want as much coal as you had before at least and more, if possible, and at reasonable prices. That depends upon good business management, and it depends upon first-rate administration. Suppose a Minister armed with the kind of staff which I have spoken of, not trained wholly out of the world I have been describing, but out of the business world generally, then that Minister, too, must be a man who feels that he has one thing, and one thing only, to consider, and that is to make a success of the Department which is entrusted to him. It is fatal if he allows the private influence of Members of Parliament, for instance, to guide him in making his appointments. I am not in favour of appointments made by Boards. As a rule they are very bad judges. I have seen them working very badly. I would rather put the fullest responsibility upon the man at the top and hang him for it if he fails to discharge his duty to the public efficiently. But the great thing is to get a Minister who is responsible to Parliament in the fullest sense, but who yet is not afraid of Parliament or to come to Parliament, and is not afraid to take the initiative, and then go to Parliament, saying: "This is the reason for what I have done, and I ask for your ratification." I sat for 25 years in the House of Commons, and a more generous body than the House of Commons for that sort of thing I never knew. It is what it really likes. I stood up time after time and said, "I have done this and exceeded my powers." At first there was always a small storm of abuse which I was quite familiar with—it was stage thunder. Then in the end they said if they approved: "You did the right thing, and it you had not done it we should have docked one thousand pounds off your salary." That is the real spirit of the House of Commons, and if Prime Ministers would only recognise it, the House of Commons is the most sensible body of jurymen in the world, and you may take it that the House of Commons, if it thinks you have done your best, will be most generous in its treatment of you. Therefore, I think for the right kind of Minister it is quite possible to get that freedom which you speak of.

25,576. Of course, it is suggested that sometime we may not have the right kind of Minister, and that he ought to be assisted or strengthened by a body of Commissioners, or a Council of one sort or another chosen very largely for expert reasons. I should like to ask you whether you could say anything upon the relation of such a body as that to the Minister. Can you make that Council or Commissioners authoritative as against the Minister, or must you say that they must act under the direction of the Minister?—Now you come to the crux of the whole matter. You must not say they are authoritative, or he will shelter himself behind them in Parliament, and half a dozen men are never as good as one in proportion, in my experience. The great thing is to take a really competent Minister and give him a full sense of responsibility and authority. But, on the other hand, these Ministers, as you have said, are extraordinarily difficult to get. If you could get these Ministers, and get a staff such as I have tried to describe, you might nationalise almost anything—I will not say everything, but many things. You might nationalise railways, coal mines and transport, and do it freely with the sense that you were dealing with things which the business of the State demanded should be managed up to the standard which the State required. The first thing which is essential is to get a really competent Minister. The difficulty here is that people are chosen for their powers of talking in Parliament rather than administration. I have known first-rate men who

4 June, 1919.]

RT. HON. RICHARD BURDON, VISCOUNT HALDANE.

[Continued.]

have never got to office, and have never got there perhaps from shyness, or perhaps because they did not like it, or because they have not attained that oratorical position which the House of Commons demands as requisite. But I will assume we have a very decent kind of Minister fit to do his work, and I will answer your question as best I can as to what his relation to the Board must be. Knowledge he must get, because everything depends upon knowledge, and expert knowledge can only be got from experts. Therefore the Minister ought to have, at any rate, advisers round him who can give him that knowledge, but it must be done, I think, on the footing that the Minister never ceases to feel himself responsible. I do not mean that he should not feel himself most conscious that these men know better than he knows, and that he will do wisely to be guided by them; but he must not be encouraged to throw responsibility upon them. Therefore I would not put them in any authority over him, but I would encourage him in the fullest way possible to consult them. Let me add this: I have had a great deal of experience of Ministers and of Councils, and people are fond of asking, "How often did the Council meet in your days?" The true kind of Council meets formally very seldom, but it is meeting always in reality. The Minister ought to live with it. He ought to sit in the room with it, smoking cigars with it, lunching with it, taking tea with it, dining with it, and being with it until all hours in the morning. Its members ought to be his guides, philosophers and friends, and they ought to understand one another and feel that the best thing in their interests and in his interests is for him to say at the end of their deliberations: "I will take my own way about it, but you will know it is in harmony, not only with the letter, but with the spirit of what you have been thinking."

25,577. *Mr. R. H. Tawney*: There are two questions I should like to ask you. First of all, could you tell us something more about the training of administrators? What I mean is: sometimes it is suggested the conduct of business is best done by what I may call rule of thumb. You suggest in your evidence, I think, that there is a science of administration independent of the technique of a particular trade or industry?—Yes.

25,578. Which is general, and which can be imparted by education?—Yes. May I add a qualification? I have been twice Chairman of Royal Commissions on University Education, and in all Reports to which I have put my name, I have always said that the essence of a university is atmosphere. That is what makes it a school of science or a school of knowledge in the widest sense. It is the inspiring contact of the personality of the teacher with that of the taught which makes the difference, and by the school of which I speak, the school which is to impart the science of administration, I mean a school which shall have the atmosphere of it, and the suggestion of not merely dry knowledge, but of initiative and personality at every turn.

25,579. But it is something which can be taught and not merely picked up?—Certainly—taught exactly as a university professor teaches his students.

25,580. You speak of the immense importance of selection. Would it be true to say that the quality of those selected depends partly upon the area from which the selection is made?—To a large extent.

25,581. The greater the number of entrants, the better the field?—To a large extent.

25,582. Are you satisfied that in the public services—the Army, Navy and the Civil Service—the area of selection is wide enough now?—No, I do not think it is. It is subject to this, that the essential conditions must be knowledge and capacity. There must be no advantage given to the poor over the rich.

25,583. But suppose we were organising a national mining service. It would be an immense improvement, would it not, to draw capacity from the poor as readily as from the rich?—Yes. I represented a constituency of working miners, or which, at least, contained a great many working miners, for 25 years,

and I came across men in that sense who were fit to fill almost any administrative post; all they wanted was the training and knowledge.

25,584. Probably in your experience of the Army, the same thing has struck you?—Just the same.

25,585. A great many battalions are really commanded by the non-commissioned officers?—Yes, and some of the most eminent men in the Army are men who have risen from the ranks. Sir William Robertson is a distinguished example.

25,586. *Sir L. Chiozza Money*: You said something which was very interesting to me with regard to the opportunity for distinction which was afforded by a well-constituted public service. Do you think that, at present, there is a sufficient opportunity for distinction in the Civil Service as it stands?—No; I agree very much with what was said by Sir Charles Harris, when he gave evidence here, of the difficulty of developing the kind of service the State wants in dealing with coal mines, if Parliament gives effect to such a principle—the difficulty of getting that under existing Civil Service conditions. A man enters the Civil Service, being qualified by examination; then he is distributed somewhere; then he finds himself under someone who may not be very intelligent, and a small piece of work, very often uninteresting, is allocated to him. If he is in the Lower Division, he is kept in a groove which is very much less interesting than the Higher Division. I am the last person to wish to see the Higher Division abolished. On the contrary, I think the Higher Division is the life and soul of the Civil Service, but I do want to see the passage from the Lower Division made more frequent. I want to see, in other words, the men who show, in practice, that they really have the stuff in them, brought forward. It can be done by their being taken as private secretaries to people in the Higher Division. There ought to be much less of a gap between the two, and promotion by selection ought to be very much more the principle. There is a difficulty about promotion by selection. When I was in the Army, I found promotion by selection at work, and—the Commission may be horrified—I abolished it, because the selectors selected their own friends. I do not say they did it deliberately, but simply because they did not know anyone but their own friends. I remember one very eminent Naval Commander saying to me: "They complain that the appointments are all filled from my personal *entourage*: so they are, but it is because I know these men, and I know I can rely upon them." It is too narrow. The right thing is promotion by seniority tempered by a very stern and rigorous rejection; that is to say, you give some weight to seniority because you do not want a man to be altogether disappointed, if he has toiled hard, because he is rather stupid, but you do not put him in places where you want real ability. I think by giving a great deal more consideration than Parliament, or our rulers, have given to it, you can devise a system under which you can get selection and rapid promotion from the efficient without the sense of injustice which too often obtains to-day.

25,587. Have you noticed in almost the only productive service we have, the Post Office service, they do have a form of promotion which combines respect for seniority up to a point with promotion on merit?—Yes, I understand that is so. I do not know enough to say how well it works.

25,588. I do not know whether you came across this in your investigation of administration, but I am told, for example, that in the Post Office service a man may be 27th on the list, and yet get the post that is vacant. Let us say it is an executive post in the provinces of some value. Although he may be 30 or 40 from the top of the list, he is chosen before the others?—Yes, I know that is so, and it is quite right. I know a case where it was done outside this country. Lord Cromer did it in Egypt. He picked the Egyptian Civil Service on that principle. He got the records of the men, and selected them on their records, and not on examinations. The record system is infinitely better than outside tests.

4 June, 1919.]

RT. HON. RICHARD BURDON, VISCOUNT HALDANE.

[Continued.]

25,589. On the other point, do you not think what I may call the hiding away of the successful Civil Servant, and the fact that he rarely, or never, gets public recognition, militates against the Civil Service and its success?—Very much. I should like to see the Honours List kept for services rendered to the State in administration, with a very few exceptions.

25,590. Do you not think it a pity that whereas, in this war, things of almost a miraculous character were performed in the way of administration—for instance the successful rationing of food, which was performed by a Civil Servant—scarcely one in ten of the public knows the man who did the work?—Yes. And the reason is that we have not a well-thought-out system of selection for administrative work. It is not like combatant work.

25,591. Was your attention directed to the extraordinary success whereby a policy was devised for the pooling of food and supplies between the Allies?—Yes, I know about that.

25,592. Is it not a fact that the Civil Servant who had so much to do with devising the policies concerned in that is unknown to the public, and he has received practically no recognition?—I do not know about that individual, but it may well be so.

25,593. Do you not think that there exists in the country a considerable class of talented men who condemn the ordinary operations of commerce, and prefer to go into other professions such as the law, and other professions, rather than follow commerce, because it does not offer them a sufficiently distinguished career, or one which is distinguished in the intellectual sense?—Yes. Some of them do very well out of the law, so that I do not condemn them for it. But, passing from that, I think there are a great many men who would be prepared to serve the State at moderate salaries, if they were to have the prospect of becoming distinguished in the sense of having rank and recognition. I am quite sure, just as in the Army and Navy you find men ready to go in and take a very small living wage compared with the standard of their class, for the honour and glory of the thing, so you would find it in the Civil Service, if you based the Civil Service on that foundation.

25,594. Might I put that point in another way? If one takes the London distributing coal trade, is it not possible to imagine a talented man who would condemn becoming a London coal merchant but who would not condemn becoming Administrator of the London coal service, and who would esteem it to be a much more dignified thing, and would give his brain to the one, whereas he would not to the other?—I have known several Army administrative officers who would have taken to that work with great delight and courage, but whether their courage was excessive I do not know.

25,595. What is your view with regard to the abolition or with regard to forbidding Members of Parliament from making any recommendations for the Public Service with regard to promotion?—I think it is a very right thing to lay it down. It is extremely difficult to enforce. I remember when I was at the War Office I published a ukase that not only were no ladies to make applications for the promotion of their friends, but if any application for promotion of an officer were made on his behalf by a lady, he must clear himself of the presumption that in some way he had inspired it. But it was not much good.

25,596. *Sir Arthur Duckham*: You spoke just now about the devotion on the part of the Services. Do you not consider their devotion is to a large part due to the traditions of the Services?—Yes, I think it is, and my complaint is that there has not been the encouragement of such a tradition in other branches of the Service at all.

25,597. In the Civil Service or a new branch that might be created?—A man may serve as a Civil Servant and do brilliant work just outside what is technically allocated to him and he will pass out of the Civil Service at 65 unrecognised and forgotten, because they look only at the little narrow duty they have assigned to him.

25,598. In your experience, do you find a Civil Servant can take initiative?—I think a Civil Servant is of flesh and blood like anyone else and probably lots of them have it in them, but the whole system is of a kind which discourages it. Unless you grow up in an atmosphere where it is encouraged you do not have initiative. That is where the business man has the strength and the advantage. He is in an atmosphere of initiative. The Civil Servant is not in an atmosphere of initiative. The soldier and sailor to a large extent are.

25,599. Is not the Civil Servant taught very largely the duty of passing on his responsibility to the one above him?—What happens in the Civil Service is this, and I have a picture of it before my mind from experience. The Minister says, "This has been thought out, and after consultation, this is the principle we worked out." He sends for the head of the department with whom he discusses it and who makes suggestions and then in the shape into which it has grown, the head of the department takes it away. The head of the department after thinking it over calls to him two of his sub-heads and says, "You will take that part, and you the other." They have staffs, and these staffs proceed to sub-divide it, and the whole thing gets differentiated until there is most minute work done lower down. I have often marvelled at it and thought how incompetent I should have been if I had to do it myself. But it has been so broken into fragments and so dissociated from the spirit of the whole that what you get is a collection of fragments in a basket, about any fragment of which no one can be enthusiastic except the man at the top who hopes to be able to sort them into their places.

25,600. They all return back up the same ladder?—Yes. The Civil Servant does his work admirably, but you do not ask him to do the kind of work you want where initiative is the order of the day.

25,601. And that tends to a levelling up of the people, both so far as pay and position are concerned?—Yes. A man is very much aggrieved if he is told that his fragment is different from the fragment of his neighbour and he asks, "Why did I not have that fragment?" and it leads to dissatisfaction and discontent and to an undue absence of the chances of the passing up from one class of Civil Servant to the higher class.

25,602. With regard to ministerial responsibility, you have given us some idea of how you think it would work. Do you think the Minister could have two chiefs in Parliament and a Council?—No, you would paralyse him.

25,603. Do you consider the Council must appreciate that the final responsibility lies with the Minister?—Absolutely.

25,604. Did you find in the War Office that all your members of Council recognised that they might advise you, but the final decision was in your hands?—Absolutely. They used to recognise it in excess. I used to say, "For goodness' sake, tell me where I am going wrong, or I shall break my shins later." They were very good, but I lived with them and we were always discussing things. If you can get men of that kind, it is far better than their having authority. They are far freer and do their best to help you.

25,605. You consider it is only by a similar method you can get such organisations controlled?—That is what I call getting rid of red tap and making the thing work.

25,606. Supposing the coal industry were nationalised, do you consider in that Administration there must be some examination or selection to bring in people for administration?—There are many posts connected with mines where special knowledge is essential. For instance, I think it would be very wrong if a sub-inspector of a mine were a man who had not been trained in a mine and had first-hand knowledge. On the other hand, I think it is very wrong if the Chief Inspector has not a very wide knowledge of a great many subjects which he could not get in the mine perhaps at all, but which he

4 June, 1919.]

RT. HON. RICHARD BURDON, VISCOUNT HALDANE.

[Continued.]

must bring to bear on the variety of points which he has to observe. Then again, to follow it out, supposing you come to the management of the mine: there you want a man who not only knows the mine and knows the work, and has business capacity and experience, but who is also capable of taking the initiative. A person who sits still until he is told to do something is deadly, and the whole future of the success of nationalisation in this as in everything else seems to turn on the getting of capable men. Then it is easy; but if you do not get a man who is capable, the best thought-out scheme of nationalisation in the world will not work. Therefore, you want to get capable men as managers—someone who will work with the men as I suggested the Minister should work with his Council—that is to say, live with them and make them feel that he is one of themselves and make them love him just as the soldiers love the competent company officer who, while he commands them, will sacrifice himself for them if necessary. So they should look up to the manager of the mine, not only as their manager, but one who by nature and not by accident ought to take the initiative with them. One point further—I am not suggesting the manager of a mine could be found except in a class specially trained in mine management, but when you get further and to the nexus which there will be between mines managers and whatever organisations there are over them and the Minister at Headquarters, then you want the competent person I am speaking of. You want the real good fellow who will come down and come with full knowledge, knowing what he wants and capable of sitting down and talking it over and taking counsel, and being a thoroughly intelligent medium of communication between them and Whitehall, or whatever is the site of Headquarters.

25,607. How would you select these people? Would there be an examination or would it be seeing the men and talking it over?—I have had a great deal to do with the question of selection by examination. I think it is a most second rate mode of selection. In the universities we are passing away from it, and we are now making selection according to record in the previous school of training, wherever we can. For instance, in Scotland we have changed the principle, and three years' record of good work done in the public school of education takes the place of matriculation in the Scottish universities. Here I should like to see something of the kind. You train your men and put them to some work, what you think they are best at. You observe carefully how each man does. You may find that he is likely to do still better at something else and you transfer him to that. As the men of aptitude develop, you select from them and allocate them to the various posts, and the field of selection should be very wide. A man should not be taken for this or that duty merely because he happens to be at Headquarters. There may be a mine manager or a workman who has shown great aptitude, and I should like always to keep a discretion to depart from the normal and take the man of exceptional ability and use him where his exceptional abilities will operate, but it must be a selection based upon observation and record.

25,608. Do you think under the National system that the man you describe as the mine manager—a type as to which I absolutely agree with you—would be given freedom of movement?—I think it is essential. Take the company commander who has to lead 120 men to death if he makes a mistake, but victory if he is right. If he is a real first-rate company commander the men believe in him because they know their lives and best chances are with him. Why? Because he has lived with his men and not been a pedant or given himself airs. That is the finest type of British officer. The mine manager ought to be like that. He ought to live with the men and be of their class, always talking with them; if there is a grievance he ought to foresee it. He ought to talk with them and develop them and get their confidence. In the end the initiative and responsibility must be his. Otherwise you will not get the good qualities which you have at the present time. No doubt a good deal of the efficiency of business men is due to the authority they exercise, but that authority has come

up into collision with another principle, the principle of desire for equality and better conditions, and the problem is to reconcile these two. I am suggesting the spirit and atmosphere in which I think they can be reconciled.

25,609. That is to say, a very great deal of authority would have to devolve on these mine managers?—I think so.

25,610. *Sir Adam Nimmo*: Do you think you can draw a real comparison between your ability to secure special men for the Army and the Navy and special men for the ordinary working of an industry? The point I have in my mind is this, do not men go into the Army and the Navy really for special reasons, under special motives, which would not apply, in the same sense, to an ordinary industry?—Yes, but I want them to apply to an ordinary industry. I want to make the service of the State in civilian things as proud a position as it is with the Army and Navy to-day, and for there to be public spirit, public honour and public recognition. Just as you get the engineer officer who will throw a bridge over a river with extraordinary skill, although he seems to have no materials with which to do it, so you may develop the same kind of capacity in that officer when he deals with a civilian problem.

25,611. I suppose it would require quite a different quality in a man to deal with civilian problems than with Army and Navy problems?—I think it requires the same qualities—initiative, power to take responsibility, and freedom to act. I lay great stress on that. You also want knowledge and decision, and the instinct for coming out right. I am sketching rather a high standard, and, as you know, it is difficult enough to get these men, even for the coal owners, and it is also difficult to get them anywhere, but we have never thoroughly recognised the value of knowledge and character in these things.

25,612. Taking the mining industry, is it in your mind to split it into different departments of administration?—I am not competent to give you an opinion on that. You and I sat together on the Coal Conservation Committee, and we examined together a good many problems there, but we did not go into that further than that we said mining problems must be brought under one roof, and there must be a Minister of Mines who will be the inspiring prophet of the whole matter, instead of the responsibility being scattered about among so many departments, as it is to-day.

25,613. Generally speaking, would you not say that the men who were to take the special charge of the mining industry required to be men who were familiar with the industry as a whole?—I think one of the superstitions from which we suffer is that you cannot know about a thing unless you have been in it from childhood. That may be very narrowing as well as very strengthening. A really capable man will acquire the requisite knowledge with wonderful celerity, but, of course, he must have experience, and must be trained and go through the mill.

25,614. The point I have in my mind is this, that the man who is likely to do the best work, let us say, on the administrative side of the mining industry, is a man who has got a thorough and genuine knowledge of the production side at the same time?—He ought to have that, certainly.

25,615. That is to say, in the working of an industry, you require to interweave, as it were, one department of the business into another?—Yes; you want knowledge and science.

25,616. Would you agree that in order to secure these men you require to bring them up through the industry?—Not necessarily. The highest and fullest knowledge is not necessarily the knowledge that is got by immersing yourself for the first period of your life in details. It is the knowledge which a man gets by progressive training. I should hope, if you nationalise the mines in this country, you will use many such men as you describe, but I think you will find the work will distribute itself in an extraordinary way and people will turn up whom you did not think of, who are quite as good as your specialists.

4 June, 1919.]

RT. HON. RICHARD BURDON, VISCOUNT HALDANE.

[Continued.]

25,617. How do you secure for the men you desire to bring up through the industry a sufficient incentive under a State Department?—Among the mine managers there are probably lots of men who would be only too proud to be actuated by the motives which actuated the officers in the Army and Navy, real distinction in the service of the State. I should hope every man who became a mine manager would have before his eyes that he might do his work so well that he might rise still higher in the hierarchy and to the highest in the end. That is what I meant by a thought-out system of national promotion.

25,618. You used two words in relation to selection, and said that it should be "stern and rigorous." Would that be likely to be realised in practice?—In my experience every process of selection, however well devised, only achieves 50 per cent. of what you aim at, and perhaps not so much, but it would be much better than what we have got now.

25,619. If you take the working of private enterprise, is not that just one of the very things that happens under private enterprise, that the private owner is watching the men that come under his own observation, and that he rapidly promotes those men if he thinks them specially efficient?—Sometimes he does and sometimes, unfortunately, he makes mistakes, as we know. What I want to do is to introduce that into the service of the State. I want to make the service of the State like the spirit of the private owner in that respect—looking for efficiency everywhere.

25,620. But looking at the problem as a whole and the working of an ordinary industry, do you not think that the capable man is more likely to be brought out by the motive of personal gain?—Well, I really do not. I think we lay far too much stress on that. A great many people go into business, not from the sordid love of money, but because they wish to make a fortune. It is a way in which to distinguish themselves. It is not that they want to drink champagne or eat turtle, but because they want to be marked out as people who have succeeded in life. I am suggesting an equally potent motive in life which leads to a discharge of public duty. I think you will appeal to that tremendously, and I am a great believer in human nature.

25,621. If the mines were nationalised, I think you have it in your mind that there should be quite a decided departure from the methods which have been followed in Government Departments in the past in dealing with the selection of men?—That is so.

25,622. Do you think in practice it would be possible to evolve a practical scheme, having regard to the practice that has been in operation in Government Departments over so many years?—If I were a dictator—that is to say, if I were Parliament—and I were entrusted with the task, I think I could undertake, if I were left alone, to find half a dozen men, any one of whom, put at the head of a great department and with a system such as we are discussing, would carry it out.

25,623. Do you think you would be likely to be left alone?—That is another thing.

25,624. *Mr. Evan Williams:* I gather you attach supreme importance to the proper choice of the Minister of Mines. Is there any possibility of securing that the choice should be made in the wisest possible manner at all times?—There you ask me a question which opens up a field of dubiety. I should hope it would be so, and it ought to be so, and it is most important that when the Minister of Mines is chosen he should be the most highly qualified man possessing all the various qualities that can be discovered.

25,625. In the absence of certainty that you get the right man and the right administration, is it wise to risk an experiment of so vast a nature?—You have always to do that. At every general election every Prime Minister is making terrible experiments, and you cannot avoid it.

25,626. I think you would agree that an experiment which proved a failure in the production of coal in this country would be far more disastrous than the failure of a Government?—That may be so,

but I am not expressing a view about it. Heaven forbid I should! It may be you are up against a complete change which is coming about in the mind of the world since the war, and which will make it necessary for you to take some step in the interests of your own lives. I do not know whether it is so or not; but things have changed, and when things change we must, like Englishmen, face the situation.

25,627. Do you think it would be wise to risk an experiment without making sure we have the right legislative staff?—You must make the choice; I am not expressing an opinion.

25,628. *Mr. R. W. Cooper:* Would the Minister of Mines of necessity be a party political appointment?—I understand what you mean. It must be. By the law of this country the King can do no wrong, and the reason is because he is advised by a Minister responsible to Parliament—that is to say, responsible to the nation. And the Minister of Mines therefore must be selected by the Prime Minister in the name of the King as the Minister who is to give advice on which the sovereign is to act.

25,629. You have spoken about the necessity of whoever has authority having freedom of action. Do you think it would be possible to have the same freedom, for example, of prompt dismissal for neglect or inefficiency in a State Department as in private business?—I think it is. I have turned out generals of very high rank into the street.

25,630. On the spot?—On the spot.

25,631. Of course in the coal industry there is the commercial side as well as the technical side. Would you expect, for example, in carrying on a trade like the export trade of coal, where prompt decision and a good deal of risk must be taken, to be able to carry that on by means of a State Department?—Yes. I am so anxious to bring this out. The State administration as it is to-day is not nearly up to the mark. What I want is an educated administration with a high level of officials trained in that kind of atmosphere which I described to Mr. Tawney, and it should be quite different from the State administration of to-day. As I said, if you have that, I should not be in the least afraid of nationalising. I am very much afraid of nationalising, if you do not get that. Therefore the prominent problem to my mind at this moment is not the abstract question yes or no on the question of principle, but the question whether you can make such an administration. I think I see my way up to a point at any rate to make it. I will not say I see it the whole way, because I do not know.

25,632. Even to the extent of taking, for example, the risk of foreign credit, and that sort of thing, do you think any State department could do that?—There, I think, you can draw an abstract line. You may nationalise as much as you like, but in a country like this, with its vastly complicated interest in foreign credit, there must be a huge amount of private enterprise, which can be only done by one man and one mind. But that does not mean you cannot control, in the interests of the State, the sources of production at home. You can dovetail the two in. It is only a question, really, of sufficiently thoughtful working out.

25,633. You think by a sufficiently well-thought-out system, the State might, in effect, carry on the business of a foreign merchant?—I do not say that, but I do say this: the State might say, "Well, we can produce the coal in the interests of the nation at such and such a price. We do not want to have bad mines in this country. We do not want to have coal so cheap that it can only be won at the cost of the lives and health of the miners. We would rather deal with it in some other way, but we think we can produce coal with our resources well-organised, and with better organisation, by much than exists at the present time, in such a way as to get at a price which makes foreign trade possible." That is done, and the State says the price below which it could not sell, and above which it is not going to allow it to be charged to the foreign merchant. Then come in the foreign merchant and buys. The State is a producer.

25,634. By "foreign merchant," which was a somewhat loose expression, I meant the Englishman, or

4 June, 1919.]

RT. HON. RICHARD BURDON, VISCOUNT HALDANE.

[Continued.]

the colliery owner, or the merchant, as at present, who sells the coals and delivers them abroad to Germany, for instance?—I was assuming, for the sake of argument only, that you carried out nationalisation, and the State is a good producer of coals and sells coal at a reasonable price. It may be that the State would say: "We prefer to sell to someone who will take the foreign trade in hand." If the State takes the foreign trade in hand, it may be very much more difficult. I do not know, and I have not thought it out, but it does not follow, because you nationalise, that you are going to eliminate the foreign merchant and the English merchant dealing with people abroad.

25,635. On the question of salary, do you think the State would have to raise the scale of salary to make it correspond with that which prevails in private employment?—I am all in favour of paying good salaries, because, in the main, you get what you pay for, and it is still more clear that you do not get what you do not pay for. That is human nature, and it is as strongly implanted in the miner as the State official. The State official, hitherto, has been the patient beast of burden who has been underpaid, and whose salary has risen very slightly compared with the cost of living. Equally good salaries do not mean the salaries which rich men require in order to live as rich men. Your general in the Army, your colonel, your captain, your admiral in the Navy, your commander, live on what the rich man often calls very little indeed, but their reward comes to them in another way. They have social advantages which he has not. They are rewarded by the public, by honours, and by positions which tell. I do not like that being a monopoly of the fighting services. I want to see it extended to the other administrative services of the State, and I think it can be. It has been partly extended to the Civil Service, and I want it extended to those larger Civil Services of which we are speaking.

25,636. I suppose you would admit that glory has a great deal to do with the halo which attaches to the Army and Navy?—I think there are many kinds of glory. The glory of a popular preacher is very great, but he does not demand a large salary. The glory of a successful politician may be very great, and often he is as poor as a rat, but he does not mind. He has much more. He can dine with millionaires each night if he pleases.

25,637. *Mr. Arthur Balfour*: You would not hold that the coal industry should be run under the same kind of rules and regulations as the Army?—No. I am obliged to you for giving me an opportunity to make that clear. I have only talked of the Army because the Army is what I know, and it is an institution I am very fond of. I only took it as an illustration of which I have had experience. You must, of course, shape your own organisation according to the functions which that organisation has to perform, and I have been only indicating that I think in the Navy and Army there is a source on which you can draw, which has been hitherto left intact.

25,638. Now with regard to this new class of organisation which you think should be trained, it would take some years to train a sufficient number of people to take up a wholly new industry?—One is prone to think that, but it is wonderful what a lot of competent men there are. I should like to put everyone through an administrative course at the London School of Economics or somewhere else before he went through this. Unfortunately our industries have not encouraged the teaching of administration. *Mr. Tawney* knows better than I, but I do not think at Oxford or Cambridge there is any systematic training in administration. There is a little at the other universities. At London there is, and there will be more, because I happen to know that the University of London has had very considerable funds just placed at its disposal for the development of its Economic Faculty.

25,639. If you turned a General into the street, or more than one General because you thought he was not sufficiently competent, that was a very simple operation. But supposing that was done in a business and the next day you had a strike through

the action of the Trade Union, how would you deal with that?—A strike, like everything else, usually arises from people having let a position grow up which they had not foreseen. I do not say that is always the case, but it is very often, and your really competent person will be like a pointer in search of game, always looking out for the centre of strikes and going very cautiously when he hears of it. The kind of man I am speaking of is a man who rather recognises it as one of the first duties to feel himself as one of his kind in close relations with his men.

25,640. Does it not often happen that a strike is caused by the rejection of a gentleman who is rather voluble, like the orator in the House of Commons and who through his volubility has a certain standing with the Union?—I saw a great many labour disputes when I was a member of the House of Commons. I saw them amongst my own constituents and elsewhere, and my experience is that if you are right and a man is really incompetent and you explain it, the men will be just as strong as you in getting rid of the incompetent.

25,641. You have a three-cornered proposition in the coal industry, and only a two-cornered proposition in the Army. You have the Trade Union, the people working and the owner?—Of course you have the difficulty that the strike may arise outside your own works. It may come from the action of the Trade Union, but that is only transferring the problem to a larger sphere. I believe if there were less suspicion on the part of the men and if they did not disbelieve nearly every word that was said to them, and if they had not in the past a certain amount of experience to warrant them in scepticism, things might be easier. I believe the solution for industrial conditions all over the world is that employers and employed should be very much more in consultation and that they should feel that the industry is a thing which concerns them commonly and they should not be antagonistic.

25,642. *Mr. Frank Hodges*: Would you care to give an opinion on the propriety of the desire of the workmen to take a bigger share in the control of the industry in these days?—I am very anxious to keep myself clear of the main question because I am really not an expert on this question of nationalisation, but I have seen a good deal of workmen and I am very much impressed with this: the lower you go in the social scale as a rule the less articulate people are; they do not talk or express themselves so easily. That does not mean that they do not know and think, and when I have got to be real friends with the workman I have generally found he knew quite as much as I did about the particular thing I was interested in. We are very often apt to think that because the workman says nothing, he is not interested. He is interested and if you can gain his confidence and mind, you will find his objects and purposes are not very different from yours. If you can get him to believe that you and he have a common object, I do not think he is a very difficult person to deal with. We are rather like two foreign Nations at present, each very suspicious of each other's designs and motives.

25,643. Of course, you know the activities of the Workers' Educational Associations, Ruskin College and the Central Labour College have resulted largely in workmen holding the belief that they should be articulate in industry and take a share in the administration of industry. Do you think that is proper?—It is a very legitimate desire when a man's livelihood and what he and his family depend upon are involved in industry that he should be interested and that he should have the chance of knowing what he is doing. I think the intelligent workman is the first to recognise the distribution of functions. He says, "I do not want to make contracts for the sale of coal. God forbid! I know nothing about it. I do not want to make the plans of the mine—that is the work of the mining engineer. I do not want to be responsible for detecting whether ankylostomiasis is showing itself in the mines. I should not find it out. But there are things as to which I do want to have my share. I want to have a voice in it being brought to consciousness whether the mine is properly and adequately

4 June, 1919.]

RT. HON. RICHARD BURDON, VISCOUNT HALDANE.

[Continued.]

inspected and looked after or not; whether proper care is taken of the workmen." In fact, there is a whole sphere of common interests which you can define, which do not mean what I call taking the higher control of the mine out of the expert's hands, but which do mean that in the sphere where workman and employer are concerned in common there might be a great deal more interchange of view and counsel and participation than there is at the present time. In other words, we are passing to a region of democracy in industry.

Chairman: Lord Haldane, I only desire now to read a letter I ought to have read at the beginning of your evidence in order that it may go on the shorthand notes. It is a letter which the Secretary of the Commission wrote and it says:—"My Lord,—The Coal Industry Commission are anxious to have some evi-

dence upon the question whether the Civil Service, under its present or any future organisation, will be competent to carry on the coal industry if nationalisation were decided upon. They believe that your lordship's experience and knowledge gained in many spheres of the public service, and as Chairman of the Machinery of Government Committee, would be of great value to them in coming to a proper determination. I am directed by the Chairman to ask whether your lordship would be good enough to give evidence on these points at 11 o'clock on Wednesday in the King's Robing Room at the House of Lords. The bearer of this letter will wait in case you wish to send a reply." That was signed by the Secretary and you were good enough to say you would come, and we are very much obliged to you for the assistance you have given us.

Witness: Thank you, Sir.

(The Witness withdrew.)

Sir WILLIAM SLINGO, Sworn and Examined.

Chairman: This is the evidence of Sir William Slingo, giving us the Post Office information that has been asked for by various members of the Commission.

Sir William Slingo is Engineer-in-Chief to the Post Office, and is responsible for the provision and maintenance of all engineering plant in connection with the telegraph and telephone services.

He has had nearly 50 years' experience with the Post Office, and taken part in the transfer of the following undertakings to the State, viz.,

The system of the Telegraph Companies in 1870,

The system of the Submarine Telegraph Company in 1889,

The Trunk Line system of the National Telephone Company in 1896, and

The local Exchange system of the National Telephone Company on December 31st, 1911, and he says the acquisition of the Telegraph systems led to a very great development of the service.

Those being the qualifications of Sir William Slingo, and the details he wishes to speak about, I will ask Mr. McNair to read the remainder of his evidence.

Secretary:

"The payments made to the Telegraph Companies in 1870 were based on agreements and subject to ratification by Parliament, and the payment made to the Submarine Company was £67,163.

The payment to the National Telephone Company on the transfer of the Trunk Line system was based on a valuation of plant made by Mr. (now Sir) John Gavey on the part of the Post Office, and Mr. Sinclair on the part of the Company.

The payment to the National Telephone Company for the Local Exchange system was based on an inventory of plant made by Mr. Gill for the National Telephone Company and checked by me for the Post Office. A staff of 700 officers and men was employed on the work, which occupied a period of 15 months. Upon the basis of this Inventory, the Company and the Post Office set separate and independent values, but they were so divergent that the matter had to go to arbitration by the Railway and Canal Commission. The claim made by the Company amounted to 21 millions, but the valuation of the Post Office was about 9½ millions. As a result of the arbitration, the amount paid was 12½ millions.

The system was largely extended between the transfer and the outbreak of war, but a certain measure of estimated financial return had to be assured before extensions were authorised. It was intended to renew a very large number of exchanges and a considerable portion of the outdoor plant, and this would have undoubtedly been done but for the war. The Staff of the Engineering Department numbered on January 1st, 1912, about 9,000 men. In the autumn of 1912, it numbered 16,000, and on August 4th, 1914, it numbered 25,000. There was an immediate heavy

drain of men and material to provide for war needs, and altogether upwards of 12,000 men joined the Colours. As a consequence of the war, all development for commercial purposes was arrested, and even maintenance work was considerably curtailed. Development is now being resumed, and a heavy programme has been undertaken for the current year.

The transfer to the State of the telegraph and telephone undertakings has been beneficial to the community in that a more extended service has been provided. Unification of plant has been rendered possible and wasteful duplication is avoided. Similar results could, of course, have been achieved if a Trust or Commission had been set up to control the work, the essentials being that powers should be vested in a single authority, and that unification of treatment for the various parts of the country should be established and maintained. Unity of control, either under the State or under some form of trust, is in the case of a telephone undertaking very desirable from the point of view of both the user and the supplier. Where conversations are carried on between towns a distance apart, it occasionally happens that some disturbing factor is present, and if more than one administration control the service, the tendency always is to assume that the "other" party is in the wrong, whereas with one administration it is possible to carry an investigation to a satisfactory conclusion and thus eliminate trouble.

From the financial standpoint also it is possible to lay out plant more economically if only one administration is concerned; economy of staff is also another factor that must not be lost sight of.

On the other hand, the difficulties of assessing a correct value for labour and supervision are enhanced as the opportunities for comparison or contrast with other similar industries are restricted. State employment is not an unmixed blessing either for employer or employee."

25,644. *Sir L. Chiozza Money:* At the head of your *précis* you say that you are Engineer-in-Chief to the Post Office. Is it true that you have just retired from that position?—The statement was correct when the matter was written.

25,645. You have just retired from the service?—Last Saturday night.

25,646. I take it that you come here chiefly to give evidence on the technical side of the work rather than on the financial side?—That is so.

25,647. Still, you have some knowledge of the financial operations?—General knowledge.

25,648. Has your attention been directed to the fact that the late Postmaster-General, Lord Gainford, in giving evidence here, said that he was under the impression that the telephones were worked at a loss when the war broke out? Is that a true expression of Lord Gainford's, that the telephones were working at a loss when the war broke out?—No, I do not think so. Of course, it all depends on what is meant by loss.

4 June, 1919.]

SIR WILLIAM SLINGO.

[Continued.]

25,649. Is it a fact that in the commercial accounts presented to Parliament of the telephone system very liberal allowance is made for depreciation of capital?—Yes. The allowance made for depreciation, for example, in the year ending 31st March, 1915—that is the first war year—was £1,600,000, the following year £1,700,000, and in the following year again £1,700,000, and for the last year to the 31st March, 1918, £1,726,000.

25,650. Is that writing off based upon a very conservative view of the life of the plant from an engineering point of view?—It is based on what I think may fairly be described as a conservative standpoint. It is perhaps erring slightly on that conservative side, but on the other hand we have to bear in mind that the value of the plant upon which this depreciation fund was based was purchased on pre-war prices, and this depreciation fund will now be inadequate to meet the cost of replacing the plant at the present enhanced value. Of course, if in time the prices should fall again then there will be a re-adjustment of the proportion.

25,651. At any rate the fact that a liberal depreciation was allowed helps the financial operations of the department by presenting what is at any rate not only a true statement of account, but shall I put it rather a truer statement of account than would have been obtained if the concern had been under private auspices?—I think so? I see in the year ending 31st March, 1914, the net revenue contributed to the Exchequer was £239,000 after paying interest on all loans and all borrowed money, after allowing for depreciation, after allowing very heavy cost for pension liabilities and other charges on a conservative basis.

25,652. So that the late Postmaster-General hardly did justice to his late department when he suggested that the telephones were working at a loss when the war broke out?—If you assume that, you want to make an addition to all your interest paid, and all your other outgoings—if you assume you must make another 5 or 10 per cent. profit, then it would be working at a loss.

25,653. As a matter of fact, you did pay interest on all your capital?—£691,000 was paid as interest.

25,654. It was after making that allowance that that balance is shown to which you have referred?—Yes.

25,655. When the National Telephone Company's system was taken over by the State that was on the last day of 1911?—It was at midnight.

25,656. Is it the fact that the National Telephone Company had allowed a very large part of its plant to run down?—Undoubtedly, as a dying concern the company would not and did not spend that money which otherwise it would have spent upon bringing the plant up to date, or even upon the renewal of plant which had served its useful life.

25,657. Is it the fact that in the short period that elapsed before the war broke out, which was 2 years and 7 months, you had already in London re-installed some of the main exchanges?—Yes, that is quite true.

25,658. And you spent on that a very large sum of money?—Yes.

25,659. Did that amount to the complete re-installation of the service in the districts?—I will give one illustration. The Avenue Exchange was a new building specially erected, specially equipped, and the company's corresponding exchange was dismantled and the plant scrapped.

25,660. Is it a fact that these operations would have continued during the last four years but for the war?—Undoubtedly.

25,661. They were stopped by the war?—Undoubtedly.

25,662. So that at the present time you have actually exchanges running which are not only inefficient, but are practically in the state of inefficiency left by the National Telephone Company's plant?—There are one or two still left.

25,663. That is owing to the war?—Yes.

25,664. Is there any doubt that, had it not been for the war, that plant would long ago have been scrapped?—Undoubtedly it would.

25,665. Is it also a fact that your service was largely stripped of men by the war? How many did you lose?—Considerably over 12,000 men joined the Colours.

25,666. Is it the fact that, as with other Government Departments, they were stripped to an extent that did not occur with many private undertakings?—I am not in a position to know what happened with private undertakings, but 50 per cent. of my men were taken, and they formed the backbone of the Signal Service in France. If it had not been for my men I think I am entitled to say that the Signal Service could not have carried out its work.

25,667. So that you, as it were, suffered special disabilities through the war?—Certainly.

25,668. Do those disabilities still remain to a considerable extent?—Yes; we have had some 5,000 out of 12,000, roughly speaking, returned.

25,669. Now may I ask you what is being done—what plans have been made to bring the service up to the state of efficiency which you would have desired and which would have been done had it not been for the war?—The men who have returned have been largely replaced, in fact, almost entirely, on what we call capital work—that is to say, on development. The number of men who were employed last October on works as distinguished from maintenance was 4,800, and in April it was 8,038.

25,670. You have doubled the number of men on the capital expenditure?—Very nearly doubled it.

25,671. Have you the automatic service at work anywhere?—We have them in about 14 different exchanges.

25,672. In any towns?—Yes, they are practically all in towns, from Paisley down to Portsmouth and Newport. The largest of them, and with one exception the latest, is Leeds, which was opened in May last year.

25,673. How is the automatic service working?—It is working exceedingly well—that is to say, it is giving great satisfaction to the subscribers, which is our measure of success.

25,674. May I ask how have you got on with the automatic telephones as compared with the private automatic companies of America—are you behind them or in front of them?—There is a little difficulty in the position there, because in America they have a private company with an enormous capital and a lot of the plant is fairly new. They are particularly anxious, therefore, not to prejudice the capital which is sunk in that plant, and not to scrap it by the introduction of the automatic service until they can see that the plant which is to be scrapped is paid for.

25,675. In other words, the ordinary financial condition of a private concern of that kind in this case makes against the introduction of the automatic telephones in America?—It makes against it there, and that is because of the fact that they have this huge capital sunk, and they must see their way to recoup that before they can, from their point of view, legitimately scrap the plant.

25,676. So that you hope to get ahead of them with regard to the automatic service?—I think that proportionately we are ahead of them.

25,677. Already?—Yes.

25,678. In spite of the war?—Yes.

25,679. When do you think you will be able to get the automatic service at work in London?—If it were my job now, and I had a free hand, I should be starting with it in 18 months' time.

25,680. Is any of the plant on order?—No. The question is now under consideration in the Department.

25,681. What stands in the way—the Treasury?—It is a Treasury restriction which, for the moment, is holding up the question.

25,682. Is it a very large sum that is involved?—Yes; my rough estimate for London is approximately five million pounds.

25,683. It would cost five million pounds to introduce automatic telephones?—Yes.

25,684. Would that make a very great difference, in your opinion, in the use of the telephone service in London?—I am certain it would.

4 June, 1919.]

SIR WILLIAM SLINGO.

[Continued.]

25,685. The experience you have gained goes to show that this automatic service ought to be substituted for the ordinary system of working?—I have not an atom of doubt that the automatic system would remove the great bulk of the objections that may be now raised to the telephone system.

25,686. Is it true that you are going to America?—Yes, now that I am free.

25,687. May I ask why you are going?—We always consider that the British Telegraph Service is a long way the first in the world, but we do not consider, on that account, that we have a monopoly either of brains or of material, and I think America is very much in the same position with regard to telephones. They think they are at the top, but they would not claim that they have the monopoly. Now, I have done certain work in connection with telephone development which has not been done over there, and they are asking me out there to give them the benefit of my experience and knowledge. I am going out in a consultative capacity.

25,688. So that the American telephone companies, about the efficiency of which we hear so much, are not ashamed to take advantage of your assistance?—No, I think not.

25,689. Now, that brings me to a point that is of great importance to this Commission. Is it a fact that you find any difficulty in getting good brain power for the State in connection with the telegraphs or the telephones? Please treat this as impersonal. I want you to regard your position as you had it with the Post Office there for a good many years. Have you had any difficulty as an administrator in getting capable engineers, and, secondly, in getting good work from those capable engineers?—Not at all. When you consider the size of the staff upon which we have been able to draw in the past, even the ordinary laws of probability should give you a sufficient recruiting ground to find the men who are wanted for the work of the character that they have been doing in a subordinate capacity all their lives.

25,690. Do you consider that you have got in that range of scientific work as good men as are commanded by the private capitalists outside in similar trades?—I am constantly being asked to nominate engineers for work outside, and I have two cases in hand at the present moment. One is in the East, another one in the North of Africa; but I have a difficulty in finding men who will accept the jobs. I have no difficulty whatever in finding men who can do the work.

25,691. Do you mean finding men in the public service who will consent to leave it?—That is the difficulty.

25,692. Why will they not leave it?—One man is now getting about £700 a year, and he will not go elsewhere under £1,400 or £1,500.

25,693. Do you mean to say that a man of that type considers his £700 in the public service is as good as £1,400 outside?—That is what it amounts to.

25,694. *Mr. Arthur Balfour*: Of course, you had only charge of the telephones before the war for two years and seven months, but do you consider that during that time it gave as good a service as the

National Telephone Company did previously?—Certainly. There were the same people doing the work and as a rule using the same plant.

25,695. Are you aware that it did not give the same satisfaction to the public?—I take it that that was very largely because the public were anticipating more than they were justified in expecting.

25,696. Are you aware that the Post Office to-day is collecting a larger sum from subscribers than the National Telephone Company did?—If they are collecting more it is because the telephones are used more.

25,697. Is it not because they are insisting on the measured rate?—For new subscribers.

25,698. And thereby have increased their revenue?—I do not think they have.

25,699. Is it a fact that they have introduced the measured rate and thereby increased the revenue?—It was introduced before the transfer.

25,700. The flat rate was more general?—There were flat rate subscribers perhaps, but we are not turning them down in London.

25,701. If you had had a Board of Directors they would have taken your advice and would have been working on the £5,000,000 scheme for London by this time?—Well, the war is only just over.

25,702. But they would have taken your advice promptly?—Possibly.

25,703. Therefore we are having delay through Government control?

Sir L. Chiozza Money: Still, you must remember that he gave a point on that.

Chairman: What is the answer to that? The question is, are we having the delay?

25,704. *Mr. Arthur Balfour*: Owing to Government control?—There is undoubtedly a difficulty in meeting the Treasury control, and because the particulars of the estimate have to be based on previous known facts, and in the case of the automatic we have not the previous known facts yet.

25,705. You know that the automatic telephone was running in Chicago 20 years ago?—Of a kind.

25,706. Satisfactorily?—Of a kind.

25,707. It worked satisfactorily?—That I do not know.

25,708. I have used it, and it was quite satisfactory. Do you consider that the telephones in this country are as good as in America?—I do.

25,709. Have you had much experience of the telephones there?—I know that in America the telephone user would be content with a service which the British would not for a moment.

25,710. Have you had experience there?—Yes, I have been out there, and I am going again.

25,711. Have you been out there for a long period?—No, not for a long period. I am a British Civil Servant.

25,712. I have had considerable experience of it, and I say it is considerably different to what you get in this country; but I take it you do not agree with that?—I do not.

Chairman: I am very much obliged to you for coming here to help us.

(The Witness withdrew.)

Chairman: I now propose to circulate the papers with regards to the diminution of output.*

Mr. Evan Williams, one of the Commissioners, asked, and other Commissioners supported the application, for some statistics with regard to the output of coal this year in order that it might be seen, and put quite beyond dispute, what the position was with regard to output. In compliance with that request, I asked the Coal Controller, *Sir Evan Jones*, to be good enough to get out the accurate figures upon the question, and they were got out last night. I should have read them the first thing this morning, but owing to the holiday yesterday it was difficult to get them printed; and they have only just arrived a minute or two ago, although I had a copy myself

late last night. I propose to draw attention to them, and when *Sir Richard Redmayne* goes into the box, he will be prepared to answer any questions which any members of the Commission desire to ask about them, but I thought it right that the members of the Commission and the public should have this important information as soon as possible. The document which explains the tables is headed "Coal Mines Department, 3rd June, 1919," so that it is brought up to yesterday. The following information is supplied as regards output of coal based upon the latest information obtainable. The output for the first 20 weeks of 1919 was at the rate of 242 million tons per annum, as compared with 287 million tons in 1913. The average number of men employed

4 June, 1919.]

[Continued.]

during the 20 weeks of 1919 was 1,111,000, being exactly the same number as the average employed during the year 1913. The average weekly output for the four weeks ending the 24th of May, 1919, during which period there were no holidays and few stoppages, was 4,813,000 tons, or at the rate of 238 million tons per annum, after allowing 5 per cent. for holidays and stoppages. Now I want for the sake of clearness to point out those three periods. First of all, in the year 1913, the output was 287 million tons. Taking the first 20 weeks of 1919 and striking the average, you get 242 million tons for the year 1919, but when you consider, taking the four weeks in May, during which period there were no holidays, and taking that as the basis, it comes down to 238 million tons, so that it is 287 million tons, 242 million tons and 238 million tons. The average weekly output of the six weeks ending the 15th of March, during which conditions were fairly normal, with no holidays and few strikes or stoppages, and the average output for the four weeks ending the 24th of May, when similar conditions prevailed, and the Sankey wage was in operation, and the average number of persons employed in the respective periods are as follows. Now this is a table of vital importance in the opinion of the Coal Controller. For the six weeks ending March, 1915, the average number of persons employed was 1,081,000, and for the four weeks ending May 24th, that is after the Sankey wage was in operation, the average number of persons employed was 1,124,000. Now comes the average output per week, and we are going to compare what was the average output per week before the Sankey wage and after the Sankey wage, and the average before the Sankey wage was 4,852,000 tons. After the Sankey wage it was 4,813,000 tons, so that it has gone down, and there are 40,000 more men employed. 40,000 more men employed, and yet the output has gone down. Now with regard to the output per man per week before the Sankey wage, it was 4·5; it has gone down to 4·3, and finally the output per actual man per shift before the Sankey wage, it was 92 and afterwards 90. Now, going on with the note of the Coal Mines Department of the percentages of absenteeism due to sickness, injury and voluntary absence, taken as the percentage of the possible number of shifts which could have been worked, that increased from an average of 10·7 in 1913 to an average of 12·5 in the first of the weeks of 1919 and to an average of 13 per cent. in the four weeks ending the 24th of May. The average number of days per week on which pits raised coal decreased from 5·58 in 1913 to 5·2 in the first 20 weeks of 1919. The average output per man for the period of four weeks decreased from 19·8 tons in 1913 to 16·8 tons in the first 20 weeks of 1919, and 17·1 tons in the four weeks ending the 24th of May, during which period there were no holidays and few stoppages. The average output per actual man shift worked was one ton for the year 1913, ·89 of a ton for the first 20 weeks of 1919 and ·90 of a ton for the four weeks ending the 24th of May. The estimated output for the year ending 1919 on the basis of the average weekly output of the first 20 weeks, and allowing for the reduced hours after the 16th of July, is, say, 230 million tons, or, calculated on weekly output for the first 20 weeks, the output for the remainder of the year being based on the average weekly output for the four weeks ending the 24th of May with an allowance of 5 per cent. for holidays and stoppages is, say, 228 million tons. The estimated output for the 12 months—now this is a very important figure; you recollect that the output for 1913 was 287 millions—the estimated output for 12 months from July, 1919, after the reduced hours had come into force is, say, 217 million tons, calculated on the output of the first 20 weeks, or only 214 million tons if calculated on the weekly output of the four weeks ending the 24th of May, 1914, with the allowance of 5 per cent. for holidays and stoppages. The consumption of inland coal and for bunkers was 210 million tons for 1914, the average for the pre-war period was 209 million tons, and for the period of 1919, 196 million tons. This is to show what the effect would be on our export trade if the diminution does not take place and an increase made. The exports of

coal in the year 1913 were 77 million tons, and in 1918 34 million tons. I want to draw particular attention to this. In order to provide approximately the same quantity of coal for inland consumption and bunkers for the 12 months from July, 1919, all present restrictions on consumption must be fully maintained, and in addition exports must be reduced from a rate of 34 million tons per annum to a rate of 23 million tons per annum. I just want to go back and remind the Press and the public that the exports of coal in 1913 were 77 million tons, whereas if we are to maintain inland consumption on this diminished output, the exports will have to be reduced to 23 million tons per annum next year. It is estimated—and here again I want to draw particular attention to a very important fact—that the deficiency on the working of the industry on the basis of the estimated output for the period of 12 months from July next, after providing for the guaranteed profits to owners at the rate of 1s. 2d. a ton, will be £46,600,000. That is the deficiency, equal to 4s. 6d. a ton on output, and for the calendar year ending 1919, it is estimated that the deficiency will be £37,000,000. Seven schedules have been prepared setting out the details on which the conclusions contained in this memorandum are based. These schedules are attached hereto. Now will you kindly look at the first schedule? I am not going to occupy your attention very long with that. It is a statement showing the output of coal and the number of persons employed in the United Kingdom from 1913 to date, and if you will be good enough to look at the bottom, you will see the various returns: Board of Trade, employment, Coal Mines Department, and so on, from which it is prepared, but I do desire to draw your attention, at least I am asked to draw your attention, to table 2, and that is a comparison of the weekly average for six weeks before Easter this year, during which the conditions were fairly normal, there being no holidays and few strikes and stoppages. It is a comparison with those four weeks with an average of four weeks ending May 24th, when similar conditions prevailed, and the Sankey wage was in operation. That is a very important table indeed. Will you please look at column 2, which gives the average number of persons employed, and you will see that the average for the six weeks before Easter was 1,081,500, the average number of persons employed for the four weeks after the Sankey award was given and ending May 24th was 1,124,000. So that that means to say that 40,000 more men were employed. I am giving you rough figures—40,000 more men employed. The output of coal for the average 6 weeks was 4,852,000, the average for the 4 weeks, 4,813,000 tons. Now that means this, that although 40,000 more men were employed, about 40,000 tons less coal were got, the difference between 852 and 813. The output before the Sankey wage per man per week was 4·5, after 4·3. The output per man per shift before the Sankey wage was ·92, after ·9. Absenteeism before the Sankey wage 11·6, after the Sankey wage 13: average number of days per week upon which pits raised coal before the Sankey wage, 5·56 and after 5·46. I have the Controller at my right-hand side here, and I wish he would tell me if I am accurate in the information I have given.

Sir Evan Jones: Yes, that is accurate.

Chairman: Now if you will kindly turn to table 3, that table, which I do not propose to go through at any length, shows how the estimated output for the year 1919 is arrived at in two ways. First of all, perhaps the Controller will just tell me, because I have not studied that table, I think on the first you take the output for the first 20 weeks of 1919, and base it on that, deducting 10 per cent. for the period of the allowance for the shortening of the working day by one hour.

Sir Evan Jones: Yes, I have taken that from the percentage in the report.

Chairman: Then another calculation, which I will not trouble you with, shows you the same thing, only it is 228 instead of 230. Now will you go, please, to table 4? That shows the estimated output of coal for 12 months from July the 12th, 1919, to the 15th of July, 1920. You will see how it is done. There, again, you have two systems of calculating—(1) upon

4 June, 1919.]

[Continued.]

the results of the 20 weeks of 1919, and (2) upon the results of those four weeks since the Sankey award. Now I want to read out table 5, which shows our export trade, and shows the amount of tons which we exported in the third column. Seventy-seven million in 1913, 62 million in 1914, 46 million in 1915, 41 million in 1916, 38 million in 1917, and 34 million in 1918. Now 1919 is an estimated figure, and it is estimated in this way, that if we have to keep a certain amount for inland consumption and for bunkers we shall not be able to export so much as we should do, and it is estimated that the exports for this year 1919 will only be 28 million; that is all we can afford to export on the present diminished output, whereas from the 16th of July, 1919, to the 15th of July, 1920, again on estimates, we should only be able to export 23 million tons. Of course, that is an estimate. If the output goes up a different state of things would apply, but Sir Evan Jones, the Coal Controller, reminds me that even the 23 millions can only be exported if we retain the whole of our present restrictions for England and home trade. The next table is a very important one, because that shows the deficiency in money that will be incurred unless the output by some means or other is increased. Table 6 is a statement of the estimated deficiency on the working of the coal industry for a period of 12 months from the 16th of July, 1919, to the 15th of July, 1920. Now I am not going to read out the whole of that, because it is very difficult to digest these figures—there are millions of tons and thousands of pounds—but I am going to give the result of the figures so that that may be clearly seen, and the result is got out after the various figures which form the table are worked out. The statement of estimated deficiency on the working of the coal industry for a period of 12 months from the 16th of July, 1919, to the 15th of July, 1920, is £46,600,000. As I say, I do not propose to read the reams of figures which justify the Coal Controller as he thinks, in bringing out that total, but the Press, to whom we are very much indebted for the very clear and lucid way in which they have reported our proceedings, will no doubt print as much of that table as they think desirable, but the gist of it is this, that if the present state of things goes on the deficiency will be £46,600,000. Table 7 is a similar sort of table, but instead of carrying it to the middle of the year 1920, it carries it for the present year 1919. That figure is £36,000,000, but I do not want to trouble you with that. It is worked out in the way you will see described here. I am very anxious, and no doubt the members of the Commission will be very anxious, to study those tables, and when Sir Richard Redmayne goes into the box he will be prepared to deal with them and assign any reasons which he thinks are the reasons for the deficiency and any remedies which he thinks are the remedies for combating this state of things.

Sir L. Chiozza Money: As this is going out to the public and Press, may I ask Sir Evan Jones if he attaches any importance to the fact that the latest figures are better than the figures on which he bases his estimated deficit of £46,000,000.

Sir Evan Jones: They are only better in one respect: the output per man per shift has increased from .89 to .90.

Sir L. Chiozza Money: No, your estimate is based upon the first 20 weeks in 1919, but the four weeks of May are better than the 20 weeks of 1919, and, therefore, if you take the four weeks of May your estimate would come out at less than 40 million pounds?

Sir Evan Jones: You will find that is not the case if you look at Table 3. I have taken the most favourable output, which is that based on the first 20 weeks of 1919.

Sir L. Chiozza Money: That is my point. You did not understand me.

Chairman: I think you will find that he understands it.

Sir Evan Jones: From the output for the four weeks to May 24th, which was during a period without holidays and very few stoppages, I have deducted, as I show on the Table, 5 per cent. as a

likely figure for the rest of the year, which brings it below the average for the first period.

Sir L. Chiozza Money: Does it do more? It is perfectly true that the present figures, to repeat the Chairman's expression, are better than the first 20 weeks in 1919.

Sir Evan Jones: No; you must compare like with like. I have compared like with like in Table 2, for I give a comparison for the four weeks ending May 24th with the six weeks under like conditions ending in March.

Mr. Frank Hodges: Might I ask the Coal Controller a question?

Chairman: Sir Evan Jones had these figures worked out under his supervision, so that any question of figures please put to him.

Mr. Frank Hodges: During the first 20 weeks of this year the Federation had to go before a Conference to ask that Conference if it was prepared to accept the Sankey Report before they took a ballot. At that Conference the workmen in certain coalfields were under the impression that their contract of service terminated. The result was that the whole of the mines of the Kingdom were practically idle for one day, which would mean one million tons of output at the rate of one ton per man per day, and for the succeeding three or four days the men dribbled back to work; so that if the Controller has not taken that into consideration in the first 20 weeks ending May he has omitted a factor which is in excess of any strikes you could have in any given period.

Chairman: Sir Evan Jones will tell us what he thinks about that.

Sir Evan Jones: I have taken an average of those 20 weeks just exactly as the output goes. The table that shows the percentage of absenteeism does not bear out your statement. The percentage of absenteeism is the percentage on the actual shifts that must be worked.

Mr. Robert Smillie: No, the actual shifts that are worked.

Chairman: We are only here to get the truth, and we all agree that it is most important.

Mr. Robert Smillie: It is only absenteeism if the collieries are working and certain men remain absent.

Sir Evan Jones: One of the footnotes on table 1 gives my definition of absenteeism—the number of shifts lost through sickness, injuries, etc., and voluntary absence from work shows the percentage of the possible number of shifts which could have been worked. What that means is, supposing a pit was working and a man absented himself, he is absent.

Mr. Robert Smillie: Not if the pits all over the country were idle on a given day.

Sir Evan Jones: If they were absent for a holiday or a strike, then it is not taken.

Mr. Robert Smillie: The idleness that Mr. Hodges speaks about here is not absenteeism. It would mean a very considerable reduction in output for that period.

Mr. Sidney Webb: May I point out that it seems to me, when we are talking about the figure of the percentage of absenteeism for the men, we have not got it. The figures are filled in here as though we had got it; the 13 per cent. is repeated as if that is a real figure, but when you look at the footnote, you will see it is not a real figure; therefore, it is rather important that we should not draw inferences from that.

Sir Evan Jones: I think you will find that the result of that would be negligible. The latest actual figure of absenteeism that we have had was for the week ending April the 26th. If we argue on the same basis of what was actually occurring before, it is probable that that would go on increasing, as it has been increasing, for the rest of the year. I consider that, taking it at the same figure, I am giving the most favourable aspect of it.

Mr. Sidney Webb: I do not want to dispute the estimate at all, I am only saying that we must not draw any inference from the absenteeism in May till we know what it is.

4 June, 1919.]

[Continued.]

Sir Evan Jones: Because in that case the amount is not the actual figure for that period, I have put this footnote.

Mr. Sidney Webb: Is it not the fact, keeping away from the question of profit and cost, and merely on the question of the amount of coal, which is a separate thing, that a larger aggregate production of coal was taking place during May than during any four weeks since the war began, with, I think, one exception?

Sir Evan Jones: No. If you take the six weeks—

Mr. Sidney Webb: Pardon me, keep to the four weeks ending May the 24th, table 1: there were produced 19,251,000 tons. I believe that only in one month, and that the month of February, they ever produced since the war began as much as 19,251,000 tons, and in that one month, last February, we produced 19,470,000 tons. With the exception of February, it looks as if there has not been a month since the war began when more was produced.

Sir Evan Jones: Have you taken into account the number of men employed?

Mr. Sidney Webb: I am on the question of the amount of coal. It is a relevant fact that in no month, with one exception, during the whole 4½ years since the war began, has there been so much coal produced as during the weeks ending the 24th of May.

Sir Evan Jones: You will notice that for the years 1915, 1916 and 1917 I have not given it monthly.

Mr. Sidney Webb: But I have reckoned it out.

Sir Evan Jones: On the average, I suppose.

Mr. Sidney Webb: Yes, for the 13 months, and I ask you whether it is not the fact that at no time since the war began have we produced more than 19,251,000 tons in four weeks, with the exception of the four weeks in February.

Sir Evan Jones: Will you look at the year 1916? There it is 255,846,000.

Mr. Sidney Webb: During the month of May, whatever inference we may draw actually, more coal has been produced during that four weeks than, with one or two exceptions, in any four weeks since the war began. That is what it looks to me like. So far as it goes it is an encouraging fact.

Mr. Herbert Smith: It is fair to ascertain what is the cause of this, and I thought that there should be an inquiry into it, because I asked for particulars of the number of shifts that the men had to go home because there was no work for them to do. Now I have made inquiries of one where there were 255 shifts lost one week, and they lost over 300 the following week. I want an inquiry into this thing, because it is set going at a moment to damage our men's characters, and I ask for an inquiry right through the Federation, name any pits you like.

Mr. Robert Smillie: Has the Coal Controller got the figures for individual mines? You have some, and you say with very few exceptions that the figures compare with returns you have from mines. Probably there have been cases in which there has been a serious reduction in output per man, and, if so, I should like to ask whether an inquiry has been made in the individual cases.

Sir Evan Jones: No, it has not come before me.

Chairman: I think it is only right to say in order that the matter may be cleared up that these figures as figures only speak for themselves, but there may be many reasons why the output has gone down. I am not going to say what my own opinion is naturally, but there may be many reasons: want of clearance may be a reason which prevents the men producing as much as they would otherwise produce. It may be that work of an unproductive character has been carried on, that I know nothing at all about, but Mr. Herbert Smith is quite right in saying those are the facts, but that, as far as his constituents are concerned, it is due to no fault of theirs, and when Sir Richard Redmayne goes into the box, he will give what of course the Coal Controller cannot give at all, because he naturally does not know that sort of thing—he will be able to give the reason, and I very much hope that the information that Mr. Herbert Smith may have with regard to men being

turned back or with regard to proper clearance being given, will be brought out, because all we want to do is to get at the bottom of this and satisfy ourselves that the output will be properly maintained.

Mr. Robert Smillie: Unless Sir Richard Redmayne makes inquiry into cases where there is a serious fall in the output he cannot get it.

Mr. R. H. Tawney: I ask for an inquiry or for a return of the cases where the men were sent back from work. Is it in the possession of the Coal Controller or not, because obviously these figures are one-sided?

Sir Adam Nimmo: If the men are sent back from work they are not included in the absenteeism list for that day.

Chairman: No, they are not included.

Sir Evan Jones: In the particulars which have been handed to Mr. McNair I put a column giving the number of man shifts lost through the failure of the employer to provide work for the men.

Mr. R. H. Tawney: That is what we want.

Mr. Evan Williams: On this side we want the whole truth.

Mr. Herbert Smith: But that has not been supplied.

Mr. Sidney Webb: Has there ever been an inquiry into the number of man shifts lost through failure of owners to supply the work? I take it there has never been an inquiry. We have gone on for years talking about the absenteeism of the miners, but we have never said anything about the absenteeism of the owners.

Sir Richard Redmayne: We have inquired into case after case—hundreds I may say—of high absenteeism, as to what is the cause. But the first portion of your question was to the effect, have we made inquiries as to the number of shifts that have been lost through faults of the management? No, not, detailed—but there have been innumerable inquiries as to that and everything else.

Mr. Sidney Webb: Which department of the Government looks after the conduct of the management of the men? Which Minister is responsible to the House of Commons for seeing that the mines are properly managed?

Sir Richard Redmayne: That is a matter for the Coal Controller.

Mr. Sidney Webb: Then I should like to ask the Coal Controller whether there has been any inquiry as to the shifts lost through the management or preventable causes by the management.

Sir Richard Redmayne: Yes, scores.

Chairman: You are rather anticipating Sir Richard's evidence.

Mr. Sidney Webb: We want to give Sir Richard Redmayne 24 hours' notice of what we want to know. Would Sir Richard Redmayne kindly bring those instances with him to-morrow?

Sir Richard Redmayne: I do not remember a single one.

Mr. Sidney Webb: They would be recorded in the Home Office.

Mr. Frank Hodges: I would suggest if any value is to be attached to these most interesting figures it can only be of real value to this Commission either at this stage or at a later stage in this inquiry if they could be ascertained accurately from particular collieries: for example, a charge has been made of declining output at a certain colliery, and I have telegraphic evidence giving reasons why; but it is too late for an inquiry to be held now into that particular colliery, because we have to report by the 20th.

Chairman: What I think would be valuable, if you would allow me to suggest it, is that when Sir Richard goes into the box you should put that class of question to him. This is a general thing that it is impossible to test without a prolonged inquiry; but it will be contended on one side that the men are not putting their backs into it; then on the other side of the picture you would say, "Look at this telegram which I have, which shows that it is not a question of the men not putting their backs into it, but it is through a want of clearance or stoppage." Those single instances will be what we call a *caveat emptor*. That is a caution to people

4 June, 1919.]

[Continued.]

against forming a judgment on this Table without knowing what the real facts are. You are perfectly right. You will say this is not the men's fault at all; they were willing to work, but they could not. Somebody else who does not know the facts will say they are going on' canny, and you will say No, that is not so.

Mr. Sidney Webb: Is it not possible to get a return as to the number of shifts which through the fault of the management have been lost? Is there no possibility of getting that return?

Mr. R. W. Cooper: Might I suggest that you should say simply the causes as to the loss of time?

Mr. Sidney Webb: Other than the men. Has no such return been obtained while we have been going on for months?

Mr. R. H. Tawney: I asked for that return many weeks ago.

Mr. Sidney Webb: Could we not have an accurate return of what shifts were lost, irrespective of the cause?

Mr. R. H. Tawney: I do not want the cause. You do not give the cause in the case of absenteeism, with regard to the men; you say they are absent, but the same applies to the owners. It may be their fault or not. We only want to know the facts. Do you not get a return of it?

Sir Richard Redmayne: Yes—a record of all the shifts lost at the collieries.

Mr. Sidney Webb: That has not been produced.

Sir Evan Jones: Do you want the number of shifts lost through disputes, etc. each week, because I have that return here?

Mr. Sidney Webb: "Disputes, etc." is a curious title.

Sir Evan Jones: It is a return I called for to verify anomalies in the tables which I was preparing. It gives it for three years, 1917, 1918, 1919, the number of persons employed per week and the number of man shifts lost on account of disputes.

(Adjourned for a short time.)

The Right Hon. CHARLES WILLIAM BOWERMAN, Sworn and Examined.

25,713. I think you are a Privy Councillor, and you have been a member of Parliament for Deptford since the year 1906?—That is so.

25,714. I think you were General Secretary of the London Society of Compositors from 1892 to 1906. You were President of the Trades Union Congress of 1901, and you have been Secretary of the Trades Union Congress since 1911?—That is so.

25,715. We have had a considerable volume of evidence here from the consumers' point of view upon the question of nationalisation. What we did was this, we asked the Associated Chambers of Commerce to nominate 4 or 5 gentlemen who would come here and tell us the views of their constituents on this question of the nationalisation of the coal mines. We had a gentleman yesterday from Leeds, another gentleman from Birmingham, another gentleman from Glasgow, and another gentleman from London, who told us the views of their various constituents. Of course, as you will understand, they represented the views of the employers' side of the question, and we thought that we ought to have before us somebody who could represent in the various trades the other side of the question, and, therefore, we have asked you to be good enough to come here and give us either your personal views, or your views in a representative capacity of what labour generally thinks of this question of nationalisation. I have not the honour of having a *précis* or proof from you, but I should be greatly obliged to you if you would tell us what in your view are the proper considerations to be adopted on this question.—Rather than give my personal view I would prefer to give the view of organised labour, as represented at the annual meeting of the Trades Union Congress, and if I give you the purport of resolutions passed affirming the principle of nationalisation of mines, railways, land, and so on, and give you the dates of those congresses, the number of delegates present, and the members they represent, probably that will answer your purpose.

Mr. Sidney Webb: That is very interesting, but apparently there is information which exists about two time lost through absenteeism by the men, also time lost through disputes, but no return appears to exist with regard to the time lost through other causes. Is that so?

Sir Evan Jones: I am under the impression myself that in this return the term "disputes" here is generally.

Mr. Sidney Webb: It is extraordinary if a return is made of the time lost through all causes that it should be headed "disputes" as though blaming the quarrelsomeness of the men.

Mr. Robert Smillie: The miners' representatives here are concerned in this as much as the employers.

Chairman: That is quite right.

Mr. Robert Smillie: If a shift is lost through any cause it means a loss of the aggregate output. We want to get at the loss per individual person, and we want to find out whether there are collieries in the country at the present time where if they could take away 400 tons more per day the men would give it to them.

Mr. Sidney Webb: Let us ask Sir Richard Redmayne to come prepared to-morrow with all the information which the Home Office has with regard to that point. There have been inquiries apparently about particular cases.

Mr. Frank Hodges: Cases where the employers exercised sabotage.

Mr. Arthur Balfour: Do I understand Mr. Hodges to say that he thought there were cases where the employers restricted the output?

Mr. Frank Hodges: Where they exercised sabotage.

Mr. R. W. Cooper: Will you kindly speak English, and say what you call "sabotage"?

Mr. Frank Hodges: Where they restricted the output themselves.

Sir Adam Nimmo: It is absolute nonsense.

25,716. Yes. After you have done that I shall ask Mr. Smillie to ask you some questions. I expect you know him?—I have that pleasure. If I may refer, first of all, to the Leeds meeting in 1904, when a resolution was passed calling upon the trades represented at the Congress to use their best efforts towards furthering the nationalisation of the means of production, distribution and exchange. That is general in its terms, and includes, of course, mines. That resolution was carried unanimously after a very interesting discussion, and there were present 453 delegates from various parts of the United Kingdom, representing 1,422,518 organised workers, men and women. Then in 1905, at the Hanley Congress, a resolution was submitted—let me say not by the miners, but by another important body affiliated with the Congress; another trade altogether—"That this Congress requests the Labour group in Parliament to introduce a Bill with the object of nationalising all railroads, canals, mines and minerals in the United Kingdom." That was passed in an assembly of 457 delegates, representing 1½ millions of workpeople. In the following year, 1906, at Liverpool, a resolution in precisely the same terms was also passed unanimously, representing about the same number of members, but with an added delegation, a total of 491. Then in 1912, at the Newport Trades Union Congress, rather a lengthy resolution was passed. Probably you do not want me to read it?

25,717. If you kindly would?—I will with pleasure. The resolution was: "That in the opinion of this Congress all land, minerals, mines, railways and canals should be nationalised in the interests of the nation, commerce and the well-being of the people generally, and further, having regard to the admittedly unsatisfactory position of the railways, from the standpoint of the trading and travelling public and the employees, this Congress emphatically expresses its opinion that the policy of joint working agreements, tending, as it must, to the formation of combines, and subsequently to the development of

4 June, 1919.]

RT. HON. CHARLES WILLIAM BOWERMAN.

[Continued.]

one great trust or amalgamation under private capitalist control, is not calculated to advance the best interests of either the public or the employees, and instructs the Parliamentary Committee to urge upon the Government the necessity of promoting legislation for national ownership in lieu of the policy laid down in the Government Railway Bill now before Parliament." No doubt you will remember that: Mr. Sidney Buxton was the author of it. There was a very animated, lengthy and interesting discussion on that resolution, and strange to say, out of 495 delegates, representing over two million members, at this time, in 1912, only one delegate arose in Congress to speak against the resolution; therefore one may say that it was practically carried unanimously.

25,718. *Sir L. Chiozza Money*: Who was that?—My recollection is that he was a member of the Dockers' Union. I will give the figures of the voting—it was one vote per thousand members: the voting was, in favour of the resolution, 1,789,000; against 16,000. In other words this particular member had a proportion of the votes of his own union because he was opposed to the opinion of his other colleagues. Then in 1916, at Birmingham, a very long resolution was passed, but I do not propose to read it to you. It was very comprehensive in its character, and urged the setting up of a Ministry of Labour: there was the question of bousing, and with regard to agriculture, advocating control and direction of land and security of tenure; the nationalising of shipping as far as possible, nationally owned and controlled storehouses for frozen meat, dried fish and all kinds of storable food. If that had been possible before the war, in my opinion it would have been a very good thing for this country. Then it winds up by advocating the national ownership and control of all railways, waterways, and mines. That resolution was brought forward on the motion, not of the miners, but of the Boilermakers' Society at a meeting of 673 delegates, representing 2,850,547 workpeople. So you see there was a progressive increase in the number both of the delegation and of the membership represented. Then, if I may come now to 1918, at the Congress in September last at Derby, where there were 881 delegates present, representing 4,532,085 organised workers of the United Kingdom. This was the motion brought forward by the miners. It is a matter of four lines only, and reads as follows: "This Congress is of the opinion that it is of the utmost importance that the mines and minerals of the country should be owned and democratically controlled by the State, and instructs the Parliamentary Committee to take the matter in hand and press for the realisation of that object." The word "democratically" was introduced. That was not in the motion as tabled by the miners, but a member of the Parliamentary Committee, who was the representative of his Union at the same moment, moved the insertion of the word "democratically"; that was carried, and on that occasion carried with unanimity. Now that is very shortly the history of the discussions of Congress on the question of the nationalisation of mines and minerals and railways.

25,719. *Chairman*: Now I want to ask you one thing: I know it myself, but I want to get it on the notes. You send out a form of agenda so that people know what is to be discussed, and come there prepared. It is not like starting a discussion on a subject which has never been down on any agenda?—No. For instance, if I may give an example: On Monday next week resolutions will be due from the Unions, and then those resolutions will be sent out in print within a week or ten days, and the Unions will be asked to send in amendments if they so desire, and the propositions with the amendments will be sent out to the Trade Unions certainly a month before the delegates assemble; in other words, to give the Unions time within which to consider the propositions and instruct their delegates accordingly.

25,720. *Mr. Robert Smillie*: What proportion do you think, as near as possible, of the organised workers of the country are connected with the Congress?—It is rather difficult to say, but I would suggest 90 per cent., if not more. The increase in the late years has been rather remarkable.

25,721. I think you mentioned 4 million just now?—I would not like to say the proportion, but the representation at Congress has practically doubled within the last four years.

25,722. I suppose that might be taken as 50 per cent. of the workers of all kinds in the country, not of the organised workers?—When I said 90 per cent. I had in mind what I should call artisan craftsmen as distinct from labourers.

25,723. The organised trade unionist artisan class you had in your mind?—Yes.

25,724. I suppose the number represented there would be about 50 per cent. of the workers of the country?—I would say Yes to that.

25,725. They are consumers of coal, are they not?—All of them, I should think.

25,726. For domestic purposes?—Precisely.

25,727. Besides that a very large proportion of them are engaged in industries in which coal is the raw material used?—Yes, a fairly large proportion.

25,728. Would you be justified in saying that they take a fairly accurate interest in the discussions of all questions of that kind before they send out to their branch delegates to vote upon it?—I have not the least doubt that is the case. I give that reply on account of the extremely interesting discussions that took place on this subject, not only last year, but on two or three preceding occasions, which rather conveyed to my mind that the subject had been well thrashed out in their lodges or branches.

25,729. I suppose we may take it that if there is any union which is affiliated to the Trade Union Congress which opposed that resolution for the nationalisation of mines, they would send forward an amendment to the agenda?—Quite so. As a matter of fact the only amendment that was brought forward last year was the addition of the word "democratically."

25,730. That was the only amendment that you had at the last Congress you held?—Yes.

25,731. Do you take it from that, that none of the societies were opposed to the nationalisation of mines, or you would have expected an amendment from them?—Undoubtedly.

25,732. May we take it that the resolution was carried unanimously at the last Congress?—Quite so.

25,733. The Congress representing the largest number you have had?—Yes.

25,734. What is the number of the Parliamentary Committee?—16: we can increase that to 17 if the vote is sufficiently large.

25,735. Those are selected at the Congress itself for the following year?—Yes.

25,736. Your position as Secretary is a permanent one, but the others are selected from year to year?—Elected year by year.

25,737. And they are elected in a way that prevents any particular industry having a preponderating number on the Parliamentary Committee?—Yes; only one in a trade, as a matter of fact, can be represented, that is to say, two members of one trade cannot be represented on the Parliamentary Committee except during the past three years when, if a Society has a certain membership, 500,000 or more, it gives it the right to send a second representative forward, provided the Congress elects him.

25,738. What are the duties of the main committee?—To take the resolutions as passed by the Congress, and to do their best to see that legislative effect is given to those requiring legislation. Our practice in the early part of the session is to ask the Ministers of the different departments concerned to receive the committee as a deputation in order to place before them and to discuss with them the resolutions passed by the previous Congress.

25,739. You would expect a Parliamentary Committee collectively and individually, the members of it, to carry out the mandate of the Congress?—Unquestionably.

25,740. The Parliamentary Committee have not decided to give evidence before this Commission against nationalisation of the mines?—No.

25,741. Are you aware that Mr. Havelock Wilson, a member of the Parliamentary Committee, and the

4 June, 1919.]

RT. HON. CHARLES WILLIAM BOWERMAN.

[Continued.]

secretary of the Seamen's and Firemen's Society, has given evidence here against nationalisation?—Not, I take it, as a member of the Parliamentary Committee.

Chairman: No, he gave his evidence in his private capacity.

25,742. *Mr. Robert Smillie:* I did not put it so, but he is a member of the Parliamentary Committee?—Yes.

25,743. It is a fact that, according to your evidence, the Seamen's and Firemen's Union had an opportunity of sending forward an amendment or a resolution to the last Congress against nationalisation of the mines?—Quite so.

25,744. They would have the opportunity of having before them your agenda in which the resolution for nationalisation of the mines was put down?—Yes.

25,745. Did you receive from them any amendment to that resolution?—No. The only amendment was the one I have suggested, namely, the inclusion of the word "democratically."

25,746. That was the only amendment that you had?—Quite so.

25,747. May I take it that the members of the Parliamentary Committee, individually as well as collectively, are expected to act loyally to the findings of the Congress?—I think they can be brought to book at any succeeding Congress if they act disloyally.

25,748. Have you or the Committee at any time approached Ministers on the question of nationalisation, either of the mines as a separate resolution, or a general resolution for the nationalisation of land and mines?—Yes, we met the Prime Minister, I think it was last year, on the question of the mines, railways and canals, and I thought that we received a very satisfactory reply from him, particularly with regard to canals and waterways, but this year, perhaps, I might say, we have not had an opportunity of meeting the Prime Minister upon the miners' resolution passed at Derby, because, as you know, he has been in Paris, and he has been unable to receive us up to the present moment, otherwise the last resolution that I have read would have been submitted to him.

25,749. I suppose, because of the national crisis of the last four or five years, the Parliamentary Committee have not been in a position to press, as they would in normal conditions, the claims of the workmen for legislation?—The Committee have carried out the instructions given to them by Congress as far as they could; they have met the Ministers, including, as I have said, the Prime Minister last year, but many of them took up the attitude that obviously being in the middle of a great war they were unable to do that which, under normal circumstances, they might otherwise be prepared to do.

25,750. As a matter of fact, you have put before us to-day, so far as you can, the views of the 4 million organised workers of this country as expressed at the Congress last year?—Undoubtedly as expressed by the resolution passed last year.

25,751. *Sir Allan Smith:* You say, as expressed by the Congress. How do the 4 million workers express their views at the Congress?—Through their various unions, their executives; through their branch meetings, their lodgo meetings, and so on.

25,752. Do you suggest that the resolutions that have been carried at the Congress are binding on the individual members of the trade unions?—I will put it this way—

25,753. Would you answer that, if you please?—If a man is sent forward in a representative capacity to a Congress to represent 5,000, 10,000 or 15,000 or 50,000 men, and he receives instructions from his executive committee to support a certain resolution, then it seems to me that he is binding the whole of his membership.

25,754. To that extent, and to that extent only?—To that extent I still look upon it as a binding vote on his part, binding the Society he represents.

25,755. Would you, therefore, consider that the various trades unions which, as you say, are parties to these votes, would be bound to honour these votes irrespective of their members' views?—I take it that they are expressing their members' views when they

receive the instructions of their own executive committees after holding meetings of the members and going forward to a Congress and expressing a view in a certain direction.

25,756. How does a trades union express its view?—They have not board meetings to fall back upon. They convene either a general meeting or a special delegate meeting.

25,757. Of what?—Of the members—not the general public—and the lodges or branches; or take the case of my own trade, the printing trade, what we call our chapels. The various offices depute men to attend those special meetings, but before those men attend the special meeting the subject to be discussed at that meeting is discussed by the men themselves, and they give their representative or representatives instructions.

25,758. Who are the men themselves?—The members of the union.

25,759. Do the members of the union discuss a thing to appoint members to go and discuss it with the members of the union?—I will try and make myself clear.

25,760. I ask how do trades unions express the views of their members?—I will give my own case, which I know most about. We hold quarterly meetings.

25,761. Of what?—Of the membership.

25,762. As one meeting?—We hold the quarterly meetings every quarter.

25,763. Of what?—If you will give me time I will try and make it clear to you. It is a quarterly meeting of the membership. There are 600 different offices in London, varying from five men to 500, and each office appoints representatives, one for each 12 members in that office. He is sent forward to a delegate meeting, which is held once per quarter. Those men know what they are to discuss when they get to that meeting. The men who send them know what their representatives are to discuss, and they go forward to this delegate meeting or annual meeting or special meeting, as the case may be, to record the opinions of those whom they represent.

25,764. Do those delegate members know what is in the mind of the members of the union?—Undoubtedly.

25,765. Is that the case in all the trades unions?—I should think so; but, again, I speak for my own. I should say the principle applying to one union would apply to all.

25,766. I should have thought that you from your position would know more about the other unions?—Then I say definitely, the principle of delegation of representatives which governs the Society of Compositors governs the whole of the unions.

25,767. You say that?—That is my answer.

25,768. What is the use of the ballot in the trades union movement?—It is very useful.

25,769. For what purpose is it used?—Let me put it in this way—again speaking for the printers. The executive can vote a sum of £30, but for anything beyond that they must go to a ballot. That is a case in point. If the members want to extend the provident benefit or the unemployment benefit beyond a certain period, a ballot is necessary, so as to give every member an opportunity of recording his vote.

25,770. If the members of the Compositors' Society wish to create a stoppage for the nationalisation of mines, would there be a ballot?—I think there would be.

25,771. According to your rules would there be a ballot?—There would have to be in the case of the Compositors' Society a ballot.

25,772. Do you know whether that applies to other Trades Unions as well?—I am bound to say I am not conversant with the rules of every Union.

25,773. But you were able to pronounce quite categorically that as you vote at your delegate meetings so all other Unions vote?—Yes, I take it so.

25,774. Can you be equally categorical in this case, that if any Trades Union wished to push nationalisation to the extent of a stoppage of work that they would require to put that issue to the ballot of the membership?—I think that would be the case.

25,775. Would you give us an indication as to the average percentage of workers who ballot on any

4 June, 1919.]

RT. HON. CHARLES WILLIAM BOWERMAN.

[Continued.]

subject?—That is a variable quantity. I have known cases in my own Union where out of 11,000 men, leaving out the superannuated men, some 9,000 have voted. I have known other occasions when probably only 7,000 have voted. It depends on the nature of the particular question submitted.

25,776. Is it usual to have such a high proportion?—Again I cannot speak of the domestic policy of all the Unions.

25,777. I suppose you have seen many ballot results published recently?—Yes.

25,778. Take, for example, the ballot on the 44 hours' week, which was published the other day. What proportion did the ballot represent of the voting power of the Union?—Without going into that, I have sometimes thought it regrettable that more members did not interest themselves in a ballot vote.

25,779. Would you suggest that one-third of the membership is a good ballot, having regard to the experience of ballots as we have had them for some years?—I should say Yes. If they do not vote I take it they are content to leave it to the judgment of those who are prepared to vote.

25,780. Do you suggest that all the people who wish to vote on a particular matter do so?—My reply is that they have the opportunity.

25,781. To that extent the value of the resolutions of a Trades Union Congress have to be somewhat modified?—No, I do not admit that. My feeling is that if there were any strong feeling against the resolution or against any subject embodied in a particular resolution at Congress that that objection would make itself known by way of resolutions from the Unions following the meeting of Congress.

25,782. Is the Trade Union Congress seriously considered by Trade Union members as a whole?—If that is a serious question I will answer it.

25,783. Please do; I would like your answer?—The fact that the membership has doubled itself from 2½ million to over 4 million in five years speaks of the earnest views the Union takes.

25,784. Then your answer is yes?—Yes.

25,785. Can you tell me of any large and important trade unions that are not affiliated to the Trade Union Congress?—No, I do not know that I can. I will mention one who was out of the Congress for some few years, the engineers; but they are back. The ironfounders were out for some few years, but they are back.

25,786. So at the moment you know of no trade union of any importance outside the membership of the Trade Union Congress?—No, the ones outside are in the main very limited in membership.

25,787. Is it not the case that this resolution for nationalisation of various operations in the country is a good old hardy annual of the Trade Union Congress?—It is not a hardy annual. I could state every subject that has been before Congress for 10, 15, 20 or 25 years. I have given you the dates when the various resolutions dealing with the nationalisation of mines, etc., were submitted; I think altogether there were six.

25,788. What was the first date?—1904.

25,789. Is that the first date on which any resolutions with regard to nationalisation was considered?—That was the first resolution in which it was considered in any definite shape.

25,790. Is that the first date that any resolution has been put before Congress?—As far as I know, yes.

25,791. You suggested something was put before Congress in another shape. Did that apply to nationalisation?—No. With regard to nationalisation, these resolutions are the only resolutions that have been passed on the point. You do not want me to give the dates again, I take it, but I will with pleasure; 1904, 1905, 1906, 1912, 1916 and 1918.

25,792. Supposing you go to the *Primo Minister*, or any head of a department, and he gives you a negative answer, what does the Parliamentary Committee do?—The Committee, of course, communicates that decision, call it a decision if you like, or the result of the interview, to the union concerned, and later on to the Congress itself. Then it remains for either the union or the Parliamentary Committee to bring forward the question again at the succeeding Congress, and that is a process that has been carried on, slowly, it is true, but eventually successful. Old Age Pensions is a case in point. We advocated that for many years until at last we were able to realise the desire of the members.

25,793. Supposing Congress considered the decision of the Minister and proceeded, how would it proceed to enforce its wish?—Through Congress.

25,794. Supposing the Minister refused and Congress was not satisfied, if Congress thought wise to bring pressure to bear how does it bring pressure to bear?—By way of argument and reasoning with the Minister.

25,795. With Ministers sometimes arguments and reasoning are not of much avail. Supposing your case failed again, how would you proceed so as to show the power of Congress?—We are hopeful with the Congress growing in numbers and in influence that the Ministers are impressed accordingly.

25,796. You have not nationalisation yet; but, notwithstanding that, you have been at it since 1904. Is there any way at all that you can bring pressure to bear on the Government otherwise than by deputations and resolutions?—Through the Trade Union movement.

25,797. How can you bring pressure to bear through the Trade Union movement? What would you do?—That is a question. If the Trade Union movement was put into such a position by continual refusals on the part of Ministers, then undoubtedly the membership would have to consider it and consult their members upon it.

25,798. Quite. If the Congress fails it has to go back to the Trade Union members?—Yes.

25,799. Therefore Congress has no power whatever beyond the ultimate vote of the members of its Trade Unions affiliated?—That is so.

Chairman: We are very much obliged to you, and we thank you very much for the assistance you have given us.

(The Witness withdrew.)

Mr. FREDERICK MILLS, Recalled and Further Examined.

Chairman: You have already been sworn. You were good enough to put in a document* yesterday which we had not seen before, and which some of us desired to read before you were asked questions about it. Probably all of us have read it now.

25,800. *Mr. Frank Hodges:* The document you put in did not bear out the evidence that you were giving. As a matter of fact, the evidence you were giving when the examination came to an end was evidence as to an interview between yourself and the Miners' agent upon a dispute which has recently occurred in the Ebbw Vale district, and you quoted from what was alleged to be a shorthand note of an interview. When I read through it I find it is the report of the minutes of meetings held as far back as December 23rd, 1918, in which you were endeavouring to set

up a sort of Whitley Council?—You must have been reading the wrong document. There are two documents—one dated December 23rd, 1918, and the other the 19th May, 1919.

25,801. I have been reading the one dated 23rd December. I did not have any other.

Mr. R. W. Cooper: I have only the 19th May, 1919, one.

Chairman: The one I read was where a number of other Trade Unions are shown to be represented. There is a list of the gentlemen at the beginning?—That is December 23rd, I think.

25,802. *Mr. Frank Hodges:* I want to find out, if possible, the cause of this recent strike which has lasted for somewhere in the neighbourhood of four weeks. I put it to Mr. Mills yesterday that that

* See Appendix 74.

4 June, 1919.]

MR. FREDERICK MILLS.

[Continued.]

striko was duo to the desire on the part of the company to cut piecework rates. I notice Mr. Evan Davies, the Mine Agent, in the interview said on page 1: "I can only say, Mr. Mills, that the stoppage did take place, duo to a few men working for less than the minimum wage at Waunlwyd Colliery." Apparently your efforts at setting up a Joint Whitloy Council as far back as December 23rd did not obviate this striko?—Because the Council has not yet been set up; it has only been partially set up.

25,803. Do you hope when you set up this machinery that strikes in your district will be less frequent?—I have every hope.

25,804. What has been the position with regard to output in your district during the last three months; has output increased or fallen apart from this striko?—I have not the figures before me, but I think it is lower than it was.

25,805. What do you ascribe that to?—General disposition of some of the men not to put forth their best efforts.

25,806. What evidence have you of that?—We have many evidences of it. The fact that there is continual trouble in regard to allowances and so forth is increasing all the time and we find a great deal of absenteeism. I have not the figures before me because I did not know I was going to be examined on such a subject, but I have with me some correspondence I had with the Coal Controller last year which sets forth the matter and I think that is still going on.

25,807. I am asking you what evidence you can put before the Commission that the cause of the decline in output at the Ebbw Vale collieries can be ascribed to the lack of effort on the part of the men?—We have the figures. I did not bring the figures with me. I have the figures of last year setting it forth.

25,808. Do you trace these facts and do you go right down to the individual man and ascertain if it is a fact or not than an individual man is producing less than before?—The colliery managers do.

25,809. Do they report to you?—Yes.

25,810. Have you a sample of a report which you can put in?—I have the report* I sent to the Coal Controller in December, 1918, which shows that the output of the Ebbw Vale collieries on a Monday is 4,350 tons; on a Tuesday 5,628 tons; on a Wednesday 5,714 tons; on a Thursday 6,149 tons; Friday is not a fair day because it is an hour longer. As a matter of fact it is 6,653 and Saturday 4,736 tons, Saturday being a short day. That has been distinctly traced to the absenteeism of the men in the forepart of the week, and the sustained effort does not come until the middle of the week and it is accentuated on Thursdays and Fridays.

25,811. That is not an answer to my question. Will you follow me a little closer. I put it to you that you made the declaration that the output has fallen during the last 3 months, that is the aggregate output or the output per man employed?—Yes.

25,812. I am not testing the output of a Monday as compared with a Saturday. You said the output per man has dropped?—Pardon me, I do not think I did. I think you asked me had the output come down? I said I had not the figures but I think it has for the last three months. I certainly did not know it had come down per man per day. I only instance these figures of last year because they are continuing.

25,813. You are not prepared to say your output per man has come down?—No.

25,814. Would you be right in saying it has gone down each week?—I think not.

25,815. Do you know in your collieries there have been constant and regularised complaints against the Company on the part of the men for the failure of the Company to provide timber in adequate quantities?—Yes, I know that that complaint has been made.

25,816. Do you know that that complaint has been recorded by the colliery firemen every day upon their books for the last three or four months?—I do not.

25,817. Would you be surprised to know that that could be proved?—I should not.

25,818. You would not be surprised?—No. I do not think it follows there has been a shortage of pit wood, because I know there has not.

25,819. I put it to you the colliery firemen can be called and their books can be called for to be produced before this Commission which will show they have reported regularly that there has been an insufficient supply of timber and consequently there has been a reduced output of coal?—I do not mind these books and men being called. All I can say is there has been no intention on the part of the company to keep the colliery short of pit wood.

25,820. Whether it was the intention on the part of the colliery or not, is it the fact the firemen have recorded daily in their books that the pits have been short of timber?—I do not know that.

25,821. I put it to you as the head of this firm you ought to know?—I know it has been alleged.

25,822. By whom?—By the miners.

25,823. And by the miners' leaders as well?—Yes.

25,824. Mr. Evan Davies in this very interview with you makes the allegation?—I am quite aware of it.

25,825. On page 3 he says, "We have cases of men at the pit who could earn 25s. a day, but as the result of the shortage of trams they are working for the minimum wage only." That is shortage of trams. Higher up he says, "I believe there has not been a sufficient supply of timber going down the mine"?—It does not follow it has been want of timber.

25,826. Have you followed up that complaint?—I see you had Mr. Evan Davies, the miners' leader, there?—Yes, and I am told the statement is quite unjustified.

25,827. Have you inquired as to whether there is a report appearing daily in the firemen's books stating there is a shortage of timber?—No, it would not occur to me to do so.

25,828. I suggest further there has been a shortage of rails although you produce rails at Ebbw Vale?—Yes, it shows how absurd it is to make such a suggestion.

25,829. In the interview between the miners' representatives and yourself with your managers the allegation is put forward in all seriousness both by the men and their leaders?—Yes. I do not doubt its bona fides. That was not my point at all, of course.

25,830. It is my point for the moment that you who are producing steel rails as it were, are in a position if you wish to produce steel trams and you have your own collieries inefficiently equipped?—We deny that absolutely.

25,831. Although you do not deny the fireman's report?—I do not know anything about the fireman's report.

25,832. Would it be a surprise to you to know that this is the view of the Ebbw Vale men with regard to the supplies of material that you afford, that there is apathy and indifference with regard to the staff in endeavouring to get adequate supplies of these things in the workings?—Of course, it is quite open to the men to say that. It is quite open to the staff to say it is not so.

25,833. There is a feeling amongst the Ebbw Vale miners that you are deliberately attempting to keep down output?—Of course, that is too absurd even to repeat in this room.

25,834. It may appear to you to be absurd, I put that this is something that has been put before you by the men on the spot with their leaders present?—May I tell you why I called that conference?

25,835. I am not talking of that conference?—You are quoting from it.

25,836. This was really a deputation?—Then say deputation. The reason I called that deputation was to try and find out if I could why, even if what you say is correct, it was necessary for the men to take the law into their own hands and stop work either without the knowledge and consent of the management or of the miners' agent or any of their under-agents. On the front page of the document you will find the miners were represented by Mr. Evan Davies, Agent; Mr. Jack Griffiths, Assistant Agent; Mr. Ben Griffiths; Mr. Tom Lawrence; Mr. Percy

* See Appendix 75.

4 June, 1919.]

MR. FREDERICK MILLS.

[Continued.]

Clarke, and Mr. Fred Miles. Now look at page 7 of the document dated May, 1919. Mr. Davies says, "We agree there have been unauthorised stoppages, and if there is any question at all about dishonour it is with the general body of men who adopt this attitude of not adhering to what they authorise us to accept here on their behalf. We have tried to get them to carry out the agreement loyally, but, perhaps for the want of the men's respect, or for some other reason—I do not know what it is—we have failed, and there is no one in this room who feels that more than I do myself." The reason I asked for this deputation to meet me was to point out to the men that by their action in ignoring their own leaders and coming out on strike without saying a word to anybody was because they had rendered 5,000 other men in other industries idle, and those men have been idle ever since and must be so until after Whit-suntide. That was the reason I wanted this out. I wanted the cards all on the table. I pointed out even if they were short of rails, which we deny, or even if they were short of pitwood, which we deny, the remedy was not for them to call a stoppage without notice or without any authorisation, but the remedy was for the miners themselves and their leaders to come to the general office where they have access at any time and explain their position. That is what I am out to stop.

25,837. That is very interesting. Suppose you have a set of circumstances like these: Here you have a body of men who complain bitterly that they are short of rails, sleepers, trams, partings, fitters' tools, and you get individual statements like these, "I have been in at work all day long, and I have not seen the haulier and cannot get a tram." If all that means a reduction of the workmen's wage below the point equivalent to the minimum wage, can you imagine any miners' leader being able to keep his men at work?—I can.

25,838. I cannot. I have had some little experience. I would not attempt it myself. Speaking as a miners' leader, I would not attempt to do it as it would be useless?—The miners' leader did not know the men were coming out on strike. He had not the remotest idea himself.

25,839. He knew the cause and laid it before you?—Afterwards.

25,840. The cause was your inability to supply the men with such tools, trams, sleepers, timber, etc., as would enable them to get a decent day's wage, the result being that in each case these men were on the minimum and their output went down accordingly?—That was not the case; that was an allegation made afterwards. The case was a very different one.

25,841. As a fair-minded man, you would be the last man to allege the falling output per man in your collieries was due to the desire on the part of the men to produce less than they originally did?—I think some of the men are deliberately doing it in our collieries.

25,842. Have you traced such a case to its origin; have you investigated such a case?—It is not my business personally to do it; the mine managers have.

25,843. If you make a statement in an open Commission of that kind that you believe certain men are deliberately keeping output down, it is for you to prove to the very hilt such a case before you utter that belief?—I believe the whole of this document is proof of it, if you will be kind enough to read it. This document, dated May 19th, is a deliberate case. I have other cases, of course. May I read you one? There is one at our Six Bell Pit under John Lancaster & Co., Ltd. This is the manager's letter: "In our three-quarter seam the coal is stiff, and the output per collier per day worked is 15 cwts. of large coal. A coal-cutter was introduced, and the first week the coal was cut by machinery the men were able to fill 3 tons 8 cwts. per collier per day. They now refuse to use it, their absurd argument being that if we could afford to pay an allowance for 15 cwts. per man per day, surely we can afford to pay the same allowance for 3 tons 8 cwts. of coal per man per day; and this in face of the fact that the men's wages increased several shillings per day when the coal was cut by machinery."

25,844. What is the date of that letter?—May 31st, last week. This is a case where the men are deliberately holding back the output.

25,845. I should not arrive at that conclusion for the moment I should say it is due to your inability to come to satisfactory monetary terms with the workmen. If you can come to satisfactory monetary terms with the men with regard to payment per ton got, you will find there will be equal willingness to meet you?—Why should they not work the machine in the meantime?

25,846. There are two points of a general character that are in your *précis*. It is under the heading of labour unrest and the remedy. You say: "Remedies for labour unrest have been suggested and, in some cases, tried, in order to obtain for labour a direct interest in the capitalistic system, notably profit-sharing, doomed to failure because, firstly, the units of labour are like shares, fixtures, and, secondly, it is not possible to share losses." Have you read the coal owners' scheme for dealing with the future governance of the industry?—Parts of it.

25,847. Have you paid any attention to the profit-sharing proposals contained in it?—Yes, I did read that.

25,848. Was that statement made after having read it?—This statement was made in February of last year.

25,849. Therefore your verdict on profit-sharing was made before the scheme was printed?—It was made years ago; you know that.

25,850. I know it was made in 1913. Do you still hold the view that the element contained in the coal owners' proposition, the element of profit-sharing, is also doomed to failure?—I do not think the coal owners' profit-sharing scheme is the same point as I have alluded to on page 8. The coal owners' profit-sharing scheme is merely another name for fixing wages on prices, as I understand it; it is merely a variation. If you ask my candid opinion, I am no great believer in the efficacy of it.

25,851. Your memory will take you back to the old sliding scale days. Do you notice any real difference between this and that?—Not a great deal.

25,852. A few pages on, under the heading of labour unrest, you say at the bottom of the page: "Labour has shown in this war that it is capable of directing industries." Would you enlarge upon that for a moment?—When the war broke out, for my sins, I suppose, I was made a member of the Munitions Board in South Wales. I had to set about the establishment of shell making factories, and it was part of my principle to appoint a Labour member on each of these boards, and it was because of their attitude on those boards I came to the conclusion I expressed there.

25,853. Can you take your memory back to that paragraph in Lord Gainford's *précis* where he said that under no consideration would he permit or would the Coal Owners' Association of Great Britain permit the workmen to have any executive control in the industry in future?—I am disposed to agree with that with this exception. I should take what advice I could get, but I think the final word must rest with the owner.

25,854. With the owner?—I should call myself in that case the owner.

25,855. How does that quite square with your appreciation of the ability of the workmen to direct industries?—Under your own scheme when he has absorbed the majority holding in the company then he can take it all; I should have quite sufficient faith then that he could carry it through.

25,856. You have faith even in his capacity to undertake executive work?—Yes.

25,857. *Mr. Robert Smillie*: Some of your answers are so serious that I wish to ask you a few questions. Did you examine at any time the reports of your firemen?—Never.

25,858. Have you certificated managers under you?—Yes. You must understand I am not in any way a collier. I was not brought up to be a collier.

25,859. Do you hold a certificate?—No.

25,860. What is your position?—Managing director of the Company.

4 June, 1919.]

MR. FREDERICK MILLS.

[Continued.]

25,861. Do you take any part in the management?—In the management of the Company?

25,862. In the management of the mine?—No; none at all, except in a general capacity.

25,863. As managing director of the company do not your managers report to you the state of affairs?—Yes, every month.

25,864. Have they reported to you the colliery firemen have been signing in the books they are short of timber?—No, I should not expect them to.

25,865. Would you expect the managers to take some action?—Certainly, it is their duty.

25,866. Will you make enquiries whether it is true the colliery firemen reported from day to day or succeeding days with regard to being short of timber?—I should be very pleased to do so.

25,867. Do you know the reason why the firemen report shortage of timber in the books?—I presume because there is a shortage of timber in their opinion or judgment.

25,868. Surely that is not the answer. Do you know it is laid down by law?—Obviously.

25,869. Then give me an answer?—Because in his judgment he requires more timber down the pit for the safety of it.

25,870. That is not the reason. The law lays it down that the fireman when he makes his examination has to enter in a report book a report of how he finds the mine; the presence of gas and the presence of danger. Is it not to call the attention of the manager there is danger because of want of timber?—Obviously.

25,871. If that report is made is it the duty of the manager to take action?—Obviously.

25,872. Will you make enquiries whether or not the colliery firemen have been repeatedly putting that into their books?—As I said before, I shall be pleased to do so.

25,873. Do you know the Inspector of Mines would consider it his business to prosecute the manager if day after day he found when he went to the colliery the reports of shortage of timber?—Yes.

25,874. Do you know that that would leave the manager open to prosecution?—Quite. I wonder if I might answer very shortly by saying I agree with you, and on pages 9 and 10 of this report of May, 1919, I deal with the very point you are raising. May I read it to you: "It is surely wrong to imagine that I, as the head of this concern, would deliberately keep you short of pitwood, or trams, at a time when we are spending millions; you can see for yourselves the millions that are being spent, and I cannot imagine anybody thinking me so crassly stupid as to assume that I would try to save a few pounds by a few tons of pitwood at a time when we are spending hundreds of thousands of pounds in other directions. Therefore I say that where you have got a shortage of trams, or shortage of timber, you have several ways of ascertaining all the facts and whether they are preventable or not. You have the Government inspector; it is his duty to see you have the timber, and that you set it up, and it is absurd, to my mind, for the miners to stop work because the miners' leaders, the miners' committee, the pit committee, the managing director, the general colliery manager and the Government inspectors are not doing their duty." Surely that is an answer to the question.

25,875. That is not an answer. Your attention was called to the shortage of timber?—Yes.

25,876. Did you make any enquiry as to whether that was true?—The colliery manager was sitting beside me at the time and said it was not true.

25,877. Did you make enquiries whether the firemen reported in their books it was true?—I should hardly consider it my business.

25,878. What was the duty of a collier if he found he was short of timber?—I do not know the direct functions of people underground.

25,879. Do you know the Mines Act lays it down?—Yes.

25,880. That a collier, if he finds a danger arising from any cause, like lack of timber or presence of gas, must at once withdraw from the place and report to the colliery fireman?—That may be so. You do not suggest he did that on this occasion.

25,881. I suppose if it is true the colliery fireman reported in the books a shortage of timber from day to day, that it was the duty of the man to withdraw from the place if they were down the pit?—I understand you to say that. I say, surely you do not suggest on this occasion it happened.

25,882. On what occasion? I will deal with the cases where the firemen registered the shortage of timber?—It is the duty of colliery managers and miners' agents to settle a point like that.

25,883. It is the duty of the managing director to see they were doing their duty?—The colliery manager was sitting beside me at this interview and he heard the allegation made and denied it there and then and it was not disputed.

25,884. So far as the union of the men is concerned, if the miners' agent had good ground for believing there was a shortage of timber, he would advise the men to stop work until there was a full supply of timber?—He did not do it.

25,885. That would be his duty?—He did not do it.

25,886. Do you complain the men stopped without the advice of their agent? If there was a shortage of timber, would you complain of the men's stoppage?—If there was a shortage of timber or a danger in the mine, I should not. It has happened before.

25,887. If the colliery firemen reported there was a shortage of timber, would you expect the men to work?—I understand from you—I do not know—that they did report. I say to that, that the colliery manager and the miners' agent both considered the report and said there was not sufficient justification for stopping the mine.

25,888. I thank you for your evidence. That is the strongest evidence we have had in favour of nationalisation of mines?—I am obliged to you.

25,889. *Mr. Evan Williams:* Have the workmen through their Joint Committees with the miners' agents in a constitutional way ever approached the manager with regard to the shortage of timber or shortage of rails?—I have no doubt frequently.

25,890. They have done?—I dare say.

25,891. Do you know if they have or not?—Not of my own knowledge.

25,892. Was there any statement made to that effect at this interview?—No.

25,893. Is it not the fact that a large number of stoppages have taken place without notices of Ebbw Vale?—A great number. I think we registered 140 pit day stoppages during the war and frequently since.

25,894. Was the reason given before the men went on strike?—None. Every one unauthorised by the miners' agent.

25,895. Was an excuse or reason given afterwards or an allegation made afterwards?—Always afterwards.

25,896. No written allegation beforehand?—Not in any case.

25,897. Is not that rather characteristic of a large part of the miners in South Wales?—Particularly in the Ebbw Vale.

25,898. What do you attribute that to?—I think it is due to the fact that since the war commenced the men have asked and always been given what they have asked for. If not given it at first they strike and get it time after time.

25,899. Do you attribute to extreme propaganda what is going on in the district?—I think there is propaganda.

25,900. Of a revolutionary character?—I think stopping a mine is a revolution.

Mr. Frank Hodges: I must draw attention to the report of this interview. Mr. Davies said he pointed out to Mr. John, the general manager, and Mr. Griffiths and Mr. Mills on one occasion the difficulty they had to get the necessary clearance.

Mr. Evan Williams: I am talking about timber.

Mr. Frank Hodges: This is one of the difficulties in the way of output.

25,901. *Mr. Evan Williams:* Was the propaganda of a revolutionary character?—Among certain classes of the men I think it is.

25,902. The trouble is not really industrial in the ordinary sense but more political?—It seems to have that tendency to my mind.

4 June, 1919.]

MR. FREDERICK MILLS.

[Continued.]

25,903. And stoppages are brought about for no other reason than to further the extreme political propaganda?—It is partly that and partly due to a certain amount of jealousy of the understrappers of the miners' agent. For instance this particular strike which Mr. Hodges asked about was brought about by two men, one of whom I think I said last night was what they call a coloured gentleman with a recognized Welsh name, who promised the men he would get them what they wanted if they followed his advice and not the miners' agent's advice. I call that political propaganda.

25,904. Is it your view that under nationalisation this unrest that is due to political action and of the other character would be put an end to?—I think it will be vastly increased.

25,905. Do you know there are miners' agents in official positions in South Wales who advocate strikes day by day for four days a week for political objects?—Yes. I read an article only to-day where Mr. Winstone, the President of the South Wales Miners' Federation, on Monday night last, I think it was, advocated a strike to bring the men back from Russia, that is to say, to strike one day a week for that; another day a week they were to strike for something else; another day a week they were to strike for some other political purpose. I have not the report before me; perhaps you have.

25,906. Four days a week strikes to be taken for purely political objects?—Yes, three or four days were mentioned.

25,907. What is the effect in your view of nationalisation on that kind of agitation?—If that is to go on the result would be hopeless—disastrous.

25,908. Would nationalisation put a stop to political action of that kind?—I think it would tend to increase it rather than otherwise.

25,909. Your characteristic policy you told us was the acquisition of the capital in the industry by the miners themselves?—That is what I hope to see.

25,910. Would you say that was the tendency of the extremist action?—No. I am bound to say I have never heard that advocated by the miners' leader certainly.

25,911. Is not the policy of the extremists who bring about these stoppages to destroy capital rather than own it?—That appears to be the tendency.

25,912. Now with regard to the question of the introduction of machinery at the Six Bells Pit. You were paying allowances in that working because the coal was stiff?—Yes.

25,913. To meet the stiff coal you put in machinery?—Yes.

25,914. Which enabled the men to turn out 3 tons 8 cwt. a day against 15 cwt.?—Yes.

25,915. Did you continue to pay them the price list tonnage rate?—Yes.

25,916. Was it what you had done because it was stiff coal worked by hand?—Yes.

25,917. Are there any other instances of that kind?—There are several instances that have occurred in the same neighbourhood, and eventually the men have decided to work the coal-cutting machinery without the allowance, but not until they had stopped working though. The present case is before the Conciliation Board now for settlement.

25,918. One word with regard to the owners' scheme. Would you agree to the payment of wages in any form as a sort of profit-sharing?—Yes.

25,919. You know previously in South Wales wages were determined by selling price alone?—Yes.

25,920. Are you against the principle of bringing in the other factor of cost?—No, bring in as many factors as you like.

25,921. You are in favour of bringing in all the factors?—Yes, any factor that will help.

25,922. And give the whole information to the men with regard to cost, prices and everything else?—I am all out for giving every information. I have nothing to hide at all.

25,923. Is it your opinion that the owners' scheme will not solve the difficulty?—I do not think it will.

25,924. Why?—I do not think the men are interested to the extent that they would be if they were financially interested in the industry.

25,925. Do you think there is a chance of their becoming financially interested?—I do not see why they should not.

25,926. You are prepared to give them the opportunity?—Yes.

25,927. Do you see a tendency for them to avail themselves of it?—I say out of our 10,400 shareholders a great number are obviously workmen.

25,928. Assume they do, would wages be regulated in any better way in the future as put forward in the Coalowners' Scheme?—I think wages will be settled more amicably around a Board nearer home where we have a knowledge of the factors. If the men were interested financially in their work there would be a greater tendency to put their backs into the work and do the work.

25,929. The figure there brought into consideration is that proposed by the Owners' Scheme—Yes, to all intents and purposes.

25,930. Your process would be a very gradual one?—All things are gradual.

25,931. Wages have to be regulated in the meantime?—Yes.

25,932. Have you anything to put forward or any other constructive suggestion to make with regard to the regulation of wages in the meantime?—I think we must take the selling price and the cost into account in attempting to regulate wages.

25,933. *Sir Arthur Duckham*: You are one of the witnesses who have come before us who controls combine works such as coal, steel, iron, and so on. Can you give us any assistance as to how these different interests would be separated or taken care of under a scheme of unification, say of coal mines in any area or under nationalisation?—I do not see how you are going to nationalise our coal mines at Ebbw Vale and leave out the iron and steel works. Might I describe them roughly? Between our Victoria Pit and the Waun Lwyd pit, which are half a mile apart, we have probably £3,000,000 worth of iron and steel plant on our own freehold. When I tell you the process is that coal is raised at the colliery, it is made into coke and from coke into pig iron; that the waste gas from the pig iron manufacture is then used to generate electricity, which in turn works the original coal, or the next lot of coal from the colliery, so that the whole business is so intermixed I do not see how on earth you are going to separate the coal from the iron and steel.

25,934. *Chairman*: Like Siamese twins?—Yes. If you separate them they probably both die.

25,935. *Sir Arthur Duckham*: You use about half the coal you raise in your own works?—At the moment about half. We use about 1,000,000 tons a year and we raise close on 2,000,000 tons.

25,936. In any scheme of unification, would it be at all possible to keep the coal separated that you raise and book up what you use for your own purposes and what you sell?—I am afraid I do not understand the question.

25,937. It might be advisable that your interests should be connected with some other enterprise?—Yes.

25,938. You might have only a colliery industry?—Yes.

25,939. Could you tie up your colliery interests to the other interests on the basis of coal raised? You know how much coal you raise, because you know how much you use in the works. Could you charge it to your works and charge the other out in agreement with the other people who are working with you, that is to say, the amalgamation?—Such a thing is possible, I daresay, but it would be very difficult.

25,940. With regard to the coal that you raise and use in your own works, do you charge yourself approximately the same price you charge the other people?—We do so now. We used not to do so. We do so by the instructions of the Coal Controller.

25,941. You do so and that would be proper finance?—No. We are such large works that the amount we use of coal bears such a large proportion to the amount we sell and the only thing which is transferred from the colliery to the iron works is small coal. We used an artificial price for the purpose of obtaining a level price.

25,942. You have an artificial price not controlled by the market?—Yes.

4 June, 1919.]

MR. FREDERICK MILLS.

[Continued.]

25,943. You could not do so by the splitting up of these interests?—The small coal when it is once raised from the pit is never weighed until it appears in the form of pig iron. The coke made never goes into a truck. It is conveyed by a mechanical conveyance right into the blast furnace.

25,944. You do not quite know what fuel you use?—We know approximately, but it certainly is not weighed.

25,945. Now reverse the question. Take the other view. If, say, the Miners' Federation Bill was carried into effect and the whole of your works were nationalised, everything included, what sort of effect would that have on your iron and steel industry your relationship to other people who have iron and steel works?—You say if the whole were nationalised, the iron works as well?

25,946. Yes, the iron works, the steel works, and the whole of your plant at Ebbw Vale?—What effect would that have?

25,947. What effect would it have on the iron and steel industry as apart from your works?—It depends upon whether the Government could run it or not. I am afraid I do not follow the question.

25,948. Have you seen the Miners Bill?—I have not seen the Miners Bill.

25,949. The suggestion of the Miners Bill is that they should take over the minerals, iron, coal, and so on, and the works attached thereto.

Mr. Robert Smillie: Is that so?

Sir Arthur Duckham: I do not say you do, but there is power to do it.

Mr. Sidney Webb: Are you suggesting it is intended?

Sir Arthur Duckham: There is power in the Bill.

Sir Leo Chiozza Money: There is a special disclaimer clause put in.

Sir Arthur Duckham: Mr. Chairman, is there not power to do it in the Bill?

Chairman: I think there are powers. I do not say that they will use them.

Sir Arthur Duckham: There is a disclaimer clause. They can disclaim anything.

Mr. Sidney Webb: The title of the Bill limits it.

Sir Leo Chiozza Money: It is only fair to tell the witness how the powers are described in the Bill. It is a Bill to do so and so, and the powers shall be so and so.

Mr. R. W. Cooper: There is no doubt about the powers.

Chairman: It says in section 5 (1), (a): "On and after the appointed day, save as in sub-section 3 of this section, provided every colliery and mine (including all mines, quarries and open workings of ironstone, shale, fireclay and limestone, and every other mine regulated under the Metalliferous Mines Regulation Acts, 1872 and 1875, but not including mines, quarries or open workings of minerals specified in the first schedule to this Act), whether in actual work, or discontinued, or exhausted, or abandoned, and every shaft, pit, borehole, level, or inclined plane, whether in course of being made or driven for commencing or opening any such colliery or mine, or otherwise, and all associated properties (including vessels, lighters, railway rolling stock and all works, including works for the manufacture of by-products, in the opinion of the Mining Council belonging to any mine undertaking or connected with any colliery or mine, and every house belonging to the owners of any such colliery or mine, which in the opinion of the Mining Council is usually occupied by workmen employed at such colliery or mine) (all of which are herein included in the expression 'mine'); and (b) all coal, anthracite, lignite, ironstone, shale, fireclay, limestone, or other mineral, excepting the minerals specified in the first schedule to this Act, whether at present being worked or not worked, or connected or not connected with any mine, beneath the surface of the ground (all of which are herein included in the expression 'minerals'); and (c) all rights and easements arising out of or necessary to the working of any mine or the winning of any mineral, including all mineral wayleaves, whether air leaves or water leaves, or rights to use a shaft, or ventilation or drainage or other royalties, lordships or rights in connection therewith, whether above

or below the ground and all of which are herein included in the expression 'rights') shall be transferred to, vested in and held by the Mining Council in their corporate capacity in perpetuity, and shall for all purposes be deemed to be royal mines, and the minerals and rights thereof respectively (2) The Acts contained in the 2nd schedule to this Act are hereby repealed (3) Provided that the Mining Council may at any time before the appointed day." It gives them the power. They need not do it.

Mr. Robert Smillie: I do not agree it gives them the power.

Sir Arthur Duckham: As drafted it gives them the power and the Chairman agrees to that.

Chairman: We will see what Mr. Slessor says about it.

Mr. Sidney Webb: Take the title of the Bill.

Chairman: We know the title of the Bill. It is on the 13th day.

Sir Arthur Duckham: I would rather take your ruling on the thing as it stands than take Mr. Slessor's opinion.

Chairman: I have not the remotest doubt—there are very few things I have not a doubt upon—that the Bill as drawn gives them power. At question 22,049 on page 916 Mr. Slessor says exactly what I say: "Supposing you had a company which owned coal mines and they used the coal for making steel in the same area. I have in my mind a colliery company like the Ebbw Vale Company. They have a large number of colliers who dig the coal and a large number of other workers who assist in making the steel. How does your draft provide for a case like that? What is to be done with the steel works? (A) That is a question, I think, in which the Mining Council have discretion. If they desire to take over the steel works as well as the colliery, they can do so; they can take it over as an associated property under clause 5 (1) (a) if they wish. It depends upon whether it is in their opinion an associated property. If they do it, they have to compensate separately for it." Mr. Slessor very rightly pointed out if they liked they had a power under the Disclaimer Clause to say they would not do it. They can do it if they like. As a matter of fact I put the question having the Ebbw Vale in mind.

25,950. Sir Arthur Duckham: I want to direct your mind to that position. If the whole of your works are taken over and nationalised can you help us by telling us the effect that would have upon the works of a similar character that were not nationalised, such as works that were not attached to ironworks or minerals?—They would be in competition with the State-owned factory. That is all as far as I can see, and it would depend upon the capacity of the State to run a composite concern like that. I have very grave doubts of their capacity to do it.

25,951. On the other hand you do not see how they can be separated?—I am certain they cannot be separated.

25,952. They could not be taken over at all or run as a composite concern?—Yes.

25,953. Chairman: Supposing it should happen—nobody knows yet—that the mines were nationalised, I gather from your answer in a case like yours you would prefer them to take over the whole of the works and not merely the mines?—I prefer them to leave us alone.

25,954. That is not an answer. If the mines were nationalised, it is a big "if," but if the mines were nationalised I suppose you would prefer in a case like yours that the whole of the works should be taken over, and not merely the mining part?—Either that you leave us alone with the mines, which is a conceivable alternative.

25,955. How would you define that where the steel works predominate? Supposing there was a mine which had thousands and thousands of tons of output a year and one small steel works adjoining, what would you do then?—You would have to determine whether the steel works were worthy of being the cause of exemption or not. In our case, where the industry is very nearly equally divided in point of importance, you can only regard it as an industry

4 June, 1919.]

MR. FREDERICK MILLS.

[Continued.]

as a whole. You have either to take it all over or exclude it all.

25,956. I put the Siamese Twins to you on purpose. Your works are so inextricably combined you say if you sever them they both are killed?—Yes.

25,957. What is the case with regard to coke ovens?—Undoubtedly coke ovens belong to blast furnaces. They do not belong to collieries.

Chairman: We are very much obliged to you.

(The Witness withdrew.)

MR. JOHN HORACE BOWDEN, Sworn and Examined.

Chairman: Mr. John Horace Bowden speaks as to the advantage public controlled electrical works have over privately controlled works. His evidence is of a very useful, but very technical, character.

Mr. John Horace Bowden is M.Inst.M.E., M.I.E.E., Chief Engineer and General Manager, Metropolitan Borough of Poplar, Electricity Department (since 1904); Member of Council of the Incorporated Municipal Electrical Association; Ex-President of the Associated Municipal Electrical Engineers (Greater London). He says:—

Capital Expenditure.—The cost per kilowatt installed in respect of companies throughout the Kingdom was £79·3, and local authorities £52·6, a difference of 50·7 per cent. in favour of public control.

In the Metropolitan area companies spent £82·98 per kilowatt, and local authorities £57·48, a difference of 44·36 per cent. in favour of public control. The cost to local authorities with company inception was £114·29 per kilowatt, a difference of 99 per cent. in favour of purely public control.

In the Provincial area the comparison is £87·3 per kilowatt by companies, and £50·6 per kilowatt by local authorities, a difference of 72·5 per cent. in favour of public control.

In Poplar the cost was £36·66 per kilowatt, which, compared with the average expenditure by Metropolitan companies, is 126½ per cent. in favour of public control.

Working Expenditure.—The average cost to companies throughout the Kingdom was 1·7d. per unit, and to local authorities 0·77d. per unit, a difference of 52 per cent. in favour of public control.

In the Metropolitan area the cost to companies was 1·113d. per unit, and to local authorities 0·804d., a difference of 23·12 per cent. in favour of public control. The cost to local authorities with company inception was 1·093d. per unit, which is 20·9 per cent. in favour of public control.

In the Provincial area the cost to companies was 1·23d. per unit, and to local authorities 0·757d. per unit, a difference of 62½ per cent. in favour of public control.

In Poplar the cost was 0·597d., which is 86½ per cent. better than the cost to the average of Metropolitan companies.

Management Charges.—Throughout the whole area the companies spent 0·223d. per unit, and the local authorities 0·135d. per unit, a difference of 64½ per cent. in favour of public control.

In the Metropolitan area companies spent 0·212d. per unit, and local authorities 0·121d., a difference of 75½ per cent. in favour of public control. Local authorities with company inception spent 0·203d., or 4½ per cent. less than companies.

In the Provincial area the cost was 0·252d. per unit in respect of companies, and 0·135d. per unit in respect of local authorities, a difference of 86½ per cent. in favour of public control.

Poplar management cost 0·059d. per unit, being 260 per cent. better than the average of Metropolitan companies.

Depreciation Account.—The amount set apart by companies throughout the area was 1·78 per cent. to capital expenditure, and by local authorities 3·28 per cent., being 84½ per cent. in favour of public control.

In the Metropolitan area companies set apart 2·01 per cent. and local authorities 4·22 per cent., being

110 per cent. in favour of public control. Local authorities with company inception set aside 2·62 per cent., which is still 30 per cent. in favour of public control.

In the Provincial area companies contributed 1·55 per cent. and local authorities 3·37 per cent., a difference of 117·4 per cent. in favour of public control.

Poplar contributed 4·55 per cent., or 126 per cent. more than the average London company.

Interest and Dividends.—Throughout the whole area companies required 5·15 per cent., and local authorities 3 per cent., a difference of 84·3 per cent. in favour of public control.

In the Metropolitan area companies required 4·97 per cent. and local authorities 2·52 per cent., a difference of 97 per cent. in favour of public control. Local authorities with company inception required 3·3 per cent., which was still 50 per cent. less than companies.

In the Provincial area the figures were: companies 4·5 per cent., and local authorities 2·84 per cent., being 58·4 per cent. in favour of public control.

Poplar paid 2·89 per cent., or 72 per cent. less than the Metropolitan companies.

Revenue.—The average price charged per unit throughout the country by companies was 2·392d. per unit, and by local authorities 1·492d. per unit, being 60½ per cent. in favour of public control.

In the Metropolitan area the charges were 2·39d. per unit by companies, and 1·692d. per unit by local authorities, being 41½ per cent. in favour of public control. In the case of local authorities with company inception the average charge was 2·52d. per unit, or 5½ per cent. more than by companies.

In the Provincial area, companies charged 2·377d. per unit, and local authorities 1·462d. per unit, being 62½ per cent. in favour of public control.

Poplar received 1·03d. per unit, which is 132 per cent. less than the average price received by Metropolitan companies.

Load Factor.—Over all the undertakings included in the statistics the Load Factor varies from 6½ per cent. to 32½ per cent. The average of companies was 19·73 per cent., and local authorities 22·16 per cent., being 12½ per cent. in favour of public control.

In the Metropolitan area the average of companies was 20 per cent., and local authorities 21·77 per cent., a difference of 8·9 per cent. in favour of public control.

In the Provincial area the company average was 19·03 per cent., and local authorities 22·29 per cent., being 17½ per cent. in favour of public control.

In Poplar the Load Factor was 27·2 per cent., or 36 per cent. better than the average of Metropolitan companies.

It is an indisputable fact that public control of electricity supply has produced better results in every respect than company control.

Legislation in the past has encouraged the development of electricity supply by local authorities.

Where the supply has been undertaken without the assistance of private enterprise the capital cost is considerably lower.

Private companies conceived by manufacturers have been saddled with excessive capital expenditure through lack of competition.

Goodwill super-imposed upon excessive capital expenditure on undertakings taken over by local authorities from companies had rendered it impossible

4 June, 1919.]

MR. JOHN HORACE BOWDEN.

[Continued.]

to supply the public at cheaper rates before the expiration of 42 years, although actual working expenses have been considerably reduced.

Electricity supply should ultimately become a department under a Ministry of Coal.

All coal should be worked and graded at the colliery and the highest calorific value should be transmitted to the longest distances.

Coal refuse should be distilled, and energy produced therefrom at the pithead, in order to save cost of transport.

Under a national scheme of coal distribution, the electrical engineer would be relieved of the necessity to become a coal expert.

With the full development of electricity supply a large revenue to the country could be raised with the minimum cost to the country by varying the price of electricity one tenth of a penny per unit, which would produce a revenue of £45,000,000 per annum."

"COMPARATIVE STATEMENT ILLUSTRATING THE DIFFERENCE BETWEEN COMPANY AND PUBLIC CONTROL.

The figures relate to the year 1913-14.

	Provincial.		Metropolitan.		2 Local Authorities with Company inception.
	93 Companies.	203 Local Authorities.	13 Companies.	13 Local Authorities.	
Capital per kw.	£87.3	£50.6	£82.98	£57.48	£114.29
Depreciation, &c.	1.55%	3.37%	2.01%	4.22	2.62%
Income per unit sold.	2.377d.	1.462d.	2.39d.	1.692d.	2.52d.
Working expenses per unit sold.	1.23d.	0.757d.	1.113d.	0.904d.	1.093d.
Management cost per unit sold.	0.252d.	0.135d.	0.212d.	0.121d.	0.203d.
Interest or dividend.	4.5%	2.84%	4.97%	2.52%	3.3%
Load factor ...	19.03%	22.29%	20%	21.77%	18.99%

25,958. *Sir Arthur Duckham*: I would like to have time to consider this. I have been through electrical factories a good deal. With regard to these figures, do you know of any public electrical undertaking that is a charge on the rates or has been a charge on the rates?—Yes, certainly.

25,959. A considerable number?—There are some undoubtedly.

25,960. How do you account for that if they are so much more satisfactory than these companies?—All these figures are given over averages. We must take averages with regard to companies and local authorities.

25,961. Did you take them over a year?—Over the years 1913-14.

25,962. In the report of the Coal Conservation Committee were these figures brought out that the public undertakings were so very much more reasonable?—We endeavoured by the evidence we gave before the Coal Conservation Committee to put forward a large number of figures. I do not think the figures have ever been got out before over the whole country in the three different series as they are here. I would like to say that in putting this as it is here and calling it a *précis* of the evidence it is a little disjointed, because in the full evidence which I sent to this Commission I endeavoured to put forward the reasons for putting these various figures.

Chairman: You gave in your *précis* the full evidence. The reasons for it we accept, and any gentleman who challenges them can see them. It consists of hundreds of thousands of figures, and there is not time this year to go into it.

Sir Leo Chiozza Money: Can it be printed in our proceedings?

Chairman: Any gentleman who challenges Mr. Bowden's conclusions can do so. Mr. Bowden has

expressed his conclusions in a clearness beyond any challenge. If you leave them standing as they are they speak for themselves. If we go through the whole of his *précis* I shall cease to understand them.

Sir Arthur Duckham: If they are public I should like to have them so as to go through them.

Chairman: We cannot go through them here.

Sir Leo Chiozza Money: *Sir Arthur Duckham* has thrown doubt upon these figures. They are well known in London. I have known the results have been better than public companies.

Chairman: Mr. Bowden has given chapter and verse for everyone.

Sir Arthur Duckham: I am not an expert on these things like *Sir Leo*.

Chairman: I should rather challenge your statement that you are not an expert.

25,963. *Sir Arthur Duckham*: There is only one question I will ask you. Would you be willing as an engineer to accept under a nationalisation scheme of coal distribution any coal they like to send you?—I have stated the reasons that the coal which ought to be sent out ought to be suitable coal.

25,964. You would leave yourself in the hands of the distributors to take all the coal they sent you?—By distributors whom do you mean?

25,965. Any sort of distributor, whoever he may be?—I should not care to do that.

25,966. You would still be a coal expert in some sense?—I would only judge the coal suitable for my boilers.

25,967. When you work you take a heat balance through the works with regard to the calorific value of the coal coming in and the power going out?—Yes. When I say coal expert, we have now to test every coal; we have to take samples of every coal.

Chairman: I rather gather *Sir Duckham* thinks this has taken him by surprise?

Sir Arthur Duckham: Yes.

Chairman: *Sir Richard Redmayne* says the same thing. I propose to let *Sir Arthur* have this to-night and *Sir Leo* to-morrow, and this witness can be recalled on Friday. You cannot go through it now.

Sir Arthur Duckham: I cannot go through it now. It is extraordinarily difficult to follow these figures; especially if this is being brought forward as an argument in favour of nationalisation.

Chairman: It is.

Sir Arthur Duckham: If these figures are being put forward in favour of nationalisation I cannot go into it now. You see the magnitude of the figures which are put forward. I think it is a document we must certainly go into closely. If they are put forward in the way they are put forward in the *précis* they ought to be gone into very carefully.

Sir Leo Chiozza Money: This other pamphlet which has been circulated has been public property for some time and has not been challenged. It is the same figures which we have in Mr. Bowden's evidence. I am surprised *Sir Arthur Duckham* does not know of them.

Sir Arthur Duckham: I am not prepared to go into it now.

Chairman: I have been looking through these figures and there are reams of them. (*To the Witness*.) Yours is very important evidence, and I am sure you wish to assist us in coming to a right conclusion upon this question. Nobody can cross-examine upon these figures straight off.

Sir Leo Chiozza Money: Not only are the witness's figures cut down, but his arguments. I should like to have an opportunity of examining him.

Chairman: If that is so we must put off the date of our Report.

Sir Leo Chiozza Money: I ask for ten minutes in which to explain the very things which *Sir Arthur Duckham* asked to be explained.

Chairman: Very well.

25,968. *Sir Leo Chiozza Money*: (*To the Witness*.) First as to the quality of the brains of the public electricity service. Has the public electricity service throughout the country any difficulty in getting first-class engineers to serve it?—I think not.

25,969. With regard to the capital of private electrical undertakings, is it a fact that the capital

4 June, 1919.]

MR. JOHN HORACE BOWDEN.

[Continued.]

isation of such enterprises suffer severely because the concerns are usually linked up with some manufacturing undertakings and are compelled to take a certain amount of material, whether it is the best kind or not?—There is no doubt about that, especially in the early stages.

25,970. Is it a fact you have known in your own experience in the past?—That is so.

25,971. With regard to the relation of these electrical undertakings to nationalisation and coal supply do you think it would be of great advantage if the electrical power was linked up with a nationalised coal supply?—I do.

25,972. With regard to what Sir Arthur Duckham asked about your selection of coal, is it a fact you now labour under great difficulties in getting suitable coal from coal merchants and factors?—That is so.

25,973. Will you explain that?—That is very largely due in my opinion to obtaining the best price that it is possible to get for the coal irrespective of whether the coal is good or indifferent in value. They simply get rid of it, and it travels in many instances, that is to say, some coal travels long distances when it might be utilised quite close to the mine and the good coal is probably used by these people able to get hold of it in the immediate neighbourhood.

25,974. The incentive of private profit making prevents you getting the coal you want?—To a very large extent that must be so.

25,975. Sir Arthur Duckham said there would be difficulties under nationalisation but they are exceeded under private ownership?—Yes.

25,976. Would it be less under nationalisation? Do you think the Minister of Mines would think it his duty to supply cheap power to the people and give you the right kind of coal?—It would be his duty to send the most suitable coal to the most suitable market.

25,977. Do you find, after you have taken the trouble to make contracts to get suitable coal, that the price is raised against you, so to speak? Is it the fact you find, after taking the trouble to get the right kind of coal, the price is raised against you?—That has happened on many occasions.

25,978. You find you are really defeated in getting the coal you require for your technical purposes?—That is so.

25,979. With regard to the relation of the Minister of Mines and the Electric Supply, is it your belief that there ought to be a direct relation between the two?—I am firmly convinced it would be to the in-

terest of electricity and the mines if the two were linked in some sort of national control.

25,980. Would you think if a Minister of Power, as I might call him, had for his object the conservation of the power requirements in the country, would give his mind to the development of electricity and send the coal to the proper place for the transformation into electricity?—That is the most important thing. If electricity increases, as it is prophesied it will, it will use half the coal of the output of the country.

25,981. With regard to these figures that have been challenged as soon as you produced them. Did you compile these figures?—The whole of the figures relating to London were obtained from the London County Council's annual returns.

25,982. On the London figures, is it not the fact those London figures have been public for some time?—Yes.

25,983. Do you think they ought to surprise anybody at this Commission? Have they been public property for some time?—Many years.

25,984. Now, with regard to the provincial figures?—They are published every fortnight in the "Electrical Times" and other papers.

25,985. You have taken these to be records and simply compiled statistically?—Yes.

25,986. You are not responsible for the accuracy of the figures except the classification in the classes you have given us?—Yes.

25,987. Does the summary you have handed in therefore represent actually the mere classification of the London County Council's figures, and, secondly, the classification of figures published fortnightly in the "Electrical Times"?—Yes.

25,988. That is the origin of the figures?—Yes.

Sir Arthur Duckham: I have not challenged these figures. Sir Leo is out of order in saying I challenge them. I cannot ask questions on these figures until I have studied them, and I could not even after I have studied them. I do not think it is necessary to call Mr Bowden again.

Chairman: That is a matter for you.
Sir Arthur Duckham: After hearing Sir Leo's cross-examination I do not think it is necessary.

25,989. Chairman: Mr. Bowden will come back if any gentleman of the Commission desires him to do so. I do not desire to ask any questions. We understand the way you got your figures is that you took them from public sources, and, as an arithmetician and classifier, you put them out in the classes we have before us?—Yes.

Chairman: We are very much obliged to you for the assistance you have given us.

(The Witness withdrew.)

Mr. GEORGE DOUGLAS HOWARD COLE, Recalled.

25,990. Chairman: (To the Witness.) You were good enough to give us the advantage of your evidence upon some of the matters connected with this enquiry upon the 2nd May last, and at Question 13,278 you were asked, "(Q) I have worked in various concerns of this sort that have committees and profit-sharings and that sort of thing. The great difficulty is this matter of responsibility for the orders at the time. Somebody has to be chief; somebody has to be captain of the ship. Do you agree there should be somebody who would be captain of the ship?—(A) In that sense, yes. I certainly agree you must have some means of settling on the spot things that need settling. (Q) It would never be done otherwise?—(A) No. (Q) You have not tried to run an executive thing by committee, I suppose?—(A) Yes, I have had a good deal of experience in trying to run offices on these lines. (Chairman:) Mr. Cole, you must come again on Tuesday. You have given interesting evidence with regard to some individual Pit Committees, I think you said, in Derbyshire which had a share in the direction and which have been a success. Could you bring with you on Tuesday the names of those Committees and tell us something about them? Obviously that is important to this inquiry?—(A) It is difficult to do that for this reason. My knowledge of those Committees is

based on discussions with the Derbyshire Miners' Association of those things happening. I do not know the names of the pits the various people are employed in. I only know what they told me. I can try to get it from the Derbyshire Miners' Association. (Q) Then we have to ask you to come back after Tuesday? (A) I will see what I can get, but I cannot promise it by Tuesday. (Chairman:) If you cannot promise it by Tuesday we may have to call you again on Tuesday week, if necessary. That piece of evidence is most important." Will you tell me more about this which you swore on that occasion?—After giving evidence on that Friday, I went to the Miners' Federation, as I thought they would be better able to get information than I should and asked them to make enquiries in Derbyshire and secure any information. I heard from them a few days ago that they had been unable to get any information of value. Thereupon I wrote to the Commission saying I had unfortunately no further evidence to offer upon the question.

25,991. I do not understand that quite. You see you made some very definite statements about conversations you had with regard to these pit committees. I want you to tell me about that?—About the conversations?

4 June, 1919.]

MR. GEORGE DOUGLAS HOWARD COLE.

[Continued.]

25,992. Yes, about the pit committees. You were told they were such admirable things, and it is most useful to understand the working of them. I suppose you had some foundation for that?—I can tell you the substance of the conversations I had away back in 1916 or the beginning of 1917.

25,993. Where were these pit committees installed?—What I did was that I addressed a meeting of the Derbyshire Miners' Council held at Chesterfield. I cannot remember the exact date. It was either 1916 or the beginning of 1917, and in the course of the discussion and in the course of informal talking afterwards, a good deal was said about the working of particular pit committees.

25,994. Can you tell me the name of a single one of them?—I am afraid I cannot.

25,995. Have you written to the Miners' Agent in Derbyshire?—I asked the Miners' Federation to get the information for me and I only heard from them two or three days ago that they had been unable to get it.

25,996. I thought you were going to be good enough to get it on your own account from Derbyshire?—I would have done that, only I thought I should get it more effectively through the Miners' Federation, and I only knew two or three days ago that they had failed to get it.

25,997. It is such a very valuable suggestion to some of us who have been thinking upon these matters, and who relied upon your promise to give us assistance. Can you not do anything more than that?

(The Witness withdrew.)

Mr. GEORGE KNOX, Sworn and Examined.

26,005. *Chairman*: I believe you are the Principal and Professor of Mining of the South Wales and Monmouthshire School of Mines, and you have held that position since the foundation of the school in 1913?—Yes.

26,006. Previous to that were you for 10 years head of the Mining and Geological Department of the Wigan Mining and Technical College, for two terms Lecturer in Mining at the Victoria University, Manchester, and for 11 years County Mining Lecturer in Ayrshire?—Yes.

26,007. Are you a Fellow of the Geological Society, a certificated colliery manager, a member of the Institute of Mining Engineers, a member of the Council of the South Wales Institute of Engineers, and a member of the British Association Committee on Fuel Economy?—Yes.

26,008. You say in your proof:

"He will state that he is Principal and Professor of Mining of the South Wales and Monmouthshire School of Mines, and has held that position since the foundation of the school in 1913. Previous to that he was for 10 years Head of the Mining and Geological Department of the Wigan Mining and Technical College; two terms lecturer in mining at the Victoria University, Manchester, and eleven years County Mining Lecturer in Ayrshire.

He is a Fellow of the Geological Society, a Certificated Colliery Manager, a member of the Institute of Mining Engineers, a member of the Council of the South Wales Institute of Engineers, and a member of the British Association Committee on Fuel Economy.

Witness is prepared to give the history of the foundation of the South Wales and Monmouthshire school of mines by an associated body of coalowners in the South Wales coalfield for the purpose of providing advanced full time courses of combined practical and technical training in:—

- (a) Mining Engineering.
- (b) Colliery Engineering (Mechanical and Electrical).
- (c) Chemical Engineering.

and less advanced part time (one day of eight hours per week) courses for colliery managers, undermanagers, surveyors, mechanics, electricians and coke oven foremen."—Yes.

Have you the name of the Derbyshire agent with whom you had a conversation?—Amongst the people I had conversation with was Mr. Frank Hall, secretary of the Derbyshire Miners' Association.

25,998. Have you written to him?—No, because I only heard the Miners' Federation failed to do it recently.

25,999. Do you know his address?—Yes.

26,000. Is it possible for you to write to him?—Certainly.

26,001. You are leaving it very late. I relied a great deal upon your promise to assist us. It leaves us in some difficulty. I am very anxious to hear about these committees which I regard as most important?—All I know about the matter is that subsequently they broke down upon a disagreement between the owners and the miners as to the matters which were legitimate to come before them.

26,002. What was the dispute about?—I think the dispute was about the right of the miners' representatives to bring before the committees matters which were not connected with absenteeism purely, but which related to other circumstances of mine management affecting output.

26,003. Then I am afraid you cannot assist us further?—I will do what I can, but I do not quite see what I am to do.

26,004. Last time I was very anxious you should assist us with that evidence. It would have assisted me personally very greatly. As you cannot do it, I am afraid you cannot. I am much obliged to you.

Chairman: I will now ask our Assistant Secretary to read the remainder of the witness's proof.

Assistant Secretary:

"Witness is prepared to give the reasons which determined the adoption of the various courses of instruction referred to with a view to increasing the safety and efficiency of mining operations.

He will explain the scheme of apprenticeship adopted by the School of Mines, to take the place of the system of premium pupilage previously existing in the coalfield, for the purpose of attracting the best brains of the youth of the district, irrespective of their social position, into the mining profession.

Witness will also explain the scheme for testing and research adopted by the board of management, and their fruitless efforts to obtain financial assistance from the National Research Committee.

He will state the steps taken by the board of management of the school to establish a board and faculty of technology in the University of Wales, for the development of higher technical education and research and outline the proposal of the industrial and business interests in South Wales and Monmouthshire, to raise a sum of £40,000 per annum in support of this scheme.

In spite of the abnormal conditions produced by the war, a considerable amount of testing and research work has been carried out at the School of Mines during the past 6 years, as a result of which many precautionary measures have been taken to increase the safety of mining operations, and to prevent the waste of fuel.

The Executive of the South Wales Miners' Federation after having approved of this enterprise on the part of the coalowners, subsequently through its representatives on the Glamorgan and Monmouth County Education Committee opposed it, although the County Committee were offered a substantial representation on the Management Committee of the school.

The development of the coal mining industry of this country from the point of view of safety and efficiency, will compare favourably with that of any other mining country, but modern developments in engineering require a larger unit than the average individual colliery company if future development is to be accelerated, and waste of fuel reduced.

4 June, 1919.]

MR. GEORGE KNOX.

[Continued.]

Mine Rents and Mineral Royalties.

Witness is of opinion that to prevent the present excessive waste of valuable mineral products and to obtain the highest efficiency in mining operations, all minerals should be owned or leased by the nation.

As mineral takings must conform to the shape of the surface of the mineral royalties of which they are formed, this frequently results in very irregularly shaped areas as shown by the accompanying diagrams."

26,009. *Chairman*: Will the Commissioners look at the diagram which the witness has been good enough to produce to us? There is a map of contiguous royalties. (*To the Witness.*) Do the letters indicate different owners?—Yes.

Chairman: From A, B, C, D and E one sees how curiously they are shaped, and how they run into each other: for example, look at C, which is in the middle of a number of others. Then, look at the two little M's on the right-hand side of L. You will see that the M royalty owner has two little islands of royalty in the patch which belongs to L. Then look at the next one, and you will see the condition of things there. You will see how curiously shaped they are. They are very useful diagrams.

Assistant Secretary: "This leads to excessive waste in boundary pillars and frequently adds considerably to the cost of operating the mines.

Large faults often traverse a mineral taking. If near the centre of the taking they may have to be cut through at various places which adds to the cost of working and delay in development. If the faults are near the boundary they may never be cut through and the coal between the fault and the boundary may be lost.

Where a taking consists of a number of small royalties there is sometimes a difficulty in arranging terms with all the owners with the result that disputed areas may be permanently left unworked. If the seams are deep and the royalty small they could not be recovered, except at great cost. If the State owned all the minerals it could save the loss of coal in boundary pillars and small inlet royalties. Colliery takings could be arranged so that square (or rectangular) areas could be worked from each colliery, and where large faults are known to exist the mines could be situated so that the coal between them could be worked with the least possible amount of tunnelling.

All wayleaves or outstroke and instroke rents could be abolished in future developments.

Nationalisation.

Witness is of opinion that the nationalisation of the coal mines, if operated by Councils of expert engineers, would produce substantial advantages to the nation as a whole by:—

1. Stabilising the price of coal to the advantage of all large industrial coal users and to the community generally.
2. Stabilising wages of the miners, thus leading to more harmonious relations between the workmen and the management.
3. Cheapening the average cost of production through more regular working of the mines and the quicker and more extensive development of backward mines.
4. Economy of administration through higher technical efficiency in the smaller mines and the larger application of mechanical appliances generally.
5. Reduction of colliery consumption of coal and cheaper power production for collieries and for general distribution.
6. Working inferior coal seams along with the higher-quality coals and utilising them for the production of smokeless fuel and recovery of by-products by low temperature distillation.

7. The prevention of waste in boundary and other pillars, thus increasing the total yield of coal for a given expenditure in development.

8. Arranging colliery takings in more uniform areas, thus reducing the cost of underground roadways, haulage, administration, etc.

9. Utilisation of small coal now left in the mine for (a) coking and by-product recovery, or (b) in producers for power production, or (c) in the manufacture of briquettes with or without the use of a binder. Dry briquettes can be stocked for any length of time or in any climate without deterioration or danger from spontaneous ignition.

10. The control of freights by the State; the pooling of wagons and the distribution of the household supply of coal by Municipalities and Urban or District Councils or other corporate bodies would substantially reduce the price of coal to the small consumer."

26,010. *Mr. Frank Hodges*: Have you made a calculation as to the number of mineral takings in South Wales?—No, not as to the number. These are South Wales takings on the two maps, but the actual number I could not give you.

26,011. Would it surprise you to learn that there is estimated to be 150 separate takings in South Wales?—No, but I can quite understand that.

26,012. Would you agree that the average takings in coal, taking the whole of the 12 seams that are generally worked, would be in the neighbourhood of 40 feet?—Yes, somewhere about that.

26,013. What do you regard as the average width of colliery barriers in South Wales?—They are very variable; you get some very narrow ones, 10 or 11 yards, and some as much as 100 yards.

26,014. Would I be right in assuming that the average thickness of the barriers would be 50 yards?—I cannot say what the average thickness would be.

26,015. I think I can get an estimate of it from one of those geological maps provided by a firm in Cardiff, which gives the number of separate takings and the barriers.

26,016. *Mr. Evan Williams*: They do not give the width of the barrier?—I do not think so.

26,017. *Mr. Frank Hodges*: I think it is estimated, so far as I can remember, that the average width of the barriers is in the neighbourhood of 50 yards?—I cannot say; I should think that is rather high.

Chairman: I am told it varies from 40 to 100.

Mr. Evan Williams: From nil to 100.

Chairman: If it is nil, is it a barrier?—I see what you mean, of course.

26,018. *Mr. Frank Hodges*: It has been also computed, I believe, that there are 900 miles of barriers between those 150 takings in South Wales?—I could not say. I have never calculated it myself, but I should think they must be an exceedingly great length.

26,019. It is a matter of arithmetic. If you have 50 yards a mile long with an average thickness of 40 feet that represents roughly 1,000,000 tons?—Yes, probably.

26,020. So that if you had 900 miles of barrier you would have 900,000,000 tons of coal left in those barriers?—That is so, if that estimate is correct.

26,021. Is it because of the fact of so much coal being left to waste that you come to the conclusion that a more systematic method would have to be adopted in futuro, if there is to be economy?—Yes, that is one of the reasons.

26,022. Do you regard it that the nationalisation of minerals is essential in order that that economy may be effected?—Yes, I am of that opinion.

26,023. Have you read the Report of Mr. Leslie Scott's Committee?—Yes. Rather hurriedly.

26,024. Do you think that that would provide adequate machinery for dealing with this problem?—No, I do not think so.

4 June, 1919.]

MR. GEORGE KNOX.

[Continued.]

26,025. Why do you not think so?—As I said, I did not give it very much study, and it is rather a voluminous document, and contains a great many sub-sections; but so far as I can remember from a cursory reading of it, there appeared too much of the question of leaving it to the determination of the colliery companies which were working, as to whether an application should be made for any release in the case of a colliery, say, that would not pay, and that they might apply through the Committee to the Minister of Mines for release in the way of expenditure in working or by adaptation of the royalty, or something like that, that is to say, if a fault was cutting through part of their royalty, they might be relieved from having to get through that. That is how I understand the point. It seemed to me that what it largely amounted to was that collieries which were not paying would be ultimately dumped on the State, to be worked by the State, if the minerals had to be got, but, of course, as I said, I just read it very hurriedly.

26,026. Do you think that there would be any sort of incessant struggle between the holders of good properties in a sort of defence against any proposals put forward by people in poorer properties?—Quite naturally, I think it would be.

26,027. Is it your experience, as a man of considerable standing in the mining industry and a man of scientific knowledge, that the system of mining in this country, as represented in the present system, is good?—Well, it compares very favourably, I think, with mining in any other country, particularly with regard to underground work.

26,028. Apparently, judging from your *précis*, you think that it might be improved upon?—Yes, I do.

26,029. Do you think it could be improved upon substantially under the present system?—It could, substantially, yes.

26,030. Under the present system?—Yes.

26,031. Could it be worked at its greatest advantage under the present system?—No, I do not think so.

(The Witness withdrew.)

(Adjourned to to-morrow morning at 10.30.)

SECOND STAGE—TWENTY-FIFTH DAY.

THURSDAY, 5TH JUNE, 1919.

PRESENT :

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. ROBERT SMILLIE.

MR. R. W. COOPER.

SIR ALLAN M. SMITH.

SIR ARTHUR DUCKHAM.

MR. HERBERT SMITH.

MR. FRANK HODGES.

MR. R. H. TAWNEY.

SIR LEO CHIOZZA MONEY.

MR. SIDNEY WEBB.

SIR ADAM NIMMO.

MR. EVAN WILLIAMS.

SIR ARTHUR LOWES DICKINSON, }
SIR RICHARD A. S. REDMAYNE, } (*Assessors*).

MR. ARNOLD D. McNAIR (*Secretary*).

MR. GILBERT STONE (*Assistant Secretary*).

Mr. R. W. Cooper: Sir, before we begin, may I ask you to be good enough, before we adjourn this week, to cause to be circulated among the members of the Commission two reports—the Majority and Minority Reports of the State Mining Commission of the Union of South Africa? I have them in my hand, and they can be obtained readily at the offices of the

High Commissioner, 32, Queen Victoria Street. As I say, there are two sets of reports, one Majority and one Minority, one set was issued in February, 1917, and the other in December, 1917.

Chairman: Yes, we will try and get them to-day so as to circulate them to-morrow.

HUDSON EWBANK KEARLEY, VISCOUNT DEVONPORT, Sworn and Examined.

Chairman: Lord Devonport, I propose to have your *précis* read, and after that the Commission will ask you some questions, if you will be good enough to allow us to do so, and I will ask Mr. Sidney Webb, on the one side, and Sir Arthur Duckham, on the other side, to question you. Gentlemen, this is the *précis* of evidence by Viscount Devonport, Chairman to the Port of London Authority, and he will speak as to the taking over of very large concerns, namely, the London and India Dock Company, the Surrey Commercial Dock Company, and the Millwall Dock Company by the Port of London Authority, and the welding of them into one single harmonious whole. He will explain how it was done, and what the result has been. I will ask the Secretary to read the *précis*.

Secretary:—

“1. The undertakings taken over were:—

- (1) The London and India Dock Company.
- (2) The Surrey Commercial Dock Company.
- (3) Millwall Dock Company.

2. The compensation payable to the Debenture and Stock Holders of the dock undertakings was arrived at by agreement with the respective companies, and the negotiations were conducted by Sir William Plender on behalf of the Government. Sir William was instructed by Mr. Lloyd George, who was then President of the Board of Trade. The offer on behalf of the Government was based upon the average annual net revenue covering six years, which it was assumed

5 June, 1919.]

HUDSON EWBANK KEARLEY, VISCOUNT DEVONPORT.

[Continued.]

would be maintainable under then existing conditions. As a guide to future probabilities these past results of working (as adjusted by the Government Accountant) were accepted as a reasonable basis—including both good and bad years—and special consideration was given to the position and results as revealed by the accounts of the last year (1907).

The Government appointed a joint select Committee of both Houses of Parliament to enquire into the merits of the Bill setting up the authority, including the terms of purchase, which were approved after due enquiry. The deliberations of the joint Committee occupied 21 days.

The consideration took the form of 3 per cent. "A" Port Stock (first charge) and 4 per cent. "B" Port Stock (second charge) charged solely upon the income of the Port Authority, which was empowered to levy rates in order to meet all revenue expenditure and to provide for interest and Sinking Fund on these stocks. The stocks were issued in exchange for existing Debenture, Preference and Ordinary Stocks, having regard to the relative priorities and security enjoyed by the respective stockholders, and in such a manner as to produce in the case of interest and dividend yielding stocks approximately the annual income which the Dock stockholders would in all probability have been in receipt of had the Dock undertakings continued undisturbed. Both Port Stocks are redeemable at the end of 90 years from the date of issue (March, 1909) by the operation of a Sinking Fund to be created by annual instalments chargeable to revenue over a period of 80 years. A postponement of 10 years was allowed before the Sinking Fund became operative. The Sinking Fund is only now about to come into operation, and the annual sum required to be set aside to redeem the initial issues of "A" and "B" Port Stocks (about £22,500,000) in 80 years on a 3 per cent. basis, as was then computed, would amount approximately to £70,000 per annum, or for each £ of stock an annual sum of £003,112 (about three farthings). It was also assumed that "A" Port Stock would command a market price of, say, 85-90 per cent., and "B" Port Stock a market price of, say, 100 per cent. Stock was issued to the Dock proprietors in 1909 to satisfy the purchase price, and the mean market quotations in that year were:—

"A" Stock ... 84 per cent.
"B" Stock ... 101½ per cent.

Further issues of Port Stock, aggregating £5,600,000, have since been made at rates of interest varying between 3½ per cent. and 5½ per cent., the provision of the Sinking Funds thereon being similar to that for the initial issues except as regards certain portions of the issues in respect of which shorter periods are prescribed.

The difference between

- (a) the average annual revenue, as adjusted, of the companies for the six years to 1907 before charging directors' fees, and
(b) the annual interest on the Port Stocks issued as consideration,

is shown thus:—

Company.	Adjusted Revenue.	Interest on Port Stocks issued as Purchase consideration.	Difference—Excess Companies' Income.
	£	£	£
London and India Dock Co.	636,272	634,147	2,125
Surrey Commercial Dock Co.	113,752	112,400	1,352
Millwall Dock Co.	55,196	57,273	-2,077
	805,220	803,820	1,400

There were certain lands belonging to one of the dock companies—covering between 700 and 800 acres—which were said to be of large potential value and from which little revenue was being obtained, that were included in the assets purchased, and large new warehouses and dock extensions had been constructed which were not revenue producing during the whole of the six years.

On the basis of the average market prices in 1909 of Port Stock the consideration paid to the dock companies as a whole represents about 26 years' purchase of the adjusted revenue.

5. The directors' fees of the three dock undertakings amounted during the six years reviewed to a sum of £15,950 per annum, and the compensation awarded to the directors for loss of office was a nominal amount of £127,600 3 per cent. "A" Port Stock producing an annual income of £3,828. The compensation so awarded in nominal amount was equal to about eight years' purchase of the annual fees, but if the "A" Port Stock were valued at its approximate market price of 84 per cent. the compensation worked out at under seven years' purchase. The rights of the staffs of the dock companies in pension and superannuation funds were safeguarded and such funds taken over and continued by the Port Authority. Certain executive officers of the dock companies received special treatment, and if the services of any of the dock companies' officers were no longer required, they were entitled to receive compensation for direct pecuniary loss sustained.

6. Since the acquisition of the dock undertakings the Port of London Authority has embarked upon considerable capital expenditure in respect of enlargements and improvements of the docks. The published accounts to 31st March, 1918 (a period of nine years), show expenditure in that period on capital account of £5,700,000. The issued capital at 31st March, 1918, aggregated £28,090,458.

7. During the same period the revenue from the docks and warehouses, etc., has considerably expanded, as the following figures, taken from the published accounts, will show. The figures represent the revenue after charging all working expenses, extraordinary outlay on repairs, and reserves for repairs, etc., postponed on account of the war, but before debiting interest on loans and Port Stocks, and appropriations to General Reserve.

Year to 31st March. Revenue after charging all Working Expenses.

Year to 31st March.	£
1910	897,572
1911	900,700
1912	1,049,209
1913	979,898
1914	1,066,969
1915	1,097,284
1916	1,175,516
1917	1,240,197
1918	1,050,456

After debiting interest on loans and Port Stocks issued the net revenue was as follows:—

Year to 31st March.	£
1910	57,929
1911	63,231
1912	169,977
1913	73,500
1914	102,267
1915	95,903
1916	144,251
1917	208,407
1918	1,488

£916,953

The Authority has accumulated out the revenue a General Reserve of £650,751 and carried forward undistributed and unappropriated revenue at 31st March, 1918, of £341,953."

26,032. Chairman: Lord Devonport, before Mr. Sidney Webb asks you any questions, I just want to ask you one or two myself. With regard to the staff that you took over, did you find that all the staff of

5 June, 1919.]

HUDSON EWBANK KEARLEY, VISCOUNT DEVONPORT.

[Continued.]

each one of the undertakings remained on with you?—The bulk of them did. Of course, there were some high officers that were superannuated; for example, each of the undertakings had a chief engineer and each of the undertakings had a manager and a secretary. When we became a united whole we did not want four chief engineers and four secretaries and so on, and so those were pensioned off.

26,033. Was your experience that any of them refused to come to you and objected to the transfer?—I do not recall a single case. I have just a sort of reservation in my mind that there might have been one man, but I am not quite definite upon that. As a rule, they all came over, and, of course, their positions were protected by the Statute.

26,034. Yes; I have the Statute here. It is 8 Edward VII., chapter 68. Section 59 deals with compensation to the directors of the dock companies, and section 60 is the section with regard to the employment of existing officers and servants. I need hardly ask you the question, but did you find that the existing officers and servants who were transferred to you did the work satisfactorily?—Oh, yes.

26,035. With regard to this compensation for directors' fees, could you tell me about how many directors there were of the three undertakings combined?—I have not that figure, but I think if you divide the gross amount of income they were receiving by 400 it will about tell you the number of persons. I think the fees they were getting were about £400 a year.

26,036. Did you take on, or were there taken on, any of the managing directors as distinct from the ordinary directors? Did the directors continue to help you?—Oh, no. The Port Authority was nominated for the first four years by the Board of Trade, and it was subsequently elected in part. Perhaps I might explain it so as to make the matter quite clear. The Authority consists of 30 members, of whom 18 are elected and the remainder are appointed. Before the election could take place a register had to come into being. The register consisted of payers of dues. Every payer of £10 dues was entitled to go on the register. As that only became the rule after the Port Authority was established, it is quite obvious that the first body could not be elected, because there was no register. Therefore to meet that difficulty the Board of Trade appointed the whole of the body to serve for four years. The body is now reconstituted every three years, but the first body was given an existence of four years, because it was deemed essential that they should have some considerable time to get things going.

26,037. Have you any views as to the capacity and capability of a Government Department running an industry?—Well, of course I have been in a Government Department. It did not appear to me to have quite the attributes of a first-class commercial organisation.

26,038. What were the defects?—I do not want to asperse the Civil Service, because I have many good friends in the Civil Service, but if I may express it in my own way, I should say that they lack the training essential to business handling and control. Obviously men who have been trained to business and commence their careers, as a rule, at 16 years of age must have a wider experience than men that are not in touch with business organisations.

26,039. *Mr. Sidney Webb*: You have given us information as to the method of compensation on taking over. Do I understand that the price fixed was to be inclusive of all the assets?—Yes, we bought on a basis of net revenue.

26,040. That entitled you on taking over to all the warehouses and all the plant, and even all this undeveloped land?—Yes, absolutely.

26,041. Everything?—Yes; we had no valuation at all except to arrive at an appraisal of net annual revenue, and that was taken for a period of six years.

26,042. Could you tell us what the arrangement was as to the date on taking over? Was there any interim period?—No. The figures of course were made up to the end of the particular year preceding the passing of the Act. I assume that it was taken

probably to March, 1903—I should think that was the date and those figures were adopted.

26,043. With regard to the administration, after the Act was passed the directors and the general manager and so on had no further personal interest in looking after the assets, and there must have been a period before you actually took possession?—There was a period. The Act was passed in 1903, and the Port of London Authority came into being on the 31st March, 1909. I was appointed chairman by the Government early in January, 1909. I was really the go-between between the old bodies which were dying on the 31st March and the new body which was to come into force, so that I really had executive power for that period of about three months.

26,044. Therefore, although there was never question of waste of the assets, yet you were there to see that the assets were kept in good order?—I would not like to say that, because when you talk about the assets of an enormous thing like the Port Authority spreading from Teddington to the mouth of the Thames, I do not profess to have exercised a supervising eye over that sort of thing.

26,045. My question was as to what protection was afforded to the public interest during the interval. Of course, I am not suggesting that the dock companies would have stolen the cash, but on the abstract point of protection during the interim period, what do you say?—I think you might take it that it was the combination of the directors of the dock companies, who were not vacating their office until March when we came into being, and the fact that they had touch with me as the representative of the new body that had not come into existence, although I had been appointed. That is how we worked.

26,046. Do you think that there was any disadvantage in that interim period? I mean, one can imagine that possibly it was difficult to get decisions taken. It was a going concern, and things had to be decided which would come into operation after the transfer. Was there a considerable difficulty or drawback?—No. I have in my mind a particular case of the renewal of a contract that was due to be renewed and it was submitted to me by the old body, and I gave a decision as affecting it, and that was taken without any question.

26,047. Just one other question with regard to the transfer. There must have been, of course, what one may call floating assets—outstanding port dues and other bills, and of course there were cash balances: all that passed, I take it, with the compensation?—Yes, they were assumed by the new body.

26,048. Without a separate value or compensation?—I think there was adjustment.

26,049. What adjustment? You say the compensation paid to the shareholders was a lump sum based on their past income, roughly speaking?—Yes.

26,050. Did that compensation include, let us say, the current balances at the particular date?—No, all the shareholders of the old concern got in satisfaction of their claim was the new Port Stock that was issued, but the new undertaking assumed the liabilities and the assets.

26,051. Could you give us any idea of the kind of economies you were able to effect? I do not speak as to the figures, but you consolidated the administration, for instance?—Perhaps I can answer your question when I tell you some of the economies which were assumed as being likely to take place. Of course there was the question of getting rid of all these directors with their fees amounting to between £15,000 and £16,000 a year, and it was assumed there would be a great economy there, and obviously there must be so, because we are an unpaid body acting in an honorary capacity. The circumstances during the last nine years have rather cut across the economies that we naturally anticipated might take place. For instance, we have had very large increases in wages, and as against that we have been compelled largely to increase the dues. I should say the circumstances of the last nine years have not been favourable to the sort of economies that we anticipated would follow, and we were assuming at the moment, probably erroneously, the continuance of a normal state of affairs.

5 June, 1919.]

HUDSON EWANK KEARLEY, VISCOUNT DEVONPORT.

[Continued.]

26,052. Could you help us by discriminating between the increase of expenses, such as wages and the other costs which, of course, would have fallen equally upon the other administration, and the actual kind of economies which you were able to effect, for instance, in having only one chief engineer and assistants instead of four chief engineers and assistants?—It is obvious that would effect an economy, but I am bound to say our range of wages is very much higher.

26,053. We will come to that?—You may take it there were economies in that direction.

26,054. With regard to the administration, taking the unification of direction in the place of there being four centres of the direction of the traffic, let us say, or of the business, did you find any difficulty in having only one centre?—No, that was very much to the advantage of the undertaking. Before the undertakings were unified and when they were on an individual basis there were all sorts of cut-throat competition that really brought them to their knees. All these undertakings were nearly bankrupt; in fact, some of them were absolutely bankrupt. That did not proceed from the fact that they were administering a bad venture, but I think the cut-throat competition brought about their downfall.

26,055. Then I see your net revenue, after charging all working expenses during the last nine years since the transfer, has, on the whole, considerably increased in spite of the increased wages. You have had to give, as we know, large increases of wages, as other employers have done, but you have, nevertheless, managed to increase your net revenue?—That is true, but you must throw into that computation the fact that we have raised dues and tolls, and therefore it is not quite as if it were a gain of revenue under normal conditions. The revenue, until the time of war, was increasing, and since the war circumstances have been so difficult, although we have managed, as you will see by the figures, more or less to maintain our revenue.

26,056. I quite understand that the increase in revenue is partly to be ascribed to an increase in the rate of Port Dues, and we could not at all claim that as the result of the transfer. I quite understand that, I think; but, nevertheless, the net revenue has increased after paying the increases of wages, has it not?—Yes.

26,057. Then I see also that you have carried to Reserve a considerable sum, £650,000?—Yes. That is a statutory requirement. We are bound to transfer to Reserve Fund until it reaches £1,000,000 such sums as are surplus. We have two outlets for our surplus. One, to create a reserve until it amounts to £1,000,000; and, having done that, any surplus revenue has to be utilised in diminution of charges.

26,058. That is to say, that no owner of the capital stock has any pecuniary interest beyond getting his interest and his pecuniary payments?—That is quite so, and we are not a profit-making concern.

26,059. It is carried on for the public benefit?—Yes. We have to pay statutory rates of interest on our stock, and the surplus which may be available after that is appropriated in the manner I have described, either to the Reserve, or after the Reserve is full, in diminution of charges.

26,060. Since the transfer you have very largely extended the enterprise, borrowing a considerable sum of capital to make the Port better?—Yes, we are doing it all the time, and that sum that is mentioned there, about £5,800,000, had it not been for the war, would have been £10,000,000 by now. Our programme has been at a standstill. It is now resumed. Not only would the works we had in hand prior to the war been completed, but we should have been well on the way to have spent, by now, £10,000,000.

26,061. But you have not found it necessary to accumulate that out of the profits of the concern? You have borrowed that money, have you not, by issuing stock?—Certainly.

26,062. It is sometimes contended that a larger profit is necessary than suffices to pay interest, in order to provide, out of that profit, for capital extension. You have provided for capital extension

on a large scale, simply by issuing new stock?—Yes. Of course it is only fair to say, since you put that question to me, that there are certain expenditures we make out of revenue; but in the main, of course, our capital is borrowed, and it is all subject to a sinking fund to pay it off in course of time.

26,063. You have a very largo staff, of course, and of very varied grades, from the manager right down to the labourer. Could you tell the Commission whether all those persons are paid by fixed wages, or salaries, or whether any of them receive any share of profits, or commission?—We have two classes of staff, the wages staff and the salaried staff. You will understand the distinction, I am sure. As regards the workers, they are paid on a basis, whatever is the rate that is fixed, or whatever they succeed in getting by methods that are familiar to most of us. As regards the salaried staff, there is a classification. A boy comes in as a fourth-class clerk, goes through the various grades, and gets where he can by his own ability. With regard to any profit-sharing, or participation, of course, there is nothing of that.

26,064. My question was, rather, whether you paid any of the people by commission dependent upon their achievements, as is so often done in business?—Yes. But really in a public Authority such as ours, if I were to say that such a thing had never existed, or did not exist at this moment, I should not be speaking the strict truth. I think I recall a case of a man who is out on the market at Mincing Lane, protecting our sugar interest, and tea interest, and I think he gets a small percentage on results, but that is the only case, and you may take it, when that agreement expires, it will not be renewed.

26,065. *Sir Arthur Duckham*: The compensation paid for these Docks was about £22,350,000?—Yes. At the time of taking over.

26,066. You have other docks besides these three, have you not?—No.

26,067. Is not St. Catherine's yours?—That is included.

26,068. Is Tilbury included?—Yes, that is included in the London and India Docks. We have every dock that exists from Teddington to Havengore Creek. That is 70 miles.

26,069. Did the assets that Mr. Sidney Webb asked you about include the invested Reserve of the Companies? Say the companies had Reserves in Consols or anything else, did you take them over?—Yes. There was very little of that sort of thing, but whatever was going became ours.

26,070. You state here that the division of the stock was "in such a manner as to produce in the case of interest and dividend yielding stocks, approximately the annual income which the Dock stockholders would in all probability have been in receipt of had the Dock undertakings continued." You really gave the Dock stockholders an advantage there?—Yes. They got a distinct advantage in some cases. For example, some of their lower grades of stocks had not paid interest for years, and there did not appear to be any great prospect of their ever paying interest, but, notwithstanding that, they had a market quotation.

26,071. You gave them better security?—We appropriated, in exchange for those stocks, a certain percentage of our new issue, as our accountant thought fair.

Sir L. Chiozza Money: Would Sir Arthur Duckham ask on that, if you take those previously non-paying parts of the undertaking, whether Lord Devonport thinks any economic improvement was effected in them?

26,072. *Sir Arthur Duckham*: You see the point of Sir Leo's question?—Yes, I see it.

26,073. If I may put it in this way, presumably the stocks which Sir Leo mentions were all part of the whole undertakings?—They were.

26,074. Could you differentiate between the non-paying stocks and the paying stocks?—No, we were advised by Sir William Plender that, inasmuch as the ordinary shareholders, or the holders of these particular classes of stocks that were non-dividend paying, or very intermittent dividend-paying, had rights, and would have had voting powers, we came to the conclusion that it was better to make a bargain that

5 June, 1919.]

HUDSON EWBANK KEARLEY, VISCOUNT DEVONPORT.

[Continued.]

would be acceptable than to have to fight these gentlemen before we could carry through our financial undertaking.

26,075. *Sir I. Chiozza Money*: If Sir Arthur Duckham would allow me, my point was: Do you think from your knowledge of the whole undertaking, that those particular parts which did not pay before, have improved under the Authority?—You must take the thing as a whole. I must answer you that by stating the position as a whole. I am aware that you have followed the thing, and you are aware it has been successful. The purchase price has been fully justified, and we are going uphill all the time, save and except where the war has cut across us, and stopped our progression.

26,076. *Sir Arthur Duckham*: You speak of the rights of the staffs of the Dock Companies, and pensions and superannuation funds, are also the special safeguarding of certain executive officers?—Yes.

26,077. Presumably you would consider that that is a proper step to take in any undertaking taken over by the State?—I do not know about its being a proper step to take. I am certain of one thing: When the State takes over it has to give full consideration to that sort of interest, but if I were looking at it from my own point of view, as a private trader, I should think many of these pension conditions were excessively onerous, and those who received them, in the main, were not entitled to them.

26,078. The pension conditions?—Yes. Some, of course, were, but many that received these benefits under this Act of Parliament had very slender claims. That is my individual opinion. But if you ask me whether the conditions that were arrived at in the Bill could have been altered, I say, speaking from the point of view of one who was in the Department when the Bill was passed (the Board of Trade), I am perfectly certain we could not have got on without making those concessions.

26,079. Were salaries increased at all when you took over the concern?—No, we did not immediately go to work, automatically, to increase salaries, because there was classification prevailing then among these various undertakings which we took over. When we came to the question of High Officers, we imparted talent of a kind that was non-existent in the old Dock Companies, notably in the engineering department. For example, for 30 years these dock undertakings had carried out no work of magnitude such as we intended to carry out. For works of great magnitude it was apparent that we must have competent engineers. We went into the market and had a public advertisement, and we picked two very fine engineers. One was Mr. Palmer, who has retired, and is now a partner with Sir Arthur Randell, and the other is Mr. Kirkpatrick, whom you know is our Chief Engineer, and a very capable man. The salaries of these men are very much higher than the poor salaries paid by the old undertakings to the engineers who suited them.

26,080. With regard to these figures you give us of the net revenue, was that a net revenue after paying rates? You say: "after debiting interest on loans and Port Stocks." Does that revenue include the payment of rates?—Yes.

26,081. Do you mean the rates on buildings?—Yes.

26,082. Local rates?—Yes, all outgoing. I think it says "working expenses."

26,083. Yes, you see that in the top figures. Now with regard to the figure for 1918 of £1,488, is that part of a year?—No, that is the absolute final figure. In addition to that, I must tell you that we carried forward a very large sum, undistributed and unappropriated revenue, to meet deferred maintenance, so that, although that figure looks a little on the weak side, in reality it is not so. There was a good deal besides that, only that was carried to deferred maintenance account.

26,084. New one or two general questions. Do you find there are less labour troubles in the port now that the workmen are working for the Government, and not for private profit-making?—Speaking from my own experience, we have had some very serious labour troubles. In 1911, we had a demand sub-

mitted to us by the Dockers' Union. That was before the Transport Workers' organisation was formed. I advocated that these men should be met, and that we should discuss the thing with them, not only as the Port Authority, but that we should get together to meet the men, the whole of the interests in the port, including shipowners and the various independent interests such as granary-keepers and wharfingers. We met the men and arrived at an agreement by negotiation, and that was signed on Thursday, and I think votes of thanks were accorded to us for the way in which we had met them; but on the Monday they repudiated the whole thing, and that led to a labour disturbance which lasted about three weeks, and then it was all over. The terms which they had agreed to were maintained. That was the end of 1911. Then, in 1912, we had the big strike that lasted for 10 weeks. The origin of that strike was the attempt to enforce what is commonly called the "Ticket" on all workmen. As a large percentage of the men were non-union men, we made it clear that we did not interfere in any way, but we could not have the men interfered with. That led to a strike that lasted 10 weeks. That ended, as you will remember, in our point prevailing. I may tell you that we have on our authority two representatives of Labour, one nominated, I think, by the County Council, and one by the Board of Trade. They are members of our Staff Committee which is responsible for all labour questions. We get many advantages from their experience, and so on, but, honestly, I am bound to say that the anticipation that Labour representation on the Authority would prevent labour troubles has not been our experience. Still, we have to take it as it comes. We have had all sorts of negotiations with them in recent years, and I really have not very much complaint to make about it. In reply to your definite question as to whether we have had less trouble, I should think we have had more; but that, I think, is the tendency of the times.

26,085. Do you find the men work with greater will for the Authority?—I am not much in touch with the actual working. I do not think I would like to give an opinion, because I am not in touch with the actual working of the docks. The Superintendent would tell you better. I would not like to express an opinion.

26,086. What control has Parliament over the Dock Authority?—None whatever, except when we go there for increased charges or for further capital.

26,087. You have to go to Parliament for increased charges?—Yes. We work under statutory schedules in the ordinary way, and, of course, we could not exceed those. But owing to the enormous increase of wages in the last two or three years it became obvious that our schedules would not bear the increase, and so we then succeeded in getting a minute from the Board of Trade to exceed our charges up to a certain amount. Of course, the Board of Trade has some power over us, but that is not Parliament. For example, supposing a trader is aggrieved by anything we do or by anything we refuse him. If he applies for a licence for a wharf or a warehouse or riverside accommodation, and we for reasons think it is contrary to our policy to grant it, if he feels aggrieved he can appeal to the Board of Trade, and the Board of Trade can either sweep him on one side and say there is nothing in it, or they can call upon us to attend the hearing. The trader has that protection.

26,088. The Board of Trade has the final word?—Yes, the Board of Trade gives the final decision, and there is no appeal against it.

26,089. Have you seen the Bill for nationalisation of Coal Mines drafted by the Miners' Federation?—No.

26,090. In that Bill it is provided that there should be a Mining Council with a Minister as Chairman responsible to Parliament and also responsible to the Mining Council, and with half the members of the Mining Council (10) elected by the Miners' Federation. In your Port of London Authority what would be your position if half the members of your Council were members of the Dock Labourers' Union?—I should think it would be very difficult to carry on the under-

5 June, 1919.]

HUDSON EWBANK KEARLEY, VISCOUNT DEVONPORT.

[Continued.]

taking under those circumstances. I should think the persistent tendency of the Labour representatives would be in the direction of increasing wages, and consequently making things dear. I do not think we should have a state of happy accord.

26,091. You would not view it with equanimity?—I do not know about viewing it with equanimity; I should not be there, and I should not be a participator in that sort of management.

26,092. *Mr. R. H. Tawney*: You spoke of the salaries you paid. Could you give us any idea of what sort of salaries they are in figures?—Are you speaking of the higher grades?

26,093. Yes. You mentioned your two chief engineers?—I think our chief engineer, Mr. Palmer, was getting £4,000 a year.

26,094. Do you know what he was getting before?—He was in Calcutta; he came from Calcutta.

26,095. Do you know what the corresponding man was getting before under the Dock Company?—I should think at the outside £1,200 or £1,500 a year, and then he had very long service.

26,096. *Sir Arthur Duckham*: There is a question I omitted. It is interesting to us to know, in considering this matter, what is the proportion of the wages paid to the gross revenue of the undertaking?—I ought to be able to tell you, but I have not got the accounts with me.*

26,097. *Chairman*: Perhaps you will be kind enough to send us that?—Yes; if I had thought of it I would have brought it along, but I will send you the last annual accounts.

26,098. *Sir Arthur Duckham*: It would be rather interesting to compare it?—Yes, you will see it all set out there.

26,099. *Sir L. Chiozza Money*: You said, as I understand it, that there were two Labour representatives on your Board and they were nominated, as I understood it, by the Board of Trade?—No, one by the Board of Trade and one by the London County Council.

26,100. Are they directors?—No, they are members of the Board.

26,101. In spite of that nomination you have had labour troubles?—Yes.

26,102. May I ask your opinion on this point: Is it not probable that your labour troubles might have been less if these two Labour men had been nominated not by the Government, but by the trade unions, so that the trade unions and their members could feel that they had actually on the Board of Management men who could represent their point of view directly?—But it so happens that one of our representatives is a past President of the Trade Unions Congress only as recently as three years ago, and he is one of the most active and efficient members of those three great organisations.

26,103. I am not denying that. I am only suggesting that direct representation of the unions might give greater confidence to the men than mere nomination by Government Departments, however able the persons may be. It is a question of representation and the feeling of confidence in election. I only suggest it to you?—I follow your point, and I can only say as regards the Labour members that we have on the Board and who have been on the Board—two of them have died, and therefore they had to be supplanted by two new members—they undoubtedly possess the full confidence of the trade

union organisations. If you put it to me whether it would make the slightest difference to us whether those men were nominated by the trade unions or the Government Departments, I think it would not make the slightest difference; we should not mind in the least.

26,104. Do these two nominated representatives take an actual part in the direction of the work of the whole Authority? Are they in a managing capacity?—They are members of the Board.

26,105. They are not restricted to Labour questions?—Oh, dear, no; they are on important committees, and we always take care that they are on the staff committee when Labour questions are discussed and decided.

26,106. At any rate, you have there established the principle that you have two Labour men who are directly associated with the management of the whole undertaking in the real sense?—If you ask me if I have established the principle—the Government has established the principle.

26,107. It has established it and it works?—Well, it has to work.

26,108. It does work, and in practice it is found useful?—Yes. I think Labour representation has not been detrimental to us. It has its advantages. I do not know whether I shall offend anyone if I say they are always looking out for themselves and the interests they represent.

26,109. But you go so far as to say it has not been detrimental?—No, I do not think it has been detrimental.

26,110. *Sir Adam Nimmo*: Do you take any responsibility for the housing of your men?—We do, indeed. First of all, we are liable for the replacement of houses that we pull down in connection with developments. You are familiar with that obligation. Apart from that, we built a model city that cost us, I think, about £200,000, and we are extending that again very largely. We have a very large obligation relating to housing.

26,111. What proportion of your men do you house?—I do not think I could quite say that. Indeed, a good deal of the estate for which we are responsible is not necessarily tenanted by men in our employment.

26,112. Would it be a large percentage that you do assume responsibility for housing, or is it a comparatively small percentage?—Relatively to the total employment, I should say it was not unduly large.

26,113. *Mr. Robert Smillie*: Have you any single apartment houses for your workmen?—No, I should think not.

26,114. Have you any two-apartment houses in which a family live?—Would you explain to me what you mean by a two-apartment house?

26,115. *Sir L. Chiozza Money*: A two-roomed house?—Oh no, I think not.

26,116. *Mr. Robert Smillie*: You have no such thing?—No.

26,117. You would not think it right to put a family in a single apartment or two-apartment house?—No, we certainly should not, starting on that basis.

26,118. *Chairman*: Lord Devonport, thank you very much for your evidence. If you will kindly send a copy of those accounts, they will be of very great assistance.

Witness: Yes, I will.

(The Witness withdrew.)

Mr. WALTER LEAF, Sworn and Examined.

26,119. *Chairman*: Mr. Leaf, I think you are a Doctor of Literature and Chairman of the London County, Westminster and Parr's Bank?—And Parr's Bank.

26,120. You are a Fellow of the London University?—Yes.

26,121. You are one of the founders and first members and Vice-President of the London Chamber of Commerce?—Yes.

26,122. You were Deputy Chairman in 1885, Chairman in 1887, and since 1917 you have been Deputy Chairman of the London Clearing Bankers?—Yes. I may say I am now Chairman.

26,123. Certain questions were asked for your in-

formation as to the lines of evidence we desire. They are:—

- (1) The effect likely to be produced by nationalisation of mines and minerals upon
 - (a) the other industries of the country (including shipping);
 - (b) the coal export trade and thereby upon international finance.
- (2) The method of purchase, if nationalisation were decided upon
 - (a) whether by mines stock or general stock;
 - (b) what rate of interest; what sinking fund."

5 June, 1919.]

MR. WALTER LEAF.

[Continued.]

Mr. Leaf says:—

"I can give evidence only as an individual, and must expressly dissociate myself from my position at the moment as Chairman of the Committee of London Clearing Bankers. I have had no opportunity of consulting the Committee and no mandate to speak in their name; and I think it highly probable that in many points their opinion would materially differ from mine.

Nor have I any experience of the mining and allied industries. Until quite recently my only banking connection has been with London and the South-East of England.

I can only answer question (1) (a) in the most general manner.

The effect of nationalisation upon other industries would, I suppose, entirely depend upon the form in which it was carried out; and I understand that various forms have been under the consideration of the Commission. To judge between these requires a knowledge of the coal industry which I do not possess.

If nationalisation is to be carried out, the two essential conditions which must be fulfilled if no grave damage is to be done to industry in general are, I suppose, (1) that there should be a reasonable prospect that it would result at least in not less efficient production than at present, ensuring a cost to other industries for coal at least as low as that at which it could be produced under private ownership. (2) That existing interests should be purchased by the State at a price which will appear equitable in the view of the average fair-minded man. The second condition may, I hope, be taken as granted; any confiscation of the interests without fair compensation would of course be a shock to public confidence which would absolutely paralyse all industrial enterprise.

With regard to the first condition there is undoubtedly much scepticism; it will largely depend on the report of the Commission whether this can be overcome.

In answer to (1) (a), I can only say that it is in the eyes of the City of the first importance that the export of coal should be raised to the highest possible level, and that as soon as possible. In order to resume our international trade it is absolutely essential that the exchanges should be put on a proper basis. This can only be done by exporting; and coal is at once among the greatest of our exports, and the one which can be at once exported, without delays arising from adaptation of war machinery and the like. There is at the moment an almost unlimited demand for it abroad. It is therefore the article of commerce to which we mainly look at the moment to restore the foreign exchange to parity. Until this is done, our manufacturers must be at a great disadvantage wherever they have to import their raw material.

The replies to (2) (a) and (b) can only be of the most general nature. Such matters of interest and sinking fund would entirely depend on the condition of the money market at the time of issue. They would be materially influenced by the total amount of securities to be issued, and by the time over which the issues could be spread.

With regard to (1) (a), it may be pointed out that we have had various precedents in nationalisation already; for instance, the Indian railways, and the National Telephone Company. The Irish Land Purchase scheme, though perhaps not technically nationalisation, is analogous from the financial aspect.

The Indian railways were purchased by the Indian Government under the terms of their concessions. Though the terms were not identical in the cases of the different railways, the general principle followed was that the existence of the Companies was maintained, the lines being leased to them, and the shareholders being compensated partly by the issue of terminable annuities of different classes, partly by stock with a guaranteed minimum and a share of profits after the minimum had been provided

The National Telephone Company was bought by the issue of Exchequer Bonds bearing 3 per cent. interest. This is, of course, a direct Government security. The Irish land on the other hand was purchased through a special fund, which undertook the direct liability, though any deficiency must be made good by advances from the Consolidated Fund.

There is thus a considerable choice of precedents which might be followed; but none can be recommended *a priori* without close knowledge of the circumstances at the time of issue.

The choice between different methods must be governed by the primary consideration that any securities to be issued must not compete, for the present at least, with general Government borrowing. Any issue, for instance of Exchequer Bonds, on the scale that would be required for the purchase of the coal companies must be regarded as wholly out of the question. When the Government appeals to the investor, the securities offered must be alluring. In the case of securities given in payment of compulsory purchase, the amount given must be just, but it need not be alluring.

The sums required for the purchase may be divided into two classes; those which are given in exchange for capital values, such as stocks and shares in coal companies; and those which are given for income, such as royalties, way-leaves, and mineral rents.

I would suggest that the payments for all rights of the latter class might be made in the form of terminable annuities. Mineral rights being by their nature of a wasting character, there would be no injustice in principle in offering for them a terminable income. Into the principle on which the valuation for this purpose should be made it is not for me to enter; but I imagine that the valuation of such rights is perfectly well understood, and could easily be expressed in the form I suggest. By avoiding any capitalisation all questions of the incidence of income tax would be evaded.

Where payment has to be made for capital, the terminable annuity introduces difficulties. The principle has been employed in the purchase of the Indian railways. But in such a case each annual payment must be regarded actuarially as partly in the nature of interest, and partly of capital; and it is manifestly unjust that the portion which is really capital should be subject to income tax.

The difficulty has been partly evaded in the case of the Indian railways by the creation of a "Class B" of annuities, in which each annual payment is subject to a deduction for a sinking fund, handed over to trustees who invest it in order to provide a fund which will, at a given rate of interest, repay the capital at the expiration of the annuity. The same principle might perhaps be used in the purchase of the capital of the coal companies.

Terminable annuities of the first class would not in any way compete with existing Government securities. There is, of course, a certain amount of Government terminable annuities in existence; but they are not regarded as an investor's security, and are, I believe, almost wholly held by Government departments. They are a form of payment which might be made just, though they would not be alluring. No trustee, for instance, could invest in them.

If it should be decided to continue the existence of the Companies, with any necessary modifications, to work the mines under lease from the Government, the system of an issue of stock with a guaranteed minimum dividend of a small amount, say three per cent., with a share in the profits after this had been provided, to give a further dividend, as in the case of the Indian railways, would seem very suitable."

26,124. Mr. Sidney Webb: You have made a very interesting suggestion with regard to terminable annuities as a method of compensation for royalty rents. I do not know whether your suggestion carries the implication that the annuity ought to be of

5 June, 1919.]

MR. WALTER LEAF.

[Continued.]

the same value as the royalty owner has been receiving from his rents. I mean the security would be very different?—Yes. I have not been able to work out the matter, and I do not know, really, how rents are valued from my want of knowledge of the coal trade. I imagine it would be quite possible to give the same amount per annum and to adjust the value by giving it for a certain number of years. One owner who has royalties which were beginning to see their end might be given annuities for a period of five or ten years and another thirty or forty years. The valuation should be given in the number of years rather than the exact amount.

26,125. It could be adjusted that way?—Yes.

26,126. You have pointed out with heavy income tax there would be a considerable drawback?—I am not resting it on payment of capital value. When you are regarding it as payment on income the question of income tax does not come in. The question of income tax is applicable to the whole income.

26,127. As between two royalty owners having incomes of different values you suggest that a difference might be made by giving one an annuity of a shorter term than the other one?—Yes.

26,128. Do not you think the heavier income tax which would be levied on an annuity of a shorter term than an annuity over a longer term would make a difference there?—It would be the income tax for the time being which the owner would have to pay whether he paid it on his annuity or royalties.

26,129. On the further point with regard to the security, you for the moment can only take into account the difference in the value of the security of two different royalties. There is a more general question, is there not, that all these royalty rents are not regarded as quite such good securities as a Government annuity; they would not find so much money as purchasers?—Clearly not.

26,130. Therefore the compensation that would be equitably due to those royalty owners on that assumption would be not the amount of the income they are getting but a smaller amount of income because of the improved security which that smaller amount of income would be bearing?—You might do it either way, by giving them a smaller income for a longer number of years or giving them a larger income and shortening the number of years.

26,131. That would be a matter of calculation?—That would be a matter of valuation.

26,132. You have drawn our attention to the Irish Land Purchase Fund as a separate fund. That, of course, is obviously of interest, as there might conceivably be a coal fund. I see you inform us that any deficiency in that Irish Land Fund must be made good from the Consolidated Fund?—They must call upon the Consolidated Fund to advance any deficiency; it remains a liability of the Fund to the Consolidated Fund.

26,133. I suggest in effect that is regarded by the financial community as a good security, as good a security as the British Exchequer, is it not?—Curiously enough, it is not. The Irish 2½ Guaranteed Land Stock stands at the present moment at much the same price as 2½ per cent. Consols, which means it returns the investor nearly ¼ per cent. more—about 9s. more.

26,134. From the point of view of the Treasury the country is paying ultimately that additional percentage because it has chosen to give the compensation in this sort of complicated way?—Yes.

26,135. We should have to take that into account if there was a proposal to take compensation out of a Coal Fund primarily?—The State would have to pay more. It would be a question for the Treasury whether they would not prefer to pay a rather higher rate of interest than make an issue which might damage the price of their principal securities.

26,136. As between two ways of issuing stock that would be a very relevant consideration?—Yes.

26,137. Assuming you could find a way of issuing the stock directly chargeable on the Exchequer, confining ourselves to a purely financial point, there would be a gain to the Treasury in paying directly from the Exchequer?—There would be a gain in price no doubt.

26,138. As regards the necessity of avoiding any competition with the Government issue, we notice that in the case of the Port of London Stock the payment was made in stock and not made in cash and a loan issued. Supposing the payment was made in stock, would that seriously compete with the Government issue? It would not be on the market?—It would be on the market as soon as issued. It might have to be a marketable stock which any owner could put upon the market.

26,139. It may be assumed it would not be put on the market altogether?—I suppose not the whole amount, but a very large amount would be put upon the market.

26,140. The owners who have been content to keep their capital in collieries or in royalty rents you think would hurry to get out of it if in Government Stock?—That would entirely depend upon what other securities were offering at the time. There might be some tempting offer which they preferred, and they would go at liberty then to realise their stock.

26,141. I suppose such an issue of stock in payment would not compete with the Government needs for other purposes to the same extent as if they issued a loan to buy up the coal and paid for the coal in cash?—That would be the worst possible form.

26,142. That would be the worst way of all?—Yes.

26,143. Rather than that it would be better to pay with stock, and possibly you suggest in separate stock?—It should certainly be separate stock.

26,144. In spite of the disadvantage that that would require a slightly higher rate of interest?—I hope the Commission will understand I have not been able to get up my evidence. If I had been able to present the case as I should have liked I should have gone straight to Sir John Bradbury and talked the matter over with him. I should like to know what the opinion of the Treasury on a point like that would be. I think the Treasury would say it was desirable to pay a little higher rate rather than to damage the credit of the Government in the eyes of the investors by knocking down the price of the various War Loan securities and other different Government liabilities.

26,145. Those suggestions are very useful. You are quite clear, I think, that without further enquiry that a payment in cash and raising of a Government Loan for the purpose would be the most injurious way?—Clearly, and quite unwise, in my opinion.

26,146. *Sir Alan Smith*: You say you would prefer to consult with the Treasury on a point of this description. Does that mean that you, who are a financial expert of standing, would prefer to discuss with a Government Department before you came to a conclusion affecting your business?—It is really not a matter that affects my business. It is a matter of Government borrowing, in which I am frequently in consultation with Sir John Bradbury, and I think the opinion of the Treasury in a matter of this sort is a dominating factor.

26,147. If we were desirous of obtaining the opinion of the Government Department we could call a witness. The difficulty is relying upon a Government Department with regard to its own business, and therefore we have asked you to assist us?—I can only do the best at very short notice. I only received a notice that the Commission wished to see me a week ago, and I have had no opportunity of consulting with anybody else.

26,148. What we should like is your own opinion and not the opinion you think would be conveyed by the Treasury. Do you seriously think from your own point of view it would be better to have a special stock?—Certainly I think it should be a special stock.

26,149. Of the nature of the Irish 2½ Stock?—I am very much inclined to say what I should prefer would be a system analogous to the Indian railways, the terminable annuities. In payment for capital it would be quite possible to have a class B annuity, I should think, in which the annuitants contribute themselves to a Sinking Fund which is placed in trustees' hands on their behalf at a rate calculated to give them back their capital at the expiration of the annuity.

5 June, 1919.]

MR. WALTER LEAP.

[Continued.]

26,150. I cannot follow you in the details of finance. I should like to see the idea in your mind in suggesting that. Do you wish to give to those who are expropriated something that will, if not satisfy them, at least carry conviction in the minds of the general public that a fair deal has been made?—Of course, I wish to do that. The Government would be taking over a revenue-producing business.

26,151. What is the revenue-producing business?—I am assuming the coal industry is producing a revenue.

26,152. What do you mean by the coal industry?—I talk about the coal mines at present. I adhere to my suggestion that the royalties should be paid by terminable annuities, what are called class A, that is to say, without a sinking fund. I suggest for the coal mines, that the payment for the shares and stocks might be made in terminable annuities with a deduction for a sinking fund that would not be a direct liability of the Government; the annuitants contribute so much out of their annual payment to trustees to accumulate to pay them off at the end of the term. The general idea, of course, is that in a revenue-producing business the payments of the annuities would come year by year out of the revenue and would not involve any direct cash advance from the Treasury.

26,153. As a financial expert, would you look with favour on the State entering into industrial enterprise, or would you prefer industrial enterprise should be carried on by private initiative?—I only wish to see the most efficient and economical method of production. I am not prejudiced against nationalisation by any means, if it can be assured it will tend to economy of production.

26,154. Do you think it will be good for the country from a financial point of view that private initiative should be restricted by the State entirely in that way?—I suppose I have a certain prejudice in favour of private enterprise. I have been engaged in it all my life, but I am quite prepared to consider an alternative. As far as I know, it has not worked badly with the Indian Railways, which is, perhaps, the chief instance we have.

26,155. Indian Railways are a different thing. The coal industry is an industry pure and simple. Railways one does not look upon in the same way as one looks upon business enterprises. Do you think the analogy is complete between the case of the Indian State Railways and the coal mining of this country?—No, I do not say it is complete. It will be a very remarkable experiment and, perhaps, a dangerous experiment to nationalise. I am not prepared to say it could not be made if it can be shown, and I may say we are looking to this Commission for light on the subject—

26,156. Please do not. You really give it as your opinion that it would not adversely affect the financial affairs if the State were to start an industry to the exclusion of private enterprise?—It entirely depends whether it would show it would tend to efficiency and economy in the enterprise.

26,157. The damage is done by that time?—Yes.

26,158. Do you think the financial security of this country would be better secured by, or better safeguarded by, the continuation of private initiative than the State conducting the industry?—We have had experience in the nationalisation of the telephones. I do not know that that has in any way damaged the credit of the State.

26,159. That is a common service again. Would you be good enough to answer the question? It is merely your opinion, and we do not ask for more than that. In your opinion, as a man of experience in financial affairs, do you think it would conduce to the financial stability of this country if private enterprise were eliminated and the State ran the industry?—The Interim Report of this Commission has somewhat modified the answer I should have given to that. I should have answered your question more decidedly two or three months ago than I am prepared to do now.

26,160. Would you answer it to-day as decidedly as you can?—My answer is, the Interim Report of this Commission has produced an opinion in my mind that

the coal industry, as at present conducted, is not conducted on the most efficient basis. I think you have gone a long way to make me prepared to look for another alternative.

26,161. Would you now please answer my question? Do you think that the financial stability of this country would be increased or decreased if it were to be known that the future was to be the State conducting the industry and not private enterprise doing so?—I do not think the financial stability of the country would be affected. I think the financial stability of the country would only be affected by the general efficiency of production, and I do not think the mere conduct of production by the State as such would affect the financial stability of the country; it is the economy of production.

26,162. You are not prepared to answer the question, evidently?—I have answered it, I think.

26,163. What would be the general effect of the knowledge that the State was coming into the industry to the exclusion of private enterprise. You cannot say whether that would adversely or beneficially affect the financial position of this country?—If you ask me in the abstract I do not think it is capable of an answer. I do not think it would affect the financial stability of the country.

26,164. In the last paragraph of your *précis* you refer to a guaranteed minimum rate of interest, say 3 per cent., with a share in the profits after this has been provided. The profits of what?—I am assuming that the companies either in their present form or in some modified form, with amalgamation or grouping in districts, are continued as separate entities and they are allowed to continue the business as such entities and under such Government control as may be thought necessary; that they would be allowed to make profits and those profits would be shared between the Government and the companies.

26,165. I do not follow you. I thought you were dealing with the payment of the royalty owners in the event of the companies being allowed to go on and the royalties being nationalised or purchased by the State?—I was referring to the companies being allowed to continue to carry on the industry.

26,166. You say this: "If it should be decided to continue the existence of the companies, with any necessary modifications, to work the mines under lease from the Government, the system of an issue of stock with a guaranteed minimum"—I understand that is with reference to the payment of the royalty owners?—Not at all.

26,167. What would you issue stock for in that case?—It would be necessary to give the companies the capital.

26,168. They have got the capital?—The capital would be taken and the stock would be issued in place of it. They would hand over the whole of their assets to the Government, and the Government in return would give them either guaranteed stock or terminable annuities.

26,169. Is that so? "If it should be decided to continue the existence of the companies." Do you mean if the State bought up all the companies and carried on under the separate companies notwithstanding the purchase?—Yes, that is the Indian Railway system.

26,170. The only other point I wish to raise is with reference to export. What is your opinion of the present International Money Exchange? Is it in a good condition or a bad one?—It is very difficult to say, because different countries are so differently situated. For instance, the exchange, taking neutral countries, in Scandinavia is in our favour at the present moment. It is against us in Spain, Switzerland and the United States.

26,171. You say Spain, Switzerland and the United States. Do we export coal to the United States?—No. Spain and Switzerland, I believe, are very much in want of coal.

26,172. Do we export coal to these countries?—Yes.

26,173. Do you think the amount of coal exported to Spain and Switzerland would be sufficient to steady up the exchange in our favour?—I should add South America, which has a very large demand for coal.

26,174. Has that demand been continued or recently fallen off; that is to say, the demand for coal from

5 June, 1919.]

MR. WALTER LEAF.

[Continued.]

those countries?—I cannot tell you; I have not the figures.

26,175. Then you give your opinion morely on the effect of the export of coal?—Yes.

26,176. Do you attach serious importance to having an increased export of coal?—I attach that importance to having the exports altogether increased, and coal seems to be the most immediately available if it can be got.

26,177. You mean the exports increased?—Yes; that is subject to the reserves for our own internal needs.

26,178. Would you suggest that the export of coal should go on even although we find we are restricted in the amount available in this country?—No, we must satisfy our own needs first.

26,179. Do you consider that where the State has expropriated certain interests in the country it would be wise to guarantee the capital of the loan issued?—Are you speaking of the coal industry, that the State should guarantee it?

26,180. If the State decides to buy out the royalty owners or if the State decides to take over the mines, having regard to the experience of the stock issued in connection with the land purchase, would you agree the State should take some means of safeguard to the coal owner or the royalty owner; that is, capital value would not be depressed if that stock was depressed?—I have tried to put the two, the royalty owner and the mine owner, on a different basis.

26,181. I am not on that point?—The suggestion is the royalty owner has not capital value.

26,182. You advocate a special stock instead of a general stock in payment?—I advocate for the royalties a system of terminable annuities, not a stock at all.

26,183. With regard to the issue of stock, you recommend a special stock?—Yes.

26,184. Is it not the case that special stocks have depreciated to a greater extent than the general stocks?—No, I do not think so. Take the Irish Land Stock.

26,185. Is that an extraordinary case?—No; Irish Land Stock has always been comparatively lower in price than Consols, which is the most comparable.

26,186. What other stocks have been issued?—There are Municipal Stocks.

26,187. I mean the Government Stocks?—I do not remember any but the Indian Railways.

26,188. *Mr. Sidney Webb*: Egyptian and Turkish Guaranteed?—I was thinking of industrial purposes.

26,189. *Sir Allan Smith*: You say the Irish Land Stock is the only special stock that has been issued, as far as you remember?—I do not at the moment remember any other.

26,190. The Irish Land Stock is the stock that has depreciated below the general stock?—It always has been. It has not depreciated more. It has depreciated *pari passu* with Consols.

26,191. Is it reasonable that the coal owners should be given a stock that would depreciate below the general stock?—If it was a Government Guaranteed Stock I do not see how it could. All Government Stocks must depreciate or appreciate *pari passu*.

26,192. You perfectly understand this stock must come on the market. Death Duties demand that the stocks shall come on the market, whether the owners like it or not. Would you be prepared to make any suggestion, if the coal owners are paid out by general stock, that the capital of that stock should be specially safeguarded?—I think it is impossible to safeguard it.

26,193. You would not make it repayable in full on demand?—That is impossible. That would be equivalent to a cash payment.

26,194. You say you are against any question of payment out by cash?—Certainly.

26,195. Why should the Government be able to expropriate individual private enterprise to the detriment of the private individual simply because they are coming into it? If the Government wishes to buy this industry, why should they not pay for it in the same way that the ordinary individual does?—I say the basis of everything is that the individual

must be paid a just price. That is what will commend itself to the average fair-minded man, and that is the standard we have to look to as being a fair and just price.

26,196. At the same time, you say you would not be a party to that fair and just price being paid in cash, if desired?—I think it would be very undesirable.

26,197. From your point of view?—From the nation's point of view.

26,198. If the nation is going to be fair and just, surely the point of view of the seller, who is the person expropriated, has some say in the matter?—If the Government will give you a stock which has a cash price that cash price must be fair.

26,199. You would not object to the Government giving a stock with a cash price?—No.

26,200. *Mr. Robert Smillie*: In the event of the Government taking over the minerals and agreeing to ask the present holders to compensate the nation for the coal already taken out, have you thought out any simple method of payment back to the State without being too harsh on the present owners?—No. That is a new point to me. I have never thought of that.

26,201. You have never thought out the question whether you have any method of protecting them against harsh payment in the event of the nation asking for compensation for royalties taken by the shareholders?—I have no opinion upon that point; it is new to me.

26,202. *Mr. R. W. Cooper*: In answer to Sir Alan Smith. I understood you to say you did not regard the mineral royalties as having a capital value?—Of course, any income can be translated into a present capital value.

26,203. Are you aware that for Death Duty purposes the capital value is constantly being ascertained at Somerset House?—Yes, and I suppose in every sale of land.

26,204. Like land?—The right is with the land, and it is sold separately or attached.

26,205. The Estate Duty is levied upon that footing?—Certainly.

26,206. With regard to your suggestion about terminable annuities, how would that work in the case of a settled estate? You know what I mean by a settled estate?—Yes. I am afraid I am not lawyer enough to answer that question. Land settlement is the last thing I should like to have an opinion about.

26,207. You have an area of coal, of which A. is the owner for life with remainder to B., who, on the death of A. will become entitled to the corpus of the property. How will your scheme of terminable annuities fit in with that state of affairs?—I do not know what would be the case if royalties came to an end during his life, or the seam was exhausted and he got no more royalties.

26,208. Do you not think a simpler plan is the ordinary business plan of ascertaining the capital value of the property and paying for it, and substituting, we will say, Government Stock for the property, and then letting the owners hold the stock on the same conditions as they held the property?—Perhaps it is the simplest; it is the most familiar, at all events.

26,209. The same difficulty would arise, but not to the same extent in the case of mortgaged estates?—Yes.

26,210. Would it not again be the simplest plan to ascertain the capital value on the ordinary principles of valuation?—Yes.

26,211. Paying for it in stock and the stock taking the position of the property?—There is no difficulty in ascertaining the capital value of a terminable annuity. That is done by the simplest of calculations.

26,212. In the case I put, if you ascertain the capital value you need not trouble about the terminable annuity?—I am thinking of the interests of the nation. I think of the Government as a borrower, and I suggest if you pay in the form of terminable annuities that can be transferred into capital value for the sake of a business or probate.

26,213. That is all right with the person getting it who is the absolute owner. I am taking the case of trustees or what is tantamount to trustees?—It is a

5 June, 1919.]

MR. WALTER LEAF.

[Continued.]

question that is arising in every case of terminable annuities, for instance, such as the Indian Railways. There are terminable annuities there. Trustees will not invest in Class A where there is no sinking fund, and Class B has been created to meet them with a sinking fund.

26,214. *Mr. Arthur Balfour*: I think you know that yesterday we had some figures with regard to the coal output?—I saw them hastily in the "Times" this morning.

26,215. In 1913 we exported 77,000,000 tons of coal, and according to the estimate, if we consume the same amount of coal in 1919-20 as in 1913, there is only 4,000,000 tons left to export instead of the 77,000,000 tons in 1913. What is your opinion about that?—I thought the figures were most alarming—calamitous.

26,216. *Chairman*: I should hesitate to cross-examine you, but I want to see that I have read aright one or two of your suggestions. With regard to mineral rights you suggest terminable annuities. Those are what you call Class A without a sinking fund?—Yes.

26,217. Will you tell me whether you would be in favour of fixing some maximum limit on the annuity. I cannot follow your point when you say the annuity in the case of a seam which is soon to be exhausted might be only for a few years. Is it possible, in your view, with fairness to fix an annuity for a maximum

for, say, 30 or 33 years? I am putting hypothetical figures. I would rather put X?—It would, I think, certainly be advisable. I have not been able to think out what that maximum would be. I suppose it might be 30, 40, or 50 years or something like that, but hardly more, I think.

26,218. The next question is with regard to the mines. I think you suggested this annuity without a sinking fund, and with a fixed rate of interest, we will say, for the sake of argument, at 3 per cent., plus a share of the profits, if any?—That would be a guaranteed stock with a guaranteed rate of interest. The rate of interest in the Indian Railways runs in some cases to 3, some 4. That is a matter for negotiation in the future.

26,219. Is there any particular name for that stock so that it can be identified?—I suppose it would be called a guaranteed stock. That is what they call it with regard to the Indian railways.

26,220. *Mr. Hodges* wants me to ask you a question. Take the case, for the sake of argument, of property in minerals which is not likely to be worked for the next 20 years, and will only come into working operation in the 21st year. Could terminable annuities fit in with a property like that?—I am not sufficiently conversant with the value of coal land. I do not know how that would be valued at all.

(The Witness withdrew.)

Sir HUGH BELL, Bart., Sworn and Examined.

26,221. *Chairman*: Sir Hugh Bell is a gentleman who speaks on behalf of the iron and steel manufacturers, and he is also Chairman of the Herden Collieries. He says:—

"I am Managing Director of Bell Brothers, Limited, a Director of Dorman, Long and Company Limited, and the North-Eastern Steel Company, as to which concerns I shall say more later; I am Chairman of the Herden Collieries, Limited, and of the North-Eastern Railway Company and other Companies.

I have been actively engaged in the manufacture of iron since 1862, when on my return from three years in France and Germany I entered the employment of Bell Brothers.

I have been requested by the National Federation of Iron and Steel Manufacturers to give evidence on the question of the suggested nationalisation of coal mines generally, and also particularly as to what would be the effect of such nationalisation upon the iron and steel industry."

(To the Witness.) You have expressed a desire to read the evidence yourself. Would you kindly do so?—I am much obliged to you for permitting me to put my *précis* before you in my own way. I think I can shorten the labours of the Commission by doing so.

26,222. Please take your time. Your evidence is important, and you represent a very large and important industry?—I will summarise what I have to say, reading those parts of my *précis* which seem to me to be necessary to support the arguments which I am attempting to lay before the Commission. You have mentioned that I represent the National Federation of Iron and Steel Manufacturers. I do not know whether you would care to have on the notes some statement what that consists of.

26,223. *Chairman*: Will you read it out so that it may go on the notes?—The number of members is 252. The approximate wages bill subject to levy is £21,000,000. The estimated nominal capital of members of the Federation is £110,000,000. The total steel production of Great Britain is 9,539,000 tons, of which 8,857,000 tons are produced by members of the Federation. The products which are dealt with by the Federation are pig iron, steel, billets, blooms, sections, plates, sheets, tinplates, bars, and rods. My evidence is divided, as you see, into four heads. The first head is a General Consideration on the Nationalisation of Coal Mines, and is

dealt with in the first paragraph of my *précis*. I need not dwell on the importance of the subject, nor for those who take the trouble to read my *précis* will it be necessary for me to go through it all.

26,224. You said you wanted to read the *précis* yourself?—Yes. I am going merely to draw attention to the heads and reads those portions which appear to me to be essential to the foundation of my argument.

26,225. What you read will go on the notes; what you do not read will not?—That being so, if the Commission will be patient with me, I will read it.

26,226. I think the shortest way is to read it and make such comments as you desire as you go along. Anything you say will be on the notes; what you do not say will not be on the notes.

"I have for more than half a century taken a deep interest not only in the business of my firm, but even more in the various difficult problems of an economic and social character which that business brought under my notice."

"I look back over that half century and see what a great improvement there has been in the conditions of labour throughout the country, and especially in my own industry."

"I view with grave apprehension the growing tendency to replace the action of economic law by Governmental interference. I find that this interference, however well meaning, is frequently ill-informed as to the most important matters bearing on the subjects with which it attempts to deal."

"I submit the question of whether any particular industry should or should not be nationalised must be determined by an examination of the case, the presumption not being in favour but against change; and I put in a quotation from the 'Economist,' which I will read: "

Government service has an inevitable tendency to introduce routine methods. The Civil Servant deals with enormous sums of money and formulates broad lines of policy, not on behalf of a private concern in which his interests are involved, but on behalf of the country as a whole and any decision taken commits his Minister before the House of Commons. In order to avoid placing their chief in a false position, the Civil Servants (and in this respect the business men became typical Civil Servants in a very short time), who obviously cannot refer every case to

5 June, 1919.]

SIR HUGH BELL, BART.

[Continued.]

their Minister without making the machine unduly cumbersome, inevitably develop for their own protection a set of rules, and their conduct becomes governed by precedent. The head of a business firm is a free agent in deciding matters of policy as they arise. The same man in a Government Department has to conform to the policy of the Department. When the Department has been in existence long enough, and rules have been established to meet all cases, initiative dies.

"In the special case of the coal mines, there are many weighty reasons why the suggested nationalisation would be against the best interests of the commercial progress of the country, and would therefore materially retard the further improvements in the general conditions of the workers which I sincerely desire should take place."

"The coal pits vary very greatly, and it requires special initiative of every kind to see that the pits are developed in their best way. I do not believe that that could be got from central government as well as by private industry."

"Again coal mining calls for constant speculation in the sinking of new shafts, whereas a highly centralised Government service does not lend itself to risk-taking."

"The magnitude of the colliery industry and its vital importance makes it an unsuitable field for such an experiment as is suggested. The coal mining industry gave employment before the war to over 1,100,000 men, and roughly one-tenth of the entire population directly depend upon it for their livelihood. Nearly the whole population indirectly depends upon it. There could be no graver decision in the whole realm of economic policy than the application of new and untried methods of organisation to so important a factor in the economic life of this country."

"The nationalisation of this industry would make about one-tenth of the male working population of Great Britain into direct State employees. It is not to be believed that the mere fact of nationalisation will make the coal miners of Great Britain into a contented body of men, completely satisfied with the distribution of the product of their industry."

"I am gravely apprehensive of the effect of nationalisation on the export trade on which the economic welfare of this country is peculiarly dependent. I desire specially to emphasise this point, as, in my opinion, it has not received the consideration it deserves."

And I deal with that in a paragraph of some importance which I do not propose to read.

26,227. *Chairman*: If it is of importance I will read it myself. What is the paragraph?

"A large export trade (which must, of course, be at competitive prices) is the chief means by which we obtain our imports of food and raw material, and coal plays a peculiarly important part in this exchange. Our essential imports (particularly wheat, meat, sugar, iron ore, hides, oil, oil seeds, timber, cotton and wool) are enormously greater in both weight and volume than our exports. The only export at all comparable in weight is coal, which before the war constituted 80 to 85 per cent. of the weight of our total exports. If coal exports are stopped, our ships must go out in ballast and charge imports with the value of the round voyage which will mean that they are imported at a higher price. (Even liners bunkering for a round voyage may be regarded as exporting coal against an import of goods.) The necessity for maintaining exports is, moreover, enormously stronger since the war owing to the fact that instead of getting a large tribute of imports from foreign countries in exchange for capital invested abroad, we have now not only sold our foreign investments but have become a debtor to many foreign countries, and must, therefore, find new ways of paying for our imports."

"In order to maintain our export trade in coal it is essential that we should secure the best possible output at the lowest possible cost, which is consistent

with the payment of adequate and liberal wages to the workers, and also that every possible effort should be made and all possible ingenuity and skill applied in securing the greatest possible demand for our products in the markets of the world."

I now proceed to considerations affecting the iron and steel trade:

"It is probably unnecessary that I should elaborate in any detail the importance of this industry and the engineering and allied trades dependent upon it, as these facts are obvious and well known. It has already been given in evidence before the Commission that the iron and steel industry consumes at least one-seventh of the total amount of coal raised in this country, and that approximately four tons of coal are used to produce one ton of finished steel and a larger quantity per ton of wrought iron. The development of the steel works during the war; which when completed will give us an annual capacity of 12 million tons of steel compared with an output of 7½ million tons before the war, means that the trade will make a much greater call on our coal resources than in the past. The iron and steel trade has therefore a direct interest in the production of a larger supply of coal for home consumption."

"Again, the iron ore mines abroad, which provide the material for nearly 40 per cent. of our production, have been seriously affected in raising and transporting minerals by the shortage and high price of British coal. Unless we can secure imports of iron ore in quantities exceeding pre-war deliveries there is not the smallest prospect of our being able to produce sufficient pig iron to supply the full capacity of our greatly enlarged steel plants. Practically the whole of these imports of iron ore are at present obtained from Spain, Algeria, Tunis and Scandinavia, and the conditions as regards the return cargoes are the same in all four cases, namely, that the ships which import iron ore usually return with coal cargoes either direct to the exporting ore country or to adjoining countries from which a short voyage in ballast is easy. In 1913, British fuel exports to Spain alone amounted to 2,823,961 tons. Unless this export is maintained, Spanish ore will only be imported at greatly enhanced prices and freight rates. The early revival of the export of coal is therefore of vital importance to the iron and steel trade."

"As regards the export of its own products, the situation may be gathered from the following figures: The American pre-war production of steel was about 31,000,000 tons a year, whereas her present capacity for production is about 48,000,000 tons. Previous to the war the United Kingdom exported about 5,000,000 tons of iron and steel and the United States only about 2,700,000 tons. America's increased output will give her an enormous exportable surplus whenever the home demand falls off. She also has the advantage in cost. At present the price of blast furnace coke in England at ovens is upwards of 42s. per ton, whereas the price of coke in the United States is less than half that sum. When it is remembered that from 25 to 35 cwt. of coke is needed to produce a ton of pig iron, the importance of this advantage in cost in its effect on America's power to compete is obvious."

"According to the Census of Production of 1907 the total gross value of the output of the iron and steel industry in Great Britain at that time amounted to about £250 millions and its export in the same year to £97½ millions. The imports at the same date amounted to £27½ millions. There was, therefore, at that time a clear surplus of exports of £70 millions. In 1913 the corresponding figures were for exports £118 millions and for imports £41 millions; an excess of £76½ millions. This excess served to pay for the various imports required in this country. I ask the Commission to consider what the effect would be if as a result of this enquiry the cost of fuel were materially increased. Approximately the same value of coal and of iron ore is required to make a ton of steel, and in the past, again speaking in round figures, about one-third of

5 June, 1919.]

SIR HUGH BELL, BART.

[Continued.]

the cost of pig iron was incurred in providing the fuel. It is, I think, evident that any serious relative increase in the cost of fuel would put this country in a very awkward position in the markets of the world, and unless our export trade can be maintained, there is absolute certainty of a large amount of unemployment in the iron and steel trade."

26,228. Before you pass from that, we have the figures, but I have forgotten them. How many wago earners are employed in the iron and steel trade?—I am sorry I have not provided myself with that figure, but I could easily get it and put it in.

26,229. I should like to compare it with the number engaged in the mining industry?—I rather think the figures are given in the census of production.

26,230. I think they are, but I have forgotten them?—As you know, it is very difficult to get them in any exact way, except from that rather obsolete document in 1907, but I will get the figures for you.

26,231. *Mr. Arthur Balfour*: It is as near as possible the same as the miners?—I do not like to commit myself to a figure, but I think *Mr. Balfour* is right. At the same time you must define the iron trade in its broadest sense.

26,232. *Sir L. Chiozza Money*: Are you including the engineers? There are not a million engaged in the iron and steel trade.

Mr. R. H. Tawney: Are you including engineers?

Mr. Arthur Balfour: No.

The Witness: I do not think you can exclude from the consideration that I am now laying before the Commission the commodities which are in the main iron; for example, a ship is certainly an iron export, and I so regard it.

26,233. *Sir L. Chiozza Money*: In that sense it would be true, but not in the other sense. There are not one million men engaged in the iron and steel trade?—I have no doubt you are quite right.

"The iron and steel trade has another special interest in the question of nationalisation arising from the fact that many of the large iron and steel works have acquired collieries for the special purpose of their business. The grounds on which this policy is based will appear when I show its practical effect on the industry as exemplified in the case of my own works."

26,234. *Chairman*: Now you come to the case of composite firms illustrated by your own business. Will you read that?—Yes, I hoped you would allow me to state it.

26,235. If you like, I will read it. I think it is better to read it all.

"Allowing for varying conditions, the features of my own business are generally typical of the results of private enterprise and management in the large iron and steel businesses of the country, and I have selected my own experience, because the facts are within my knowledge, and I shall be able to answer any questions or give any explanations which may be desired."

"The firm of Bell Brothers was founded in 1844 by my father and his two brothers. In 1854 they began the manufacture of pig iron at Clarence on the north bank of the Tees, having acquired leasehold ironstone royalties in Cleveland. In subsequent years they acquired further ironstone royalties at Skelton and elsewhere in that district. In 1864 they acquired coal royalties in the County of Durham. They also became possessed of limestone quarries in Weardale. In 1887 a series of experiments to manufacture steel from Cleveland iron was begun on a large scale in the open hearth furnace. For a variety of reasons these were suspended for a period, but were finally brought to a satisfactory conclusion. About 1895 Messrs. Dorman, Long & Company had simultaneously conducted a similar series of experiments, and in 1899 a fusion of interests took place, and Bell Brothers, which had been previously a purely family concern, was floated as a public limited company, Dorman, Long & Company and the family of Sir Lowthian Bell, my father, agreeing to take all the ordinary shares of the new company and to erect steel works at a cost not less than £300,000 for the manufacture of steel from the Cleveland iron made

at Clarence. In 1903 the whole of the shares of the North Eastern Steel Company, with the exception of a very trifling amount, were acquired. In 1917 the shares of Sir Bernard Samuelson & Company were acquired. Regarding the whole enterprise as one, the following figures show the annual productive capacity:—

Ironstone	1,644,000 tons.
Coal	1,425,000 "
Limestone	300,000 "
Pig Iron	1,026,000 "
Steel Ingots	811,000 "

This will be greatly increased in the immediate future by large steel works at Redcar now in process of erection and only partially at work, and probably still further by a reconstruction of the works of the North Eastern Steel Company which is now in contemplation."

"Extensive alterations and improvements are also in progress at Clarence, with a view to increasing and cheapening production. The Britannia Works of Dorman, Long & Co. are also being greatly improved. I desire to point out to the Commission that those responsible for the various parts of what I am now treating as a whole have pursued a consistent policy throughout, endeavouring as opportunity offered to secure for themselves supplies of their own raw materials, and I wish to emphasise the point that it would be impossible under Government management to build up and develop a business of this kind or to undertake the further development to which I desire to refer. As I have stated, Bell Brothers, already possessing their own ironstone mines, became colliery owners ten years later. They have again and again increased their holding in coal, and have at present a large undeveloped royalty (Hutton Henry) in the County of Durham, which it was, prior to the present enquiry, their intention to develop in order to maintain, and I may say increase, their supplies of fuel. The acquisition of the works of Sir Bernard Samuelson formed part of the same policy, this company possessing both ironstone mines and coal mines. The Britannia Works of Dorman, Long & Company had been dependent for their supplies of pig iron and fuel on outside sources, and found this extremely inconvenient. When the various developments had been completed the concern would be self-sufficing for fuel, flux and ironstone, subject to the reservation that the supplies of pure oxide of iron needed for the steel furnaces would have to be drawn from overseas."

"The event has amply justified the foresight of my father and his brothers. The tendency observable for at least the last half-century towards what is called "concentration" has been nowhere more marked than in the iron trade. Units of over-increasing size have been formed. To-day the view commonly held by those best able to judge is that the composite works will command the market. It is essential that the process should be uninterrupted from the ore to the finished bar."

"But in my opinion we may go even further and say that it is of the greatest importance that the quality of the fuel used in the blast furnace should be constant. I would prefer a somewhat less excellent coke of absolutely uniform composition and physical condition to a fuel of better average quality which varied within somewhat wide limits. It was in consequence of this view, among others, that when the question of erecting by-product ovens came up for discussion we determined to put the ovens at the iron works rather than at the collieries."

"A further reason for pursuing this course is the fact that among the by-products of the production of coke is combustible gas. This can be utilised in various ways. At the steel works I think it would be safe to say that no other fuel is required for the production of steel than the coal brought to the works to make coke for use in the blast furnaces which form an essential part of the composite plant. The combustible gas coming from the coke ovens, and the gas, also combustible, but possessing much less energy, coming from the blast furnace, ought to supply all the power required to recover the other

5 June, 1919.]

SIR HUGH BELL, BART.

[Continued.]

by-products of the coke works, to blow the furnaces, to heat the melting furnaces and to roll the steel ingots."

"To go back to the question of maintaining a constant quality of coke, this will evidently be better done by bringing fuel from the various sources from which it can be drawn to one central point where the different qualities can be prepared for use in the coke oven. This preparation consists in washing and mixing in such proportion as will secure that the resulting coke shall be, as far as possible, of constant quality. I need not labour the point, but suppose I am drawing coal from three different collieries—one containing 8 per cent. of ash, the other 10 per cent., and the third 15 per cent. I mix these three together and get coal of 11 per cent. of ash. This will suit me very much better than having one day coal with 8 per cent. of ash and the next day, perhaps, coal with 15 per cent."

"In fact the quality of the coke has such a vitally important effect upon the economic working of the furnaces that it may be broadly stated that, save in exceptional times of prosperity, the whole difference between working the furnaces at a loss and at a profit will depend upon the proper quality being maintained."

"I am, therefore, strongly of opinion that any separation of ownership must necessarily be disadvantageous to the steel manufacturer, and I view with the greatest apprehension the proposal to remove my collieries from my own management and place them in any other hands whatsoever. It will involve reversing a policy deliberately adopted more than 60 years ago and consistently followed ever since with, I affirm, the best results."

26,236. Will you kindly tell us how far your collieries are from your steel works?—Within 20 miles. If you will allow me to say so, your question is a very pertinent and germane one, because if they were, say, 100 miles away I think the considerations might have to be modified, but wherever the coal is situated, as it usually is, in somewhat close proximity to the markets, within a distance of, say, 50 miles, I believe the balance would be in favour of keeping the coke ovens at the steel works and not at the collieries. Perhaps you will allow me to add that I have not dismissed the possibility of coke works at collieries. There are certain conditions—I myself have an example of them—where the presence of coke ovens at collieries is obviously indicated. The Horden Collieries have been mentioned, I believe, in this room by Lord Gainford. At one of our collieries at Horden, the Horden Colliery itself, we have thought it well to build by-product coke ovens, because there we have a means of utilising all the power we shall require. We shall convert it into electricity, if we are allowed, and I venture to think if we are not allowed a great mistake will be made; we shall use the electricity for drawing the coal at the colliery at which it is produced and for the whole of the underground operations at that colliery. The surplus we shall send to the adjoining colliery at Black Hall and probably later to Castle-Eden, which (again if we are allowed) we shall put into order. Any surplus we shall pour into the mains of a private enterprise (again if it is allowed to continue), I believe to the advantage of all the parties concerned, including the consumers drawing their supply from the private enterprise.

26,237. Are your collieries and your steel works separate legal entities, or are they owned by the same company?—They are owned by the same company. They are owned by Bell Bros. The leases are in the hands of Bell Bros., but Dorman, Long & Co. are the capping company of the whole concern. It does not affect the question. My answer to you is, Yes.

26,238. Do you regard your collieries as merely ancillary to your steel works? Do you have collieries for the purpose of producing steel or are they two separate undertakings?—We bought the collieries to use the coke at our blast furnaces in 1864. We do not use the whole of it at the blast furnaces. We

sell some part—as little as possible, because we do not want to be in the coal trade more than we can help. Our one object is to make now steel, then pig iron.

26,239. Then what you would say, I suppose, would be that you are a steel manufacturer who has collieries for the purpose of your steel business, and you are not both a colliery proprietor and a steel manufacturer?—No. I am a steel maker, and for the purpose of my business I possess collieries. I happen to make, for example, bricks at my collieries, but they are just as much part of the steel enterprise as the finished ingot. I make bricks because it pays me to make bricks as part of the enterprise, and I should, I think you will allow, be a very unwise man if I did not take that opportunity of adding a little to my profit.

26,240. Thank you. Now will you go on:

"GENERAL ECONOMIC CONSIDERATIONS.

"The facts which I have stated place the ironmaster occupying a similar position to mine in a very exceptional position, and enable him to throw an important light on perhaps the most vital problem of all, namely, whether these industries could have paid higher wages to the workers than they actually paid under private management. The heads of a business such as I have described are familiar with the whole of the process of manufacture from the raw material to the steel bar, and are therefore able to examine the costs in a manner which is not by any means usual even in that industry, and is very rare in any other. I have studied this question for many years past. My first paper on the subject was published in 1892. The result of my examination leads me to the following conclusions, which I am inclined to think are generally applicable to all manufactured articles, and I affirm that they apply to all those which I have had the opportunity of examining. I have no doubt of their substantial accuracy with regard to coal, iron and steel."

"If we take the selling price of my product at 100, I believe it will on the average be found to be divided as follows:—

Wages	70 per cent.
Salaries	5 per cent.
		—	75 per cent.
Sundry items with which I will shortly deal in more detail	15 per cent.
Gross profit as to which also I have something more to say below	10 per cent."

"These proportions will vary from month to month and even from year to year. In my experience of the iron trade there have been many years when the Divisible Profit in contradistinction to Gross Profit has entirely disappeared, and there have not been wanting occasions when the item Gross Profit had also vanished. But on the average of years I am of opinion that these figures will prove correct, and I am prepared to submit to the Commission full evidence in proof of this view."

"It is necessary to examine each of the items in some little detail in order to justify and explain them."

"Wages.—By this is to be understood not only the wages paid directly to men in the ironmaster's employment, but also to those paid indirectly. For example, in Cleveland the railway dues on a ton of steel amounted before the war to about 10s., but of this, as near as may be, 3s. was disbursed by the railway company in wages; and so with all the other services and commodities which the ironmaster draws from other sources. We should not, I think, be far wrong if we put it that the ironmaster pays the men in his own employment 50 per cent. of his gross receipts, and something like 25 per cent. indirectly to men in the employment of others."

26,241. Now I will read the next paragraph:

"Salaries.—There is a little ambiguity in this term, and its interpretation varies from industry to industry. For example, in the case of the railway, salaries bulk somewhat larger, and there may be

5 June, 1919.]

SIR HUGH BELL, BART.

[Continued.]

other industries with which I am not familiar, in which it is smaller. Speaking generally, I define a salary as payment for services in connection with administration and not with production. There are cases on the border line in which the item may be charged to either class, but inclusion in the one or the other would make very little difference in the result. After careful consideration of the question, I am of opinion that the 5 per cent. I have mentioned is about the correct figure for my own trade. This covers all disbursements for administration, from the Director and General Manager down to the latest come juvenile clerk or sub-manager."

"Sundries.—In this item is included a very miscellaneous collection of disbursements. Among these I may mention, in the first place, royalties. This is an item which has already been dealt with by other witnesses, and I will say no more with regard to it than that it appears to me to be an economic incident from which it is impossible to escape. Another item is interest paid to others. If I may again refer to payment of the railway company, I would point out that out of the 10s. I have assumed as the charge for railway services something like 3s. 6d. is required to meet the interest and dividend payable to the owners of the railway capital. It is a matter of indifference to me, as an ironmaster, to whom this payment is actually made. If the State become possessed of the railway property they must in some way or other obtain the funds to pay, not only for the existing capital they will have acquired, but (what is perhaps of more importance) to pay interest on the large additional expenditure which stands before the railway enterprise if the development of this country is to continue. In the item 'sundries' is also included all rates and taxes for which provision has not been made in the wages and salaries. I would like to point out in passing that a very large proportion of the payments we make for rates and taxes goes to remunerating men in the employment of the local authority or of the Government, e.g., the police, the school teachers, the men serving in the Army and Navy, all the multifarious crowd (alas! now so overgrown and indisciplined) of civil servants, and last, but not least, the army of persons whose business it is to collect the money to pay themselves and the rest of the crowd."

Now will you go on with the question of profit?—*Profit.*—I come finally to the 10 per cent. which I have set aside under this head. The political economist finds great difficulty in dealing with this subject. The practical man of business finds it equally puzzling, and most of the commercial disasters depend on mistakes made with regard to it. For the purpose of this discussion perhaps the following tentative definition of Gross Profit will suffice: Gross Profit is the surplus of receipts remaining after all the current charges have been defrayed, and there has been set aside such amount for amortisation of the capital as the circumstances of the case warrant plus such further amounts, for ordinary wear and tear, as ought to belong to the period under review which from circumstances it has not been possible to spend for the purpose during that period. A concern managed under these conditions would be maintained at any time during its history in precisely the condition in which it was at any previous moment."

"But in industry that is not sufficient. It is necessary not only to maintain, but to improve. Take any industry you please and you will find that the conditions of production are continually altering. If a going concern is to maintain its position it must be prepared to spend some part of its surplus in making improvements, which will not add to its earning capacity, but will merely maintain it. It is obvious that such expenditure cannot be added to capital indefinitely or even at all. If added indefinitely, profits would ultimately disappear. If added at all, there would be a tendency in dividends to decline. All possibility of increasing the works would vanish because new capital would be unobtainable. It is necessary to dwell on this in order to justify the next proposition I have to lay before the Commission, namely, that no industrial enterprise

conducted on sound principles can with safety distribute more than between one-half, and at the outside two-thirds of its gross profits, the remainder being needed for the maintenance of the undertaking."

Shall I read the note?

26,242. Yes, if you will kindly do so?—"Incidentally, I would like to point out the effect of a very heavy Income Tax levied on the gross profits. It cuts into the funds available for the purpose to which I am referring. Assume, for example, some concern with a gross profit of 100, assume that the Income Tax stood at 10 per cent., assume that the management determined on a division among its shareholders of one-half of the gross profit, and of the retention for the purposes of undertaking the other half. The shareholder would receive 45 per cent. of the total, the management would retain 45 per cent., and the tax collector would take 10 per cent. The 45 per cent. remaining in the concern would be available for the purposes to which I have been referring. Assume that the Income Tax from 10 per cent. rises to 50 per cent. Instead of 45 per cent. for the purposes in question the management would be left with only 25 per cent., a sum quite insufficient for the purpose. I need not dwell on the matter further beyond pointing out that if the 50 per cent. Income Tax is imperative, and the 45 per cent. retention from gross profit equally obligatory, the unfortunate shareholder would be left with 5 per cent. instead of 45 per cent., and I am afraid would not be very ready to respond to the management when appeal was made to him to provide additional capital."

"I have thought it incumbent upon me to dwell at some length on these various questions in order to found on them an argument which appears to me of essential moment in considering the questions now before the Commission. I understand that one, if not the chief object which is sought to be gained by the nationalisation of mines is to satisfy the demand for a higher wage by those engaged in that industry, and that it is alleged, among other things, that one source of this additional remuneration would come from the amount of profit taken by the present proprietary. I think it will be evident from what I have said that this cannot be the case. For, supposing the whole of the divisible profit had been utilised in this way, it would not have added 10 per cent. to the wages paid. I can give confirmation of this view by telling the Commission that if my firm had paid 10 per cent. more wages than the sums actually disbursed in the last 50 years no profit at all would have been left for the owners. It may be contended that additional remuneration could have been obtained by more efficient management. In reply to this view I maintain that individual management, relying for its remuneration on its success (which for the present purpose I measure by profit), is more likely to be efficient and thrifty than the management of a department which in ultimate recourse will have either a call upon the taxpayer or an apparent power to regulate wages in an arbitrary manner and independently of economic laws. I admit that many mistakes have been made, and are continually being made, by individual management and individual managers. These mistakes, however, bear early fruit and are rapidly corrected by the pressure of circumstances; whereas under State management they would tend to be disguised until perhaps they had done irreparable injury."

26,243. Now I will read on. If you want to make any comment while I am reading it, stop me and add what you want to say:

"I may interpolate here an important consideration which calls for notice, namely, the interconnection of the wage level in different trades. The collier is asking for higher wages on the ground, as I understand it, that his employment is dangerous, difficult and disagreeable. Implicitly he is contending that his wages in relation to the services of other classes are too low. But the same view is being put forward by the railway men, who are equally demanding higher remuneration under threat of withholding

5 June, 1919.]

SIR HUGH BELL, BART.

[Continued.]

their labour. Beside all this, other classes of miners claim to receive similar advances of wages to those sought by the colliers on grounds alleged to be peculiar to them. For example, the Cleveland miners, who are members of the National Mining Federation, have demanded and have obtained the same advances. The limestone quarrymen in Wear-dale, whose interests are cared for directly by the Cleveland Miners' Association and indirectly by the Miners' Federation, are also to receive the same advances. It would therefore appear that the result of the present agitation will be to maintain the whole of the wages in the United Kingdom at their present very high rate, and possibly to raise them still further. If this occurs it will mean that unless and until productivity increases in equal proportion the cost of all commodities in the United Kingdom will be enhanced in equal proportion, with the result that the real position of the wage earner will not be improved."

"This brings me to another aspect of the question. Speaking generally, I suppose it will not be denied that the proceeds of the sale of any important article of production must suffice to pay the whole of the cost of that article, including in the term cost everything that is essential to its production. I think I am further entitled to assume that a return on the capital involved forms one of these essential items. From what I have already said it will be seen that I regard it as susceptible of proof that in the division which has taken place up to now there has on an average been no fund from which any considerable increase could be accorded to any one of the items of cost by taking it from some of the other items. This contention is not incompatible with the fact that wages have increased to a very remarkable degree since I first began to deal with labour questions. Apart from certain exceptional periods (among which I must certainly set the last five years) there has been a steady increase in the rate of wages which does not fall far short of 1 per cent. per annum. It may be asked, how is this circumstance to be reconciled with what I have said as to the impossibility of according any increase of wages out of the proceeds of the industry? The answer is that during the whole of the period in question there has been a steady improvement in productivity. I put the proposition in this way. The bargain between the workman and his employer is that in return for a certain wage paid by the employer the workman shall during the hours of his labour give the whole of his energy to the discharge of his task. The amount to be paid to him has been settled by a long process of higgling, and whatever may be said as to this in the past, no one conversant with the facts of to-day will doubt that in this process of higgling the workman stands at little or no disadvantage to his employer. Speaking with the experience of more than half a century, I express my complete conviction that the workman has secured the full amount which over time the industry in the circumstances then prevailing could afford to pay. But this mere fact made it incumbent on the employer to do everything in his power to add to the efficiency of the workman, and it is from the interaction of these two forces that the steady rise of wages has occurred. The employer has sought continually to improve the conditions under which the labourer exercised his calling so that the resulting produce should be increased. I am quite prepared to admit that to effect this he had to call for additional skill from the workman. But he was willing to pay for this additional skill. The general effect of the process may be shown by the following example: When I first became acquainted with the manufacture of pig iron the cost of labour at the blast furnace amounted to something like 6s. per ton. Prior to the war, and indeed prior to certain changes in conditions which set in some time before August, 1914, this cost had fallen to about 3s. 6d. per ton. In the interval not only had wages risen in the remarkable manner to which I have made reference, but the hours of labour had been reduced from 12 to 8 per day. I should like here to show how much can be effected when the parties are prepared to devote themselves wholeheartedly to the solution of any industrial problem. It took several

years of close and patient inquiry between the Ironmasters of Cleveland and the Blast Furnacemen's Association to find this solution, but, in fact, they found it without calling upon Parliament to interfere. Not very different from this is the history of the shortening of hours in the coal mines of Northumberland and Durham."

"This brings me to submit a consideration which is too frequently neglected by all the parties concerned in industrial production, namely, the necessity of affording to all the persons interested the fullest information possible. I have long held the desirability of this. I have never omitted the opportunity of urging it upon my colleagues, and I have been ready, as far as possible, to give information to the workmen with whom I have been connected. Before this enquiry began the Durham Coal Owners and the Durham Miners' Federation were discussing the manner in which information as to the costs of working coal in the County of Durham and the resulting profit should be officially made known to the workmen. I am sorry our negotiations were interrupted by the present enquiry. They show on the one hand how far the coal owners were prepared to go in giving information, and I venture to think that they show on the other hand how much the miners had to learn as to the nature of costs and, second, how ready they were to be instructed on the matter."

"I should like at this point to state my very strong conviction that the amount of profit earned in any particular industry, and still more in any particular establishment in that industry, is no direct measure of the wage payable to the men employed. The amount of wage is, in my judgment, determined by the general condition of the labour market, and not directly by the wages of any particular branch of it. This does not mean that if my profits are at any moment very high I will not be willing to pay wages in excess of those prevailing in the country at large. The fact is the manufacturer does not pretend to be a professor of economics, or even to be conducting a technical school of economics. He is seeking to make a profit, and he will often sin against economic laws and give extra wages to secure large profits, which he would otherwise lose, rather than risk a strike which would deprive him of the opportunity of making hay while the sun shone. In a perfect economic world this phenomenon would not occur, but in the world as we know it it very frequently happens. It is to be observed that the converse is also often true, and that in a falling market with declining profits the manufacturer will often pay wages in excess of his real capacity rather than incur the greater loss which would be involved in obtaining reduction to a figure which under the circumstances would be a reasonable one."

Now perhaps you would like to read the last paragraph?—Perhaps I may interpolate an observation with regard to the last sentence you have read. I have known pig-iron in Cleveland at 28s. a ton. I lost less money making it at 28s. a ton at the bottom of the market than I lost at 65s. in a falling market. I had not been able, in my reduction of expenses, to overtake the fall. I had been able, in the extremely depressed market, to trim the sails of my ship so that it would stand the weather.

"It may be thought that I have not suggested to the Commission any plan to alter a state of matters which cannot be regarded as satisfactory, and I admit the force of the remark. But this is because there is no Royal Road by which we can travel to a solution. To bring about the improvement we all desire will call for the hearty co-operation of all the parties involved. At present an attitude which may be called antagonistic exists between them. This must cease. To effect this it is necessary that the fullest information should be afforded by the management to all engaged in the enterprise. That the final word must rest with the manager cannot be contested. (If two men ride a horse one must ride behind and leave the reins in the hands of the other.) But this need not prevent the workman

5 June, 1919.]

SIR HUGH BELL, BART.

[Continued]

being made fully aware of all the circumstances of the trade in which he is engaged and in which, may I add, he has already so deep an interest and so large a share. We are too apt to look more at the competitive side of industry in all its aspects. We overlook the fact that commerce is not conflict but

co-operation, and that the best bargain is the bargain out of which both parties derive advantage. This view and the spirit it produces would, in my judgment, go far to find the solution for which we must all strive."

Chairman: Thank you very much for your proof.

(Adjourned for a short time.)

26,244. Sir L. Chiozza Money: Sir Hugh, you realise, of course, that the parts of your evidence which most concern us are those which have direct relevance to the question of nationalisation? May I, first of all, direct your attention to what you say on the first page of your *précis* with regard to Government interference in industry? Do you realise that when the war broke out our inadequate production of iron and steel was a great danger to the country?—We were short of large quantities of iron and steel, and of course I cannot deny that.

26,245. Is it not the fact that in 1911 and 1912 some of us had a very serious discussion as to whether the iron and steel industry in this country was adequate for its needs?—Yes, I am aware of that discussion. I did not agree with the views expressed.

26,246. You remember I tried to point out in 1911, in some articles which met with a good deal of attention in the North of England, that our inadequate production of steel was a great danger to the country?—Yes.

26,247. Do you think that is very creditable to private enterprise?—Quite.

26,248. Is it not the fact that owing to the inadequate production of iron in this country by private enterprise, the Government had to come to the rescue of the country during the war, and that in about three years it increased the production of steel by about 50 per cent.?—Yes. Now let me tell you where I think that the date of the rescue ought to be taken to—it is a good deal before 1911. The British Government and British engineers have from the very beginning placed every obstacle in their power in the way of increased steel production in this country.

26,249. I did not quite catch your answer. Do you say the Government and the engineers?—Yes, and the civil engineers.

26,250. It is not only the Government?—No, I put them both together. The discovery of the so-called Basic process was a very distinct drawback to Great Britain, because the materials which Great Britain possessed were by no means suitable for that process. The British Government and British engineers, instead of doing as was done in the case of foreign countries, namely, encouraging the manufacturers to increase the production of steel of that quality, put every possible obstacle in the way. Basic steel was absolutely prohibited. You could not use it for Admiralty and many other purposes. The Indian Government, for a long time, refused to take such a thing as a rail made out of basic steel. Every possible objection was put in the way of increasing the output of basic steel in this country. If we had been encouraged, there is no question but that we should have increased our output of steel.

26,251. How do you mean the Government should have encouraged it? After all, what was the Government control of steel in this country? It is true orders were given by the Admiralty, but the great demand for steel in this country was from private enterprise. Therefore your accusation lies against private enterprise?—I beg your pardon. The fact that the Admiralty had prohibited steel of that quality put a black mark against it for general purposes. Over and over again attempts were made to get the Admiralty to accept it, but unsuccessfully. If I may go a little further, on the outbreak of war, it was very difficult to get basic steel accepted for the purposes for which it was ultimately required, and for which it was admirably suited. If that had been done ten years ago, the position would have been a very different one.

26,252. But forgive me; the greater demand in this country was by British engineers, and not by the

Admiralty. Was not private enterprise superior to the black mark put on it by the Admiralty?—I have no hesitation in saying that the objection which was taken in Great Britain to basic steel was largely the cause of the slow increase of manufacture of British steel.

26,253. Does this also account for the fact that the magnificent iron ore deposits in the North of Europe were used so freely by the German steel industry, but not by this country? What has that to do with the basic process?—Everything. If you examine the figures—I have not them by me—you will find that the proportion of home ore and imported ore has remained almost constant between Germany and Great Britain; regard being had to the proportion between foreign and home ore, it remained almost constant. Our gradual increase in the production of pig-iron, which is the material with which I must begin, has gone, almost *pari passu*, with the introduction of foreign ore. Therefore nothing can be made out of that argument which is put as to the conspiracy, so called, of the Germans in taking foreign ore. They took foreign ore because they were making more steel, but they did not make more steel because they were taking foreign ore.

26,254. In 1900, the pig-iron output was 9,000,000 tons. In 1912, it had fallen to 8·8 million tons. During those same years Germany was enormously utilising ores from North Europe, and we were making very small use of them indeed. What has that to do with the British Admiralty?—I will tell you. In 1912 there was the Durham coal strike. I was going to interrupt you and ask you to take any other year.

26,255. I will do so. In 1900 it was (in millions) 9·0; 1905, 9·6; 1906, 10·2; 1907, 10·1; 1908, 9·1; 1909, 9·5; 1911, 9·5; 1912, 8·8; 1913 (a boom year in trade), it was only 10·5, or barely more than in 1900?—It is not at all surprising. The reason we did not make more pig-iron was because we did not have the ore.

26,256. I put it, it was more economic for this country, with its great seaboard and its access to Spain and Sweden, to get iron ore and put it near the coal than for the Germans to get ore from North Europe with a long haul to get it to their coal. Yet you did not do it?—I reply that you are mistaken in the conclusion to which you have come, and the reason the Germans made more iron was because they were raising more home ore, and the reason the English did not make more iron was because they had not the ore out of which to make more iron.

26,257. I suggest the reason was quite different, and it was that, under private enterprise, we went on for a very long period with stupid little blast furnaces which were obsolete, while on the Continent they had blast furnaces with capacity of thousands of tons against our hundreds of tons?—I deny the inference. I deny our furnaces were insufficient. I will give you my own experience in the matter. Some years ago (I should think it was about 1896) there was a great talk about the American practice. My brother and I, who were then in charge of the business, thought it would be desirable to see if we should bring over an American engineer to teach us to conduct our business. We brought one. He came to our works. I said to him: "It is no use you telling me how I can produce more iron, because I am producing as much iron as I am able to produce with the resources I possess, iron ore and so on. I want you to tell me how I can produce it any better, and what appliances I can introduce to make it under better conditions." He made a very careful examination and he told me that, subject to certain small details, he did not think I could do any better than I was doing.

5 June, 1919.]

SIR HUGH BELL, BART.

[Continued.]

26,258. What year was that?—I think about 1898. The reason of that was quite obvious. The reason why the Americans were doing things that we could not do was because their labour conditions were quite different. There was no margin of labour to enable us to effect the savings which were then common in America.

26,259. I suggest to you, from information which I received myself in steel districts at the time, that not many years ago you could not put up the latest type of furnace in this country without going to Germany for some parts?—Well, but why not?

26,260. I was told that they could not place contracts in this country?—Why is that any slur upon the British iron-master? When I was a young man, I went to a German iron works and asked them where they got their machinery from—did it come from Glasgow or Manchester? The time came when I went to an iron works and asked a British iron-master if the machinery was from Düsseldorf or Berlin? I find no fault with that. The Germans had found out something which I could not do, and I got my machinery from Germany, and as soon as I am allowed to do so, I will do it again.

26,261. You admit, do you not, that between 1900 and 1913, the iron output of this country was practically stationary?—I do not deny it.

26,262. Is it not the fact that in three short years, with Government aid, and Government stimulus, and Government bounties, we increased the steel production of this country by 50 per cent.?—And it remains to be seen whether we were wise.

26,263. I suggest that if it had not been for that wisdom on the part of the Ministry of Munitions, we should have lost the war?—I do not know. There is no doubt the conditions which had been obtaining in 1914 were entirely different from what obtained before. I think we British steel makers may claim that, as soon as the demand was made upon us for increased production, we responded with very adequate results; but what the ultimate result will be is another matter.

26,264. Not only did it save us in the war, but it also put the iron and steel industry of this country in a position where in the course of a little while the production will be larger than can be absorbed by a rapidly increasing industrial world?—I sincerely hope so.

26,265. Do you not think so?—I am not sure.

26,266. With regard to other matters tackled by the Government during the war, I see you say: "The Departments which have successfully secured 'production at any cost' would undoubtedly not have similar success if called upon to produce at competitive market prices." Are you aware that, with very few exceptions, and exceptions so few that they prove the rule to the contrary, the national factories which were run by the Ministry of Munitions during the war produced more cheaply than private contractors, and that that is the verdict of the Auditor-General?—I do not mind whether it is true or not. The question is whether when things become normal that will be true, and I do not believe it will.

26,267. Do you think the same will happen in times of peace?—No.

26,268. You admit it is a tribute to what a perfectly scratch Government Department was able to do in the way of hasty organisation, having to work with any manager and clerks and offices they could get hold of. That is true, is it not?—No. It was not anyone they could get hold of. I was not one of them, but they were the best brains in the country. The Government called for the aid of every person who occupied a distinguished position in the trade and put them on to do this job.

26,269. I am sorry if I expressed myself not quite accurately. I was not doubting the accuracy of what you say. I know it very well, but what I mean is that it was a scratchy organisation, where the sub-agents, the clerks and the material all had to be hastily got together when the best young men went to the war, and therefore conditions were wholly

against Government enterprise, and not in its favour. Is not that true?—Well, you are stating it.

26,270. Well, is it not true?—I do not think so.

26,271. Do you not think that the same brains and the same public spirit that came to the aid of the country during the war could be enlisted in time of peace to help the nation?—No, I do not.

26,272. Do you know Lord Devonport, sitting in that chair preceding you, told us that they got for the purposes of the Port of London Authority two of the most capable engineers?—I heard Lord Devonport say so.

26,273. Did he not say that they were paid better than the engineers who used to be employed by the little dock companies?—I daresay.

26,274. And that they did very much better work because they had a better opportunity?—I daresay. The London Docks is an example of what I speak of in my *précis*, namely, the tendency towards the concentration of industry. I admit and agree that the amalgamation of all the little private enterprises and the unification of all the London docks may have been a very good thing. I have every reason to believe that Lord Devonport was perfectly frank and sincere in saying he believes it is. But there have been other views expressed on the subject. With that we are not concerned. I do not deny the large enterprise has better opportunities and pays better salaries than a small enterprise, and that the reorganisation of the docks of London was quite a thing to be undertaken by some large organisation, and that that large organisation would bring to the consideration of the question submitted to it the application of better principles than could be applied in the case of any single one of the docks.

26,275. Do you know it was suggested by the late chief engineer of the Post Office that not only were they able to find good men to serve them, but those good men would not leave the public service even to get a better salary outside it, and when opportunities offered he had difficulty in persuading them to do so even although it was to their pecuniary advantage?—If any person stated that as a fact, of course, I accept it, but it is rather contrary to my own experience.

26,276. Are you aware that with regard to electricity supply, one of the few industries to be tackled by public enterprise, we have it given in evidence that the public undertakings employ a smaller quantity of capital per kilowatt and supply electricity to the public at a much lower price than private enterprise?—I confess that surprises me enormously. I should like to have the thing investigated.

26,277. Here are the figures collected by the London County Council with regard to the capital per kilowatt for the years 1913-14. For 13 companies in the Metropolitan area it was £82.98, and for the local authorities £57.48. Does that surprise you?—Very much.

26,278. And the price charged in the case of companies is 2.39d., and the price charged by the local authorities 1.692d.?—I have heard that.

26,279. Would you not be inclined to revise your *précis* if you thought those facts to be true?—No. I think it would require a great deal of examination before I was satisfied as to that. The figures surprise me very much, and I should like to examine them further. I have something to do with the production of electricity. We produce it at our works. We produce it under conditions which make these figures very surprising to me, and I should like to see them further examined. I should be very glad if I had had the opportunity of hearing Sir Arthur Duckham cross-examine the witness of yesterday on the subject.

26,280. I should have liked it also, but we did not have that advantage. I am only suggesting to you, assuming those facts were as stated, would they not make you inclined to revise your opinion?—No, I think not.

26,281. Not even if the facts were as stated?—No.

26,282. Does it not occur to you that a public authority is able to command capital at a lower price than a private individual? Does not that give an initial advantage?—That can only be while the

5 June, 1919.]

SIR HUGH BELL, BART.

[Continued.]

public authority is not plunged up to the hilt in enterprises of that kind. As soon as it begins to be saturated with things of that sort I think the rate of interest will rise, but that is a speculative opinion.

26,283. So far as things have gone it is true that public undertaking has certainly the advantage of being able to command cheaper capital?—It obtains a means of paying interest on capital from a source which has no reference to the enterprise. That is the point.

26,284. To come back to the iron and steel industry, Messrs. Bell Brothers are rather an example of what one may call collective enterprise?—Collective?

26,285. Yes?—Why?

26,286. In the sense that the firm covers a large number of undertakings which are welded into an economic unit?—Yes.

26,287. You speak a good deal of economics in your paper, but you know a good many people deny that they want competition between as many competitors as possible in the public interest?—You say so.

26,288. But it is so?—I have heard a good deal of inveighing against trusts with which I was in sympathy to some extent, but with which I disagree on the whole.

26,289. Messrs. Bell Brothers occupy no inconsiderable proportion of the iron and steel industry of the country?—This great enterprise will be producing something like one-tenth of the total steel in the kingdom.

26,290. Do you not think very similar advantages can be enjoyed by the coal industry?—It is enjoyed. We produce a million and a half tons of coal a year.

26,291. You explained to the Chairman that your mines were ancillary and that you did not want to enter into the coal industry as such, but that your mines were required economically to work your iron and steel industry. I am speaking now of the coal industry not in relation to the iron and steel industry. Do you not think similar advantages to those which you justly claim for this combination called Bell Brothers?—It is called Dorman, Long & Co.

26,292. I am thinking of the old name—might be enjoyed by a suitably arranged portion of the coal industry, say a district like South Wales?—I very much question it.

26,293. You do not think you could get the advantage of employing the best brains in the South Wales field and putting those best brains in charge of the whole district, so that their brains would not tell upon one little group of men, but would tell upon the whole district?—I am sure you do not want to catch me or I to fence with you. I want to put the thing in my own way if you will let me. The answer to your question is Yes and No: Yes, there are no doubt advantages in having a large colliery enterprise and a group of a good many collieries together, and I could give you examples from the County of Durham, say the collieries owned by Lord Joicey and his company, where I think the management is better, because the management is over a large group. That may be so of Wales, where the groups are very considerable. I think considerable advantage arises from that as it does from the case of the London Docks which you have already instanced. I very much question whether those advantages would not be lost if that group became a very big one, and I feel quite satisfied that they would be all lost, if instead of having the stimulus of private enterprise they had the rather deadening effect of Government control. I do not know whether I have gone to the root of your question.

26,294. I think you have answered it very fairly and I should not ask you to change your opinion as to the deadening effect of Government control, but you admit that there may be economic advantages arising from a large scale treatment of this subject?—Not only do I admit it, but I assert it.

26,295. There is one other point I want to question you upon which is of considerable importance. I refer to the end of your evidence where you speak of what can be done to alter what you call the antagonistic attitude which exists between Capital and

Labour generally, and in what we are specifically concerned with here not the least, the coal industry; and you use those words, "They must cease"—that is the antagonistic attitude. I think you realise we are here concerned not with, as is sometimes said, matters of theory, but we are up against the condition of theory and the condition of men's minds. Do you think in that condition it is sufficient to say to either side and particularly to both sides together: "They must cease"? Does it carry you any further?—It depends upon the sanction. If you could compel us to love one another, it would be all right; but if you cannot compel us you must try to persuade us, and it is the process of persuasion that I am endeavouring to insist upon to the Commission.

26,296. It is the very fact that you cannot compel which I have in mind. It is the very fact that men have reached a certain condition of social and educational development that leads to their minds, as I suggest, being in a certain condition, and that condition is that you have 1,100,000 men who have reached this condition of mind—that they are not satisfied with private ownership as a means by which they work. If that is a true account of their condition, what do you suggest to this Commission should be done to change that condition of mind? Do you think it could be done by putting forward the arguments in your paper?—It is what I have been doing for 50 years, and if I were to live for another 50 years, which I hope will not be the case, I should go on doing it. I am most sincerely convinced that the only solution of the problems we have before us is the solution I have suggested, for which I have been working, and which, I think I may say with some assurance, we have been in the direction of finding in the North of England. I have given an instance at the end of paragraph 24 of my *précis*, where I point out you have precisely that kind of thing. The ironmasters of Cleveland and the Blast-furnacemen's Association came to an arrangement of the very kind you are suggesting—not, indeed, of the parting with the ownership, which I believe to be in the wrong direction, but in the direction of giving to the men what they were demanding. What were they demanding? They were asking for some leisure in which to live their life in a better and healthier way. The ironmasters from the very beginning of the negotiations said: "We are entirely at one with you: we want to find a solution." We began with this proposition: "Nothing that is done must materially enhance the price of making a ton of pig-iron. We do not believe there is anything more for you under the present conditions. Can we find out a way of solving this problem which shall comply with these postulates?"—and we did find it.

26,297. Do you suggest that these men are now satisfied with the condition which obtained? Take this very class?—I am not acquainted with a contented man; I do not know one.

26,298. *Mr. Herbert Smith*: Even yourself?—Even myself. I should be sorry if there were contented men. I want men to strive for better things.

26,299. *Sir L. Chiozza Money*: You have spoken of the conditions of labour, and mentioned more leisure. I suppose you also mean more wages; but I put it to you that there is something more than that at stake, in that men are considering not merely wage, and not merely leisure, but they are considering their status, and if I may so put it, their manhood; and that they say, rightly or wrongly—putting aside right and wrongs at the moment—that the nation ought to own these large-scale industrial operations?—The nation?

26,300. They may be wrong, but that is not the point. They want to feel that they are doing work for the nation as national property. Do you not think, if they think that, it is, at least, respectable, and ought to be respected, and it ought to be met in a reasonable way?—It is respectable, and I respect it; but let me add, it is fatuous.

26,301. If a million men will not go on on the old conditions, does it not cease to be fatuous; does it not become a practical question?—I think not.

26,302. Supposing your million men will not go on unless these mines are owned by the nation, what

5 June, 1919.]

SIR HUGH BELL, BART.

[Continued.]

are you to do?—You ask a very proper question, and I admit the force of it entirely. My answer is, I cannot believe that my fellow-countrymen, whom I believe to be commonsense people, will take up that attitude. If I did not hold that opinion, I should be in the greatest alarm as to the future of the country, because there is no limit to the demands which might not be made on the same basis. To give a totally fantastic illustration, the men might easily say: "We will not work in a country in which anybody believes in vivisection, or in anti-vivisection," or some other fanciful idea. It is because one feels that they are never going to drive these views to the ultimate decision of a contest which would involve the whole community that one is inclined to say: "Now let us reason with these men in the meantime." I am reasoning with them, and if you will allow me to say so, I am reasoning with them through my answers to your questions. I am endeavouring to show to them, through the intermediation of this Commission, that they are crying for the moon, and that the thing cannot be got. It is not in their interests that it should be got, and it is in their interests to seek a solution in a different direction.

26,303. If I were a miner, why should it be in my interest to get coal, not for the people of the country, but to get it for the private proprietor of that coal, with a royalty on it payable to a man who merely happens to own the land under which it is found? Why should it be to my interest to go on with operations of that sort? Why should the landlord own the coal which is 2,000 feet below the surface? Why should he draw a royalty? Why should I work for a shareholder who does not know as much about the mine as I do, or as a London solicitor does?

Mr. R. W. Cooper: He may be a solicitor in Newcastle.

26,304. *Sir L. Chiozza Money:* Yes. If I were so stupid as to take up that attitude, what would you say would be a sufficient reply? Would it be sufficient to say something about vivisection? What has that to do with that highly practical question of affairs?—May I say that your question would be an admirable one if it were addressed to a jury to prejudice, but it is not a good question if it is addressed to someone from whom you want a frank and sincere answer.

26,305. I suggest to you, if that represents the condition of mind of a million men working for you, it is idle to argue that it is not a practical question. You have to meet it?—I do not say it is not a practical question, but the answer sought to be given is not practical.

26,306. With regard to your admirable *précis*, if I may say so, which has interested me very much, in spite of all you say, the unrest in labour has not improved in this country; it has not got less, but it has got more. It was great before the war broke out, and now it is more than ever it was before. It is more because of the consequences of the war, and this same feeling is spreading all over the world. Can a feeling which is spreading, like this, over the world be related to a subject like vivisection?—I put that to you as a fantastic illustration. I agree it is a fantastic illustration, and I am sure you so understood it. The end of your question was going to be the beginning of my reply. The condition of things which you are describing has existed not only in this country, but in the world. I happened to be in New York in the spring of 1914, and I had then the opportunity of talking to some of the leading financial experts in that city. They were all full of alarm as to the outlook of the future. We did not foresee the war at the moment—at least I did not, and I do not think they did. We were all agreed as to the extremely dangerous condition of the labour market, and I ventured to say to these gentlemen—

26,307. *Mr. R. D. Tawney:* Of the what?—The labour market. Perhaps I should not have used the word.

26,308. *Sir L. Chiozza Money:* We know what you mean?—What I meant was the general labour unrest. I said to those gentlemen: "I agree the pre-

sent situation is a very alarming one." I am of opinion that the solution of it will be found in the direction which I have ventured to indicate in my paper, and that that solution will not be a solution of the drastic character which some of you anticipate. They were all anticipating social changes of an extremely far-reaching character, and as I believed, and as they believed, of a very dangerous character. I think the solution, as I understand it, will not be very efficacious in effect, and that is why I say it depends upon those of us who are taking an active part in the direction of industrial affairs who endeavour to persuade people that that is not the way to look for a solution. Let me go on. You talk of a man working for the nation. Does anyone really believe that he works for the nation except in periods of high stress like we have come through, when no doubt ultimately we were all explicitly working not for our own profit and private success but for much larger and higher ideals? What in the ordinary course of events a man works for is his wife and family. He looks no further than that. I believe the men who work for me, if you please to call it "for me," but whom I am always accustomed to regard as my co-partners in the enterprise, are thinking far more of the fireside than the nation, and they would not think any different if they were working for the inanimate nation than for Hugh Bell.

26,309. Would you not work better if you knew your work inured not only for the benefit of your wife and family, but you knew by an economic process it filled the cellars of the country? Would not that operate in your mind to make a better citizen?—A world without rent might be a better world, but I do not know of it.

26,310. There are possibilities of getting rid of such an absurdity as a royalty on coal, are there not?—Are there any?

26,311. Possibilities of getting rid of a royalty on coal?—I do not know; I do not know where it is got rid of.

26,312. But your favourite economists have denounced it as an absurdity. I suggest you would work all the better if you knew you had got rid of such an absurdity?—I do not know why you should get rid of it. Will you tell me that please?

26,313. I do not know that it is possible, but if you did would you not work all the better for knowing you had got rid of it?—It might be possible, but I do not know where it is done.

26,314. It comes to this: you have nothing more to suggest than you have put in this paper, and you frankly admit that these methods have not lessened industrial unrest, but it has increased and was never greater than at the present time?—That I admit. What I deny is that the remedy you suggest is a good one.

26,315. *Mr. R. W. Cooper:* You were asked about Lord Devonport and the Port of London Authority. I believe you yourself have some personal experience of the running of Port Authorities?—Yes, I have.

26,316. I think you are the Chairman of the Tees Conservancy?—Yes.

26,317. That, although it is a smaller river, is an authority like the London Authority?—Yes. It happens, I think, to stand, excluding coal, as about the seventh port in the kingdom.

26,318. Is there any reasonable analogy between running a Port Authority and the British coal industry?—I do not think there is any.

26,319. You were asked a good many questions by Sir Leo Money with regard to the suggested sins of the British steel makers. I do not know much about them, but I assume before the war the production of steel was equal to the demand?—Yes.

26,320. On page 2 of your *précis* there is a paragraph about the export trade, which I observe you did not read when reading your *précis*. It is the concluding sentence at the end of paragraph 8: "I equally believe that under Government direction it would be impossible to maintain the efficiency and elasticity of the arrangements for obtaining foreign orders which has been gained by the experience of private owners and merchants over many years of foreign trading." What is your view with regard

5 June, 1919.]

SIR HUGH BELL, BART.

[Continued.]

to the practicability of the State running the export coal trade of this country?—I think it would not go on for a week.

26,321. *Mr. Arthur Balfour*: Do you think if the coal mines were nationalised it would do away with labour trouble?—I do not think so. I do not observe that the police are entirely free from labour unrest.

26,322. Do you think if the coal mines were nationalised we should get a greater output?—I am afraid not.

26,323. And at a cheaper cost?—I am sure not.

26,324. Is it possible always to pay the same wages in this world?—I have not found it so.

26,325. It must depend upon supply and demand?—That is what I contend.

26,326. Therefore it is a fallacy to attempt to sit down and fix a wage in advance for a very long period ahead?—I entirely agree.

26,327. If the goods which are produced cannot be sold you cannot pay the wage?—That is so.

26,328. Is it impossible to run this country on the basis of one section of the community refusing to work if they cannot have everything they want?—I think it is clear one section of the community, and not necessarily a large section, could stop all the industries. For example, supposing all the engine drivers refused to do something unless some other thing were done, it is clear it would put the industries of the country at a standstill. They are not a large class, but a class as small as that could stop the community. If bodies of that kind get together and determine to act together against the public interest, we are in a very awkward position indeed. I do not believe they will.

26,329. But if they did it, it cannot last?—No, we should all starve.

26,330. The question of antagonism was referred to in the last paragraph of your proof. Is it not the fact that there are a very large number of owners of works who are in very good relations with their employees to-day?—Yes. I hope I am not unduly proud, but I believe I am in very good relations with my men.

26,331. Do you not believe the antagonism is very much overstated?—I think so.

26,332. A question was asked you with regard to Post Office officials who had not accepted service abroad at higher rates than they were getting at the time. Is it not possible that that was due to the loss of enterprise and initiative that very often affects Government officials?—I daresay. I would remind you that I accepted it from Sir Leo Money as a fact, but it is not my experience.

26,333. Sir William Slings made that statement?—Yes.

Mr. R. H. Tawney: Sir, I see from this paper everything which Sir Hugh Bell does not want, but I cannot discover what he does want. Would you ask him whether he has any proposal to put before the Commission?

26,334. *Chairman*: (To the Witness.) *Mr. Tawney* says you have told us a lot of things you do not want. Can you kindly offer us any suggestion as to what you think would be a solution of the difficulties which undoubtedly exist?—I think I have said so. I want hearty co-operation between the two parties.

26,335. How shall we get hearty co-operation between the two parties? If you will tell us that, you will get over what is giving us a lot of trouble?—There is no royal road to it.

26,336. Is there any road to it?—I do not know. It is a difficult and uphill job.

26,337. Will you tell us how we can surmount it?—By patience.

26,338. *Mr. R. H. Tawney*: That only means saying: "Be good, and you will be happy"?—You are a moralist.

26,339. Indeed, I am not. I have not said co-operation—you have said it?—No, but you said: "Be good, and you will be happy."

26,340. What is it you want us to do? You say "co-operation"? What do you mean by co-operation?—We have been endeavouring to do that in the North of England. That is why we are here now. The men came and said to us: "Show us your costs"

We said: "We will," and we showed them, and we talked to them as to what were the costs. I do not know what your experience of costs is, but it is not easy to determine.

26,341. Is it your only proposal that we should talk to the men about costs? I do not want to parody you, but I want to get something positive. What do you want us to do?—Perhaps you will say it is negative—leave things alone.

26,342. That is your last word to the Commission and the Government—leave things alone?—I think the proposed interference will only make things worse, and I am inclined to think with regard to many of the interferences in the past that although the motives for them were unexceptionable, the results have been disastrous. If I may be permitted to name one of the things, there is the statutory imposition of the minimum wage. Of all the disastrous things in the coal trade, there has never been anything so disastrous as that.

26,343. That again is only telling us what you do not like, but I will not press you further.

26,344. *Mr. Robert Smillie*: There is a statement in your *précis* on page 5 which I should like to ask you about. You say in dealing with the reduction of hours of labour from 12 to 8: "I should like here to show how much can be effected when the parties are prepared to devote themselves wholeheartedly to the solution of any industrial problem. It took several years of close and patient enquiry between the ironmasters of Cleveland and the Blast Furnacemen's Association to find this solution, but in fact they found it without calling upon Parliament to interfere." You make a statement here which if it goes unchallenged will be believed. You say: "Not very different from this is the shortening of hours in the coal mines of Northumberland and Durham." That is, by mutual arrangement the employers and the workmen's representatives settled the hours of the blast furnacemen. Do you want us to believe that it is by the same method that the hours of Durham and Northumberland were shortened?—I hope you will forgive me if I say your interpretation of my language is not correct. I am not saying that the ironmasters in Cleveland settled the hours in the County of Durham. I am saying—I think the sense of the sentence is quite clear on the point—that the colliery proprietors and their men in those two counties settled the hours of employment in those two counties. I think as an interpretation of English that is the interpretation.

Chairman: Yes.

26,345. *Mr. Robert Smillie*: No, it is not. As a matter of fact, you say here that while you reduced the hours of labour from 12 to 8 of blast furnacemen, the employers and the workmen met in a conscientious manner and agreed to a reduction of hours?—Yes.

26,346. And you say on somewhat similar lines the hours of the miners in Durham were settled. Is that true?—Yes, it is.

26,347. Will you tell us what took place when the Eight Hours Act came before the House of Commons again and again?—At that time Northumberland and Durham were deadly opposed.

26,348. I remember it very well, and that is the reason I ask the question?—They were opposed to it because they were getting the shorter hours by arrangement with the employers.

26,349. I beg your pardon! That is not the reason. The boys in the mines of Durham and Northumberland were working the longest hours in the kingdom, and it was because it was going to reduce the hours of the boys that I put it to you that you did not mutually arrange with your employers to reduce the hours of the boys, but it was forced on you against your will by Act of Parliament. Is that not true?—Yes, and it gives a very inaccurate statement of the case. In Northumberland and Durham by a process of long negotiations the hours of the men had been reduced.

26,350. To 6 or 7?—I will take it from you. That is quite near enough for your purpose and mine. It is also true that the hours of the boys had not been reduced.

5 June, 1919.]

SIR HUGH BELL, BART.

[Continued.]

26,351. The boys and the day-wage workmen?—Some of the boy workmen. It is also true that Durham and Northumberland were at that time quite contented with the arrangement, and it is also true that the passing of the Eight Hours Act compelled Durham and Northumberland to come under the arrangement which they were not prepared to submit to at an earlier stage of the negotiation. But I do not think we need continue the discussion.

26,352. Yes, we need. We want to get at the facts which are stated?—I was going to make an admission which I should think would quite satisfy you. I was going to say I entirely agree with everything you said, and I do not withdraw what I said. I agree with you that the passing of the Eight Hours Act shortened the hours of boys, and I assert that the shortening of the hours of the collieries was done by mutual arrangement.

26,353. The shortening of the hours of the hewers was done by mutual arrangement, and the boys wished to come under the Act. The shortening of the hours of the boys was done against your will. You would not settle by mutual arrangement with regard to the shortening of the hours of the boys, and I venture to put it to you, if any class required shorter hours it was the boys, and it was bitterly opposed by you and your colleagues?—No, I beg your pardon. You have no right to say we bitterly opposed it. On the contrary, for a very long time before that every question had been debated in the counties, and we were seeking a solution which was not easy to find. It was found by the passing of the Act. I am still very doubtful indeed whether the Act was a wise one. Indeed, if I were called upon to say "Yes" or "No" to it, I would say "No" to it. I do not think it was a wise Act.

26,354. Are you still bitterly opposed to it?—I have not said so. You must take my words exactly as I use them.

26,355. If, in your opinion, it is unwise, are you prepared to ask the House of Commons to go back to the old position?—No, no more than I am prepared to ask them to go back upon other unwise measures they have passed. I have accepted them, and I am going to make the best of them.

26,356. In a paragraph in your *précis* you deal with taxation. As a matter of fact you deal with your mines, and your furnaces, or this, that and the other, and you deal also with your taxes, to keep up "schoolmasters" and a lot of other people. You do not mention His Majesty, and the Royal Family, but you mean them, I suppose, too? Your taxes are going to keep them, and I think you mention: "and the rest of the crowd"?—Yes.

26,357. Whom do you mean by "the rest of the crowd"?—All the people who are kept out of the taxes.

26,358. Do you know who keeps you, is it the miners?—No, I keep the miners.

26,359. Surely, you would not have anything to pay taxes with but for the mine worker?—He would not have any wages but for me. I once had a discussion with my surgeon, who was complaining of the coal owner. I pointed out to him that he was a necessary evil, and I was a necessary good. If I had been a perfect man, I should not have needed his help, but he could not get coal without me, or such as me.

26,360. You are a very wealthy man, are you not?—I do not know.

26,361. I think you have amassed in your lifetime, or some one has for you, an immense fortune. I put it to you, that we are entitled to argue with you in the interests of the miner?—I agree.

26,362. Could we get coal without the mine owners of this country?—You could not get coal without the coal being there.

26,363. Yes, but they did not put it there?—No, nor did they put the land there.

26,364. Can we get coal without the landlord?—I suppose you could.

26,365. Could we till the soil, supposing the landlords were all in America, or Australia, or Timbuctoo?—Yes, or if they did not exist.

26,366. Consequently, it is not because they are of any use that they are drawing rent from royalties?—So you say.

26,367. But I want to know what you say?—I do not say anything about it.

26,368. Are they not useful only for drawing rent?—I do not know. They are there drawing rent.

26,369. Did they do anything to put either the land or the minerals there?—Some of them did a great deal to put the land there.

26,370. I am very glad to hear that, because I have been trying to find out who created the land. You say the landlords did it, but I did not know that before?—They did not create it.

26,371. But they put it there?—Yes. It was not worth anything before they began to deal with it.

26,372. I venture to say it was not the landlords that dealt with it at all. You cannot say the landlord put a single shovel of land there?—I know that is your view.

26,373. You mean they hired someone else to do it?—Not necessarily.

26,374. Did they put in any of the coal?—No.

26,375. At least we are thankful that you cannot prove they put the coal there. I suppose we could get the coal, or the corn, if the landlords were not there? Do they allow anyone to get the coal, or the corn unless it is got under the landlord's conditions?—No.

26,376. So that they are a class of people who run the country exactly as they want to do?—No.

26,377. Have they not threatened to go on strike if Parliament takes the land and the minerals from them? Are they not prepared to fight?—I do not know.

26,378. Have you read the evidence given before this Commission?—I have read some of it.

26,379. Have you read the Dukes' evidence, which said they were prepared to fight to the very last?—That is in defending their own rights.

26,380. They would be only using their powers as landlords?—I suppose so.

26,381. Have you any objection to the workmen using their powers to fight?—None.

26,382. That is all I ask you?—May I say one thing? If I were a workman, the one thing I would not give up is the right to strike, and the one thing which I, as an employer, will not give up, unless Parliament compels me—even then I am not sure I will not stand up against the wall and be shot for it—is the right to discharge a man. I demand the right to employ him or not, as I please.

26,383. And we deny your right to discharge him unless there is a just cause?—I hope I shall never discharge a man for anything else.

(The Witness withdrew.)

Mr. GEORGE KNOX, Recalled.

26,384. Mr. Evan Williams: Could you give the Commission some idea of the amount of money that has been spent by the Welsh Coal Owners in setting up the schools and research works and so on?—About £80,000.

26,385. That is in connection with the schools?—Yes.

26,386. They make a levy of so much a ton on the

output of the coal value?—One-tenth of a penny amongst the Associated Coal Owners.

26,387. Do you know of any other money that you were prepared to spend just before the war in research?—They devised a scheme for research which when put into operation will cost about £30,000 or £40,000.

26,388. Per annum?—The total cost to instal it,

5 June, 1919.]

MR. GEORGE KNOX.

[Continued.]

26,389. What is the annual contribution to keep it going?—The annual contribution to-day is between £11,000 and £12,000 and it is proposed to put another levy on through another council in connection with another scheme which will bring in probably £40,000 a year.

26,390. Do you remember the plan which was formulated and about to be carried out to get hold of an old colliery and make experiments on coal dust and so on?—Yes.

26,391. That was in connection with the school as well?—Yes.

26,392. In South Wales, the coalowners have not been backward in research work and in studying education?—That is so.

26,393. The chief object they had in setting up these schools was to enable those who could not pay the fees for apprenticeship to become colliery managers and colliery engineers of the best type?—That is so.

26,394. They provide scholarships at your school?—Yes, 13 scholarships altogether I think are provided.

26,395. *Mr. Herbert Smith:* For a population of what?—There are 13 scholarships of £40 a year. I do not know what the population is. This is referring to those who can attend full time. Then they give a number of scholarships for those who can only attend part time, that is to say, those who work five days in the mine, and come one day a week to the school.

26,396. *Mr. Evan Williams:* What assistance has the Miners' Federation in South Wales been towards the education of the working class in this way?—Unfortunately they have opposed this scheme ever since the commencement.

26,397. You speak of the favourable comparison of coal mining in this country with any other country in the world?—Yes, so far as exploitation is concerned—the underground work.

26,398. Then you speak of larger units than the average as future development is to be accelerated?—I mean a colliery like the Powell Duffryn which can operate very much more cheaply than a small colliery in turning out 500 tons or 600 tons a day. They cannot, of course, expend a very large sum of money at any time for development purposes or in making experiments, or even in installing new machinery.

26,399. *Mr. Robert Smillie:* Would you kindly repeat that?—A small concern is limited in the amount of experimental work it can carry out and in the amount of money it can apply to new development work. Their area is too small to expend a very large sum upon, because they would never have it returned.

26,400. *Mr. Evan Williams:* You advocate the joining up of two or more small concerns to make a bigger concern?—Yes, with other conditions attached, of course. My suggestion is that if the nation owned the whole of the minerals and that those were laid out in areas big enough to be worked by collieries situated in the proper place, a very large amount of money would be saved in the working to begin with, and, secondly, in the development, and, thirdly, in the actual getting of the coal.

26,401. What size of units would you recommend in a case of that kind?—They would require to be larger and larger, just as the development increases: that is to say as the amount of expenditure required to carry them through increased. Twenty-five years ago a very small amount of money, comparatively speaking, was quite sufficient to sink and develop an ordinary colliery. To-day it would probably take five or six times as much, and in the future, that is to say, 20 years from now, it may take four or five times as much again.

26,402. Would you leave the single big colliery as a unit by itself for management, or do you suggest a joining upon more than one of these?—I would have those in one coalfield joined up.

26,403. Would you have the coalfield under one management?—Under one Council, but each area, that is to say, each unit, would have its own management, direct management as far as the mines themselves are concerned.

26,404. As far as the engineering of the colliery is concerned, would you leave each unit to do its own?—Certainly.

26,405. The whole of the engineering?—Yes.

26,406. What would be the functions of the Council in the district?—The functions of the Council would be as experts to enquire into the best means of generally carrying out engineering problems and to advise the local management as to how these things should be done and leave them to carry them out.

26,407. They would be purely advisory?—Advisory in that respect.

26,408. Without any executive control over the engineering or management of any particular colliery?—They would require to have some control, otherwise they could not have their instructions carried out.

26,409. You mean they would have the power to enforce the adoption of their suggestions?—Yes, to be successful.

26,410. Do you mean that absolutely or would you qualify it in any way?—It is not a question so far as the carrying out of the thing is concerned that I have considered. I am chiefly concerned in the technical side of the operation. I think we ought to get the best advantage we can with regard to present day knowledge of technology. In mining engineering it is essential we should have a definite sized unit placed in the most favourable position with a view of getting the best result and that can never be done if we adopt a system whereby the work will not devolve on the people who have been trained to carry it through. One of the chief difficulties I think we are faced with in the coal trade is the fact that the mining engineer has control of everything; he controls not only the mining side, but he controls also the mechanical, electrical, chemical and engineering side, and controls the whole thing.

26,411. The general manager of a colliery company, do you mean?—The mining agent, who has usually developed from being a colliery manager into that of being an agent. As a rule he is not trained as a mechanical engineer nor an electrical engineer, and, far less, as a chemical engineer. I think our development is being retarded because he is expected to take charge of all this staff and equipment. If we have bigger units it would be possible to have a well-trained man in each of these units.

26,412. Who would be in charge over the whole? You would not have a number of, say, 3, 4 or 5 persons in charge of different departments without someone in charge of the whole?—There would be someone to direct the whole work. He need not necessarily be a mining man. I should think his training ought to be that of an economist and administrator.

26,413. You rather lay stress upon the irregularity of barriers in South Wales?—Yes.

26,414. You give two plans. One is particularly interesting as it shows my own taking. "(A)" is the first one. I can give you some information about this?—I have no doubt.

26,415. The boundary on the left is a big fault, and the fault you show on the right has been taken as the boundary and a straight line has been drawn across the bottom to make a straight boundary?—Yes.

26,416. That happens to be the same in my case. If some other colliery owner from some other part of the district was in my place he might tell you the same about his colliery?—Yes.

26,417. It is possible a great deal more of that is being done than you are aware of?—Yes, I can only go by the royalty map.

26,418. You have no knowledge of the arrangements made between colliery companies to straighten the boundaries and make natural faults and things of that kind as the boundary?—No; quite a lot of that would necessarily be of a private character. I know of some where there have been great difficulties in trying to come to an arrangement.

26,419. Some have failed?—Yes.

26,420. Take it from me a large number have succeeded?—Yes, I am aware of that.

26,421. You did say you were aware of the proposal being made to set up a body which can bring

5 June, 1919.]

MR. GEORGE KNOX.

[Continued.]

such rectification of the boundary about, a Sanctioning Authority proposed by the Report of the Commission?—Yes.

26,422. You have read that Report?—Yes.

26,423. Do not you think it is possible that such a body as that, if brought into existence, could put right these points in question with regard to the irregularity of barriers which you are complaining of?—They might be able to do part of the work; that is, to adjust the outlying portions or barriers like that on ("G") on plan No. 1, for example, where they keep twisting out a large way from the main body of the taking.

26,424. I happen to know ("G") as well?—These pieces would have to be adjusted if these are going to be worked economically; everybody admits that. Would they have power to take a number of royalties, such as those, say, on plan No. 2. Take 3, 4, 5 and 11. Would they have power to adjust those so that the colliery could be worked from the best position in the Valley for sinking with the least possible distance for haulage underground? In South Wales we have a much more difficult problem than anywhere else; we are limited to the position in which we can sink. Very often the shafts are situated near the boundary, and we have the whole of the development to take place on one side, which adds considerably to the cost. That is one thing I have in mind.

26,425. You think such a body ought to have that power?—It ought to if it is to be of service..

26,426. Do you think it ought to have the power to work, say, 3, 4, 5 and 11 as one unit?—Yes, if it is to be of service.

Sir Leo Chiozza Money: Would that entail the sinking of a new shaft?

Mr. Evan Williams: No

Sir Leo Chiozza Money: Not necessarily

26,427. *Mr. Evan Williams:* No. From the existing shafts you could bring the coal from the same distance on the other side and divide the coal in such a way that it would be an equal distance?—Yes, as nearly as possible. If you take No. 10 for example, the collieries there are shown by the two smaller rings. They are very near the edge of the boundary to the south and a very long distance to the extreme south-west. The area marked from 14 could have been much more profitably worked from 10.

26,428. If such a body as we have been talking about had the power you think that would meet the position?—It would assist to a great extent.

26,429. In what way would it be short of meeting it to the full extent?—The difficulty would be, I think, in being able to take deeper mines. In South Wales in the steam coal series, the difficulty would be in getting the companies to agree to arrange the areas in that way with regard to the amount of money they have already spent in development in getting to the position the mines are in at the present time.

26,430. Supposing the Body had the power to compel them that would meet the point to the fullest extent?—Yes.

26,431. *Sir Leo Chiozza Money:* If this was worked as a whole, that is to say, the district shown on the map No. 2—if the shafts were sunk in ideal places, would there be fewer shafts than shown on the map?—Yes, in some cases there might be one or two shafts fewer. In most cases the position would be made very much better by the shafts being in other places.

26,432. *Mr. Evan Williams:* Unfortunately we cannot choose the position for our shafts. We have to take the valleys and sink them there?—Yes.

Sir Leo Chiozza Money: I meant with due regard to the valleys.

26,433. *Mr. Evan Williams:* If you had fewer shafts you would get probably a smaller output?—Some of the shafts being in adjoining royalties were made smaller because the royalty taking was smaller. They might have been made bigger if there was a bigger area to work.

26,434. I will now take a few points which you say would be an advantage to nationalisation. You mention stabilising the price of coal. What do you mean by that?—That there would be less fluctuation in the price of coal if the coal was worked as one

concern that if it was worked under the present system.

26,435. There would be less fluctuation from year to year?—From day to day, or year to year.

26,436. At what price would that be stabilised?—I cannot say that. My point is if you had a stabilised price for coal it would have a tremendous effect in stabilising the other industries which depend upon coal and in stabilising the outlook or the spirit of those who are getting it.

26,437. Would that not have the effect of putting industries in rather a different position when they had to meet competition abroad?—Not if the price was low enough.

26,438. Does not the price of coal generally follow the state of trade, in the iron industry, for instance?—It does to some extent. I think the iron industry is much more dependent on the coal industry.

26,439. I think it is the other way about. You would have to be stabilised at a pretty high level?—I do not know what you mean by high level. You mean the price of coal would have to be very high?

26,440. You intend the industry to be self-supporting, to make a profit?—Yes.

26,441. You talk of stabilising wages. The price, of course, would have some reference to the level of wages?—Yes.

26,442. If the level of wages was high the price of coal would necessarily follow?—Yes, certainly.

26,443. Do you see any prospect of getting wages down?—No, but I think it is the general condition of things that when you have steady employment you have wages at a lower level than when the employment is irregular.

26,444. Is that the position really?—I think that is the position. When employment is regular the aggregate wages may be big, though the daily wages may be smaller.

26,445. Is it not the other way about, that when work is irregular and trade is bad, wages are lower, and when the work is regular wages are high?—I am talking of different trades, not of one trade. That is quite true if there is not a demand for coal and the work is irregular due to that, then the prices would be smaller.

26,446. If wages are high the price of coal must be high?—Yes.

26,447. How do you propose to get more regular work from nationalisation? You mention cheapening the average cost of production through more regular work?—If we are to understand that the discontent of the miners is due to the conditions that we have had reported before the Commission, that is to say, they object to working for people who are making profits and so on. If they were working for the nation they could not raise that objection.

26,448. When you say regular working you mean less absenteeism?—Yes.

26,449. You suggest the absenteeism is due to their disinclination to work for private owners?—It is a point that I am not in a position to express an opinion upon.

26,450. I thought you meant regular work on the part of the individual or on the part of the colliery?—The colliery I was referring to.

26,451. The regular working of the colliery day by day?—Yes.

26,452. That means a bigger outlet for coal?—Yes.

26,453. How do you say nationalisation is going to increase the outlets for coal?—By having a much steadier demand for coal.

26,454. How would nationalisation affect the demand for coal?—If you have one concern only to deal with the total production and the total output they can arrange that in a much better way than 1,500 or 1,600 different people can deal with the same thing or I should think so.

26,455. You mean in the way of getting more uniformity in the days of working all over the country?—I mean for disposing of their produce.

26,456. What effect would nationalisation have on the consumption of coal in this country and abroad?

5 June, 1919.]

MR. GEORGE KNOX.

[Continued.]

The regularity of working at the colliery depends upon the demand for coal?—Yes.

26,457. How is that to affect the amount of coal required for other industries?—The nation would, after a few years' experience, get to know how much coal was required over the whole year. Much more is required in some periods than others, and then the amount would be arranged to work out that average, and during the time when a less demand for coal was required, though the coal was put out, it could be stored.

26,458. Do you think the storing of coal is a practical suggestion?—Some coals, yes. If coal is properly treated, yes.

26,459. What kind of coal do you suggest can be stored without loss?—Almost any kind of coal if it is compressed.

26,460. How do you suggest that South Wales steam large coal could be stored?—I should not store the large at all; I should store the small.

26,461. What if you had no demand for the large?—The whole demand would be supplied by the large, I should say, and the small would be stored.

26,462. Would you make people burn large instead of small if there was not a sufficient amount for all?—You could afford to give it to them, for that matter, it is almost the same price.

26,463. People wanting large must take small?—I am not storing it in the natural state as it comes out of the mine; I am compressing it in dry briquettes and storing it in that way.

26,464. You say the small coal can be used for by-products. Do you suggest any small coal from which by-products can be got is left in the mines in South Wales at present?—Yes.

26,465. Can you give me any instance where coking small is not brought out?—A large amount of the coal that is left in the steam coal area could be used if mixed with the coal from the south crop area. The south crop area is too fat for coking purposes, and is used for gas making. They do not belong to the same people. That is one of the difficulties of having separate organisations. If you had the two mixed together you would get a good quality of coking coal.

26,466. Are you aware that a large amount of the small coal you refer to as on banks at the present time there is no demand for?—That is so.

26,467. Do you suggest it is better to bring that small coal out and put it on bank than to leave it underground?—Yes, I should not leave it underground; it is absolutely wasted there.

26,468. If there is no demand for it on the surface, what then?—You mean a demand for it if you convert it into coke, by mixing it with other small coal.

26,469. Where is the extra demand for coke, to come from?—There should be in this country a sufficient demand for coke, if we are developing and the steel industry is increasing year by year.

26,470. Has not all the coke we required been made in past years?—I could not say.

26,471. *Mr. Robert Smillie:* You have a pretty good knowledge of the Scotch coalfield as well as the South Wales coalfield?—Yes.

26,472. And the English coalfield as a whole?—Yes.

26,473. Do you think the fullest advantage has been taken of mechanical haulage in British mining; that is conveying material from the coal face to the shaft?—No, I think that could be improved considerably in many areas due to the fact I have mentioned, that the Mining Engineer is usually harnessed with the whole operations about the colliery. The result is he cannot possibly give the time and attention to it which a mechanical engineer could give, and, after all, the question of haulage is a mechanical question.

26,474. Does the private ownership of the minerals sometimes make it necessary to set out the pit in a way that is not the most favourable for the purpose of ultimately getting the best out of it?—That is so. Unfortunately in South Wales we are greatly handicapped in that respect.

26,475. I suppose we must take it that in roads that would adapt themselves to mechanical haulage that mechanical haulage would be cheaper than hand haulage or pony or horse?—Yes, quite.

26,476. There would be a considerable reduction in cost on that side?—Yes.

26,477. Do you think, generally speaking, our pit-heads have been set out in the best possible way to save labour?—Some of the modern mines, yes; many of the older ones, no.

26,478. In some of the modern mines which are set out at the present time practically automatically there must be an immense saving of labour as far as they are concerned?—Yes, undoubtedly.

26,479. Speaking generally, with regard to large mines from 500 to 1,000 or 1,500 tons the only reason they should not be fitted according to the best equipped service arrangement is because the owners are not prepared to spend the money or they think it would not pay to spend the capital?—That may be the reason in some cases. In many cases they leave it to their engineer, and, if he has not had experience, or has not been trained to realise the use to which modern equipments can be applied then he might not think it necessary.

26,480. I think you are of opinion that the duties of a manager of a mine would be sufficiently onerous in carrying out the Mines Regulation Act and the safety clauses without being troubled with the commercial side of the thing or the service of wagon running, and things of that kind?—Yes, I have long objected to that. We have protested repeatedly to the Home Office and other people with regard to the examinations held by the Mining Board, which includes all kinds of mechanical, electrical and chemical engineering problems which men who are going to be managers have to study because they have to get a certificate. This takes a lot of the essential time which ought to be given to actual mining problems and actual mining work. The same applies to the man when appointed. When he takes up his duties a considerable amount of the time he ought to devote to actual mining operations has to be given to these ancillary operations on the surface.

26,481. As a matter of fact, before a person can secure a first class certificate of competency he has practically to be, in theory, an electrical engineer, a mechanical engineer, a surveyor and a chemist to some extent?—Yes, he has to have a smattering of all these subjects.

26,482. A question was put to you that if wages were high the price of coal was high. Does that always follow?—Not necessarily.

26,483. Wages might be increased very considerably by better development and larger output without increasing the price of coal?—If you could reduce the other costs.

26,484. As a matter of fact, when the miners' wages are the highest in the world, is not the price of coal low?—That is so.

26,485. I suppose it may be taken that in America the wages are higher and the prices lower than anywhere else?—I think that is so.

26,486. In this country, if we could reduce the cost of production by better equipment and better development of the mines, wages might remain at their present high rate and the cost of production be reduced very considerably?—Yes.

26,487. There is a possibility of that?—It is quite possible. In comparing the conditions in this country with America we must not forget that a very large amount of the coal in America is got at or near the surface and is got by means of mechanical diggers, and so on, thus the labour cost is very low. Those have to be taken into consideration in comparing the cost.

26,488. We have discussed here the royalties position, the case of getting coal and the conditions under which coal is got in America, and they are quite different in this country, so I do not put it to you because of that fact. Have you given any thought to the amount of coal that is left in the barriers in leaving in supports and leaving in top coal, and have you any figures at all that give any

5 June, 1919.]

MR. GEORGE KNOX.

[Continued.]

indication, that is to say, figures you have taken from evidence, Committees or Commissions or of your own knowledge?—I have read several papers before the Institute of Engineers on this subject. It is the one which I am most interested in, because the waste of coal is the thing I deplore most of all in our mining operations, that is, the amount of coal that is being lost and can never be regained from various causes. In the Report of the Royal Commission I went through that some years ago, I mean the Royal Commission of Coal Supplies on Waste in Working, and I tabulated the evidence given by mining engineers from the various coalfields. It can only be approximate, of course, but it is astounding the amount of coal that is being left in various forms. In 1913, calculating the percentage of loss from the evidence given, and the total amount of coal in reserve, as given by the geological survey, the loss is estimated at about 19,000,000 tons.

26,489. The first loss?—That is the loss on the amount of coal we had in 1913. If we went on working the seams with the same loss as we had up till 1913, the amount we would not get that we ought to have got was 19,000,000,000 tons, equal to about 30 years' output.

26,490. *Mr. Evan Williams*: Over the life of the collieries in the country?—Yes.

26,491. *Mr. Robert Smillie*: The known coal at that time?—Yes, the known coal in reserve.

26,492. That is the estimated loss if they went on working as they work now?—Yes.

26,493. I suppose it might be taken relatively speaking the past loss would be the same?—I think it would be higher. I think we have had an improvement during the last 20 years.

26,494. Supposing you could increase the efficiency of coal by 25 per cent., that is the efficiency for heating, lighting, and power purposes, that would be equal almost to an increase of output of 25 per cent?—Yes.

26,495. Do you think it is possible to increase the value really as a heating power unit of coal considerably by the different treating of it?—I do. I think that is the great prospect that we may look forward to with confidence in the future, the development of power production at the colliery itself.

26,496. Or in centre stations, which ever is thought best; either at the colliery itself or the converting of coal at central stations and the raising of power by the gas companies?—Yes.

26,497. You look to a very great change during the next 25 years in our treatment and use and methods of using coal?—Yes. That was another point I was going to refer to with regard to waste. The waste of the material which we ought or might derive from coal is enormous. We take one of the best equipped collieries in South Wales. They are producing power to-day at a farthing per unit chiefly from the waste heat as the result of coking their coal at the collieries.

26,498. *Sir Arthur Duckham*: Does that one farthing include the price of gas?—Yes.

26,499. *Mr. Evan Williams*: Before the war they were producing it at one-tenth of a penny?—I think that includes everything in the charges.

26,500. *Sir Arthur Duckham*: You do not know what they put the gas in at?—No, I cannot say.

26,501. *Mr. Robert Smillie*: How would that compare with the cost per unit when it is raised by burning coal for steam raising. They are using the gas there from the by-product works?—Yes.

26,502. How would the unit compare with the price at the colliery by raising steam by burning coal direct?—It is less than one-fifth of the cost by raising steam by burning coal direct in an ordinary Lancashire boiler. That is an occasional case. I do not know anywhere else where they are doing it so

cheaply from the colliery works. I think the cost of supply in our district is about 5d. per unit.

26,503. *Mr. Evan Williams*: Do you suggest the cost of the average colliery for making electricity from steam is 1½d. a unit?—Yes, with old boilers and small plant.

26,504. In my own case with steam we make it at three-eighths of a penny?—Are you using turbines?

26,505. No?—What is the consumption in pounds per horse-power?

26,506. About 11 lbs. a kilowatt?—That is very low.

26,507. Do you know what they charge the power company in South Wales at the present time per unit?—We are paying 4d. in one place, and 5d. in another for consumption in houses and for lighting.

26,508. And for colliery purposes?—I do not know what they pay.

26,509. Will you take it from me it is under a penny?—I think you should know.

26,510. *Mr. Robert Smillie*: You agree it was necessary to get the largest possible output of coal?—Yes.

26,511. You agree it would be unwise to continuously increase the output of coal and use it as they are doing now if you can save a large portion of it by using the coal better?—Yes; we can never replace coal once it has been got out.

26,512. *Mr. Frank Hodges*: I understood you to say the South Wales Miners' Federation opposed the scheme for education at the Mining School under the coal owners' proposals?—Yes.

26,513. Did I understand from that the implication was the South Wales Miners' Federation was opposed to technical education?—I do not know what the implication is. The fact that they opposed it I know. I have had to experience that. What their reason was I do not know.

26,514. Have you concluded from that they were opposed to technical education?—No, I do not suppose that would lead one to say they were against technical education. It would not incline one to think they were in favour of it.

26,515. As a matter of fact, they opposed it because it was a coal owners' scheme?—I think so.

26,516. Do you know they encouraged the setting up by the Local Authority of a Technical Institute at the expense of the ratepayers, so that they could have some control of the affairs?—Yes.

26,517. They were in favour of technical education provided it came through the local authorities?—They had the opportunity of appointing half the managing committee of the school and they refused to have anything to do with it on those terms.

26,518. I am fully aware of the kind of proposals and the conditions under which the proposals were made. I do not want you to leave the Commission under the impression that because the South Wales Federation opposed this school they were opposed to technical education?—I do not suppose it does amount to that. I do not think their interest in technical education is anything like what it ought to be, not only in South Wales but I should think over most of the country. Take the case of South Wales. The Miners' Federation, I should think, have very nearly a majority on the Education Committee in Monmouthshire, and they have talked, as they did in Glamorganshire for years, about what they are going to do in founding higher technical centres, but they have never done it.

26,519. It is within your knowledge the Education Committees of Glamorganshire and Monmouthshire have only recently had a majority of labour members upon it?—They had a fairly large representation before.

26,520. Not sufficient to decide the policy of the Education Committee?—No.

26,521. *Mr. Evan Williams*: Or even to suggest a policy?—They could do that.

(The Witness withdrew.)

Sir LIONEL PHILLIPS, Bart., Sworn and Examined

26,522. *Chairman*: Sir Lionel Phillips, I think you are a partner in the firm of Wehrner, Beit and Co?—I used to be. It is liquidated now. I am Chairman of the Central Mining Company.

26,523. You are now Chairman of the Central Mining and Investment Corporation and one of the Governors of the Imperial Mineral Resources Bureau?—Yes.

5 June, 1919.]

SIR LIONEL PHILLIPS.

[Continued.]

26,524. You have had, as I suppose everybody knows, a very wide experience both practical and financial in the development, equipment and management of mines?—Yes.

26,525. You have been good enough to prepare a *précis* of your opinions upon this subject for us which I will ask the Secretary to read.

Secretary:

"I have had a wide experience—practical and financial—in the development, equipment and management of mines.

With regard to (1) (a) and (b) of your letter of 13th May—

(1) the effect likely to be produced by nationalisation of mines and minerals upon—

(a) the other industries of the country (including shipping),

(b) the coal export trade, and thereby upon international finance,

the problem awaiting solution is, I take it, that of bringing within the reach of the working classes more of the amenities of life than they have hitherto enjoyed. The aim, I think, cannot be achieved either by nationalisation of mines and industries or by any other short cut, nor would the distribution of accumulated savings among the less fortunate of human beings produce the desired effect, rather the reverse. All kind-hearted persons who are well housed and fed are deeply concerned that others are badly housed or insufficiently fed. Considerations of sentiment, however, cannot, in my opinion, provide a remedy. Economic laws are just as inexorable as natural laws, and to disregard them can only result in disappointment and suffering. The quantity of commodities which are available for distribution among human beings depends upon the use made of the raw materials which a bountiful Providence has placed at our disposal. The greater the ability and the energy put into production, the greater the output. The more work men do the more work there will be for men to do, and the greater and cheaper will be the products. Hence, there will be more to go round and they will be within the purchasing power of far greater numbers. In the broad sense there can be no such thing as over-production. There may be, of course, over-production of a given article at a given moment, but that does not disprove the general principle; it merely demonstrates a want of elasticity in the special branch of production concerned. It is, therefore, fundamentally sound for everyone to do as much work as he can consistent with due regard to health, which means a due measure of leisure. The grave point under consideration is whether the State is likely to secure as high an output as private enterprise, and at the same, or at a lower, cost. My experience does not lead me to believe so. Take the coal-mining industry as an example. Coal mines were found, developed and worked by private enterprise. In mining generally vast sums have been sunk and lost in looking for valuable minerals. There are instances of this going on in England to-day. Is it conceivable that Government officials, in receipt of fixed salaries, should either be willing, or, indeed, permitted, to expend large amounts of public money in the speculative quest for payable mines? It may be said that this does not apply to an established industry where, as far as discovery is concerned, the limits are known. The question is, therefore, can the Government manage an industry as well as private enterprise? The probabilities are, I think, all against it. The nationalisation of one industry should, as a natural consequence, be followed by the nationalisation of all industries, the consequences of which would be the most appalling mismanagement, muddle, political wire-pulling, corruption, and, in fact, every disability imaginable, and consequent ruin to the people. What is known as the Government stroke would be the common pace, and any State trying such an experiment in a competitive world would soon be forced to abandon it. Meanwhile, however, no one could foretell the damage that would be done to the country and to the very classes it was hoped to benefit. The effect upon other industries of a higher cost of

coal cannot be assessed, but could be demonstrated only empirically. I should like to draw a distinction between what I conceive to be the functions of Government and those of commerce and industry. The business of the State is to see to the safety of the country, the health of its inhabitants and the maintenance of order. This, in itself, is a gigantic undertaking, but it pales into insignificance beside the task of actually running the industrial, commercial and other concerns of a highly developed country. The State has probably interfered far too little in the past with the manner in which industries are conducted. Where, for instance, national assets, such as coal, are not being worked, in the opinion of the State, as efficiently as they ought to be worked, it is the business of the State to interfere, so that the efficiency is secured. But there is an immense difference between criticising procedure and designing plans for the better conduct of operations and carrying them out. The carrying out of such plans should be left to those who are engaged in the particular business.

Again, it is impossible for the State to hold the balance fairly between employers and employed if it becomes itself a gigantic employer. Such a question as the division of the fruits of industry between capital and labour is, of course, the concern of the State, and it can be regulated by a variety of methods. Men are not born equal, and any process designed to equalise them would mean levelling down, rather than levelling up, which is what the system of individualism encourages. Ambition to rise and rivalry are the keynotes of progress.

There may be directions in which, under special circumstances, the State can undertake services which could not be entrusted to private enterprise, but anyone having an acquaintance with bureaucratic administration would not select it as the best system for success in industry. There are, of course, those who base their advocacy of socialisation upon the assumption that mankind can be made to give its best effort, not for its own advancement, but for the benefit of its fellows. I am afraid we have not arrived at that stage.

With regard to point (2) (a) and (b)—

(2) the method of purchase if nationalisation were decided upon—

(a) whether by mines stock or general stock,

(b) what rate of interest, what sinking fund,

in the event of nationalisation, the purchasing price should be paid, not in mines, but in general stock. The rate of interest that should be paid is a debatable point, but a sinking fund should certainly be established to redeem wasting assets."

26,526. *Mr. Sidney Webb*: If I may begin at the end and take your suggestions with regard to compensation, assuming that nationalisation of the coal mines were determined upon, you suggest that it would be most suitable that payment should be made in a general stock and not in a special stock?—Quite so.

26,527. I suppose the meaning of that is that you think a general stock would be more marketable and could be issued at a lower rate of interest?—Yes, it would be a better security.

26,528. And, therefore, the Treasury would save by issuing a general stock as compared with a particular stock?—I think so.

26,529. On the other hand, it has been put to us to-day that there would be some disadvantage in issuing a general stock in that it would compete with the other general stocks of the Government, and possibly lower the price?—That depends, of course, on the form in which the issue was made. As a matter of fact, one of the things I had in mind was a mine stock, which might be regarded by the present possessors as being a less good security to them than a general stock, because they would not have faith in the way the Government would work the mines, and, therefore, they would be better satisfied with a general security, and I think the cost to the State probably would be no greater.

5 June, 1919.]

SIR LIONEL PHILLIPS.

[Continued.]

26,530. Then a suggestion has been made to us that rather than issue stock at all it would be even better for the State to issue terminable annuities. What do you think as to that suggestion?—Calculated on a fair basis, it would be quite satisfactory. All those financial questions after all come to much the same thing.

26,531. That is to say, they are only the currency in which the price is paid?—Yes.

26,532. But still there may be an advantage to the Treasury which has to pay to select a form of currency which involves no loss?—Of course.

26,533. To go back to the other question, you deprecate any nationalisation, of course?—Yes.

26,534. You point out, for instance, that it is inconceivable that Government officials in receipt of fixed salaries would be willing, or indeed permitted, to spend large sums of money in the speculative quest of payable mines. I would ask you whether that applies to oil, for instance?—I think it does.

26,535. Has there been much private enterprise engaged in boring for oil in this country?—No, not till recently.

26,536. Is it being done under private enterprise now?—I do not think it is entirely private enterprise now.

26,537. Is not the whole expense being borne by the Government and the whole risk being run by the Government?—Yes, quite so.

26,538. Therefore you have a State enterprise boring for oil where private enterprise has not attempted it in the past?—It was done as a war measure, notwithstanding the result.

26,539. That is another point; but, still, the enterprise is there?—Not by the Government. I may say that I had something to do with the initiation of this enterprise. This boring for oil was essentially a Government measure. It was not one of those cases in which an individual in the Government service said, "You must go on with this."

26,540. Before we pass from that, surely there must have been somebody in the Government service who said the word "Go"?—There was, but indeed at the very top.

26,541. But then the very top is also a Government servant?—That is perfectly true.

26,542. *Mr. Arthur Balfour*: I should like to hear what happened?—I was not in at the final arrangements, but I was present at the preliminary discussion that took place when Mr. Pearson attended, and so on. The Minister was very anxious that something should be done. It was even hoped that oil might be got for the war. At that time I was Controller of the Department for Mineral Resources, and in the course of my duties I made investigation into the possibility of getting oil from the shales of Dorset and Norfolk. There were innumerable difficulties there on account of the sulphur contents of the shale. Then the question of boring came up, because no one knew at all how long the war might continue, and what circumstances might imperil the oil supply of the country. On that account the question of boring for oil and obtaining a supply in this country became a most important one from the standpoint of imperial concern, I may say. Therefore, it was taken to the highest authorities, and it was not a mere Government official in some office.

26,543. *Mr. Sidney Webb*: Was he not in an office?—Yes, he was.

26,544. *Chairman*: Not a mere Government official?—No, not a mere Government official.

26,545. *Mr. Sidney Webb*: You mean it was the Prime Minister?—I do not know whether it was the Prime Minister: it was the Government.

26,546. A Government official having a salary?—Yes.

26,547. Subject to all the loss of initiative and failure of enterprise which the receipt of a salary always carries.

26,548. *Mr. Arthur Balfour*: Might we not have the full story?—Might I add that what I had in my mind in saying that a Government official should not be permitted to expend large sums of public money in the speculative quest of payable mines,

was the ordinary everyday business of finding a new coal mine or tin mine which would have to be dealt with by someone much lower down than the Minister, otherwise you would so overwhelm your head of the Government that he could not attend to anything else.

26,549. *Mr. Sidney Webb*: Surely every experiment would have to be sanctioned by the Minister of Mines?—Upon that subject you have first to have a Minister of Mines; we have not one in this country.

26,550. You suggest that it is inconceivable that Government officials in receipt of fixed salaries should either be willing, or indeed permitted, to expend large amounts of public money in the speculative quest for payable mines?—Yes, I mean that absolutely.

26,551. There you have an instance where you have a very speculative quest undertaken by a Government official in receipt of a fixed salary which private enterprise could not have undertaken?—Quite so.

26,552. Is that not rather inconsistent with your statement that it is inconceivable?—I think not; it is inconceivable in the general sense, not in this very special sense. I can give another case in which the Government during the war took upon its shoulders a very speculative proposition of sinking boreholes in Ireland for coal.

26,553. Was that done by an official with a fixed salary?—Yes, it was done by a Minister of the Crown.

26,554. Who had a fixed salary. He was not doing it for his own profit?—No, quite so.

26,555. Therefore he was not lacking in initiative on that occasion, nor was there any failure of enterprise?—Quite so. This was the Minister.

26,556. I take it he is a Government official, like anyone else?—May I add that if any particular official in a particular case spent a large sum of money, say £300,000 or £400,000, and had not succeeded in getting what he sought, I imagine that his services would be dispensed with, and very likely questions would be asked in Parliament with regard to it.

26,557. Has that been your experience in the past?—It was never my own personal experience; I was very modest in the things I did.

26,558. Of course, I did not mean to suggest with regard to your own services: what I meant was, have you known any case in which Ministers during the war have ventured on these large experiments and have failed, that have been dismissed or disgraced, because, as a matter of fact, I think we know that there have been several cases in which there have been large failures, and necessarily so?—Quite so.

26,559. But they have not been turned down?—The only national ventures that I know of that have not yet been demonstrated are those I mentioned of boring for coal in Ireland and boring for oil in England.

26,560. Do you think that any Minister is likely to be disgraced who has been boring for coal in Ireland and has not succeeded?—I think it is a question of what will happen.

26,561. The instances you have given of public enterprise carried out by Government officials in receipt of salaries do not bear out your impression that there is no public enterprise?—As a matter of fact I am speaking in general terms of mines in general, but the conditions such as we have had when the Government determined to bore for oil, or when they determined to bore for coal, are rather special instances of not everyday enterprise.

26,562. But they encourage us to look with a little more charity on officials with fixed salaries?—I should not for a moment like to be understood to be depreciating the immense value of and the high opinion held of Civil Service officials in this country, but I think any man in receipt of a modest fixed salary who went in for a speculative proposition would feel that he was running a great risk in the event of failure.

26,563. You say an official with a modest fixed salary. You do not suggest that the decision as to

5 June, 1919.]

SIR LIONEL PHILLIPS.

[Continued.]

whether an expenditure of millions should be incurred either would or ought to be entrusted to an official with a modest fixed salary? It would necessarily go to the Minister?—I am afraid that is not practicable in mining affairs. For instance, I am head of an organisation which employs about 100,000 people, roughly. We have mine managers who are paid very high salaries, much higher than in this country, but they are endowed with tremendous power.

26,564. Therefore, the decision does not rest with an official with a modest fixed salary? It goes to the head man on the spot?—I am afraid it must.

26,565. Who is it that makes the decision to try a speculative experiment? What sort of a person is it?—In that case it would be put up to the head office. I am referring to the case of looking for a new mine.

26,566. Just as the looking for the oil was put up to the head office of the Government?—Yes. Of course, the point we have to consider is that in the individual case, if the head office permitted the expenditure of a large sum of money and had failed, the concern would go to the bad. The State cannot go to the bad in the same way.

26,567. A concern of the magnitude that you are speaking about must try a great number of experiments, and probably some would not be a success?—Quite so.

26,568. You live on the balance?—Yes.

26,569. And probably the State would do the same?—We are more often right than wrong.

26,570. You point out that the nationalisation of one industry should as a natural sequence be followed by the nationalisation of all industries, the consequence of which would be the most appalling mismanagement. Do you think that always follows?—I think you are well acquainted with South Africa. There the coal mines and the diamond mines have been very successful as a matter of private enterprise.

26,571. Quite so; but I think, if I remember right, those concerned in those mines have been very keen indeed that the Cape Government should develop the railway system. That is not a private enterprise?—No, it has always been a Government concern. I said there were exceptions.

26,572. You do not suggest that if one industry is nationalised it is a natural sequence that all industries should be?—I mean by that rather industries in the nature of coal mines. If you are going to nationalise coal mines, there are other technical industries which should be nationalised.

26,573. You might be led on to nationalise bakers' shops?—Yes.

26,574. Then you point out that the business of the State is to see to the safety of the country, the health of its inhabitants and the maintenance of order, and you say that is in itself a gigantic undertaking. May I remind you that in most countries in the world the State does more than that; even in South Africa it governs the railways?—The State does more in South Africa with regard to looking after its mines.

26,575. The duties of the State are not limited to those subjects you have mentioned?—I did not mean that too literally. What I did mean was this. You can divide with a very big margin the particular spheres in which the State can actually act with advantage, and the spheres where private enterprise should be left to do it.

26,576. You put the line so that the railway industry falls on the one side for the State to manage and the coal mining industry on the other side for private enterprise to manage?—No, I should not do that. I would rather put it in this way. I believe the railway enterprise of this country would probably have been helped a good deal by a little more consideration on the part of the State, without the State necessarily taking upon its shoulders the running of the railway. That is quite a different thing. For instance, we have now coming down from the north three main lines of railway. It is quite possible that if originally they had been laid out with more consideration, two sets of huge main lines might have been adequate for the traffic. It is quite possible that more was spent in capital outlay on account of competition than need have been the case. There-

fore, it seems to me always the duty of the State to be very watchful that needless capital expenditure, needless outlays are not being incurred or needless waste in any industry is not permitted. The State can very well insist upon everything being done in the country for the best advantage, because that is the national advantage, but it is quite a different thing for the State to work the proposition.

26,577. That brings me to one of the points that we have had very forcibly put before us. It has been put before us on, perhaps, the highest authority, that the present administration of the coal mines I will not say is like the railways, but that the outlay has been unnecessarily expensive owing to the separate private enterprises, but also that the individual administration of the collieries is extravagant and wasteful, not because of any particular crime on their part, but because of the fact that there are 1,500 of them. It has been very strongly urged upon us that great economy would be brought about by collective production. Would you feel inclined to agree with that as a general opinion, that collective production would be more economical than the individual production among all the separate concerns?—That is a very big question. I should say that there are, of course, numbers of instances in mines, particularly where a given area placed under one control may give you much better results than a number of units working separately.

26,578. I think there was a very conspicuous instance of that, was there not, at Kimberley?—Quite so.

26,579. Now, we have had before us in evidence that the present separate ownership and separate working of the 1,500 colliery concerns in this country is a great cause of loss and increase of expenditure, and it has been put to us that collective production, if it could be brought about in one or other way, would lead to a saving of expense. You suggest here that where, for instance, national assets such as coal are not being worked, in the opinion of the State, as sufficiently as they ought to be worked—that is our evidence for the moment—it is the business of the State to interfere so that efficiency is secured. Then you go on to say, "but there is an immense difference between criticising procedure and designing plans for the better conduct of operations to carry them out"?—Quite so.

26,580. It has also been suggested to us that we might propose that the colliery companies should be required to unite so as to get the benefit of collective production carrying it on on their own account. If that were done we should be face to face with what some people would call a national coal trust. Would you regret that as a danger?—I do not think it would be good policy to put all the coal mines together. I cannot imagine the whole of the coal mining industry worked as one unit being better worked than it would be if you had it in a variety of units.

26,581. Supposing you had one unit for each coal-field?—I think it is quite possible if you took given areas and if you united them by having areas not too large for supervision, that you might get better results than by working them all as separate units.

26,582. Suppose you were convinced that that was so, would you suggest that it would be desirable to set up these local trusts?—Quite so.

26,583. In private enterprise?—In private enterprise.

26,584. You would not be afraid of a political outcry against monopoly in that case, and a possible rise in price against the consumer?—All you would do would be to make your units more efficient in themselves.

26,585. Instead of having 1,500 you would have, say, 20?—Or even 150.

26,586. You do not regard the competition as any danger?—I do not think so.

26,587. When the mines in South Africa were united in the De Beers Company the competition was eliminated?—There you have an article of luxury which fluctuates enormously in value, and at one time

5 June, 1919.]

SIR LIONEL PHILLIPS.

[Continued.]

went to so low a figure on account of the quantity produced that it would not pay to produce them.

26,588. That is exactly what we have been told about coal?—Therefore, either the industry would have to shut down or combine, and combined it has been very successful since.

26,589. And the price?—The price has gone steadily up. In recent years it has advanced tremendously.

26,590. If anything similar were done with coal the price would go up?—It is on a different basis. Diamonds are an article of luxury, and if people have spare money they buy diamonds. In the case of coal they must buy it.

26,591. It is a commodity they must have. Would that make the price go up or would it be less?—I am not quite sure, because there is a lot of coal in the world. If you had the monopoly of a product, as in the case of diamonds, which is purely an article of luxury, the consequence is if the demand is great it can be supplied, and if it was small the supply could be diminished; but in the case of coal you have to compete against the whole world.

26,592. For the home market?—Not necessarily for the home market; but it is conceivable that you might have such cheap coal produced in the United States that they may invade the market.

26,593. After all, coal and diamonds have a certain relation one to the other?—Yes, chemically.

26,594. And if the price of coal were put up high enough, that might become an article of luxury?—I am afraid as an abstract proposition one may say that is correct.

26,595. You point out that if the State becomes a gigantic employer it is impossible for it to hold the balance fairly between employers and employed. I do not know which way you think it would incline the balance to danger?—The point is this. If you can imagine the State being a sole employer of human beings, I cannot conceive of any reasonable distribution.

26,596. At any rate it would not be inclining the balance between employers and employed?—Yes.

26,597. You were referring to the State being a gigantic employer, not the sole employer?—Quite so.

26,598. I find from the 1911 Census that the total number of persons in Government employ in this country, apart from the Army and Navy, was 788,550, and by 1915 the total for the United Kingdom must exceed a million. Now that is 1/16th of all the persons employed. That is pre-war. It was already the direct employer of one million persons?—Quite so.

26,599. This document goes on to say that "A single Government Department, the Post Office, has directly in its employment nearly 2 per cent. of all the households of the nation, and municipalities like Glasgow and Manchester have each 20,000 employees, or more than one-tenth of their households, on the city payroll." Does not that make the State already a gigantic employer?—It is a large employer.

26,600. If it is already employing one million persons it is not an unheard-of proportion that it may become the employer of two million persons. You are rather putting it to us as a matter of alarm that if the State were to take on a million people it would be a gigantic employer. I put it to you that it has already taken on a million people, and the heavens have not fallen?—I think it would be much better if they had not a million employees.

26,601. You do not suggest that you can put back the clock?—I do not suggest that you can put back the Post Office or the control of sewage.

26,602. Is there anything which the State does now-a-days that you think had better be given up?—No, but I am not convinced by any means that there are not many things which the State does that it had better have left alone.

26,603. At any rate, you do not propose that any of them should be given up, and I gather you do not propose that any more should be added?—I think anything that the State can avoid doing directly in the shape of trading is best left alone.

26,604. Would it be putting it wrongly if I suggested that your position was that we had exactly reached, in the year 1919, the ideal point that we have taken over by the State as much as is good to be taken over—that we happen to be at the ideal point?

—I could not admit that. I should say you have overreached it already.

26,605. But you do not propose that any should be given up?—I have not gone into the question to see how far you could release anything that the State now does.

26,606. *Sir Allan Smith*: With regard to this oil proposition, do you know whether private enterprise offered to bore for oil at Chesterfield, and the Government refused?—Yes, I believe they did.

26,607. On that hypothesis, would not your answer with regard to private enterprise be modified?—I do not think private enterprise was very keen on the proposition, because it was looked upon as a highly speculative one; but there is no doubt that during the war an offer was made.

26,608. In that case, and in the Irish case, with regard to coal, would you differentiate between enterprise and grievous national necessity to do something?—Quite so.

26,609. Would you suggest that these bores were done because we were in desperation to do something, and not because our enterprise was tickled in the least degree?—They were both cases in which there were specific reasons why the State thought it desirable to do something; it was not ordinary enterprise.

26,610. With regard to the question of paying money for this, would you agree that, although the Minister, were he in office, would desire to do a certain thing, he would require to get the Treasury to give him the money?—Certainly.

26,611. Supposing the Treasury did not have the money at the time, is it conceivable that the desire of the Minister of Mines would be blocked simply because the Chancellor of the Exchequer refused to pay up?—Quite so.

26,612. Do you know whether that is the case at the moment, that money is being refused for the industries of this country on account of the financial position of the country?—I can quite well imagine it, but I am not in the Service now. I may perhaps say that in my experience in a Department, we had a great many masters, and before you could get anything done, you had to get the consent of a variety of other Departments, especially the Treasury. The result was that it took a very long time to get anything done, unless it was so urgent that you rushed off to the head of the Department. Unless you advised him that it was urgent for immediate action you would be held up for a long time, and the opportunity might not occur again. That is one of the cumbersome things of Government administration: there is no one in a position to say "Go ahead," there never can be in a Government administration—you must go through the regular routine.

26,613. *Mr. Sidney Webb*: Unless you go and see the head of the Department?—On occasions you cannot do that, but in my experience, the moment one Department writes a letter to another Department you get your subordinates exchanging correspondence on an elaborate scale, and it becomes very difficult, because you have to support your own section, and you find yourself up against all kinds of difficulties.

26,614. *Sir Allan Smith*: Have you found that suggestions that were approved by the Minister under whom you were working during the war have been done down by the objections of his colleagues?—Yes, on occasions.

26,615. When you were working in the Ministry, did you find that your enterprise and your activities were thereby and for that reason stimulated?—Not at all.

26,616. Did you find that the circumlocution was so much that you had rather an inclination to say, "Very well, if we cannot get on, we will let things go"?—We were working, of course, under very special conditions during the war, and if one could go to a Department and say this thing was very important, you got permission more rapidly than you would in normal times. Some of the enterprises that I undertook myself would never have been thought of in times of peace; for instance, we opened up the

5 June, 1919.]

SIR LIONEL PHILLIPS.

[Continued.]

phosphate deposits in Cambridge. As a paying proposition, you would never do it; but they were of immense and imperative value, so that it is not fair to compare the kind of permission that I would have got under the stress of circumstances at that time with the ordinary conduct of affairs through Government Departments in normal times.

26,617. You have had some of the same of Government Departments in normal times?—No, not much here.

26,618. In South Africa?—Yes, a great deal.

26,619. Did your experience in Government Departments in normal times give you the impression that they are suited to conduct an industry?—No.

26,620. *Chairman*: I am asked to ask you two questions. First of all, I think you were head of the Mineral Resources Development Committee of the Ministry of Munitions?—Yes.

26,621. What is your opinion in respect to the creation of a Mines Department or a Ministry of Mines in the United Kingdom?—I reported to the Minister on the subject very much in favour of the creation of a Mines Department. I was opposed to the idea of a Minister of Mines, because I thought there were too many Ministers already. As a matter of fact, for carrying out any business undertaking, you cannot get on if you have too many people in a room. Already you have a very large number of Ministers, and it seemed to me undesirable to add to the number, because you cannot get on with the business; therefore I, for one, was opposed to the idea of a Minister of Mines, but I am very much in favour of the extension of the present Mines Department. I do not suppose you would desire me to go into the whole question of one's idea about Government administration, but in two words might I say this: If you had a Ministry, say, of 12 men, and each of those 12 men had under them a variety of under-secretaries with departments for which each is responsible, the Minister himself would have an opportunity of thoroughly studying the requirements and the desires of all the subordinates under him, and in turn would have an opportunity of coming to a decision. A fewer number of people would have a better opportunity of carrying it through. That is on general lines. As to the necessity for a Department of Mines, it is obvious that very little consideration has been given to the mining industry in days gone by. The Home Office has done its best with the staff it has, but it has devoted itself to questions of safety and statistics only. There are innumerable instances in which tremendous losses have taken place through there being no one with authority to interfere, either with the landlord, or with the way in which a mine is being worked in this country, and it seems to me that you require a properly organised Mines Department, attached to which you could have committees set up with authority to interfere, as far as might be advisable in the national interest, with the proceedings of private individuals. It is all pretty clearly stated in the report that was handed in.

Chairman: Can we get a copy of that report and circulate it?—Yes.

26,622. This is the report of the Controller of the Department for the Development of the Mineral Resources of the United Kingdom, and I see that you were the chairman of that committee?—Yes.

26,623. It contains, I think, your views on the subject?—It does.

26,624. *Mr. R. W. Cooper*: I suppose you keep yourself well informed upon South African affairs?—Yes.

26,625. Is it not the fact that in 1917 there was a Commission in South Africa to consider the question of State mining?—Yes.

26,626. Have you read their report?—Yes.

26,627. I will read you the last paragraph of the Majority Report: "Finally, a careful and impartial consideration of all the circumstances, experiences, difficulties, and adverse results in connection with State mining in other countries has confirmed the opinions and conclusions expressed in the Majority Report, namely, that having regard to all the conditions which obtain in South Africa at the present time, your Commissioners cannot recommend the Union Government to engage in the mining of any minerals."

Sir L. Chiozza Money: May we have the Minority Report?

Chairman: What does the minority say: do they agree with the majority?

Mr. R. W. Cooper: No.

Sir L. Chiozza Money: Who are these people?

Mr. R. W. Cooper: They were appointed by the Governor-General, Mr. P. Ross-Frames, Mr. J. L. Van Eyssen, Mr. J. Taylor, Mr. R. H. Miller, Mr. de Villiers Roos.

Sir L. Chiozza Money: Cannot we have the Minority Report now?

Mr. R. W. Cooper: There are two Minority Reports. Mr. Roos confirmed his previous report. Mr. Miller, after reviewing the foreign evidence said: "Your Commissioner has practically nothing further to add to his previous recommendations, except in so far as they are affected by the new position now existing due to further leases having been given out, and in so far as he has to recommend that all revenue accruing to the State, as a result of leasing, in excess of an amount calculated similarly to the ordinary taxation derived from privately owned mines, should be earmarked for future State enterprise, or used for the redemption of State loans, and not treated as ordinary revenue."

Chairman: I think Mr. Roos's report is on page 29. He says there: "I do not think that a further report is necessary. The State asset in South Africa consisting of the East Rand areas is so unique in character that a comparison with State mining in other countries is almost beside the question. I have found nothing in the further reports and evidence laid before the Commission to shake my opinion as expressed in my previous report." Nothing shakes some people!

Thank you very much indeed. We are very grateful to you for coming here.

(The Witness withdrew.)

We have here now two witnesses on behalf of the National Gas Council, and I will ask, if I may, Sir L. Money on the one side, and Sir Arthur Duckham

on the other, because he is interested in the Gas evidence, to ask questions.

MR. DAVID MILNE WATSON, Sworn and Examined.

Chairman:

"Mr. D. Milne Watson states that he has been asked to appear before the Coal Commission and does so in a dual capacity—first, as President of the National Gas Council, a body comprising the great majority of the gas undertakings in the country, and, secondly, as Governor of the Gas Light and Coke Company, the largest gas undertaking in the country and probably in the world.

He understands that the Commissioners desire to hear generally the views of the gas industry on the question of the nationalisation of the coal mines of the country. The gas industry, he believes, is the second largest buyer of coal in the United Kingdom, using annually some twenty million tons of coal, being even larger users than the railway companies, and, therefore, its views are entitled to consideration.

He wishes to bring before the Coal Commission the following resolution, which was recently passed at a

5 June, 1919.]

MR. DAVID MILNE WATSON.

[Continued.]

meeting of the Central Executive Board of the National Gas Council:—

"That the gas industry, which is one of the largest consumers of coal in the Kingdom (carbonising some twenty million tons of coal annually) and has wide experience of the coal market ranging over many years, views with serious alarm the proposals for nationalisation of the coal mines, and is of the opinion that this would neither engender a spirit of efficiency in the collieries nor effect national economy."

From this it will be seen that the gas industry is wholly opposed to the nationalisation of the coal mines.

Witness's Company is one of the largest individual buyers of coal in the country, purchasing some two million tons of coal annually. He has himself been responsible for buying coal for the Company over a large number of years, and, therefore, is speaking from his own personal experience.

Before the war coal was either bought directly from the collieries, in the case of the larger undertakings, without the intervention of middlemen, or through merchants. The latter method of purchasing coal was the usual one in the case of smaller undertakings, but also was, to a certain extent, employed by the larger undertakings.

In his Company some 440,000 tons were usually bought from merchants, that is to say, 22 per cent.

Merchants were a convenience in a certain class of business. It was quite impossible for the collieries to send a representative to each of the gas undertakings, and it was equally impossible for the small gas undertakings to send direct to the collieries. Merchants were thus necessary to the carrying on of the trade and, generally speaking, gave satisfaction. In the case of large contracts the merchant's remuneration was occasionally not more than 1d. per ton, 2d. was a very usual figure, and witness does not think this work could be done any cheaper or more efficiently by any other body of men.

The gas industry objects to nationalisation, because it was, on the whole, quite satisfied with the method of purchasing coal which prevailed in pre-war times, and because it does not believe that nationalisation would work satisfactorily.

The industry has had a large experience of control during the war, and, while admitting that this was necessary and always will be necessary during periods such as we have just passed through, it does not believe that control in the form of nationalisation is required in normal times for the protection of the public. Indeed, it is thought that the public would undoubtedly suffer.

Allowing for the fact that the state of affairs in the coal trade was quite abnormal during the war, yet the Government control undoubtedly gave us a foretaste of what might be expected under a system of nationalisation. Gas works have had to take unsuitable coal, sometimes coal that was not gas coal at all, and sometimes gas coal that was not suitable for the particular works to which it was sent. This has caused great waste and corresponding financial loss. Only bituminous coal can be used advantageously for gas making, and, moreover, all grades of what is commonly known as "gas coal" are not suitable for every gas works. This is a point of great importance which has been largely lost sight of under the system of Government control.

The serious loss of having to use unsuitable coal will be shown by the technical witness who will follow.

Referring to the Coal Transport Re-organisation Scheme, it is realised that the endeavour to save train mileage was done with the best intentions; nevertheless the effect was in many cases most serious.

It seemed difficult for Government officials to understand that if coal has to be sent a long way it is better to send only the best coal. In a journey of, say, 150 miles, it is better to add 20 or 30 miles train haulage in order to send really suitable coal.

Innumerable instances exist of coal being sent despite the protests of the users. Witness's own Company had to complain from time to time about coal containing up to thirty per cent. of ash being sent all the way to London. Such coal ought to have been used as near the pit as possible in order to avoid the waste caused by sending thirty per cent. of ash long distances. In other words, when such coal was forwarded one in every three wagons was to all intents and purposes useless.

Government control has also meant that we have been subjected to entirely arbitrary decisions in the question of price. Witness quite realises that the effect of the control has been to keep the price within limits, and it is desirable that this should be done. At the same time, in the future this can be achieved by other means than nationalisation. Why should not the coal industry be dealt with much in the same way as the gas undertakings, which have a partial monopoly? Why should not legislation be passed giving power to the Government to appoint auditors to see that the prices charged are only such as will give a fair return to the colliery owner, due allowance being made for development, depreciation, etc.? This has been done in the gas industry, in which approximately 150 millions of capital is invested.

Witness is of opinion that there is no necessity to nationalise the mines in order to improve the conditions of the miners. Legislation can be passed dealing with wages, proper housing and other improvements without nationalisation.

It is felt that nationalisation would put the purchaser of coal entirely in the hands of Government officials. If coal was nationalised, there would, of course, be no competition. Our experience gained during control is that we are not likely to get as much consideration from an industry which would be a Government monopoly as from keen business men in competition with one another. Our pre-war experience was that if a colliery sent us unsuitable coal, we could go to another. This made the seller considerate of the customer's interests, both as regards price and quality. If there were only one seller there would be very little attempt to please the customer, because he would not be able to go elsewhere. The price might be increased excessively for the purpose of getting revenue for the State, and supposing the unfortunate gas undertaking could not pay the price and tried to get its coal elsewhere, the only other source would be from abroad, and nothing would be easier than for the Government to refuse to allow the importation of coal, and in that way force the consumer to pay the price demanded.

Witness does not propose to go into the political aspect of the question, though that is a serious one.

Witness does not think that monopolies are beneficial to the public as a whole. It is much more healthy that there should be competition for business instead of the "take it or leave it" attitude which seems inherent to monopoly, of which a nationalised coal industry would be a gigantic example.

Witness wishes to point out that the gas industry furnishes an example of the effect of healthy competition on an industry. It was often said that in the old days the gas undertakings were very independent, but the advent of electricity altered all that. Gas undertakings were put on their mettle and had to adopt a more business-like and conciliatory attitude to their customers, and make an effort, not only to get new business, but to retain old. This was greatly to the advantage of the public.

A great deal has been said with regard to the saving of expenso by an industry being run by the Government; in witness's opinion this is not likely to be the case as far as the coal industry is concerned.

Witness wishes to point out that if the businesses of the various users of coal are not to be seriously injured it is imperative to study the requirements of each individual user, whether he be a user of steam, gas or house coal, and it would be necessary to keep a large number of officials to sell and allocate the various descriptions and grades of coal. The conduct of such a gigantic monopoly as the coal industry would involve the employment of an army

5 June, 1919.]

MR. DAVID MILNE WATSON.

[Continued.]

of officials, who would have no direct interest in pleasing the customer.

Witness thinks that the Government should leave the industry to carry on its own business, but establish an efficient financial control with regard to profits, wages, housing, etc. This could be done for a comparatively small cost, and it would do away with the chief grievance which the purchaser has experienced occasionally in the past, viz., the sudden and considerable rise in the price of coal brought about by an increased demand from abroad.

The nation would, in the way indicated, get the benefits of individual enterprise, efficiency and initiative in conjunction with effective Government control."

26,628. *Sir L. Chiozza Money*: You were kind enough to answer one or two questions that I put to you before on the subject; therefore I need not trouble you very long. You again, I notice, in your evidence argue from the abnormal conditions of war to the normal conditions of peace. May I ask you if it is not the case that in the war we suffered from conditions in respect of coal and in respect of transport which were so extraordinarily abnormal that no fair comparison can exist between them and the conditions of peace?—I quite admit that during the war we were working, and the Coal Controller was working, under very abnormal circumstances and, as I say in my *précis*, I do not want to take all that happened then as exactly what is going to happen to us in normal times; but our experience has been such that we are very unwilling to see the State as a purveyor of all the coal in the country.

26,629. You do recognise that the Government in time of war has to ask people to do things it would not otherwise ask them to do. It not only has to ask them to take a kind of coal that may not be suitable for them, but it has to ask the people to make extraordinary sacrifices. You would not say because the Government has to ask a man to sacrifice his life in the time of war that he would be asked to do it in times of peace?—Quite so.

26,630. Now with regard to your difficulties about getting coal: is it the case that you have no difficulty whatever in times of peace in your dealings with the coal purveyors? Do you never have difficulties?—We really have, speaking generally, of course, very little difficulty. You can always go to someone else. The matter of price is a matter for arrangement.

26,631. May I read what another gentleman, who has constantly to buy coal, told us yesterday? He was an electrical engineer, speaking not only on his own behalf but on behalf of other municipal engineers. He said, in effect, that after elaborate tests had been made to procure the most suitable coal and this had come to the knowledge of the coalowner, he proceeded to raise the price to that consumer in particular, and accordingly the engineer had to begin with his tests all over again. I asked him if this occurred more than once, and he said, Yes. Has your experience been like that?—No, our experience has really not been like that. Of course, there may be instances of collieries having taken advantage of the knowledge that one coal is more suitable than another and trying to put the screw on, but the number of collieries and the number of varieties of coal is so large that it is unthinkable to me that that could not be got over by the purchase of other coal. Certainly, in my experience with the collieries I have never had that sort of thing to contend with. I have been buying coal for 20 years now, and I am sure we have contractors who have been on the books of the company, some for 30 years. I have one contract that goes back to 1873 without a break.

26,632. If we imagine the coal of this country to be under a responsible Minister of Mines, can you conceive of that Minister, who is charged with supplying coal to all sorts of users to produce the best results, placing difficulty in the way of a gas company?—I do not think he would deliberately go

out of his way and do it, but it would be a very difficult thing to arrange to supply the coal that was required without an enormous staff to do it. When you come to realise that there are literally hundreds of varieties of coal, it is quite a different thing to the supply of water or electricity or gas or many other things, or even telephones or the Post Office, where there is no question of a variety of articles. Here you are proposing to deal with a material which has a hundred varieties. If you go to one colliery you find they have several different grades of coal from the same pit, one of which you find is suitable; the other may be worth many shillings less. All that has to be studied. Then, as I have already explained, certain coals are not gas coal at all, but even when you do get gas coal some varieties are totally unsuitable for certain works. It is a science in itself to find the proper coal for proper works. All that would mean, if there is going to be no hitch or trouble, an army of technical experts so as to place coal in the proper places.

26,633. I suggest to you that the Government would be in a superior position. Imagine a contract under the control of a capable man of affairs. He knows that a certain seam of coal of a certain character runs through a certain portion of that district. Now that is under the control of this colliery company or under the control of another colliery company, or even a third or a fourth one, but he would know the quality of that coal as a whole. Surely he would be able to handle the coal with much less officialism than it requires to handle it now by separate colliery proprietors? Is that not so?—Imagine yourself with a very good gas coal seam and imagine that a very large number of people wish to obtain coal from that seam, the allocation of that coal is going to be a matter of considerable difficulty. More than one company wants it. How is it going to be parcelled out? Under the present system if you want the coal you pay for it, and according to its value to you; therefore, the colliery owner has a ready way of ascertaining its value. It distributes itself.

26,634. I suggest to you the contrary. They know it is a coal for gas purposes which has only to be drawn from one colliery, and instead of being on sale from a number, it only comes from one. Surely, if you consider it as a simple operation, one is much more simple than the other?—I heard the other day that if coal were nationalised there would be a level price, and there would be no competition, and we should get our coal at a reasonable price. Of course, that is very attractive, no doubt, but how is that going to be arrived at? There are certain coals that we like to get hold of; everybody would like that coal, or at least 20 or 30 people would. They all begin to compete for that coal. At the present moment the person who is prepared to pay the price gets it; it settles itself. Now under a system by which it is going to be allocated, how are you going to get over a difficulty of that kind? Is the official to say, gas company A is to have it, or gas company B.

26,635. Surely it could be settled by any man of affairs by having regard to the distance of the gas undertaking from that particular seam of coal. Those who were nearest to it would have it, so as to secure the shortest run. It naturally follows that a gas company that was the greatest distance away would not have it.

Sir Arthur Duckham: Even if there is less ash in the coal?

Witness: The most suitable coal ought to travel the longest way.

26,636. *Sir L. Chiozza Money*: Then the word "suitable" must be used with that connotation. "Suitable" means suitable for the particular purpose?—Supposing two cargoes of coal arrive at Beekton, one coal contains 25 per cent. of ash and another 10 per cent. of ash, and it is a question of sending that up to Kensal Green to the gasworks there, a haulage which costs about 3s. or 4s. a ton. In that case there is no doubt as to which coal we would send; of course we would send the coal with little ash in it, because you get more coal for the amount of money you spend. Therefore the

5 June, 1919.]

MR. DAVID MILNE WATSON.

[Continued.]

gas company which is the greater distance away would get the advantage.

26,637. You would send the coal with the highest calorific value the greatest distance?—Yes.

26,638. You would assume that "suitable" with that connotation, there would be no difficulty in arranging for the supply to be classified and divided up in the United Kingdom?—All I can say is that unfortunately it has not been done yet.

26,639. In times of war it could not be done for reasons which you have admitted are potent reasons, and which have had to go, even before the convenience of a gas company?—Quite so.

26,640. Is it not the fact that the gas returns show—I am speaking now of pre-war—that a gas company supplying gas to the public as compared with municipalities supplying gas to the public had a larger capitalisation per 1,000 cubic feet of gas?—I am not aware of that fact.

26,641. May I give you the figures for 1911? The capital for 1,000 cubic feet of gas per annum in the case of private companies was 16s., whereas in the case of municipalities it was only 12s. 7d.?—One would like to know the number of companies.

26,642. This is all of them, it is all the authorised undertakings?—It is quite possible that that may be so, but, of course, the municipalities are very often in a very good position with regard to the coalfields. I am not disputing your figures, but I have not seen that particular pamphlet. I was prepared for something of this kind being asked, and I armed myself with some figures regarding price, which is also a criterion.

26,643. Is it the fact that municipalities use less capital to produce the same result than the companies?—I have not the statement before me.

26,644. You may take it from me that it is so?—You are quoting it.

26,645. Taking the working expenses per 1,000 cubic feet—that is a Government return—the figures for companies is 31·86d. and only 21·8d. for municipalities?—I have got Field's Analysis before me, which is a standard work on these things. Taking the three great London Metropolitan companies, the capital employed per 1,000 cubic feet was 10s. 1d., and taking the following corporations—Birmingham, Bolton, Bradford, Carlisle, Leeds, Manchester, Leicester, Nottingham, Oldham and Salford, which are typical—

26,646. They are smaller than the London units?—Not when you take them together.

26,647. They are smaller units. They have not the advantages of the extraordinary area covered by the Gas Light and Coke Company?—Birmingham is a large undertaking.

26,648. Would it not be better to take the whole of the country? Is it not unfair to take certain cases? Is it not the fact that, taking the whole of the country, you get nearly less by 4s. per thousand cubic feet in the case of municipalities than in the case of the companies?—I have not that figure before me. Taking the series of companies and taking Field's Analysis, which is open to all the world to examine, there you have these three Metropolitan companies, all of them very old companies and more or less loaded up with capital. The 10 or 12 individual corporations put together work out at 10s. 4d.

26,649. Does not Field give you the whole country?—It does not. If you take the suburban companies round London, their capital employed is as low as 8s. 4d., which compares with certain provincial companies which work out at about 8s. 11d. It is a very interesting study. There is really not anything in this point.

26,650. I should have thought there was a good deal in it. Take the revenue per thousand cubic feet. That is the price in the case of companies, which comes to about 42·65d., and in the case of municipalities 38·5d., a cheaper result?—The revenue includes the residuals. It may be that they are not

selling well. After all is said and done, what really counts is the price of gas, and I have taken out the figures in order to show you that it is not against the companies. Here are 11 Municipal Undertakings which I have taken out.

26,651. Which 11? You are aware that if you make a selection of companies you can show anything?—I am taking typical cases: Birmingham, Bolton, Bradford, Carlisle, Leeds, Leicester, Manchester, Nottingham, Oldham, Salford and Widnes. Widnes is one of the cheapest gas suppliers in the world. It does not prove anything up to the hilt, of course, but if you take a series of English provincial companies such as Bath, Bristol, Brighton, Derby, Newcastle, Plymouth, Portsea, Rochester, Sheffield, and taking a series of 5 years, the figures are, for the year 1917, the average companies' price was 26·69d. For the corporations which I have quoted the figure was 31·12d. In 1916 for the companies it was 25·4d., for the corporations 27·89d. In 1915 for the companies 23·69d., for the corporations 27·02d. In 1914 for the companies 21·63d., for the corporations 23·16d. In 1913 for the companies 21·58d., and for the corporations 23·20d.

26,652. You see what you have proved. Here are the figures for the whole of the country. If, therefore, your selected figures show an improvement, on the other side it follows that the balance you have not quoted would show an extraordinary balance against the companies?

Sir Arthur Duckham: May I ask a question on that?

Sir L. Chiozza Money: May Mr. Watson answer me?

Chairman: We are getting very far afield from the question.

Witness: I think the answer with regard to that is also this, that as a matter of fact gas undertakings have been mostly municipalised in the North, and they are near the coalfields. Gas companies exist mostly in the South where they are a long way from the coalfields; therefore it means high cost for carriage, which tends to make them higher in their charge for gas.

26,653. *Sir L. Chiozza Money*: If you had given that explanation of these figures that would have been a better answer than giving a comparison of those towns which are obviously not on the same basis. Now I put it to you again that the Parliamentary Returns show that the municipal gas undertakings are run with less capital and supply a cheaper product?—With the qualification I have given in my answer.

26,654. *Sir Arthur Duckham*: Following up that question, presumably the number of small companies privately owned is considerably greater than the number of small undertakings owned by municipalities?—Yes.

26,655. Therefore their capital cost would be greater?—Yes.

26,656. These averages worked out in a Parliamentary control figure, is it not conceivable that they are worked out taking each undertaking as a unit?—It is quite likely.

26,657. The Gas Light and Coke Company might have 2s. 2d. and a small company 4s. 2d., and it might be averaged up to 3s. 2d.

Sir L. Chiozza Money: Is that so?

Sir Arthur Duckham: Is it a fact? How are your averages got out?

Sir L. Chiozza Money: I do not know, but he does not say Yes to your question. It is per thousand feet, so that it is a weight average per thousand feet.

26,658. *Sir Arthur Duckham*: Then I should like to check that. On this point of nationalisation you represent an industry which consumes perhaps as much coal as any other industry in the country?—Yes.

26,659. And you represent a company which buys perhaps as much coal as any other company in the country?—Yes.

5 June, 1919.]

MR. DAVID MILNE WATSON.

[Continued.]

26,660. What would be your position if you had to purchase your coal from a body at a fixed price? You would have to pay the fixed price?—Yes.

26,661. How would you be able to be sure that you purchased the coal that you wanted? What redress would you have?—Absolutely none.

(The Witness withdrew.)

Mr. ARTHUR EDWARD BROADBERRY, Sworn and Examined.

26,663. *Chairman*: Are you a member of the Institute of Civil Engineers; past President of the Institute of Gas Engineers and are you Chief Engineer and General Manager of the Tottenham District Light, Heat and Power Company?—Yes.

26,664. It is to be observed that you do not really express any view upon nationalisation and I do not think you mention the word in your *précis*, but one can gather you are against it. I will read your *précis*:—

“ Mr. Broadberry will state—

That he has had 40 years' experience in gas manufacture. For 20 years he has had chief control of the Tottenham Gas Undertaking, a company using 160,000 tons of coal per annum for coal gas manufacture, or about 1/100th part of the whole quantity used in the country.

That it is essential to successful and efficient working that absolutely suitable coals should be obtained. This requirement is only likely to be met by competition and free choice of selection.

That, apart from price, which is a commercial rather than a technical matter, there are many points of consideration which can best be met by free choice and competition.

Suitability and class of the Coal.

That anthracite, semi-anthracite, cannels, hybrid cannels, hard steam and non-coking coals generally are unsuitable.

That clean bituminous coking coal, giving a good yield of gas, a low sulphur content, a strong coke, prolific tar and ammonia, is best suited to good working and consequent economy in coal used. Cleanliness, that is, freedom from ash, is very desirable.

That during the period of control many samples tested have shown over 20 per cent. ash and some over 30 per cent.; the highest, 64.97 per cent., was very exceptional, as was also the lowest, 1.32 per cent.

That, provided the coal is otherwise good, the yield of gas, tar and ammonia is reduced proportionately to the ash content. The effect on coke, however, is disastrous. All the ash remains in the coke, and as the coke produced weighs about two-thirds the original weight of coal, 20 per cent. ash in coal means 30 per cent. ash in the resulting coke. Such coke is not only inefficient as a fuel in proportion to its ash, but it causes the employment of extra labour for incessant clinkering, reduces the efficiency of boilers, and the dirt which has already unnecessarily added to the railway costs of carriage forms 4 cwt. clinker for every ton of coal carbonized, and this has to be carted away to some shoot near or far.

That proper cleaning of the coal is of national interest and can only be obtained by promoting competition between the collieries.

That another important factor in economical use of coal which is of an importance quite as great as cleanliness is suitability. A coal may be very clean, but at the same time unsuitable for gas making altogether.

That even if suitable for one class or type of gas making plant, a coal may be unsuitable for another. Each type has characteristic variations as to its requirements.

That individual selection and freedom of choice is therefore desirable and indeed essential in efficient working.

That during the last accounting period before the war our make of gas was 13,148 cubic feet per ton.

26,662. Can you imagine any redress that you would like to be given you under a State undertaking?—I really cannot. With all the desire to appreciate what officials have done and try to do, I cannot see how there could be a remedy.

During the last accounting period to December, 1918, the make was 11,425 cubic feet per ton, and this was mostly due to unsuitable coal. On these figures, if we could have worked to pre-war efficiency, we should have used over 13 per cent. less coal, and if our working is typical of the other 99 per cent. of producers, the coal wasted in twelve months due to unsuitable coals now that we have no free choice amounts to 2,080,000 tons per annum.

That, bearing on this question of unsuitability, it is worth recording that three years ago Mr. Broadberry toured South Yorkshire in search of good gas coal, and on calling at one colliery was fortunate in meeting the managing director of the next colliery (some miles away), which he intended visiting, and was saved the time and trouble of going there by the managing director telling him they did not raise an ounce of coal suitable for gas making, but only steam hards; nevertheless thousands of tons of coal are being sent to us for gas manufacture from that particular colliery. There is no national economy in such arrangements. If freedom of choice existed no more would come from that source.

That another important consideration in selecting the particular colliery from which to secure supplies is the question of equity of weight. Some collieries regularly send good full weight and others are just the reverse. Competition is the only corrective in this matter.”

26,665. Do some collieries send 18 cwt. instead of a ton?—It is not quite so bad as that but it is getting on that way in some cases.

26,666. Then you say:—

“ That another matter of great importance is the regularity and reliability of consignments. It makes all the difference to economy of working whether or not supplies come in a steady stream or whether a glut of deliveries comes in and has to be put to stock to be followed by a scarcity which necessitates picking it all up again.

That highest and lowest stocks at Tottenham in various years were:—

		1916	1917	1918
Highest...	...	45,000	59,000	56,000
Lowest	5,000	29,500	4,800

This represents a great waste of labour, which could have been largely avoided by direct arrangement between the user and supplier, when the latter had the fear of competition from rival collieries.”

You have not actually said so, but I rather gather from the tone of your proof that you are not in favour of nationalisation?—I am not in favour of nationalisation.

26,667. You do not actually say so in your proof. Would you tell us briefly why you are not in favour of it?—The only indication that I have of the effect of nationalisation is what we have been experiencing through the last 2½ years, and that is the control under Government. That is the only indication which we have at the present time as to what national control of the mines would be likely to be, and it is a very clear indication that we would get very little sympathy from a Government Department, in making arrangements as to what coal we might have or might not have.

26,668. *Sir L. Chiozza Money*: Your *précis* shows that you would know there was a war during the last four years. May I ask you whether you quite realise the extraordinary straits to which this country was put in respect of coal?—I think I know it quite as well as most people.

5 June 1919.]

MR. ARTHUR EDWARD BROADBERRY.

[Continued.]

26,669. I wonder if you do. Do you know the quantity of coal we had to send to France and Italy?—Yes.

26,670. Do you know that through those enormous quantities we were short ourselves and also through sending men to fight in the war? We had to send these extra amounts out although we were short ourselves?—Yes.

26,671. Do you know we tore up railway lines to the extent of scores of miles and sent them over to France, together with locomotives and wagons?—Yes, all that is common knowledge.

26,672. Then why is there not some exhibition of that common knowledge in your *précis*? What would you have done? Would you have let any consumer of coal have any amount of any kind without regard to those exigencies?—My point is that through control the production of coal has been wasted.

26,673. If you were told by a business man who has charge of the transport that he saved 700 million coal ton miles by his arrangement, would you believe him?—I should rather doubt it.

26,674. He swore it on oath?—Oh, yes.

26,675. He is not a Government official, but a business man of rather high calibre. Would you believe him?—I should doubt it. I should think he was probably misleading himself. Anyhow, I do not agree it would be all to an advantage even if he did what he claimed.

26,676. Do you know the late Controller, Sir Guy Calthrop, was a man of high business calibre?—He was the Coal Controller and he was exercising control over the coal.

26,677. Excuse me! His Majesty's Government entrusted to him the charge of seeing we got as much coal as we could in those difficult circumstances, and entrusted to him the task of distribution to the best national advantage in circumstances of appalling difficulty. He was a man of high eminence. Do you mean that he played the fool with our coal?—I do not suggest he played the fool with the coal, but he was entrusted with a job which was more than he could properly manage.

26,678. Do you know that the circumstances were exceedingly grave, and do not you see that these appalling war conditions have no relations to peace conditions? Do you not acknowledge it?—I do not acknowledge that they have no relevance.

26,679. But you think they have only a little relevance?

26,680. *Sir Arthur Duckham*: Do you consider that the gentleman put in charge of the distribution of the coal by the Government had any knowledge of coal?—I do not consider that he had any knowledge of coal. He was an expert railway man.

26,681. Do you not think it would be well to have a man with knowledge of coal dealing with distribution?—I should have thought it would have been very much wiser.

26,682. Do you know of cases during the war where even, although there was stringency, two sorts of dissimilar coals, which would have been suitable for two different persons, were delivered to one place for the wrong people?—Yes.

26,683. For that sort of thing it would not have taken any more carriage to have done it accurately?—No.

26,684. *Chairman*: I am asked to ask you whether you are right about the Coal Controller. I do not know one way or the other, but it is suggested to me it was not the Controller of coal who did this consignment of coal to the various people, but it was the local Coal and Coko Supply Committee which despatched the coal to the various people, and not the Coal Controller?—That is not so at all. The local Coko and Coal Supply Committees were set up at the beginning of 1916 and the Coal Controller was not appointed until 1917, but we were allowed, during the year 1916, to make our own purchases from collieries, and very little interference came from the Coal and Coke Supply Committees.

Chairman: I will ask our assessor, Sir Richard Redmayne, to tell us the facts.

Sir Richard Redmayne: The fact is that the whole of the distribution of the coal of this country is in the hands of local committees consisting largely of coal owners. Sir Adam Nimmo is Chairman of the Scottish bodies.

Sir Arthur Duckham: Do they touch big undertakings?

Mr. R. W. Cooper: We had to act under the direction of the Controller.

Sir Arthur Duckham: Do they supply the coal to large undertakings such as the Gas Light, Coal and Coke Co.?

Sir Richard Redmayne: They distribute the coal. Different firms make the arrangements, but all arrangements are subject to the sanction of the local Committee.

Sir Arthur Duckham: But take big companies like the Gas Light, Coal and Coke Company. Are they under the control of the local committee?

Chairman: Sir Adam Nimmo can tell us about it, perhaps. I think you were on the Scottish Committee, Sir Adam.

Sir Adam Nimmo: Yes, I am Chairman of the Scottish Committee.

Chairman: How is it done?

Sir Adam Nimmo: We allocate a certain quantity of coal to be sent to the gas works at Glasgow and we intimate to the different collieries that we think should supply the coal within the distribution area the quantities that they should give. We scrutinise these figures from time to time to see these quantities are delivered and we get returns from the gas works every week as to whether the quantity we understand has been delivered.

Chairman: It was suggested the Coal Controller did that. Is that right, or was it done through the local committees?

Sir Adam Nimmo: Through the local committees, acting as for the Coal Controller.

Witness: In our case it is absolutely the Coal Controller, and we have nothing to do with the Coal Committees.

Mr. R. W. Cooper: We had numberless express directions from the Coal Controller to send particular coals to particular places.

Chairman: The practice does not seem to have been uniform.

(The Witness withdrew.)

MR. DUNCAN CARMICHAEL, Affirmed and Examined.

26,685. *Chairman*: I think you are the secretary of the London Trades Council?—Yes.

26,686. I have not had a *précis* from you, and therefore I must ask you questions to elicit your views. We have had a number of gentlemen here representing a number of Chambers of Commerce of the Kingdom, who gave their views on the question from the employers' side. We had gentlemen from Leeds, Birmingham, and Glasgow, and one from London. Then we had Mr. Bowerman on the other side, who gave us the resolutions passed, from time to

time, by the various meetings of the Trades Union Congress. I understand that you come to speak on behalf of the London Trades Council?—Yes.

26,687. Will you tell me, as I have not got a *précis* from you, what the London Trades Council is? I know it personally, but we want it on the Notes?—The London Trades Council represent over 120,000 trade unionists in London, through 150 trade unions and branches. We have about twenty of the local trades councils also affiliated at nominal fees, so that we have, besides the 120,000 actually affiliated from

5 June, 1919.]

MR. DUNCAN CARMICHAEL.

[Continued.]

the branches, probably 50,000 or 60,000 from the local trades councils besides. We have over 250 delegates, the majority of whom attend regularly, and discuss problems such as this at various times, once a month.

26,688. I have to ask you questions so as to let the public know it. Do you represent a great number of working men in different industries?—Yes, in every industry, practically, in London.

26,689. You say your delegates meet once a month. Are you authorised to speak on their behalf?—When they have passed a resolution during the time I have been there, and have not rescinded it, then I claim to speak on their behalf, when dealing with that subject.

26,690. Have they passed any resolution on the question of nationalisation of mines?—Yes, they have.

26,691. When did they pass one?—They gave me instructions to support it at the Nottingham conference in January, 1918, and I moved the resolution dealing with this point.

26,692. How many delegates were present when you received that mandate?—I should say about 130.

26,693. What was the mandate that you received from them? I know you proposed the resolution. What were you entrusted by them to do?—We had been discussing, of course, the great scarcity of coal that winter. I was the Joint Secretary of the London Food Vigilance Committee at that time, which was dealing with the scarcity of coal and food, and other things, and they passed a resolution on the instructions of the Executive who had considered the Agenda at the previous meeting, and when it came before the Trades Council, it was carried unanimously.

26,694. Was there much of a discussion on it?—Usually a discussion upon those matters, at that time, lasted about an hour.

26,695. Then they passed a resolution instructing you to support it, in favour of the nationalisation of mines?—Yes.

26,696. Are you, personally, in favour of nationalisation?—My personal view, of course, is in favour.

26,697. Having got to that point, I want you to tell the Commission, quite shortly, what are your reasons for being in favour of nationalisation?—From the pit to the consumer, there seem to be, in my opinion, too many people dipping into the profits all the way. I have examined, myself, during the past twelve months, into various commodities besides coal, and I have found that, with nationalisation of some of those commodities, including coal, you could sweep away a lot of unnecessary labour and also unnecessary profits.

26,698. You put that very clearly, and I will only ask you two more questions. Could you tell me if the London Food Vigilance Committee is still in existence?—Yes, the London Food Vigilance Committee is still in existence, and a report is published once a month by me.

26,699. Has that ever expressed any opinion upon the nationalisation of mines?—Yes, it has expressed its views on many occasions, and, of course, it specialised principally upon the food side, because, at the time we were most active was in the summer of 1918, when we demonstrated in Hyde Park—ono of the largest demonstrations ever held there—and had deputations to Lord Rhondda, on the 1st August and other times. We wrote to Mr. Guy Calthrop dealing with the coal question.

26,700. *Mr. Sidney Webb*: It has been complained that this Commission has not given sufficient attention to the views and needs of consumers. Now the workmen that you represent are not connected with the coal trade in the main, are they? I suppose the coal porters are?—We had the coal porters in, but owing to the difficulty in getting a delegate at their busy season they unfortunately dropped out last year.

26,701. Therefore I may take it that the Trades Council in so far as it is expressing an opinion about the coal mines is not speaking from the point of view of the miners but from the point of view of the London consumers?—Yes, the London consumers.

26,702. That is to say, your members, 160,000, may be taken to be one-sixth or one-seventh of the whole population of the households in London?—Yes.

26,703. The view you are expressing is really a consumers' view, is it not?—It is a consumers' view pure and simple.

26,704. Of course your members are not many of them rich. It is the mass of poor consumers you are speaking about, is it not?—Some of my members have had to suffer considerably through the scarcity of coal in the winter time, because under private enterprise distribution failed entirely.

26,705. I do not know whether in the resolution that was moved you had in view only the getting of the coal in the mine, or the distribution of the coal as well. Do you think that your members were thinking of distribution as well as production?—Yes, I believe they were in favour of distribution as well as ownership.

26,706-7. Would you personally (I must not ask you about your members) be in favour of superseding the present mass of small coal dealers in London by some of the public organisations, say the London County Council, for instance?—Well, publicly I have advocated municipalisation of coal distribution in London. The London County Council could obtain supplies, and the municipalities could distribute them.

26,708. *Mr. Frank Hodges*: Is there any suggestion that the Miners' Federation of Great Britain has ever approached you as Secretary of the London Trades Council or approached the Trades Council itself with a view to getting the support of the Trades Council to the proposition of nationalisation?—There has been no approach made, and, in fact, we have not approved of the miners' proposition this time coming before the Labour Party, and we have put an amendment down to it. We have had no communication from the Miners' Federation of Great Britain during the period I have been Secretary.

26,709. Neither officially nor unofficially?—No, neither officially nor unofficially.

26,710. *Sir Adam Nimmo*: I suppose you represent the general Trade Union view in your district?—I do.

26,711. Is it the view of the Unions you represent that industry generally should be in the hands of the workers?—If you are going to classify the workers as the people of the country as a whole, then they are in favour of that.

26,712. Do you refer not only to what are called the working classes but to all classes?—My people look upon those who are necessary in production or distribution as being workers, whether they are managers or porters or any other shape or form, and they do desire that those people who are necessary shall own and control the industries.

26,713. I suppose your suggestion is that the Trade Union should have a very big say in the control of the industry?—I never knew a trade unionist who wanted to interfere in those things that he does not understand. If there are men who are to-day paid high salaries for managing, the trade unionist is quite prepared to allow those men to continue their work that they are best fitted for.

26,714. Do you mean your view is that every man should be in his own place?—Yes.

26,715. And that the best ability of the country should be brought to bear upon the industry proposed to be owned and controlled?—Yes.

26,716. Is that your view?—Yes. The workmen's representatives should be upon every board, because wherever they have been tried they have proved successful to my knowledge.

26,717. Would you say that they should have representation on these boards in proportion to their numbers?—No, I do not think numbers count. I think the intelligent man if he is able to put his case intelligently will get his point, if it is reasonable.

26,718. You are not here to insist upon a dominating influence?—No, on the contrary. With regard to Boards and those things, such as we have had to deal with during the war, which was abnormal, we had the admission from Lord Rhondda that where the workers were on them they were most effective.

5 June, 1919.]

MR. DUNCAN CARMICHAEL.

[Continued.]

26,719. Would they act, really, in an advisory capacity?—In an advisory capacity, and be there to see fair play so far as the workmen were concerned.

26,720. I see you say there was a considerable amount of money lost, in your view, between the pit and the consumer?—Yes, it goes into people's pockets who have done no useful work in the transit.

26,721. Do you know that in detail? Do you know the figures in detail?—Not in coal, but I know it in various other commodities that have been handled by the Government during the war.

26,722. Is it your view that, in regard to those other commodities you would nationalise their distribution as well?—Certainly, because it is proved that you can do it far better nationally than you ever had it done privately.

26,723. And you would be making really for the nationalisation of the distribution of commodities?—Certainly.

26,724. Do you think that would be a wise plan to follow?—I feel sure of it.

26,725. And thereby close all individual enterprise that stood behind the distribution of these commodities?—Yes. It is a burglar's enterprise. The burglar is a very clever man very often, but I would stop his career, and with regard to those people who are doing nothing but taking what they have not created I would stop their career just as much.

26,726. But I think you said a minute ago you did not know what the charges were in connection with the distribution of coal?—Yes.

26,727. Therefore you cannot say whether in respect of coal that the analogy of a burglar is a correct one or not?—No.

(The Witness withdrew.)

(Adjourned to to-morrow morning at 10.30.)

SECOND STAGE—TWENTY-SIXTH DAY.

FRIDAY, 6TH JUNE, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM.

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

SIR ADAM NIMMO.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB.

MR. EVAN WILLIAMS.

SIR ARTHUR LOWES DICKINSON, }
SIR RICHARD A. S. REDMAYNE, } (*Assessors*).

MR. ARNOLD D. McNAIR (*Secretary*).

MR. GILBERT STONE (*Assistant Secretary*).

MR. JOHN JOSEPH TERRETT, Sworn and Examined.

26,728. *Chairman*: I think you are the Honorary Secretary of the National Food Vigilance Committee?—Yes.

26,729. You are a member of the National Union of General Workers?—Yes.

26,730. You are the District Secretary of the Lancashire and Cheshire Branch of the National Democratic Body?—Yes.

26,731. I must ask you a word or two about your various organisations in order that it may appear upon the record. First of all with regard to the National Food Vigilance Committee, who are they?—It is a body of trade unionists and socialists which was formed in the first year of the war to agitate and deal with questions affecting the cost of living.

26,732. Are they a body which is spread over the whole of the Kingdom, or are they confined to one particular area?—They are spread over the whole of the Kingdom.

26,733. How many members are there?—The Committee are about 42 in number.

26,734. How many do they represent?—They are a voluntary organisation.

26,735. I understand that. There is a Committee of 42. I want to know how many constituents the Committee represent?—They call themselves a Com-

mittee—they act as a Committee—they are simply formed as a Committee.

26,736. Do they represent themselves only?—Yes, you may put it in that way, certainly.

26,737. You are the Secretary of these 42 gentlemen?—That is so.

26,738. Where do they live?—In London principally and in Lancashire.

26,739. How many of the 42 live in London?—Twenty-four.

26,740. I suppose the balance in Lancashire?—Sixteen in Lancashire and two on the Tyneside.

26,741. You say you are a member of the National Union of General Workers; who are they?—The National Union of General Workers is the largest union of general labourers in this country.

26,742. How many are there?—350,000.

26,743. Who is their Secretary?—Mr. Will Thorne, M.P. I want to say I am only a member. I do not appear in any representative capacity for them.

26,744. I understand that. The last one that you are attached to is the National Democratic Party?—Yes.

26,745. Where are their headquarters?—Sicilian House, London.

6 June, 1919.]

MR. JOHN JOSEPH TERRETT.

[Continued.]

26,746. How many members are there of that party?—There must be about 100,000, I should think.

26,747. Are you officially connected with it or are you merely a member?—I am officially connected.

26,748. What is your official connection with them?—District Secretary for Lancashire and Cheshire.

26,749. Now I will first of all deal with your 42 gentlemen—the National Food Vigilance Committee. Have you ascertained the opinion of your Committee with regard to the nationalisation of mines?—Yes.

26,750. What is it?—Our view is that the nationalisation of the mines in the form it was suggested by the Miners' Federation Bill, unless it is amended, will be one of the greatest curses that could come on this country.

26,751. Unless it is amended, it is one of the greatest curses that could come? Now will you please tell me, if you can, what are the views of the National Union of General Workers—what do they think about it?—They have never been consulted on the subject.

26,752. What about the National Democratic Party? What do they think about it?—The National Democratic Party take very much the same view as the National Food Vigilance Committee. They are rather inclined to favour nationalisation, but they regard it as a very great danger unless amendments are introduced to safeguard the public?—That is the position.

26,753. Now will you perhaps excuse me for having left the most important thing to the last? What are your views about it?—Those are my views, that, unless there are certain amendments introduced to safeguard the public in the Miners' Federation Bill, the nationalisation of the mines will be a greater curse than it is a blessing.

26,754. What amendments do you suggest?—Our view is this, that it will be necessary to so alter the Miners' Federation Bill as to include the constitution of another body besides the Mining Council which is proposed in that Bill, and that there shall really be, if the mines are nationalised, two governing bodies, one whose work will be to control production and the other will be to represent the various classes of consumers and to control transport and distribution, and we want a second body to be invested with powers that they will be able to challenge any tyrannical or oppressive act on the part of the body which controls the production in the direction of overcharging the public or by raising wages to an unjust height, thereby imposing upon the public a burden which would really have to come out of the earnings of other classes of workmen very largely. We want them to have the power to challenge that, and if the body controlling the producing of coal does not agree with the body which represents the consumers' interests, then we want the matter to go to an independent arbitration.

26,755. Now this is my last question: You are honorary secretary of this National Food Vigilance Committee, and you are a member of the National Union of General Workers, and in the district of Lancashire and Cheshire of the National Democratic Party. What is your own occupation? Are you a workman?—Not at present. At the present moment I am a paid official of the National Democratic Party. Before that I was working as a meat packer.

26,756. *Mr. Robert Smillie*: Will you tell us the names of the officials of the National Democratic Party?—The general secretary is Mr. David Gilmore, the chief organiser is Mr. Jarrett, the chairman of the executive is Mr. J. F. Green, M.P., the chairman of the organising committee is Mr. J. A. Seddon, M.P.

26,757. Can you tell me how the National Democratic Party is financed?—It is financed in exactly the same ways as any other democratic political party in this country, by applying for subscriptions and using them when they come in.

26,758. Would you oblige the Commission by putting in a balance sheet of the Democratic Party, with an account of the subscriptions and where they come from?—I am not in a position to speak on that point without consulting the executive.

26,759. Are you giving evidence here on the part of the National Democratic Party?—I am giving evidence on behalf of the Lancashire and Cheshire district.

26,760. Would you ask the official of the National Democratic Party to supply the Commission with a balance sheet stating where their money comes from and how it is obtained?—If the Commission wants a balance sheet of the National Democratic Party, it seems to me that it is the business of the Commission to send for it, and not me.

26,761. You are here as a witness for them?—For the Lancashire and Cheshire district.

26,762. And you want to strengthen your importance by your connection with the National Democratic Party?—It is not necessary to have regard to any importance of mine. You can take me purely as an individual, if you like.

26,763. *Sir Allan Smith*: We have been told that this question of nationalisation has been approved on repeated occasions by the Trade Unions Congress. Is your union, the National Union of General Workers, affiliated to the Trade Unions Congress?—Yes, and the National Union of General Workers have always supported the broad principle of nationalisation: they have never gone into details; in fact, its details have hardly ever been gone into anywhere in the Labour Unions.

26,764. Have your Committee taken any vote in order to represent your views?—We have never taken a vote on the question direct.

26,765. Can you tell me what is the average ballot of members of the Trade Unions?—That is rather difficult to say; it varies. It is generally agreed by Trade Unionists that the system of taking Trade Union ballots is an imposture from beginning to end, and requires reform.

26,766. What numbers of persons do you think go to a ballot?—I should think if you manage to get 50 per cent. on an important question, you have done very well; if it is a strike, you might get 95 per cent., perhaps, in some circumstances.

26,767. What is the average proportion?—I do not know that there are any figures that would enable us to judge.

26,768. Do you think one-tenth of the membership is a good vote?—It is all I should expect on many political questions such as this.

26,769. *Mr. Herbert Smith*: Am I right in saying that Mr. Will Thorne, M.P., is on the Parliamentary committee and elected by your Union?—Yes; he was elected by the Trade Unions Congress on that committee.

26,770. Was he nominated by your society to that position?—Yes.

26,771. Would you be surprised to hear that on two occasions at a very recent date he and Mr. Clynes have spoken in favour of the nationalisation of mines?—I am in favour of the nationalisation of mines so long as the public are protected and we do not drift, as this Bill will carry us, into one of the worst syndicalisms that has ever been imposed on this country. It will mean the enslaving of men in your Union to men in yours.

26,772. You need not get excited?—No, but I may as well speak plain and straight to you.

26,773. You came here in a dual position. Will you tell us how your National Democratic League is financed, and who the people are who are at the head of it?—All I can tell you about it is that its finances are a great deal cleaner than the finances of the Independent Labour Party.

26,774. That is not saying much, unless you clear it up?—If you want the matter cleared up, it is your duty, as a Commission, to send to the party and ask for a statement of funds—that is the best way—and not to waste the time of a witness who has come here to speak on the question of the nationalisation of mines.

26,775. I want to ask you about the reply you made to Sir Allan Smith with regard to the voting. Do not your rules provide for the method of voting as laid down by the Registrar-General?—Exactly; but because the Registrar-General has accepted a particular form it does not make it perfect, and it does not make it satisfactory.

26,776. I have asked you a question?—And I say Yes.

6 June, 1919.]

MR. JOHN JOSEPH TERRETT.

[Continued.]

26,777. Do your members got supplied with a ballot paper and are they not left to vote as they think fit?—Exactly.

26,778. Then will you tell us why it is corrupt?—I did not say it was corrupt. I say it is unsatisfactory, because the position is this: that the ballots which are taken in trade unions should be taken in such a fashion that they are as secret as the ballots that are taken in a Parliamentary Election, and unless you do that I say there is no independence in the voters.

26,779. Which society do you speak about that does not take the votes in secrecy?—The Miners' Federation for one.

26,780. The Miners' Federation supply the members with a ballot paper, and they put it in a box without any interference by anybody?—Yes, I am aware of that; but when I found them in a row in a tramcar near Wigan filling up those ballot papers last March on your strikes, and even threatening boys to make them sign, it is pretty clear to me that that is no satisfactory ballot.

26,781. You are talking about one particular district as to which I have no knowledge. Is it a fact that your party issued a circular advising men and boys all to work?—Yes, we issued a circular—anyone is entitled to do that—advising them to vote against the strikes. We have a perfect right to do it.

26,782. I am not questioning any right; I only want to know the facts. I want to put it to you that the method of voting is as secret as anything can be?—No, it is not.

26,783. That it is just as secret as where there are Parliamentary canvassers?—The only proper thing to be done is to have a ballot taken in such absolute conditions as to enable the worker to record his vote as secretly as he records it on a Parliamentary Election. It is really a more important vote than a Parliamentary vote.

26,784. *Chairman*: We are very much obliged to you for your very clear evidence. Do you desire to add anything or to make any further statement?—Yes, Mr. Chairman, I want to point out an additional reason or two why we are pressing so vigorously for this reform of the Miners' Federation Bill.

26,785. *Mr. R. H. Tawney*: May I ask who are "we"?—In this case I am speaking definitely on behalf of the National Food Vigilance Committee.

26,786. Will you tell us about that National Food Vigilance Committee? I am not trying to get at you—but will you tell us who are on it?—The Chairman of the National Food Vigilance Committee is Councillor Tom Kirk, of the West Ham Town Council, the Vice-Chairman is Councillor Miller, of the Widnes Town Council.

26,787. Is it composed of representatives of trade unions?—No, it is composed of voluntary members who are interested in the question of food and the cost of living, including coal. We decided not to have any delegates. We thought one volunteer was worth more than ten delegated duffers, because they only waste time.

26,788. Do any of the Executives of the larger Cotton Societies belong to your Council?—Yes, Mr. George Barnes of the Tape Sizers' Amalgamation.

26,789. You know the cotton trade?—Yes.

26,790. Is that a large society?—It is one of the key industries in the cotton trade.

26,791. Do you think it a large society?—It is not a large society, but it is a very important one.

26,792. Does the President of the Weavers' Amalgamation belong to it?—No, he has never been asked.

26,793. Does the Secretary of the Weavers' Amalgamation belong to it?—No, he has never been asked.

26,794. Does the President of the Operative Spinners belong to it?—No, they have not been asked. The committee was not formed on those lines. When you have a committee formed on a question of domestic education you do not ask every secretary and chairman to attend.

26,795. It is quite unnecessary to defend yourself?—Then why waste my time with asking a number of absurd questions about it?

26,796. It is for me to decide whether I am wasting your time, not you?—Certainly, but there have been

a few witnesses here who have been talked to about wasting time. I do not want to waste time.

26,797. *Chairman*: I am sure you will treat the Commission with respect?—Quite so.

26,798. *Mr. R. H. Tawney*: Does the President of Card Room Operatives belong to it?—No.

26,799. Or the Secretary?—No.

26,800. Do any of the branches of the Amalgamated Society of Engineers in Lancashire?—No, they have not been asked.

26,801. Or any of the officials?—They have not been asked.

26,802. *Chairman*: You were about to give us the advantage of your views on this question of nationalisation. Will you please continue?—We are pressing for this business very seriously indeed, because we can see that under this Bill which has been promoted by the Miners' Federation we shall be practically put in slavery to the miners' leaders. That is what it really means. The consumer will have no protection whatever. Then I want to say that so far as we are concerned we do not trust a large section of the miners' leaders. We have noticed that they have abused such powers as they possess. There is one gross and glaring case, and that is the disgraceful treatment of Mr. James Walton, M.P., by the Yorkshire Miners' Association. Although the majority of the members of my committee are both old socialists and old trade unionists, we say that a body of men who act in that way are absolutely unworthy to be trusted with the enormous power over practically every industry in this country which would be conferred on the members of the Miners' Federation. Next by the fact that they are going to have a council composed of 20 members, 10 of whom will be nominated by the Miners' Federation—what does it mean? It means that whoever is the Minister of Mines is going to run his Council with the assistance of those ten men, because if he does not then the onus and the responsibility will rest upon him keeping together the diverse elements represented by the other ten, and of course he is not going to do that; so that this Bill practically means that the nation is going to buy out the mines of this country and hand the property over to the Miners' Federation. That is why I say you must have an absolute safeguard from the consumers' point of view.

26,803. Is there anything else you desire to add to that very clear statement?—There is just this, that not only is it necessary to protect the consumer from the dangers of a syndicalist development in the miners' direction, but it is equally also necessary to protect the consumer from the dangers of bureaucracy. Even supposing those difficulties did not arise with regard to the nomination of a large number of miners, even if the thing were run by a much more mixed committee than is suggested by the Bill of the Miners' Federation, you would still be face to face with the dangers that arise from bureaucracy. Our experience in agitating the food question—because the bulk of our experience has been with the Food Minister—is that we have found that, unchecked by a real representation of the consumers, the result of bureaucratic administration is not to cheapen the cost of production, but to make it dearer. All the way along the line we have found this fact, that wherever you have expelled the private trader and brought in the bureaucracy with no check imposed on behalf of the consumer every cost has gone up, and in the special instance of the Food Ministry, which was formed for the purpose of reducing the price of food, instead of that the effect of its operations has been to drive it up to a height which hitherto it had not attained, and probably it would not have attained, even under the difficulties of private management during the war. That has simply arisen through the blunders of officialism. You cannot stop it, you cannot check it, unless you have some power appointed direct from those who have to pay for it—that is, the consumers. Parliament is absolutely useless for controlling the expenditure of a spending department. It has been proved during the war, all the way along the line, that all Parliament can do is to inquire where the cash has gone after it has been spent. Then, of course, with regard to bureaucratic management, we have noticed

6 June, 1919.]

MR. JOHN JOSEPH TERRITT.

[Continued.]

this, that the bureaucracies first of all make the muddle—they get into a mess—and then they become unscrupulous. They start imposing on the public the vilest muck by force, compelling them to pay the top price for it, in order to repair the wretched mistakes and muddles into which they have tumbled. They have done that with regard to various articles of food, and, as a matter of fact, they are really doing it with regard to coal now. All over London the general complaint is that you are not supplied with coal at all; you are supplied with the very worst kind of muck that will only burn by an apology. We all know what we have had; we have had the rottenest beef, the vilest bacon; and as for the beer supplied by the bureaucracy, you had better ask the miners in Lancashire about it. All this has been done to cover mistakes—in some cases to get more

revenue; but it all implies an absolutely unscrupulous method of doing business. It is a position of rooking the consumers worse than the profiteers have rooked them. It is quite possible when you get the mines nationalised you will have the same sort of thing going on there, and even the bureaucracy conspiring in order to make the public pay for their goods. After all, the Chancellors of the Exchequer—we know what they are: they are always in a plight to raise the wind, and if they can get the officials, say, of a body controlling the mines to charge the public more for their coal in order to get a revenue for the Chancellor of the Exchequer, it is quite possible it may happen if you have no power to deal with it.

Chairman: I think we now know what your views on this subject are. You have put them forward very forcibly and clearly.

(The Witness withdrew.)

Mr. R. H. Tawney: May we have a return of the total number of royalty owners classified so as to show the number of owners receiving royalties of

different values? That can be got from the Inland Revenue.

Chairman: I will send a message about it.

MR. CONCERNING THOMAS CRAMP, Affirmed and Examined.

26,804. *Chairman:* I think you are the President of the National Union of Railwaymen?—That is so.

26,805. I have not any *précis* of your evidence; therefore I must ask you one or two questions in order that it may get on the notes. Will you kindly tell me the number of men in your Union?—Approximately about 460,000.

26,806. When did you become their President?—At the beginning of 1918. Would you allow me to correct the first statement? You said men: we have a large number of women also who have come on the railways during the war.

26,807. Now I must explain to you, as I have not a *précis* of your evidence, what we want you to give us your opinion about. We have had called before us a number of gentlemen from what I may call the employers' side who gave their views upon nationalisation with regard to various industries. We have had gentlemen connected with the steel industry; we have had gentlemen from the Chambers of Commerce of Birmingham, Leeds, Glasgow and London, and we thought it right that we should have the views of the men employed in the various industries other than the mining industry. Now you are President of the National Union of Railwaymen, and I should like you please to be good enough to tell us first of all your own views, and then the views, as far as you know them, of your constituents upon this question of the nationalisation of mines?—My views, and the views of those whom I represent, I think, coincide perfectly. We are emphatically in favour of the nationalisation of mines for reasons both direct and indirect. Directly, we are concerned mainly in getting better conditions for those whom we represent. The railways are not quite in the same position as other concerns in this country; that is to say, their charges are limited by statute; they cannot in a general way pass their charges on to the consumer. It follows that whenever we make an endeavour to get improved conditions for the people whom we represent we find obstacles are placed in our way which are difficult to overcome by reason of the costs incurred by the railway companies. One of the definite costs incurred by railway companies is, of course, the cost of coal. In private hands the cost of coal has fluctuated very greatly and has risen considerably, of course, during the war. In the early days of the war when we endeavoured to obtain an increase of war wages we were met with the rejoinder from the companies' side that they had already had to pay out more for coal—enormous sums. They could not give us the figures exactly, but they had to pay out enormous sums, which they could not pass on to the consumer in the way that other concerns could do. Now it seems to me that if you had a nationalised system of mines you would at any rate have a stabilised system of prices—that the people who owned the mines in the ultimate are the people who are interested in the whole of the other industries of the

country. They would not place undue burdens upon the railways by raising the cost of coal above the necessary line; and, therefore, if you could have that stability, if you could have that consideration, as it were, given to the cost of the coal supplied to the railways it would have a material effect upon the prosperity of the consumers themselves. Therefore we believe that directly we might have a very great deal to gain from the nationalisation of the mines. Indirectly the people whom we represent would benefit to a very great degree by the raising of their social conditions. Outside of London the majority of railwaymen with their wives and children live in Yorkshire, Lancashire or the Midlands, generally speaking in coal-producing areas; that is to say, wherever there are large bodies of miners there are comparatively large bodies of railwaymen also. We believe in the nationalisation of the mines. You would raise the social status of the miners; the houses in which they live would be improved, and their social conditions generally would be very much better. I think you will realise that it is obvious that where there are other bodies of men and women living in proximity to those employed in any large industry the conditions must be reflected on the others; that is to say, that in the midland and in the northern districts one finds railwaymen living in very poor houses indeed, paying very high rents, and living under rather unpleasant conditions, because they are conditioned by the bulk of the population who are miners. Therefore we believe that our conditions would be improved indirectly also by the process. There is one other point of a subsidiary nature, and that is this, that probably a nationalised system of mines would have regard also to the condition of other large industries, and that the quality of coal supplied to our railways might be improved. The quality to-day varies very much in different parts of the country. In South Wales the engineman will tell you he has much more difficulty in dealing with his material than he has in some other parts of the country where they have a different class of coal. It might well be, though I do not press this point so much, that we would have a better class of fuel for our mon to work with than we have under the system of private ownership. Those, Sir, are the chief points which weigh with us when we favour the nationalisation of the mining industry.

Chairman: I am very much obliged to you for your evidence. I will now ask Mr. Smillie on one side and Sir Allan Smith on the other to put some questions to you.

26,808. *Mr. Robert Smillie:* Do you believe that you are speaking, as far as you have been able to gather, for the whole of your membership?—I am quite sure of that.

26,809. I do not know whether you have made yourself acquainted with the proposals in the Bill which the miners have drafted for the nationalisation of the mines?—I have them in my mind in a general

6 June, 1919.]

MR. CONCERNORE THOMAS CRAMP.

[Continued.]

way, but I confess I have been so very busy of late that I have not all the specific points in mind.

26,810. Have you heard the question discussed at Labour Conferences?—Yes.

26,811. I suppose you have not found very much opposition from the other Trade Unions?—I have found practically no opposition from other Trade Unions.

26,812. *Mr. Frank Hodges*: As chairman of the National Union of Railwaymen, have you received any application from the Miners' Federation during the last week or so soliciting your support for nationalisation?—No, I do not remember anything.

26,813. Do you know whether any other officials of the National Union of Railwaymen have received any communication from any authorised federation officially soliciting their support?—No, I have no knowledge of anything of the kind.

26,814. *Sir Allan Smith*: Your Union, along with the Miners' and another Union, form what is known as "The Triple Alliance"?—Yes.

26,815. You were concerned in the troubles of February and March of this year along with with the miners?—Yes.

26,816. You have given a very clear statement of your reasons for favouring the nationalisation of the mines. I understand from your statement that the main consideration that has moved you to favour the nationalisation of the mines is that it would increase the prosperity of the workpeople concerned in it?—Yes.

26,817. It would improve their houses?—I think so.

26,818. Do you know whether the condition of workpeople's houses has been improved of recent years?—I think not; generally speaking, it has not.

26,819. Do you know whether any of the colliery owners have been re-building their houses?—Not to my knowledge.

26,820. Would you be surprised to hear that some have?—I should not be surprised to hear that some have, because there might be a very small section doing that which I did not know about.

26,821. You have no knowledge on that subject?—I have not. I live in Sheffield when I am at home, which is not very often of late, but I have not noticed there any progress in building operations in colliery villages.

26,822. You say that the quality of the coal suffers from the fact that it is won by private enterprise?—No, I do not say that the quality of the coal suffers in that way, that would be absurd; but I say at the present time the coal which is supplied to engines in some parts of the country is not of the best quality to enable the men to get on well with their work.

26,823. Who supplies the coal to the railway companies under present arrangements?—Colliery companies.

26,824. Under whose directions?—Under their own directions, I presume.

26,825. Are you advised of the powers of the Coal Controller?—I beg your pardon, I did not know that you meant during the period of the war.

26,826. I said at present?—It is my mistake, of course, the Coal Controller docs.

26,827. So that he may, as well as private enterprise, contribute to the unsatisfactory position of the war supply?—I should assume that he, under duress of war circumstances, is placed in that position.

26,828. You have made a special point about the fluctuations in the price?—Yes.

26,829. Do you know whether it is the case that railway companies contract ahead for a long period for their supply of coal?—Yes.

26,830. And on that basis no doubt the price is determined?—Yes.

26,831. What then causes the extraordinary fluctuations in the price of coal?—So far as the war was concerned, of course, the permissive act caused enormous fluctuations because it was based on the most favourable contracts that any particular company made. In normal times I should assume that the ordinary ebb and flow of the market had a great deal to do with it.

26,832. What has ebb and flow of the market to do with a contract for a period of time?—When they

make their contracts, it is pretty obvious, I think, that the colliery companies, on the one hand, would take into account all the circumstances likely to arise in their judgment during the next few years. If they thought they were going to be placed in a favourable position, they would make their contracts as high as possible; on the other hand, if they thought they were going to be in an unfavourable position, they would not.

26,833. That price would remain for the period of the contract?—Yes.

26,834. So that in respect of that contract there would be no fluctuations in the price?—I am not complaining of the long or short period, but I say there are fluctuations.

26,835. Do you really anticipate that those fluctuations would be avoided under nationalisation of the mines?—I think they would. I think the Ministry of Food gave a very excellent lead in that direction when, during the war, with all their difficulties, and having to improvise this machinery, they were able to check to some extent the extortions of the profiteers, and immediately they started to de-control, one found the profiteers began to show their hands.

26,836. Would you suggest that the Ministry of Food is altogether free from the charge of profiteering?—I would not say that they were altogether free, but I would say that they were very much more free than the private firms.

26,837. Having regard to the fixing of the price, do you suggest that the quality of the article was kept up?—I think in some cases the quality was improved; in other cases, owing to the war conditions, it was impossible to improve it. I am speaking with some little knowledge of this, owing to the fact that I am a member of the Consumers' Council.

26,838. Do you think that the benefits that you have suggested would follow nationalisation would be possible without nationalisation?—I do not.

26,839. Take housing, for example: do you think it is necessary to nationalise the mines in order to improve the housing?—I think that if you nationalise the mines, you would give opportunities for better houses which are non-existent under private ownership.

26,840. That may or may not be, but do you think that it is necessary to have nationalisation of the mines in order to secure improvement in the houses?—Not absolutely.

26,841. I suppose you have in mind the Government programme with regard to houses?—I had in mind some time ago a Government programme which I have forgotten.

26,842. But I suppose you know there is such a thing contemplated as a Ministry of Health?—Yes, I have heard of that.

26,843. And one of the functions of that Ministry is to deal with houses?—Yes.

26,844. And that the Government proposes to indulge in a very large expenditure of money in the improvement of houses?—Yes.

26,845. Do you think it is necessary to nationalise the mines in order to procure greater safety for those employed?—I think it would tend in that direction.

26,846. Do you think it is necessary?—Not absolutely necessary.

26,847. Do you agree that, in a large proportion of cases, as far as special regulations with regard to safety are concerned, that these regulations have followed the precautions that have actually been taken in private mines?—No, I do not know that. My knowledge of mining is not sufficiently extensive.

26,848. But your knowledge of mining is sufficiently extensive to enable you to say that it is necessary to secure nationalisation in order to secure an amelioration of existing conditions?—Yes.

26,849. *Sir J. Chiozza Money*: You have been a member of the Executive of the Consumers' Council?—Yes.

26,850. Can you affirm, from your own knowledge, or not that the de-control by the Ministry of Food of important articles of food, the price immediately rose, not only a little, but a great deal?—Yes, that is absolutely true, and the quality deteriorated.

6 June, 1919.]

MR. CONCERNORE THOMAS CRAMP.

[Continued.]

26,851. Is it a fact that in consequence of that the Food Minister is seriously thinking of again controlling those articles?—Yes.

26,852. Had your Food Council advised him to do that?—Yes.

26,853. Are you aware that, in evidence given before this Commission, leading coal merchants have said on oath that in their opinion if the Coal Control were removed prices would immediately shoot up?—No, I am not aware of that.

26,854. *Mr. Evan Williams*: I think you said your remarks with regard to the quality of coal applied to the pre-war period?—No, I said the control of contracts and the supply of coal apply to the pre-war period, in answer to Sir Allan Smith.

26,855. So that what you said about the quality of the coal that has been supplied for locomotive purposes applies only to the pre-war period?—No, generally. Of course, I was speaking on the question of contracts that Sir Allan Smith asked me about.

(The Witness withdrew.)

Chairman: Now I have from time to time made statements as to the witnesses and evidence that has been produced before this Commission, and I propose now to make the last of those statements. I very much hope that we have now got to the last witness, Sir Richard Redmayne. He will be the 112th witness called on this stage. It may be necessary to have two short witnesses, and I shall interpose them during Sir Richard Redmayne's evidence if they come. I very much hoped that Sir Richard Redmayne's evidence would be concluded this evening, but it is obviously of such importance that I hope on this occasion every member of the Commission will address to Sir Richard Redmayne such questions as he thinks are appropriate. I shall not on this occasion ask only one member on each side. The matter is not to be hurried. I think we must adjourn somewhere about 5 o'clock or half past this evening, and should it so happen that Sir Richard Redmayne's cross-examination is not concluded by that time the Commission will have a short public sitting on Friday of next week. It will then begin its private deliberations and the report will be in the hands of the

26,856. I am not dealing with Sir Allan Smith's question. Your statement was that the quality of coal supplied by the collieries to the railway companies was not as good as it ought to have been?—No, I am afraid I have not made myself clear. Coal which is supplied in some cases to railway companies is drawn from collieries in the locality—obviously during the war the most sensible thing to do—but it makes it much more difficult for a locomotive man in many instances, and in my opinion it might be deemed advisable under a nationalised system to supply a locomotive class of coal, which would be a good thing for the railways generally.

26,857. Irrespective of the distance which has to be covered?—Yes. I do not stress that point too much.

Chairman: We are very much obliged to you for giving us your views.

Government by the promised time. With regard to the 112 witnesses who have been called on this particular part of the inquiry, the analysis of the classes of witness is as follows: coalowners, exporters, merchants and factors, 15 witnesses. You will recollect that the coalowners deputed four gentlemen to speak on their behalf, and others were summoned as well. Mine managers and surveyors, 5 witnesses; miners and miners' wives, 6 witnesses; consumers on behalf of the employers, 7 witnesses; on behalf of the workmen, 3; scientific economists, 12; finance 3; costing, 2; State control and civil service, 3; safety and health, 6; mechanical and electrical employments in mines, 3; State ownership abroad, 5; and the most numerous class of witnesses whom we have listened to were the royalty owners, 25. The balance making up the 112 are miscellaneous witnesses who cannot be conveniently grouped under any particular class. I hope, therefore, that in the time allotted to us we have been able to consult and have the advantage of almost every party or group of parties who are concerned in this country.

I will now call Sir Richard Redmayne.

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B., SWORN and Examined.

Chairman: I propose with regard to this evidence to read part of it myself, then to ask Sir Richard to read part, and to relieve him from time to time by reading other parts myself, or by asking the Secretary to do so. This is the *précis* of evidence by Sir Richard Redmayne, K.C.B.:

"QUALIFICATIONS.

In view of the fact that from certain quarters suggestions have been made that my practical experience in mining both technical and commercial is not as complete as my theoretical knowledge, I deem it advisable to state what was the nature and extent of my practical experience (both technical and commercial) prior to my entering the service of the State.

(1) I was for 8 years employed at the Hetton Collieries in the County of Durham as a mine apprentice, under official, and under manager. These are large collieries with an output of over 3,000 tons *per diem*, coke ovens, washing plant, rolling stock, private railway and shipping staithes.

(2) I was for nearly 2 years manager in Natal of colliery property, and was also commissioned by the Natal Government to carry out certain work on its behalf in connection with mining.

(3) For 8½ years I was Resident Manager of the Seaton Delevall Collieries in Northumberland where I had charge of a group of collieries with an output of 3,000 tons *per diem*, rolling stock, private line and shipping staithes, and three villages (947 houses).

(4) I was for some years a Managing Director of the Stafford Coal and Iron Company (two large collieries in North Staffordshire working coal and ironstone, and with blast-furnaces and by-product works), and of the Florence Coal and Iron Company in the

same county. At these collieries I and my co-managing director were responsible for the general conduct of the business of the collieries, financial, commercial and general. I was originally called in to report on and value these mines and works, and, as the result of my report was requested by the late Duke of Sutherland to join the Board in the capacity named above and undertake the complete reorganisation of the Stafford Coal and Iron Company. The result of this policy was to convert a disorganised and losing concern into a very flourishing undertaking.

(5) I was also a Director for some years of the Blaina Colliery in South Wales.

(6) I also had a general consulting practice as a mining engineer and was consulted by colliery owners and others in respect of colliery and other mining enterprise both at home and abroad. I relinquished my practice and directorships on entering the Civil Service.

(7) I have had experience of mining in Belgium, France and America (the latter metalliferous).

(8) I was, and am, a member of the Institution of Mining Engineers (Past President of the South Staffordshire, East Worcestershire and Warwickshire Branch).

I was, and am, a member of the Institution of Mining and Metallurgy (Past President).

I was, and am, a member of the Institution of Civil Engineers.

I was, and am, a Fellow of the Geological Society; and I have for some years, since I entered the Civil Service, been an Honorary Member of the Surveyors' Institute.

(9) For the past 11 years I have been H.M. Chief Inspector of Mines, and since its initiation, Head of

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

the Production Branch of the Control of Coal Mines and Technical Advisor to the Controller.

(10) My position in the Government service, and more especially of late years whilst serving as Chairman of the Coal Mining Organisation Committee, and as a member of the Coal Exports Committee, Chairman of the Coke Committee, Vice-Chairman of the Coal and Coke Supply Committee, and later still as Adviser to the Coal Controller, and a member of the Coal Conservation Committee, has, I think I may say, afforded me peculiar facilities for taking a broad and comprehensive view of the coal trade of this country and expressing a sound opinion thereon.

In view of the opinion which has been frequently expressed by witnesses and commissioners regarding the stagnating effect of Government service, perhaps I may be permitted to add that I am not conscious that since my transfer from private practice to State service my efforts have been reduced or my work has become less efficient, although less remunerative to me personally.

HEADS OF EVIDENCE.

Mr. Sidney Webb asked that I should give evidence on the ownership of minerals and Mr. Balfour requested that I should speak on the subject of the further application of labour saving appliances and introduction of economies into mines. I, therefore, now deal with these two subjects as well as other matters and I propose for the purpose of clearness adopting the following sequence in giving evidence:—

- (i) Ownership and Value of Mineral Properties in the United Kingdom.
- (ii) Possibility of Greater Application of Mechanical Appliances in Coal Mines.
- (iii) Economies of administration and working procurable under a system of collective production as opposed to the present system of numerous small enterprises.
- (iv) Present State of the Industry in point of production."

26,858. Sir Richard, will you now read your *précis*, making such remarks as you think desirable from time to time:

"(I) OWNERSHIP AND VALUE OF MINERAL PROPERTIES.

I treat of this subject under the following sub-heads:—

- (1) The present system of ownership of minerals.
- (2) Restrictions in the way of development arising from the present system of ownership of minerals.
- (3) The method adopted in valuing mineral properties.
- (4) Considerations to be observed in any system of expropriation of mineral properties.

(1) *The present system of ownership of minerals.*—I desire to make the preliminary observation that my evidence relates to coal, clays, and stratified ironstone only. I omit, as without the scope of the present inquiry, metalliferous minerals. Clays and certain stratified ironstone only being included because it would be difficult to exclude them in view of the fact that in many cases they are interstratified with the coal seams and worked in conjunction therewith.

The right of ownership of coal may be stated in general terms as being of the following kind:—

It is a general maxim in common law that whatever is in a direct line between the surface of any land and the centre of the earth belongs to the owner of the surface."

It is quite obvious this is a metallurgical fallacy. If the whole world was divided up into plots they could not go down to the centre of the earth. It would be like an inverted cone: "Hence, the owner of freehold lands has a right to all minerals underneath the surface with the exception of 'Royal Mines,' " Royal Mines being gold and silver:—

"This general rule, however, is capable of being modified by showing a title to the minerals distinct from that to the surface.

In mineral districts, the ownership of the surface is often vested in one person and that of the minerals in another.

The severance of the minerals from the surface may arise by a grant of the lands with an exception of the minerals, or the lands may be manorial.

In Copyhold lands the minerals under the surface (or on the surface) belong to the lord while only a possessory interest is vested in the tenant. But neither the lord without the consent of the tenant, or the tenant without the licence of the lord, may open and work new mines.

The right of Common is the right of taking a profit in the land of another in common with others. *Primâ facie* the lord of the manor is entitled to all waste lands within the manor, and it is not essential, in order to support this *primâ facie* title, that he should show acts of ownership in such lands. When common lands are enclosed and no special provision is made to the contrary the allotments are freehold.

The law governing the right to work minerals under the present system of ownership is of interest and may be of value in connection with the present enquiry.

It is a general rule that when anything is granted, the means of attaining it, and all the fruits of it (so far as the power and estate of the grantee extends) are also granted. Thus, a grant of minerals involves also the power and right to enter and to work them, unless there is some restriction in the grant itself.

A tenant in tail has an estate of inheritance, to hold to himself and the heirs of his body, or to himself and particular heirs of his body. These tenants in tail are entitled to commit any kind of waste, but this power continues only during the life of the tenant in tail (waste consists, amongst other things, in opening new mines or quarries). A tenant for life, without being authorised, cannot commit waste.

A tenant for life, *without impeachment of waste*, may open and dig mines at his own pleasure, though a court of equity would probably interfere if were shewn that he was exercising his privilege in a wanton and malicious manner.

A tenant for a term of years is similar to a tenant for life, but often the mines are reserved to the owner with power to work. If not, neither the lessor nor the lessee can alone work the unopened mines.

A *mortgagee in fee* in possession has a right at law to commit any kind of waste, being then considered as the absolute owner of the inheritance; but he will be restrained by a Court of Equity which will direct an account of timber; for instance, cut down and order it to be applied in reduction of the mortgage debt and a similar principle has been applied to mines.

Copyholders cannot, unless there be a special custom to warrant it, commit any kind of waste, and any species of waste not warranted by the custom of the manor, operates as a forfeiture of the Copyhold.

Ecclesiastical persons who hold lands in right of a church, are disabled from committing waste, though, like other tenants for life, they have the right to take from the lands the materials necessary for repairs they cannot legally open new mines, but they can work those already open

(2) *Restriction in the way of development arising from the present system of ownership of minerals.*—It will be seen from what I have just said that there are certain *legal* restrictions operating against the free development of mineral areas. Quite apart from these, there are other forces operating in the same way inherent to the present system of ownership, some of these may be indicated.

In the early days of the Control of Coal Mines, cases were brought to my notice where the inability to obtain powers by colliery owners to work minerals was leading to loss of output. The difficulty in the way in most cases was either (1) due to the refusal of the owners of the minerals to treat; or (2) the fact that the ownership of the minerals was unknown; or (3) the sub-division of the area into very small ownerships whereby the cost of negotiating a lease in the ordinary way was prohibitive and out of proportion to the value of the coal to be won or worked

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.O.B.

[Continued.]

The Controller of Coal Mines had no power to deal with such cases and the accumulation of a number of them led me to advise that powers should be taken under the Defence of the Realm Act to secure the necessary powers, and this was accordingly done and I attach copy of the Order in Council in question.*

I might say for the information of the Commission that the particular Defence of the Realm Regulation 9, g.g.g. is not now operative; it has been repealed:—

"It will be recognised that the powers conferred on the Board of Trade by this regulation had to be very sparingly used, and only in such circumstances where there was the clearest evidence that the putting of such powers in operation was calculated to further the rigorous prosecution of the war. Further, they were of a temporary nature only, inasmuch as the Regulation in question has now been repealed. Many applications received were unable to deal with owing to the fact (1) that there was no shortage of the particular class of coal in question"—it was governed by the conditions of the war, and if there was a special class of coal, as the perusal of the Regulations will show, that only constituted our power of intervention,—“or (2) that there was no labour available to get the coal and so no additional output would have been obtained.

The fact, however, of the Department being clothed with these powers did enable it to bring pressure to bear in the proper quarter, and to cause Lessees and Lessors to arrive at a mutual settlement and a number of cases were settled in this way. I have it on the authority of various mining engineers that they also found the powers of use as a lever in persuading owners of minerals to lease their mines on terms in keeping with those current in the district.

I would point out that so far as the Department was concerned, it always endeavoured to see that the royalty owner received the market value in respect of rent for the minerals, and the usual and proper protection for surface damage, if any.

One important case dealt with by the authorisation of my Department was that affecting a large colliery in the Midlands, where a considerable area containing about 2 million tons of Silkstone coal was involved. The coal in question was a coking coal of high quality, and it was shown that additional output would be attained by the matter being dealt with. The area in question was being rapidly surrounded by goaf, and was accessible only to the one colliery.”

I proceed to give a number of the cases which follow, and they may be of a very contentious nature. I can give chapter and verse for each case stated, and I have before me a number of these cases. I prefer not, unless compelled to do so, to give the names of the particular collieries; it would not be fair.

26,859. Quite right.

“The area was divided up into a great number of small ownerships, it being no uncommon case for one owner to possess only 20 perches of coal. In many cases the ownership of the mines had become severed from the surface and no title could be shown by the present owner of the surface. In other cases of small area, several separate ownerships were involved, such as first and second Mortgagees—Leaseholder and Freeholder.

The area being covered with buildings, the method of workings adopted was to leave permanent pillars for the support of the surface which permitted the extraction of 45 per cent. of the coal.

It will be obvious that in this instance the ordinary methods of negotiation were absolutely prohibitive to the working of the coal and the national interest was served by the area being freed for working.

I believe the cost of negotiating small areas of coal is very often out of all proportion to their value, and is a substantial addition to the Royalty Rent. I recently had particulars of a case where the purchase price of the minerals was £350 and the negotiation costs were 80 guineas, and this despite the fact that no complications of title or of working were involved. It will be readily seen that such costs as these coupled

with stringent regulations as to reparation of surface damages constitute a very serious tax on the working of coal in certain cases.

Unknown ownership of Minerals.

I have knowledge of the fact that considerable areas of coal are of unknown ownership, take as one instance, the severance of properties caused by roads, canals and railways. Subsequent sales and re-sales of adjoining properties have resulted in title to the mines under the severing strips being lost, and I have no doubt whatever that in numerous cases the parties receiving payment for such coal have no title thereto. In other cases, such coal, where not leased by the Colliery Company, is worked by them and the proper royalty rent placed to a suspense account against the possibility of a claimant appearing. I should most certainly say that the royalties on coal as above described should be the property of the State. It may be urged that these areas are small and not worth consideration, but in the aggregate they amount to considerable sums.

Refusal of Owners to Lease Mines.”

I am using the word “mines” in the Staffordshire term, which means area of coal.

“A number of cases have been brought to my notice of either absolute refusal to lease mines, or the demand of prohibitive and unreasonable terms, even where no grounds for asserting that mineral support was essential, existed. I venture to say that an examination of the majority of colliery plans would show cases where coal had been left unworked for one or other of the reasons given above, resulting in an absolute loss of coal for ever. I have one case in mind at the present time of divided ownership of minerals where one joint owner out of five is preventing coal being leased and the main headings of a colliery are standing at the coal in question.

In several cases that were brought to my notice the fact that the Board of Trade powers existed resulted in terms being arrived at by the mediation of my Department. I am strongly of opinion that powers should exist to enable such cases to be dealt with, for not only is a total loss of coal occasioned, very often extending into the lateral as well as the immediately subjacent minerals, but expense is incurred in so re-arranging the workings as to cut round these areas, and this further involves loss of output.

Minerals in Lease to one Colliery Company lying within the take of another Colliery.

A common source of trouble arises from the fact that with ownership in detached areas, the whole of a mineral owner's property is leased to one colliery company, with the result that trade jealousy may prevent that company extending facilities for working of certain areas on proper terms to an adjoining colliery in whose mining area they exist. I have knowledge at the present time of a case where a colliery company have shortly to give up possession of the lease of an area now forming part of their royalty, which has been leased along with other properties to an adjoining colliery.

The present lessees have to withdraw their rails and leave their present roads, although the area they are working will not be accessible to the new lessees for 20 or 30 years, and in some cases the coal to be left is actually surrounded by goaf and is of such extent that it will probably never be worked by the newcomers, though accessible to the present lessees. I maintain that cases such as these constitute grave national losses, and cannot be defended on any economic grounds.

I believe that the incidence of private ownership of minerals is often prejudicial to the economic working thereof. A large proportion of the cost of winning coal is due to dead work, such as the construction and maintenance of shafts and underground roads, and the fullest value will only be obtained where proper regard is had to the geographical situation of the minerals in relation to the various shafts and roadways by which they can be won. It is obviously unsound to allow collieries to be closed from

* See Defence of the Realm Manual, 6th edition, p. 98, Reg. 9, G.G.G.

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

exhaustion when further mineral areas could be profitably and economically won therefrom if facilities were obtainable.

Barrier Coal.

I have had brought to my notice cases where large mineral owners have leased their minerals to several colliery companies, and have imposed conditions as to the leaving of barriers on the rise which are hampering development by collieries in that direction. Such mineral owners are actuated no doubt by regard for the security of their property on the dip, but it is put to me that the apprehensions are groundless, and I do know that there is conflict of opinion by equally eminent authorities, and if the coalfields are not nationalised, (by coalfields I mean royalties) there should undoubtedly be an arrangement by which it should be possible to refer such cases to some overruling authority, who would lift consideration of the matter out of the realm of self-interest."

I lay stress on the fact "if the coalfields are not nationalised"—that is to say the mineral areas—nationalisation of the mineral areas being, in my opinion, the most simple and effective mode of removing what are obstructions to the free development of the coal.

"The subject of avoidable loss of coal through barriers, though very important, may perhaps to have been by some witnesses rather over emphasised, for it must of course be recognised that the leaving of barriers is sometimes a condition inherent to good and proper mining; it would, for instance, be very unwise to work out a barrier holding up "rise" water, if the result would be to allow the water to find its way to the deep, from whence it would have to be pumped at a very great cost, in addition to which serious damage and increased cost of working the dip coal would result.

Again it must be borne in mind that barriers are to some extent necessary for purposes of keeping separate the ventilation of adjoining mines.

Incidentally, I may mention that I do know that for some time eminent mining engineers have had under their consideration, schemes for co-operative pumping at central stations, with the object of reducing pumping costs, securing more efficient drainage and permitting certain barrier coal to be worked, and I think that in the carrying out of such schemes, the authority and powers of the State might with advantage be invoked.

Barriers separating royalties vary from 40 to 100 yards in width. A consolidation of royalties doing away with the necessity for boundaries for any but engineering purposes would bring a great part of the coal now so left into the market. The late Sir George Elliot estimated that this would, together with the saving in coal at present consumed in working circuitous haulages occasioned by these barriers, add 10 per cent. to the annual output (1893).

Support of the Surface.

I have already referred to the obligation of the mine owner in many cases to take responsibility for damage to the surface, and I do not suggest that mine workers should be freed from this liability, but I maintain that where the damage is likely to be considerable some graduation of the price of the coal should be made, as the custom now is the royalty owners not only often obtain payment for their coal at full value, but afterwards claim large sums for the injury of the surface due to the working of such coal. I know that in some cases it is at the option of the lessor or lessee to leave surface support for buildings, and in some cases coal is being left as support unnecessarily. The mine worker may have plenty of coal to work and prefers to leave pillars sooner than face the risks of onerous claims for surface damage. In other cases where the lessee is anxious to work the coal he is prevented by the prohibition of the lessor. The damage which would result if the coal was swept out in a wide face would very often be negligible and thus valuable coal is being left unnecessarily."

I may say I have tried this myself under my own house. On one occasion I worked the coal by long wall face and packed it tight, and the damage was very much less than would otherwise have been the case.

26,860. It subsides evenly?—Yes, a wave of subsidence, and then it settles.

26,861. *Chairman*: I will now ask the Secretary to read the next part. When we come to any point where you wish to add anything or make observations, will you say what you have to say?—Certainly.

26,862. *Secretary*:

"*Support of Railways and other Statutory Undertakings.*

I do not consider that at the present time any very serious loss is taking place in the leaving of coal for support of railway works which is not absolutely necessary for the public safety or on grounds of economic policy, viz., that the cost of repairs would far outweigh the value of the coal. Mining engineers to railway companies at the present time have, of course, a much better conception of the effect of colliery workings than was the case a generation ago. The recent Howley Park decision, which gives a railway company a common law right of support outside the statutory distance, and which it was apprehended might result in the sterilisation of coal, has in very many cases been met by mutual arrangements between colliery companies and railway companies, on the basis of a proportionate distribution of the cost of repairing the damage caused by working the coal, and the setting free of the embargo which would otherwise exist.

Certain of the older Canal Acts, however, confer on the undertakers an absolute right of support, and I believe that in some cases this right is being exercised without regard to the value of the coal support entailed being taken into account. I am of opinion that such cases should be the subject of inquiry with a view to the national interest being asserted.

Onerous Terms imposed by Lessors.

I have frequently met with cases where the prospective lessor has known that his particular area of coal was of vital moment to a colliery company, and in some cases opportunity has been availed of to extract extortionate terms, either of wayleave or by unduly inflating the price. Underground wayleaves are, in my opinion, absolutely unjustifiable where the exercise of such wayleave does not inflict any loss on the owner of the property passed through.

In some cases lessees are forced to take in lease and pay minimum rent for seams which they have no possibility of being able to work in a reasonable time, merely to obtain the lease of vital areas.

Difficulty sometimes arises on the termination of a lease where renewal is sought. It may be that the lessees have had to pay a minimum or certain rent, which has been in excess of the value of the coal worked during the term of the lease, and on the conclusion of the lease they may be overpaid to a considerable extent. Such overpayments are frequently in whole or in part forfeited which, while it may be right in law, does not seem to be right in equity in all cases.

(3) *Value of Lessors' Agents.*—I admit that in many cases the existence of a mineral agent who is looking after the interest of the owner of the minerals is to secure the working of coal which would otherwise be lost—particularly is this the case where the royalty is paid on a tonnage basis, where, if no check is taken, the tendency might be to leave coal which presents for the moment some difficulty in working.

I consider, however, that the present system of Royalty Owning is against the National interest and, if the minerals were owned by the State, it would be possible to remedy many abuses which now exist.

(4) *The method adopted in valuing mineral properties.*—The valuation of mineral property may arise in three ways:—

(a) On sale of the freehold.

(b) On the disposal of the goodwill, i.e., sale of the colliery.

(c) For the purpose of local assessment, i.e., rating.

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.O.B.

[Continued.]

I am at the moment concerned only with the first of these. In making a valuation for the sale of the freehold the principal points for consideration are:—

- (1) The probable quantity of marketable coal contained in the area in question.
- (2) The date at which the property will commence to be worked if not already worked.
- (3) The probable yearly output; and
- (4) The annual income derivable therefrom calculated at so much per ton of coal or per acre, or by whatever other means is locally adopted.

Having ascertained the probable revenues derivable from the various seams and the period of their endurance, the annuities are capitalised by allowing to a purchaser a fair rate of interest with an annuity to recover the capital.

With regard to the amount of the percentage to be allowed, or years' purchase a mineral property is worth to a present purchaser, much difference of opinion exists. In fact the question of "interest upon the capital invested" and the "interest required to redeem capital" is at present imperfectly understood and carried out. I, personally, have adopted the following figures, as the result of rather long practice and a comparison of the methods of the most experienced valuers of mineral property and the examination of many hundreds of valuations made over the last 100 years:—viz., the allowance of 8 per cent. upon the annuity which, in the case of perpetuity, would be 12½ years' purchase; [The duration of a mine is less than a perpetuity; the allowance for that depends entirely upon the length of time the mine has to last] and for the purpose of redemption of the capital an allowance of 3 per cent. [the method of valuing these annuities is that described in King's "Theory of Finance," third edition].

But it will be seen that an obvious fallacy exists in the allowance of so low a discounting figure as 3 per cent. at the present time—the conditions in respect of the value of money have altered considerably during the last ten years or more, particularly so of late.* Instead of redeeming capital at 3 per cent., one can and should substitute 4½ to 5 per cent. The effect of this increase would be to increase the amount of the purchase price. I am doubtful, however, whether one should increase the percentage allowed to a purchaser much beyond 8 per cent. Any increase would of course reduce the amount of the purchase money.

In determining the value of a virgin property, one has to assume a date at which it will become productive, frequently a matter of pure surmise, and presenting a field for the exercise of the valuer's knowledge and experience. The further the income derivable from the property is deferred the less, of course, is its present value.

(5) *Considerations to be observed in any system of expropriation of mineral properties.*—If the nationalisation of minerals in connection with the coal mining industry is undertaken it would appear necessary to nationalise:—

- (1) All those minerals which are worked in conjunction with coal and on which royalties are payable, viz., coal, clays, and ironstone. Royalty is not, or very rarely, payable on building stones worked from coal mines, and therefore may be neglected, and only in some cases is royalty payable in respect of clays worked from coal mines. Where the "clay" is of a special kind, e.g., fire-clay of South Staffordshire and West Yorkshire, or the ganister of Yorkshire, rent is charged and is usually higher than in those cases in which it is a by-product of coal mining; e.g., North of England, where it is not incumbent on the colliery owner to work the clay and where, I believe, either no rent is chargeable thereon or merely a nominal rent. It is all a question of the terms of the individual lease.
- (2) I think, as the Coal Industry Commission has been established to inquire into the Coal

Mining Industry, it need not—cannot, in fact—concern itself with the question of the nationalisation of the minerals worked by other branches of the mining industry, e.g., the oil shales of Scotland, the hematite of Cumberland and North Lancashire, the clay ironstone of Cleveland in the North Riding of Yorkshire, or the tin of Cornwall, and the lead, zinc, and copper of other parts of the country. Although it is to be presumed that were coal and the minerals worked in conjunction therewith nationalised, the collateral question would be forced to the front.

- (3) But the question does arise for immediate consideration as to how those properties adjacent to coal mines are to be treated which, though not containing coal, contain the minerals (clay and ironstones) which are worked in the adjoining coal mines. I take it they would have to be treated in like manner to the coal mining properties."

That is rather an important point. I hope I have made myself clear. In this country there are stratified iron deposits, such as the clay ironstones of Cleveland, which come under the Coal Mines Act of 1911 and the previous Coal Mines Acts. I exclude those entirely. It is a complete and separate field. But inter-stratified, as in the case of North Staffordshire, with the coal and ironstones, and a man may be one month working in coal and, conceivably, the next month working in ironstone, and the minerals come along the same road and up the same shaft. It seems quite impracticable to exclude the ironstone in a case of that sort from the coal—to separate them. I want to make that point quite clear.

26,863. *Secretary:*

"Mineral properties can be divided under three heads:—

- (a) Developed or producing properties.
- (b) Potential. Coal known to exist but awaiting development.
- (c) Properties in which the existence of coal is uncertain but suspected.
 - (a) The first, as I have shown, it is easy to value.
 - (b) As to the second, while such minerals lie dormant, the owner is in exactly the same position as he would be if the minerals did not exist at all, and, as I have said, in valuing such properties one would have to take into consideration the probability in point of years as to development taking place and determine the extent of deferment accordingly. My own practice in the case of unopened mines would be to allow, in deducing the present value deferred, from 20 to 25 per cent."

That ought to be years. In an unopened mine as I have said further on, you have to exercise your experience in determining the probabilities as to the time when it will become productive, that is to say, at what time the annuity will commence and in such a case when valuing such properties I have adopted the practice of regarding the deferment as being from 20 to 25 years.

26,864. *Secretary:*

"My own practice in the case of unopened mines would be to allow in deducing the present value (deferred) from 20 to 25 per cent. to a present purchaser, and redeem the capital at 3 per cent. That is, in the case where the prospects were of an average character; but there is great variation in the value of such properties, as wide differences exist as to certainty and extent of occurrence of minerals in such lands."

Yes, the words "per cent." should remain as they stand. If any member doubts how that is put into practice I can work out an example for him and show it to him.

26,865. *Secretary:*

- (c) As to the properties included under the third heading, the mineral rights are probably valueless.

* For correction, see the opening remarks of the Witness on Friday, 13th June.

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

The valuations under (a) will exist in nearly every case and could soon be modified to bring them up-to-date, and many valuations will exist under (b). Perhaps the best way would be for a Valuation Board of Experts to be set up and proceed simultaneously, district by district, to draw up a schedule of valuations when the work could, no doubt, be accomplished within a year, as it could proceed on a pre-arranged and common basis of valuation for the whole country.

Thus, it would be reasonable to at once exclude from the valuation:—

- (a) All areas as to which the existence of coal, ironstone, or fireclay therein is at present unknown.
- (b) All properties, the ownership of which is undetermined within a period of, say, one year from the date of notification of the commencement of the valuation of coal, &c., properties in the United Kingdom.
- (c) All deposits below a depth of 5000 feet from the surface (the deepest coal mines in the world are just about 4,000 feet, and 4,000 feet was the depth limit assumed by the Royal Commission on Coal Supplies in estimating the available resources of coal in the United Kingdom). I do not doubt that some day coal will be worked from a greater depth than this limit, but the period is so long deferred that we may safely exclude the coal from this scheme of valuation.
- (d) It would probably be deemed just to exclude underground wayleaves."

Sir L. Chiozza Money: Is it permissible to ask Sir Richard a question on this point? Does he contemplate remaining with the State a liability to pay compensation in respect of coal hereafter found in at present unsuspected fields?

Witness: That is dealt with later on in the proof. I can deal with the question now, if you like.

26,866. *Chairman:* Yes, please do so?—Inasmuch as the existence of the coal is unsuspected and may be found and determined by Government boring, I suggest later on in my proof that there should be a proper comprehensive system of boring determined on now in fields which may be suspected; the boring for the discovery of that coal should not, in common justice, confer any benefit on the owner of the surface, but it should be the property of the State. Appendix B relates to that point, or, at least, it indicates the coalfields that may exist.

26,867. *Secretary:*

"To allocate in advance of valuation of each individual property a definite sum to cover the expropriation for division among the several parties concerned has occurred to me as a possible means for settlement, and has the merit of simplicity, but I am a little doubtful as to whether this would be a sound procedure, and it would probably result in the total purchase price being in excess of what was required to meet the just demands of the owners. But some rough idea of the total expenditure, which would be involved in the transaction might be arrived at by valuing the annual sum derivable from royalties payable in respect of coal alone."

Witness: That is, royalties exclusive of wayleaves.

Secretary:

"From the Royalties Commission (1889-1903) the average royalty paid on coal in Great Britain and Ireland is about 5½d. per ton, and the average wayleaves, &c., upon all coal produced, i.e., whether sold or not, is about ¼d. per ton.

Taking an average of the annual outputs for the five years immediately precedent to the war at 270,000,000 tons, viz:—

1909	263,774,312
1910	264,433,028
1911	271,891,899
1912	260,416,338
1913	287,430,473

Average; 269,589,216, say ... 270,000,000

and deducting 5 per cent. for colliery consumption (in some cases an allowance is made for colliery consumption, in others none is made), there remains 256,500,000 at 5½d. = £5,878,125, which may fairly be taken as the annual sum paid in respect of royalties alone. Deducting from this figure the annual value of the mineral right duty, the average of which over the period 1912-1916 = £321,000, we have the sum of £5,557,125. The value of this annuity, allowing 8 per cent. to a purchaser (12·5 years' purchase), is worth in present money £69,464,062, say, £70,000,000, or if 10 per cent. is allowed to a purchaser, the present value would be £55,571,250. As this annuity may for the purposes of valuation be regarded as a perpetuity, it is not necessary to consider the question of redemption of capital.

The position of the State, if it became the purchaser, would be as follows:—

It would say, in effect, to each owner of a mineral tract: The value of your property to a purchaser is in present money "X," and you are required to lend to the State the amount of this purchase price at, say, 5 per cent. per annum, in exchange for which you will receive bonds bearing interest at that rate in perpetuity, which bonds you can sell whenever you like.

The question arises, Would the national total "X's" amount to £70,000,000 or £55,571,250, as the case may be? I doubt it for two reasons, viz:—

- (a) In many instances the annuities being for short terms are not worth 12½ or 10 years' purchase; and
- (b) In many cases, e.g., undeveloped properties, the annuities would be deferred for a number of years and, consequently, in present money are worth very little—in some cases nothing. Properties which will not be developed for 50 years are practically valueless and might, therefore, be at once omitted from a compensation scheme.

I have mentioned the exclusion of underground wayleaves from the valuation, but there are two forms of wayleave which should in all equity be included in a system of compensation, viz.: (1) shaft wayleaves and (2) surface wayleaves, in those cases where the grant of these wayleaves tend to destroy the amenities of an estate. In some cases an owner of coal benefits considerably by sinking shafts on his property, as his coal may thereby be worked earlier than would otherwise be the case; on the other hand, it may be that the shaft is such, and the main roads driven through his property that the working of his coal is deferred for many years. In the former case I am doubtful as to whether he should be compensated for the loss of his wayleave; in the latter case he should be compensated.

It has been from time to time suggested that exploratory borings should be carried out by Government with a view to determining the existence of new coalfields (see Appendix B)."

Chairman: We had better look at that.

Witness: That is an extract from an address I delivered a few years ago on this point.

Chairman: I will read that.

" APPENDIX B.

EXTRACT FROM A PRESIDENTIAL ADDRESS (BY WITNESS)
TO THE INSTITUTION OF MINING AND METALLURGY,
APRIL, 1916.

An estimate of the available resources of coal was made by the Royal Commission on Coal Supplies which reported in 1905. But since that date our knowledge in respect of the available resources of coal has been considerably enlarged.

The extensions—then of a somewhat speculative character—of the Notts and South Yorkshire fields have been proved, and the limits are now roughly known. The compass of the Kent coalfield has been more correctly determined, and extensions of the Warwickshire field have been proved. Geologists are now not only speculating on the co-termination of

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

the Warwickshire and Staffordshire coalfields, but as to the probability of the existence of an entirely hidden coalfield in Southern England. Much, however, yet remains to be done in the way of exploratory work. Thus the eastern and western limits of the Warwickshire field have not yet been determined. In respect of the Staffordshire coalfield west of Birmingham, the area between Wolverhampton and Shifnal remains to be proved, and I incline to the belief that in the latter area there are considerable deposits of coal. Another large and apparently profitable area of investigation is in Lancashire, where there is every reason to believe that there lies, immediately under the Red Rocks to the south-west of Manchester, a very large tract of Middle Coal Measures, "the accessibility of which depends only on the thickness of the Permo-Triassic Cover." Much good work could be done here by correlation of existing information, but the area is so complicated by faults and the like that borings would seem to be absolutely necessary satisfactorily to prove the value of the extension of the coalfield in this direction. Coming south, many borings have been put down round and to the north of London—well into Buckinghamshire—and the underground geology of this area is broadly known. But to the west, viz., the area between Loudon and Bristol, remains unproved.

Dr. Watts, in his Presidential address to the Geological Society in June, 1912, drew attention to this subject, pointing out that in Eastern and Southern England there exists "an area of Palæozoic rocks unconformably covered by Neozoic rocks larger in extent than the uncovered Palæozoic outcrop of England and Wales." Exploration has not proceeded far, and he argued that the time had come "for the organisation of a systematic survey of this area by means of a considered series of borings, so planned as to investigate the structure of the concealed Palæozoic floor, to ascertain the thickness of cover, to locate any coal basins which may form part of the floor, and to elucidate their exact tectonic conditions in order to determine their suitability for profitable working."

It is eminently desirable that further extensions of our coalfields should be defined, and hidden fields, if they exist, be discovered to replace the dying fields of South Staffordshire, Bristol and elsewhere. It is to my mind essential that the exploratory work necessary to prove the areas indicated should be placed in the hands of persons thoroughly versed in both geological and engineering knowledge."

Then, returning to your *précis*, you say:

"In those instances where such boreholes were successful, it seems to me to be doubtful whether the owners of the surface should receive an unearned increment to their property, though they should be compensated for any damage done to their property which might result from the working of the minerals contained therein.

(6) *Gradual acquisition by the State of Mineral Properties.*—An ingenious suggestion was made by Mr. Gemmel to the effect that, were the State to determine upon Nationalisation of Minerals and Collieries, this could be effected by its acquiring the properties as and when the leases fell in, and then and at such time take over and work the collieries. But this does not commend itself to me as a satisfactory solution. The effect would ultimately be disastrous to production; owners of collieries having no expectation of renewal, there would be no inducement to carry on development other than was necessary to maintain the normal output during the term of the lease, at the expiration of which the collieries would be in a very backward state, and, consequently, not in a position to continue the current rate of output, beyond the terms of the lease, without the expenditure by the State of considerable sums on development, during the prosecution of which the output would suffer."

26,867. Now would you kindly read the second paragraph of your *précis*?—Yes.

"POSSIBILITY OF GREATER APPLICATION OF MECHANICAL APPLIANCES IN COAL MINES.

1. The wider application of mechanical appliances for getting and transporting coal in mines does not

tend, as is sometimes ignorantly supposed—perhaps I should say used to be supposed—to a decrease in employment of labour and a lowering of wages, quite the reverse is the case, as we see in America, where labour shortage in the past has led to the more extensive application of so-called labour-saving devices with resulting increase in wages. Decreased costs allow of the payment of higher wages. Indeed, the chief impression left by an historical review of coal mining in the United Kingdom is the enormous progress made during the last two or three generations in every respect except the return made to capital. This is apparent when one reflects that such everyday features of colliery working at the present time as shaft cages and guides, the safety lamp, the steam locomotive, the trade in coke, ventilating fans, wire ropes, mechanical haulage, mechanical screening, the use of compressed air, and application of electricity to signalling, lighting and motive power have all been introduced within the last 120 years. There is hardly an appliance (save the simplest tools) or a machine in use at a modern colliery which could have been made at the beginning of the last century. Wages increased enormously; thus, taking the Great Northern Coalfield as an example, at the beginning of the eighteenth century the wages of coal hewers (roughly then as now, one-half of the workmen employed underground) were 1s. to 1s. 2d. per shift. One hundred years later they had doubled, being at the beginning of the nineteenth century 2s. 3d. to 2s. 6d. per shift of 8 to 12 hours, and at the end of the last century they were 5s. to 6s. for a shift of seven hours. (Free house and coals are not taken into account in these wages.) The return on capital, on the average, remained stationary."

The whole point there is to show that, after all, the introduction of these appliances, so far from acting as a deterrent to the advance in wages, in my opinion, has conduced to an increase of wages, the return on capital remaining stationary.

26,868. Mr. R. H. Tawney: Taking an average of what?—Taking one year with another. Taking the last 120 years, the average return on capital is pretty nearly what it is now. Such variation as there has been is not comparable to the variation in respect of increase in wages.

26,869. I only want to know what average means: It means over a period of years?—Yes. Then subparagraph 2 says: "It may be reasoned therefore that what has characterised the past will be true of the future, and it is in this direction that our hope must lie in keeping down the cost of production," namely, the further increase of so-called labour-saving appliances.

"There has at times been some opposition from the miners in the early days to the application of so-called labour-saving devices to mining, but a more intelligent realization of the benefits accruing therefrom now exists, and I am not aware that opposition does now exist to its introduction.

3. I have already in my previous evidence indicated in general terms the directions in which mitigation of loss of output from shorter working hours may properly be expected. I refrained then from putting a definite percentage value upon these prospective mitigating causes, and am still unable to do so, but I can indicate the probable further extent to which they can be adopted."

Then:

"4. *Mechanical Coalcutting.*—Mechanical coalcutting had at the beginning of the present century only emerged from the experimental stage. The table which I put in when giving evidence on the last occasion illustrated this.

Machines fitted for work in Longwall-faces are the type most commonly adopted. A further extension of these is possible, and the use of the reciprocating and "heading" types, so largely used in America, is capable of considerable extension in those mines worked on the bord and pillar and double stall methods. The amount of coal cut per machine per annum for the years 1903–1918 inclusive in Great Britain and the United States of America respec-

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

tively shows the increasing gain in output which may properly be expected from this source."

26,870. *Chairman*: I do not think we ought to trouble you to read the tables, but I would like to take the total in 1903 when there were 643 machines. In 1908 (after five years) there were 1,659. By 1913, the next five years, there were 2,897. In 1918, the next five years, there were 4,047. So that from the year 1903 to the year 1918, a period of 15 years, the number of machines had gone up from 643 to 4,047?—Yes, about seven times.

26,871. And the output from 5,000,000 tons odd to 27,000,000 odd?—Yes. I would like to point out one curious fact, that the output per machine has gone slightly down.

26,872. In 1903 the output per machine was 8,158 tons; in 1908, 8,143 tons; and in 1918 the output has gone down to 6,820 tons per machine?—And may I point out that the average output per machine was roughly about 8,107 before, but that the decrease synchronises with the war period, so that that fact probably the conditions inherent to the war have to be taken into account.

Then passing to the next table and adopting the method of dealing with it which you did, Sir, it shows the total number of coal cutting machines in use and the output of bituminous coals mined by machines in America. In 1903 their machines were 6,658, and the latest year for which we have a return was the year 1916, when there were 16,197. The output cut by machine was, in the year 1903, 69½ million tons, and in 1916 there were 253½ million tons. The output per machine has gone up from 10,457 to 15,638. That is a very remarkable comparison, but one cannot put too much upon it. One cannot draw too many deductions from these facts because, as I say further on, "It should be stated that the American machines are nearly all of the percussive and chain-breast types and are working as a rule much thicker seams and under different conditions than obtain in the United Kingdom."

Chairman: Yes, I follow that. Then you say:

"It may be taken as clearly proved by practical experience that there are many seams where the adoption of coal holing machines in place of hand holing will ensure,—

- (a) a larger output from the same area of workings with the same number of men;
- (b) more "large" coal; and
- (c) a lower working cost.

This reduction in cost will be greater as the cost of labour is higher and the holing harder."

Witness: That may be regarded as axiomatic. The point at which it pays to introduce a coal cutter is largely determined by the conditions. It becomes increasingly economical the higher the rate of wages and the harder the coal. Then I say:

"Judging by published statements, 6d. per ton is an average saving, but it is doubtful whether cost of motive power in driving the machines is fully considered in all the statements. As has been stated elsewhere by witness—

"The working cost per ton is naturally the point which receives the first attention of the colliery manager, but it should not be overlooked that an increased production of large coal may give a profit considerably outweighing even some increase in working cost."

The North of England Institute of Mining Engineers issued a report on Mechanical Coal Cutting in 1903 in which are published the results obtained with machines under-cutting in Longwall faces at about 30 collieries in various coalfields of Great Britain. The examples included all the then best known machines and a great variety of natural conditions of working—thick seams, thin seams, level and inclined, good roofs and bad roofs, deep and shallow. The average saving in comparison with hand holing was 7d. a ton on labour in the face, but this 7d. had to cover first cost of plant and the cost of power and maintenance. But machines at many collieries were

being tried in a tentative and experimental way and the cost was therefore higher than it probably is at the present time."

It seems to me the time is ripe really for a thorough enquiry now by experts into the possibility of further introduction of coal cutters and machines, and if such a committee would visit America, I think they would gain some very useful knowledge.

"(5) *Conveyors*.—The rapid clearing away of the undercut coal is a matter of much importance and in this connection mechanical coal conveyors are of importance. They were introduced into mines at a date later than mechanical coal cutters. They are usually worked in conjunction with the latter but may be and are frequently used where mechanical coal cutting is impracticable.

In those mines in which, owing to liability to the occurrence of firedamp in dangerous quantity it is inadvisable to use electricity for actuating the coal cutters or conveyors the motive power can be supplied by air compressed some distance back from the face, the compressors being driven by electricity.

(6) *Mechanical haulage underground*.—There are two dicta true of all coal mines, viz., (1) wherever 7 horses are employed in underground haulage it pays to substitute them by a mechanical haulage engine. (2) The closer you can keep the mechanical haulage to the face the lower the cost for haulage. This has led of late years to the introduction of what is known as secondary mechanical haulage, the nature of which witness will explain."

With regard to that, the haulage on the main roads is carried out in the vast majority of cases—you might almost say in all cases but for the fact that there are a few exceptions—by mechanical means, either electric compressed air or by some system of mechanically-driven rope haulage. Those are large roomy roads and have cost a considerable amount to make and are laid with heavy rails. But there comes an intermediate stage between that haulage and the face haulage which is usually carried on by ponies and in some cases by hand, and that linking-up haulage is known as secondary mechanical haulage. It is haulage actuated by light engines along roads as to which, owing to the roof conditions not having perfectly settled, it is impracticable to make those roads fit for permanent haulage. Of late years this secondary haulage has been more and more carried out by mechanical means, and is still capable of being carried out in some cases to a greater extent by mechanical means than at present. That is the point I wish to make.

26,873. *Mr. Herbert Smith*: Have you any figures on that?—No, no definite figures. My knowledge is drawn from experience.

Then I say in paragraph 7:

"(7) *Winding, Pumping, etc., by Electricity*.—Witness endorses the statement made by Mr. Merz to the effect that if electricity were available in "bulk," that is if it were supplied from an electric system, it would pay to drive even colliery winding machinery by electrical energy."

The reason why I say "even" is this: A winding engine is a most peculiar piece of mechanism. It has to overcome considerable inertia in lifting the weight from the bottom; it gains speed, and that speed becomes at one point almost actual acceleration. Then it has to slow down and land its load. That is a most difficult process to carry out economically by electricity, and the last thing that would be driven electrically at a colliery or a mine would be the winding engine. But if electricity is supplied at such a price as, for instance, the price charged by the Newcastle Electricity Supply Company in this county, which is the largest electrical concern in this country, then it pays even to wind electrically. I put it as the last resource.

"(8) *Consumption of Coal at Mines*.—An investigation was carried out by the Distribution Branch of the

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

Coal Control into the consumption of coal at 23 representative collieries when the following facts were ascertained:—

	Tons per annum.
The total consumption at the 23 Collieries is	408,710
Equal to 9.5 per cent. of the total production at these Collieries.	
It was estimated that economies in consumption could be effected under various headings as under:—	
Without additional plant... ..	10,486
By Electrification	78,580
By installing other new plant...	8,600
Total	97,666

Equal, on present consumption, to a saving per annum of nearly ... 24 per cent.

The estimated coal consumption at Collieries is about 18 million tons per annum.* If, therefore, the possible economy at mines generally be taken at only half thereof the results shown at 23 mines the annual saving would be 2,000,000 tons.†

The reason I take 17,000,000 tons is because, as explained in the footnote, the actual consumption for boiler fuel is 16,856,341 tons. The balance is equivalent to waste heat converted into tons of coal.

"(9) It may be asked why, in view of the mitigating factors indicated above, they are not put into practice to a still greater extent than at present? The answer is that, in many cases, the present system of numerous separate ownerships militates against it. Thus, the larger the load factor the cheaper is the unit of electricity. Under a system of collective production power would be more cheaply supplied with a corresponding economy in the use of coal. Capital would also be available to allow of the smaller concerns adopting labour-saving appliances to a greater extent than at present. This is one of the directions in which the present system (of numerous small entities as against a combination of interests) is wasteful and extravagant."

Then I come to paragraph III.:

ECONOMIES OF ADMINISTRATION AND WORKING PROCURABLE UNDER A SYSTEM OF COLLECTIVE PRODUCTION.

(1) I have already, in my previous evidence, pointed out that the accumulated experience gained in the different coalfields might be so directed as to raise the standard of efficiency in many directions in operating the 3,129 coal mines at present existing in the British Isles. That that end could best be achieved by a system of collective production is, I think, obvious.

A system of "general" management broken into so many units, I suggest, falls short of the high water mark of efficiency. I have had an excellent simile put to me by a railway friend, "Assuming that each station on a railway system was left to evolve its own destiny, without control from a central authority at Headquarters, we should get something akin to the system of separate units which obtains in coal mining."

(2) *Distribution.*—Prior to the War, the distribution of coal was regulated mainly by the need for getting a market, plus the idea that only certain classes of coal were suitable for manufacturing purposes. As a result, coal was sent freely up and down the country from one producing area to another, regardless, to a large extent, of real requirements.

* viz., consumption of boiler fuel.	16,856,341 tons, or 6.2 per cent. of output.
Equivalent coal of heat from coke ovens or blast furnaces or from outside sources.	1,539,402 " 0.57 "
	18,395,743

† viz., 12 per cent. of 17,000,000 tons.

A great deal of misconception existed prior to the War, and still exists, as to a particular class of coal being necessary for a particular manufacturing purpose. In the majority of instances it has been demonstrated to be largely a question of efficiency of combustion.

The principle should be established that coal should be consumed as near the actual point of production as possible, with great resultant saving in transport; this can only be achieved by setting up central control.

The present system of private ownership of wagons is obviously wasteful. There are some 700,000 privately owned railway wagons hampering the railway companies by reason of special shunting and marshalling of the rolling stock. The system also has the effect of increasing colliery costs owing to the amount of shunting they also have to do.

Keen competition between rival coalowners allows of the foreigner in normal times largely exploiting the coal output of the country.

Prices should be regulated by a central authority comprising—

- Representatives of the Coal Owners.
- " " Miners.
- " " Government.

(3) *Central Purchasing of Materials for Collieries.*—A central purchasing agency would, as I have previously stated, make for efficiency and economy.

The material annually consumed by the collieries of the United Kingdom is enormous. It must be apparent that some 1,500 concerns purchasing materials independently cannot do so as effectively or cheaply as if they were one concern. It has been argued that combination in this respect would lead to combination on the part of the sellers. I would point out in reply to this that in respect of two items largely consumed at collieries this already exists as regards one of them, viz., explosives, and as to the other, pitwood, the commodity is mainly (normally) an imported article and in the hands of comparatively few traders.

(4) *Displacement of the vested interests.*—Economy of administration in this respect is obvious. The number of directors would be greatly reduced, as also the number of managing directors, consulting engineers, and general managers. The middle man would largely disappear.

(5) *Saving in Freights.*—A national coal combination could control freights to an extent that would be impossible to an individual freighter.

(6) *Underground Haulage.*—This would be simplified and cheapened by the abolition of eccentric boundaries.

(7) *Central Pumping.*—Under a collective system of production pumping could be concentrated at the most advantageous points with considerable resultant saving in cost.

(8) *Working of the Coal Seams.*—Generally, under a system of collective production artificial factors which impede mining would be removed. Owing to the extinction of the competition prevalent in normal times between rival coal owners coal, good and inferior, could be worked together instead of bringing up only that which is necessary to allow of one owner competing with another. It might be argued that the consumer would suffer in that he would on the average be provided with a poorer class of coal than heretofore, but this does not necessarily follow, and the fact of there being a lower grade of coal on the market would lead consumers to make use of it on the score of cheapness and adopt more scientific means of burning it than at present, with advantage to everybody."

I do not mean to say that the good coal would be excluded from the market, but there would be more inferior coal on the market and the average would be lower. If the consumer wished to have a higher class of coal he would still get it, but my point is that he would purchase the cheaper coal and improve his process of consuming it.

Chairman: Gentlemen, we now come to one of the most important parts of Sir Richard Redmayne's proof. I announced the day before yesterday he

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

would deal with the question of diminution of output. This paragraph is headed: "The present Position of the Coal Mining Industry in point of Output"; and I will ask him to read that.

Witness: With regard to the first paragraph, I have had to alter it because of a numerical error. It should read: "The movements in point of total output per shift per person employed and the total number of persons employed are shown by the figures before you." They are shown by a diagram also of which I have only one copy. "This discloses a disquieting fall in the output per person per shift worked, a reduction of fully 9 per cent. as compared with the pre-war figure and of nearly 5 per cent. as compared with June last year, and the declination has been gradual and persistent." Then:

"It is not easy to account for this fall. Mr. Straker has put forward one reason which, while it may be a partial explanation, does not, in my opinion, entirely explain the decrease—far from it—viz., that the mines are crowded by the miners returning from the Army and that there is insufficient pit room for the workers, with consequent diminished output per person employed. But I would point out that the decrease commenced nearly a year ago"—as a matter of fact it commenced before a year ago, and I have a diagram here which shows the whole thing graphically—"that is, before the advent of the large body of incoming men—and has continued on the down grade ever since. Other reasons which might be advanced as contributing causes to the decline are:—

- (1) Possible backward state of development of the mines and lack of plant.
- (2) The probable fact that the incoming men, owing to long absence from the mines, have not yet "got into their stride."
- (3) The fact that so many men are working on the minimum wage which, together with the war wage and the flat rate advance recently granted, allows of a considerable daily wage being obtained without resorting to payment by piecework.
- (4) Generally, the high rates of wages.

As to (1), the mines are not in a more backward state of development and are not less well provided with plant than they were a year ago.

As to (2) and (3), the same criticism that I have applied to Mr. Straker's contention is to some, but lesser extent, applicable to these possible explanations.

I think that probably the main explanation is to be found in (4).

The average miner works to attain a certain standard of comfort, and when that is attained he is satisfied. The higher wages rule, the less work is necessary to attain that standard. That there is a policy

(Adjourned for a short time.)

Chairman: It will be quite apparent to us now that there will have to be one other public sitting, and that will be on Friday next at half-past ten. Sir Richard Redmayne's evidence is too important to be dealt with in the short time at our disposal. The next and last public sitting will be at half-past ten, and there may be then two quite short witnesses, in addition to Sir Richard Redmayne. I hope we shall finish quite early on Friday next.

26,874. *Mr. Arthur Balfour:* Taking the mineral rights first: I gather from your proof that you really think the best way to dispose of all the disabilities is for the State to purchase the mineral rights?—That is my idea. I recognise that a royalty does fulfil a certain function; it is a differential tax on production, allowing bad collieries to be worked side by side with good collieries, using good and bad in the terms of the minerals that they contain. It seems to me that it makes for simplicity and directness and to develop the resources of the nation to the greatest advantage if the nation owns all the minerals.

26,875. When the last Commission was held on the question of royalties, that was in 1893?—It reported in 1893.

of deliberate and organised restriction I do not believe, but the result to the community as a whole may well prove very serious if something is not done, and done quickly, to remedy the evil.

I have, after careful consideration, come to the conclusion that I would be failing in my duty did I not bring these facts to the notice of the Commission. That the miners can increase their output, and have responded to an appeal to do so in the past when they realised in 1915 that the necessities of the nation demanded it, is proved by the results obtained in the period when the output per person per shift rose above the pre-war period to the extent of 4 per cent.

I know that the leaders of the miners are just as anxious as I am that the highest possible output, consistent with the health and safety of the miners, should be secured, and I feel sure were they to organise and carry out a crusade, having for its object the bringing home to the miners the seriousness of the position, they would be successful in their efforts.

I put in a comparative statement of the extent of absenteeism at coal mines. It will be seen that this also shows an unsatisfactory state of affairs."

That has since been put in by the Controller.

26,874. *Chairman:* Yes?—I would like, if I may, to call the attention of the Commissioners to some words written in the year 1893 by my late friend, Sir George Livesey. He and I used to correspond on the co-partnership principle, which he was anxious to see extended to coal miners, and writing in the "Times" of 1893, during the time of the great Midland strike, he gave expression to some words which seem to me to be remarkably applicable to the present stage, and although it is not perhaps evidence, it is interesting. He says: "It is clear that the present system is extremely unsatisfactory with coal owners and miners separated into two hostile camps frequently, and at the present time, at open war, but both united in one object, to sell coal at the highest possible price, whereas coal being the foundation of England's industrial prosperity, it is essential that after the coalowners and the miners have received fair remuneration and good wages coal should be sold for all purposes at the lowest possible figure."

Chairman: Sir Richard, I desire to thank you in the name of the Commission for the very careful and excellent proof which you have given us. We know that you have been here every day assisting our deliberations, and it must have taken a great deal of time and energy at nights to get all this valuable information together. We are very much obliged to you for the result.

Witness: Thank you, Sir; I am very much obliged to you.

26,876. What was their principal reason for reporting against the acquisition of mineral rights by the State?—As far as my memory carries me, there was no reason: they did not give a definite reason. I think they said that there was not any widespread demand for nationalisation, and, to put it simply, they shied at the proposition.

26,877. Yes, I think that is the case?—I refreshed my memory a few days ago by reading it up, and that is the impression it left on my mind.

26,878. Taking it for the moment that the mineral rights were acquired by the State, how would you propose to deal with surface wayleaves in the future?—In exactly the same way, subject to certain modifications, as they are dealt with now. Such wayleaves as are right would be continued to be charged. I mean if a man hauls coal from a mine right past my drawing-room window, I say, Yes, you may do so, but you must compensate me for the unsightly trucks I see going round. That seems to me a matter quite apart. It is quite simple.

26,879. But you do agree that in the future, if surface wayleaves are required for the working of collieries, some reasonable compensation should be

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

made?—Certain surface wayleaves, but I should like to enter this caveat. Supposing I am a royalty owner, and the pits are sunk in an unsightly position, and I receive at present a wayleave on everybody else's coal coming out, the State comes along and takes my royalty and compensates me for it. It also compensates me then and there in a lump sum for the wayleaves.

26,880. Those are what I call present and past wayleaves. I was referring to future wayleaves?—They must be, I grant you, dealt with quite differently.

26,881. What is the present position with regard to the disablement of minors? What fund is there to compensate them?—If a miner is disabled through accident or ill-health occasioned in the mine and proved to have been so occasioned, then he receives compensation under the Compensation Act; but short of that, if a miner, through a break-down of health, quite apart from that, short of his being on a permanent relief fund or some other fund, of course there is no means of compensating him.

26,882. I take it you agree that there should be some kind of arrangement made for men working in a colliery?—What I should like to see in all industries is that when a man has borne the heat and burden of the day, before he is crippled, and before he is exhausted, he should be able to retire to a well-earned rest and spend his latter days in well-earned comfort without the fear of being put on the street, so to speak.

26,883. Regarding the retirement fund, as separate from a disablement fund, you say the man at a certain age should retire; but there is no fund except that which is set up by the individual colliery, at the present time?—I am not aware that there is any fund even in any industry, colliery or collieries, for providing a miner with an income when he retires, voluntarily, from a break-down of health. What I mean is this: A man might arrive, say, at the age of 65: his health may not be broken, but he may have the infirmities inherent to *Anno Domini*, and I think it would be only right and proper that there should be some arrangement whereby that man, when he attains the age of 65 or 70, if he so desires, should be able to retire in comfort. Some men would not perhaps retire: I can call to mind one of my coal-hewers who hewed on his 79th birthday.

26,884. There are some companies who provide for the retirement of their officials?—Yes.

26,885. And their workers, too?—Yes.

26,886. With regard to the question of research and investigation in the coal industry, do you not think that ought to be centralised in some way in some department to ensure that it should be carried on continuously?—I do, indeed: there is, of course, a good deal of research going on in the coal mining industry: there are all the institutions of mining engineers where papers are continually read, and which have done good work in the past, and then there is the Home Office Department, which has a large station carrying out experiments on safety lamps, colliery explosions, and so forth, and lately on electric signalling. Then there is the small Doncaster Research Laboratory. Then there is a committee set up by the Department of Scientific and Industrial Research—a committee that has not met for some considerable time, but it is composed of mining engineers. I quite agree that all those bodies might be centralised, and the centralisation would make for efficiency, it being more comprehensive.

26,887. And a staff of experts should be kept for investigating, not only the coal mines in this country, but in every country?—Yes, to bring the best practice of every country into play.

26,888. I am much obliged to you for the great trouble you have taken on the question of mechanical safety devices, and so on, but I take it that, in addition to the labour-saving, the great point in mechanical appliances is to enormously increase production so that higher wages might be paid in that way?—Quite so, that is what I have endeavoured to bring out.

26,889. I take it you do feel that there is still room for considerable development in this country on those lines?—Surely!

26,890. Now on the real main question do you think that the mines in this country would be as efficiently run, and would give us the output which is necessary at the price which is necessary, if they are centralised and run as a national concern as compared with the present or some intermediate condition?—No man can say.

26,891. Do you think they would?—It is a leap in the dark.

26,892. You refer to the question of price regulations: do you think it is desirable that there should be price regulations in ordinary times?—A regulation for the selling price of coal?

26,893. Yes, or any other article, in normal times?—I think the law of supply and demand must operate.

26,894. That is probably the best regulator you can put on the price?—I am a firm believer in the law of supply and demand. You cannot interfere with economic laws without getting into an awful mess.

26,895. I take it that in any scheme that might be devised it is important to make the output of any individual hewer the basis of his remuneration if you are to get output?—Yes. As human society is at present constituted, and until we approach a little nearer the angels, I think the reward should always be in proportion to effort, and effort will always be in proportion to the reward offered.

26,896. Do you agree with other witnesses that basing wages on selling prices is not a satisfactory method?—I think it a most unsatisfactory method.

26,897. Do you agree that the present situation, where wages have been paid by subsidy, or by return of taxes that have come from the industry, or by taxes from the general community, is a position that cannot be maintained?—It is economically unsound to run an industry paid for by the taxpayers.

26,898. If the cost of coal is high, through whatever the circumstances may be, finally you have to put it on the selling prices of the coal?—It always comes back to the consumer.

26,899. You are bound to do that?—You must if you are going to run the industry at a profit.

26,900. With regard to the present Coal Control Department, I take it that it is absolutely essential that that should run on for a certain time to clear up the conditions created by the war?—What do you mean by "the Coal Control Department"; do you mean as at present constituted?

26,901. I mean the Coal Control Department as it is at present must clear up the situation left by the war?—I would rather put it in this way, that the situation must be cleared up.

26,902. When that Department ends, do you not think there should be in this country some one central authority to supervise and regulate the coal industry of the country?—The coal mining industry, after agriculture—and only, possibly, after agriculture—is the biggest industry of this country, and what is more, it is the key industry, and in view of those facts, I should have thought that there should be some central authority.

26,903. Any such Commissioner—Coal Commissioner, or whatever you like to call him—I take it you would agree should have probably a National Council to advise him, composed of owners, workers and consumers?—I did not say what should be the nature of the central authority. I agree there should be some central authority, but as to what form that central authority should take, I am not prepared at the moment to say. It should be some central authority: of that I have no doubt whatever, and whatever central authority that is, I should think the powers that be would be well advised if they created a body composed of those chiefly interested (we are all interested, though not chiefly interested) in the industry, and create out of the industry an advisory body to assist and advise the central authority.

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

26,904. Do you think it would be advisable to have the central authority's powers vested in one individual with an advisory council? That is the question I want you to answer?—A Minister of Mines you mean?

26,905. Call him what you like: I would rather that he was not a Minister?—I would rather answer your question in this way, that there would perforce be an individual Minister of Mines, or whatever you like to call him, at the head of such an authority as you describe.

26,906. I take it that one National Council would not be sufficient; you would have to have district councils in the different districts of the country, as at present defined by the Home Office districts, to keep in closer touch with the actual facts and to advise the National Council?—Whatever body might be constituted for the control or supervision of the industry, it would have, in order to be effective, to work through district bodies—call them councils or whatever you like; but I would not say necessarily that the districts should be the divisions devised by the Home Office for the purpose of inspectorate. Might I give my reasons for saying that? For instance, the southern division includes Kent, Bristol, Forest of Dean, North and South Staffordshire, Warwickshire, and so on; the methods of work, the whole history and the customs, say, of the Forest of Dean and North Staffordshire, are entirely different. The system which has grown up through the ages is quite different, and it would be very much better to combine like with like in any system of districts, so that probably, instead of being simply the divisions of the Home Office established by the Home Office for the purpose of inspectorate, the divisions for the purpose of economic government would be more numerous.

26,907. Otherwise you would defeat your object if you placed them too far apart?—Yes.

26,908. Further than that, I take it, if the scheme is to work thoroughly, you have to come to a system of pit committees at the collieries?—You mean a still further stage?

26,909. A still further stage?—I think there must be some form of pit committee.

26,910. And they would report to the district council, or report to the National Council?—Personally I do not quite grasp the objection that seems to exist in certain quarters to a pit committee. For instance, what is it more than a stabilising of the deputations which a colliery manager has continually to meet, sometimes every day, on different subjects regarding the health, safety, convenience and comfort of miners? If there were a permanent deputation composed of the miners, personally, as a past colliery manager, I would welcome it—I see no objection to it. The harmonious conduct of a colliery requires tact, and so forth, but personally I cannot say that I have ever found that any system of that sort would be likely to be in opposition to discipline and the good conduct of the mine. It is only stabilising the deputations.

26,911. The difference between the pit committee and the National Council, I take it, you would agree, would be that on the pit committee you have the colliery managers and workmen, whereas on the other you would have the consumers present?—You would have to bring the consumers in somewhere, probably in the district council, to have some say on the price of coal.

26,912. On this question of central pumping schemes, suppose you have a central authority such as I have sketched out, would it be necessary to have compulsion?—Yes, I can speak there with some fervour, because for the last two years I have been wrestling in spirit in one part of the country with the coal owners, and as my colleague, Sir Arthur Dickinson, will bear me out, it is impossible to get them to take any concerted action; it is impossible without compulsion.

26,913. So that you would really have to try to work it by voluntary means, but in the background some authority to do justice, and charge the cost of doing it to the coal owners by some rate per ton, if they would not do it voluntarily?—True.

26,914. We have heard a good deal about the grouping of collieries, and I think it is agreed that

a little more grouping is desirable?—Of course, I stated so pretty strongly on the previous occasion, and I have also inferred it on the present occasion; there are so many small places that are short of capital and one thing and another.

26,915. There, again, would you have to have compulsion?—They have not grouped themselves yet.

26,916. Do you think, if there was a central authority that could assist in those movements, you would have quicker action?—It means a little more than assist: I am afraid it means the application of a big stick.

26,917. Do you think it would be a good plan to publish the outputs of the collieries monthly in some clear concise form so that the public would be informed on the subject?—I think even if the returns were not quite accurate, owing to the haste with which they would be prepared, it would be a good thing. It is so very easy to condemn a department for not issuing their statistics with the celerity with which one thinks they might be issued, because I have had, for my sins, during the last 11 years, to deal with the issuing of statistics, and the work is immense in producing accurate statistics. Anyone who has had to deal with them knows that. I would go this far and say, even if monthly statistics were not accurately kept, but were subject to correction, it would be a good thing: they need not be very detailed, of course, but broad statistics.

26,918. Would you go as far as districts?—I would go as far as some districts—yes, I would go as far as districts.

26,919. With regard to the question of baths and pithead drying arrangements, I think you do agree that they should be established?—Yes, certainly. That has been the Home Office policy of which I am a humble member; but Parliament was too much for us.

26,920. Do you agree in that case that it would be better to try to have them used by the officials and the workers voluntarily rather than have them made compulsory?—I would make them compulsory.

26,921. Would you make their use compulsory?—I would eliminate small mines. You do not want to erect a public bath for five or six people. You might say every mine employing 50 persons or above, or something of that sort. I would make the erection compulsory, whether it was required by a majority of the men or not, and I am as convinced as I am sitting here that within a very few years you would find everybody in the mine using them. That has been the result in France and in Germany: their use was not compulsory originally—I do not think they are yet.

26,922. Do you not think it would be a reasonable thing that the money spent on those baths, say, in the first five years, during which period they should be completed, might be charged against revenue?—I think that is a fair proposition.

26,923. With regard to the inspection of mines, if this central authority were set up, I take it that the inspection of mines should be under the control of that central authority and not separated and under the control of some other authority?—I think that you would have, in order to work a Mines Department—or call it whatever you like—properly, to put all things appertaining to the mines under that authority. For the same reason I would put research under it, but I would work that research in conjunction with the Department of Scientific and Industrial Research.

26,924. Do you agree that it would be desirable to have a few more inspectors?—Yes, I think so, in order to get more thorough inspection. The present inspectors are very hard worked; they are overworked, and, after all, a man cannot do more than he can do. I would welcome an increase in the inspectorate.

26,925. *Mr. Robert Smillie:* If the Government were taking the minerals and not the mines, would not the Government be in a position to establish central pumping plants and charge it on the royalty to the private owners who might work the mines?—Yes, that would be possible.

26,926. But if the Government took over the minerals and the mines then you would not require

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

any compulsion to force the mineowners to pay for the pumping; the Government would pump themselves?—Quite true.

26,927. That would remove that difficulty?—Quite true.

26,928. With regard to output returns, whether they are monthly or however they would be done?—I do not think they would be done weekly very well.

26,929. Supposing you propose to have monthly returns, what is the purpose that you wish to serve by having them?—The purpose I had in mind—I do not know what the Commissioner who interrogated me had in mind—but what I had in mind was this, that the nation would know month by month where it was. After all, what is the object of all returns but to give information? These returns would give information to the public for whatever use they might think fit to put them—monthly instead of annually.

26,930. Speaking of the returns such as Mr. Balfour has asked for and such as you have in your mind, they would not indicate as to whether the output per person employed per shift worked is going down or up?—No, they would not.

26,931. It would give an indication for the colliery or for the district, as the case might be?—Quite true.

26,932. It would not give an indication as to whether or not there were reductions per person employed per shift work.

Mr. Arthur Balfour: I hoped that information would be included in the report.

26,933. Mr. Robert Smillie: I want to get it from Sir Richard how impossible it is from the kind of return he has in his mind to give you what you want?—Unfortunately I could not get inside Mr. Balfour's mind. I did not know what he wanted. I knew what my answer conveyed, and that was information to the general public as to what coal had been produced during the preceding month.

26,934. As a matter of fact, to get what Mr. Balfour required, you would want to know the number of shifts worked, the number of persons employed per day, the number of shifts that were lost by men, and divide it from day to day by the total output, to find out whether the output per person employed has gone down?—It could be done. You may remember that we got very elaborate returns for the Coal Mining Organisation Committee monthly as regards absenteeism, and so on.

26,935. What Mr. Balfour wants to know is, amongst other things, whether or not the miners are shirking in any district or any colliery, either generally or individually—whether they are deliberately reducing the output, whether their output goes down as their wages go up.

Mr. Arthur Balfour: Might I say what I really wanted. I really wanted to get a feeling of competition between districts, so that one district could see what another district was doing and would endeavour to emulate the better return.

26,936. Mr. Robert Smillie: Would you be likely to get under State ownership more than under private enterprise the emulation of a colliery manager to beat some other manager, and the emulation of the men in the knowledge that their wages would not be reduced by the State?—I think the spirit of emulation as between manager and manager would exist just as much under State control as under the present control, because the manager if he is worth his salt would be anxious to show what he could do. He is anxious to do that.

26,937. At the present time under private control one of the very things that the colliery owner desires to hide is the question of output?—They do not care to publish it abroad.

26,938. Under State management every manager would be a servant of the State?—I do not use the word "State." In my original evidence I said each unit would benefit from the collective knowledge.

26,939. With regard to baths, do you seriously say that a colliery employing not more than 50 persons should not have a bath? Surely 50 persons is too high?—I said 50, but you might make it 30 or 25. I

am not wedded to any particular figure. There should be some point.

26,940. What is the number under the Metalliferous Mines Act? Is it not 30?—30 constitutes a small mine under the Coal Mines Act.

26,941. What would you say when there is a group of small mines?—I quite agree for the purposes of baths a number of small mines might be grouped.

26,942. After all, the needs of the families of 10 or 15 men are just the same as the needs of the families of hundreds?—Quite so; and if there were not a number of small mines in the region of one small mine the men at the small mine could have the privilege of using the baths at the neighbouring and bigger mine. That is a detail that could be worked out.

26,943. In answer to some questions put by Mr. Balfour you rather favoured the State keeping experts to go into research of one kind or another and to make discoveries as far as possible in connection with the mining trade that might increase output. Do you seriously say that the State should burden itself with an army of experts in order that it might assist private capitalism?—I see your point; but perhaps my answer to Mr. Balfour was too short. What I had in mind was this, if I may go on, that health and safety are matters directly concerning the Government at the present time, and I do think with regard to health and safety the research work could be carried out on a little more extended scope. I think that it would be an advantage to the industry were research work carried out in the region of economics, and that should be under the ægis of Government; but I did not intend my answer to convey the meaning that that was to be paid for by the State and the mines to remain in private ownership. What I meant was that the State should carry out that and see that it was properly carried out, but that they should make the owners pay for it.

26,944. With regard to safety, you know I am with you, whether the mines are privately owned or State owned. I am with you that all the research that can be undertaken for safety ought to be undertaken?—Yes.

26,945. You gave us some very interesting figures with regard to the known extent of the British coalfield and tracts of country in which it is believed that there is coal although it has not been proved. Is it the fact that the surveying which has been carried on and paid for by the Government has discovered certain coalfields and mineral fields in this country?—I would rather put it in this way, to be absolutely accurate: the result of the investigation of the geological survey of Great Britain has conducted very much to economic development, not only with regard to minerals, but with regard to water.

26,946. It has been said that it was the result of the geological survey really that discovered iron in Ransay?—Yes, I believe that is a case in point.

26,947. The Government did not secure anything from that, did it?—I mean in the shape of money?—No, I do not think it did.

26,948. You gave us at the outset of your *présis* some valuable information with regard to the present system of ownership of minerals. Did your remarks apply to Scotland or to England only, or to England and Wales?—As to the law operating?

26,949. Yes?—I was speaking generally of the United Kingdom. I am a little bit uncertain when I come to Scotch law. I have not the experience there that I have had in English coal mines.

26,950. You have heard of a Scotch law of 1592?—I have heard of it from you.

26,951. Do you know that it has been produced here?—I do. I have a copy that I have filed for further reference. I am rather interested in antiquities, and I was rather interested in that antiquated law.

26,952. It is not necessarily ancient?—It is 1592.

26,953. Provided it is the law to-day, it is just as young to-day as it was in 1592?—Yes. I believe there is a law of Charles I. that compels a Magistrate to force everybody to go to church on Sunday, but there is not a Magistrate who would try to carry that out.

26,954. There is a law in Scotland that would cause you to be hanged for stealing sheep. You are not

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

going to do that? You are not going to steal sheep?—No, coal is what you are after.

26,955. You have heard it suggested that the Act of 1592 referred only to the precious metals, that it did not refer to coal?—To gold and silver.

26,956. But not to coal?—No.

26,957. Would you believe me if I told you that I hold in my hand a copy of a feu-charter that was granted in 1618, and coal and coalpits are specifically mentioned in it?—That is interesting.

26,958. Do you know that the Chairman has managed to secure a copy of a feu-charter, the Wemyss Charter that I asked for here, and coal is also mentioned in it for the same period?—I will take it from you.

26,959. I hold a copy of one issued in 1618, and coal and coal pits are mentioned in it, and it is granted in feu-farm. It is called a feu-charter, and then in the body it is called a feu-farm. Are you aware that under that charter there was a nominal rent?—I have not read it.

26,960. Will you take that from me?—I will take anything from you.

26,961. That there is an annual rent. Would you be surprised if I told you that it was for the afore-said mines and minerals in addition to the annual rent of one-tenth of the minerals from the same which shall happen to be found and dealt with, deducting always the whole expense and cost thereby contracted. Would you be surprised to know that that is in the feu-charter granted by James, that one-tenth part is to be given back to the Crown, and are you aware that that has not been given back?—No, I am not aware of it.

26,962. If that is the law and if that is the feu-charter under which metals are being worked, do you think that the law should be carried out?—All laws that are on the Statute Book should be carried out—short of one being compelled to go to church.

26,963. Even the law with regard to sheep stealing?—Do you bracket that with sheep stealing?

26,964. If Parliament laid it down that all mines and minerals by whomsoever held belong to the Crown and could only be worked with the consent of the Crown, and that an annual rent was to be charged, and where it was also stipulated in the bond that one-tenth of the product should be given, is not that a strong argument for saying that the minerals ought to be restored to the Crown, which means to the State?—I am not quite clear on the point. I understand that this is a Charter in which there is charged on the minerals a royalty rent which consists of one-tenth which is payable to the Crown. Am I right?

26,965. Yes—in addition to an annual rent?—That, of course, should be paid. I take it that it was a royalty rent of one-tenth. That is a fairly good royalty rent.

26,966. Would you also take it that if Parliament laid down that all the minerals belonged by right to the Crown and were held on behalf of the people through the Crown and that charters were required to be issued in order to work the minerals or coal, would you say the Crown or the State have the right to take back what the Crown at that time had granted?—I am rather out of my depth just now, but I do not think the Crown or anybody else has the right to take back what he has already granted. If I gave you a sovereign to-day I have no right to come and say I want it back.

26,967. But supposing you lent it to me?—Then I should want 21s. back.

26,968. It is only a feu-charter for so long as the King pleased?—If he lent it for a period of years, he should have it back at the termination of the lease.

26,969. As a matter of fact, he took it from another fellow and granted it to this fellow?—They had that way of doing things in those days.

26,970. I have no doubt you would desire to see harmony between the workmen and the employers when the time comes that the State takes over the mines?—Most certainly.

26,971. And that you have done a good deal in your time to endeavour to secure harmony?—I have endeavoured to live at peace with all men.

26,972. I suppose it is not possible to get the best results from the mines of this country unless there is something like harmony between the management and the workmen themselves?—No.

26,973. The results would be better, at least, if harmony is secured?—That is the only way to run the industry.

26,974. That is your own experience?—Yes.

26,975. I think you heard Sir Hugh Bell state yesterday that, as far as Durham is concerned, the relationships there are very good indeed?—Yes, and, generally speaking, they are.

26,976. From your knowledge, they are?—Yes.

26,977. You remember he said prior to the outbreak of war they were very hopeful of establishing committees of some kind which would have improved the relations that existed then?—Yes, I heard that.

26,978. If the Chairman will allow me, I want to read a letter which will explain a question I want to put to you. This letter is dated the 23rd of May, so that it is not ancient history. It is written by Mr. George Thompson, miners' secretary, Shotton Lodge. Do you know the Shotton Colliery?—I do not think I have actually been to the village, but I know it, because I was not far from the colliery when I was an under-manager.

26,979. Is it not part of the Horden Company's property?—Yes, it is worked by the company.

26,980. I think Bell Brothers are nominally the owners?—I think the Horden Colliery Company is a separate concern; they may be largely interested in it.

26,981. *Chairman*: Sir Hugh Bell said that he was the Chairman of it?—I think Sir Hugh Bell stated yesterday that he was either chairman or director; it is a separate company.

Mr. R. W. Cooper: Sir Richard is perfectly right.

Mr. Robert Smillie: I think he says it is a company now.

Mr. R. W. Cooper: He is referring to Dorman Long & Co.

26,982. *Mr. Robert Smillie*: I will read the letter, so that you may see the harmony that is existing there: "Dear Sir, I am instructed to write you on the most vexed question of larger houses for our big families. We have some outstanding large families that are living in houses that are not near large enough, and we are at a loss to treat them properly. If you could meet a deputation when you are at Shotton, when we could talk over the whole question of our big families and bigger houses, we would be much obliged. Our men ask me to state that for you to meet us would be the best course to adopt.—Yours faithfully, GEORGE THOMPSON." Now I will read the reply. The reply is written from Hardwick Hall, Castle Eden, to Mr. George Thompson, Shotton Colliery. "Dear Sir, In reply to your letter of the 23rd instant, you can take it from me that we do not intend to build any more houses at any of our collieries, whether large or small, and for this decision you can thank Mr. Smillie and his friends." That is signed by J. J. Prest. Is that the kind of thing that would induce harmony at a mine?—I think it is a very foolish reply to make.

26,983. Who is Mr. Prest?—He is the General Manager of the Horden Colliery Company, Limited.

Chairman: There may be some explanation of the letter. We had better ask him to attend at the next meeting of the Commission on Friday next week. The address is the Horden Collieries, Limited. He ought to have an opportunity of explaining that letter.

26,984. *Mr. Robert Smillie*: I will not ask Sir Richard any further questions on it. The most important part of your evidence is on the question of output. On page 7 of your *précis*, under No. 9 in the first column, you say: "This is one of the directions in which the present system (of numerous small entities as against a combination of interests) is wasteful and extravagant." Then you give a number of things: saving in freights, underground haulage, central pumping, working of coal seams. All of those things, I take it, seem to you to be wasteful and extravagant as they have been done up to the present time?—Yes. What I was comparing was this: The present system of the number

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

of small separate entities as compared with what would result from a combination of those entities either in one group or into large separate groups.

26,985. You used in your previous evidence the words "wasteful and extravagant"?—Yes.

26,986. You said: "The present system is wasteful and extravagant"?—Yes, and I do again.

26,987. I gather from questions put to you here that some gentlemen on that side of the table object very strongly to the term "wasteful and extravagant"?—They do.

26,988. Has your experience, on any of the numerous committees on which you have sat, gone to prove waste and extravagance?—It is interesting you should remark that, because when Sir Adam Nimmo was cross-examining Mr. Rhodes he alluded to the fact, and asked the witness his opinion, and he put the point that my expression of opinion had given rise to a considerable resentment in the country. That I desire now to absolutely deny. It gave resentment in a certain quarter in Scotland, and a meeting was held and considerable resentment was expressed. The chairman, Mr. Mowatt, said he had not had the benefit of reading my evidence except in the newspapers. I would not, personally, condemn anybody if I had not read his evidence in full. Here is a document signed by Sir Adam Nimmo as Vice-Chairman of the Mining Sub-Committee of the Coal Conservation Committee, in which this is said: "While we consider it necessary to oppose a Ministry of Mines and Minerals should have adequate power to prevent permanent and unavoidable loss of coal; we think the end in view might to a large extent be obtained voluntarily, and as the natural result of these operations among the transporters at each district. If the interest of all the collieries in the district were consolidated, the intervention of the proposed Ministry of Mines and Minerals for the purpose of preventing loss of coal would in many cases be unnecessary; not only would combined drainage schemes be introduced where required, but unnecessary barriers would be worked out, and the best methods of working the mines in the districts would be experimentally ascertained and generally adopted, so that loss from working the abnormally thick seams, and from leaving top and bottom coal, and perhaps also from the order of working contiguous seams would be reduced to a minimum, without intervention or compulsion."

26,989. *Sir Adam Nimmo*: Mr. Rhodes, I take it, spoke for his own district?—Yes.

26,990. He was not speaking for Scotland at all?—No.

26,991. He was speaking for those he had come into contact with over a large area of the country that he knew?—I was rather astonished at this. I cannot produce them because they are private, but I am perfectly willing, with the consent of the writers, to hand them to you (addressing the Chairman); but I have received letters from general managers from all parts of the country, Yorkshire included, expressing satisfaction and general agreement with my evidence.

26,992. *Mr. Robert Smillie*: Is Scotland included?—No, Scotland is not included in the letters.

26,993. *Sir Adam Nimmo*: The Coal Conservation Report refers to loss of coal, but I am not aware that it uses the words "wasteful and extravagant"?—I have read what it says. It says what it says—nothing less and nothing more.

26,994. *Mr. Robert Smillie*: If you find that gradually the water is rising, and for want of co-operation amongst the colliery owners in the district an old out-of-date pump fails to prevent the water rising, and they will not combine to get a new pump, and the coal is now drowned out, and many hundreds of men thrown out of employment, would you say that that was wasteful and extravagant so far as the loss of coal is concerned?—Yes, I would.

26,995. Was there not evidence before the Coal Conservation Committee that many hundreds of thousands of tons of coal were lost in Staffordshire because of the lack of combination with regard to pumping?—Likely to be lost and lost.

26,996. I would like to come to a point that you and the miners are concerned with, and that is really the question of the loss of output at the present time. I suppose it may be taken for granted that the returns which the Coal Controller has been kind enough to put before us bear out the statement that there has been serious reduction in output?—Very serious.

26,997. I want to call your attention to your evidence on page 7 in the second column, where you do not agree altogether with Mr. Straker. You said you would like to point that the decrease commenced in 1917. Were we not still calling up young men for the Army at that time?—Yes. The decrease really starts right back into 1916, and what you say is quite true, we were calling up men to the Army.

26,998. You and I know very well that, generally speaking, the youngest, strongest and best of our young men went?—Quite true.

26,999. There were a very large number of old miners, and oven miners who had given up working, went back into the pit?—Yes.

27,000. You would not expect as high an output in those circumstances?—Quite true.

27,001. It is a fact, I think, that up to 12 months ago there were large bodies of our young men called away from the mines?—Yes.

27,002. Would not that account for a reduction of output?—It would.

27,003. You recognise in your evidence that men who serve two or three years at the front and come back will not for some time at least be able to do full work?—Yes, that is so.

27,004. Recognising to that extent that you look for a lower output per person till they get hardened to it?—True.

27,005. Have you had any inquiries made at the colliery where there has been reported a serious loss of output?—Wherever there is a serious loss of output I always inquire into those cases. I have here a pile of very detailed inquiries into case after case of loss of output; sometimes it is one thing, sometimes it is another thing; and my means of determining whether or not there is such a loss of output are various. I got forwarded to me the fortnightly returns of the Inspectors of Mines as to the state of their districts. I have reports from my own Economic Coal Inspectors created under the Coal Department, as to the state of their districts, and besides that we have a form that comes in from every colliery, called Monthly Production and Employment Report, and it states under the heading of number of days or parts of days why coal was not won owing to ordinary stops or idle days—that is one—Sundays another—holidays, transport difficulty, accidents, disputes and other causes—"Please specify cause separately." That comes from every colliery, and the output is given. You can find baldly from that whether or not the output has fallen and the cause probably. On going through these any case of serious fall of output is sent to me, and I institute an inquiry. Now, I have thought over all those items that you have put forward, and they are all contributory causes, no doubt, to the decrease of the output per man, per shift, namely, the fact that the young and most able-bodied men have been largely recruited to the Army, and also that these men are returning, and have not got into their stride. All of that is true, but it is not the whole truth. I am only giving an opinion now, and I may be wrong, but I had all this plotted on a chart, and I find that there have been ups and downs from the year 1916 to the present date, but that the average of those ups and downs is a steady fall all the way to a point that is alarmingly low, and I couple with that the fact that we know that behind every large rise in wages there is a following wave of decrease of output per man per shift. In that respect I would call your attention to the diagram put in by Mr. Hugh Bramwell, I think it was in the form of a diagram, when we were enquiring as to the output in 1915, February I think it was, and that fact was borne out. On only one occasion do I know where the contrary is true, which redounds greatly to the credit of the miners. I instanced that case, I think it was in cross-examination by Mr. Hodges last time, and that was when we urged upon

6 June, 1919.]

SIR RICHARD AUGUSTINE STUBBERT REDMAYNE, K.C.B.

[Continued.]

the mining community the necessity of an increase of output owing to the exigencies of the nation. You may remember that you yourself addressed several large meetings on the point, and that the result was quite remarkable. The increase in output per man, per shift, rose 4 per cent., and that is shown on this diagram, and it attained a level from 1915: in 1916 it was in advance of the level for a number of years back, and if you would like to look at this diagram I will pass it along to you.

27,006. In the meantime there was no charge of absenteeism brought against our men at that time. You and I were sitting on the committee?—We concentrated on a reduction of absenteeism. We thought that was the most useful line of action. We did urge in season and out of season that it behoved everybody in the industry to do their best.

27,007. Mr. Hodges and myself and Mr. Smith probably from day to day, or hardly a day passes but what we get letters signed from one or other colliery complaining that the men have been sent home day after day or are in the pit and are only doing half work, and in some collieries there would be 400 or 500 tons more a day if there could be a clearance. If we are getting these signed letters in which the people say they want to have an enquiry, is it not right there should be an enquiry?—I have not the least doubt in the world you are getting such letters; I get such letters. I go into those cases with the greatest detail. I have here case after case of detailed enquiry into such cases. Sometimes I found there was no shadow of truth in them, sometimes I found there was. It would weary the Commission, but here are these cases at your disposal and all my minutes on the points, the results of my inspectors' reports, and so on. There is case after case, and many of the causes given I must say are not even founded on fact; some are not the whole truth or partially the truth, and sometimes they are true. On reviewing all the cases and preserving an absolutely open mind on the question, I cannot think that is the whole truth, namely, that the cause of the decline in output is attributable to want of clearance—partially, yes.

27,008. Would it not be amazingly useful to myself, Mr. Hodges and Mr. Smith, if those cases were proved from some other source and if we could get information? Would it not help us if we could get that information to show our people and we could show they were wrong?—Quite. I would welcome any form of enquiry, the more thorough the better.

27,009. There has been a dangerous state creeping over the miners of this country, and we have talked it over, and that is that the men begin to think the management does not want the material got away?—If that thought is abroad in the minds of the men—and if you say it is I accept what you say—it is very lamentable, but personally I do not think that is so.

27,010. *Mr. R. W. Cooper*: Have you among your papers the evidence taken before the Mining Royalities Commission which reported in 1893?—I have not got it here.

27,011. There are one or two questions about that I wish to put to you. I thought I cleared up this point at an earlier stage; but, as Mr. Smillie has asked you about the old Scottish Act of 1592, I must ask you a question upon it?—I do not think I have thoroughly studied that.

27,012. Have you been in this room when the Chairman referred to the fact that I had handed to him a Scottish Law Report giving a decision on this very Act of 1875?—Yes.

27,013. Were you in the room when one day I read extracts from the Judgments of the Scotch Judges?—Yes.

27,014. That same question was raised apparently in 1890 before the Mining Royalities Commission, before which Mr. Smillie gave evidence?—Yes.

27,015. Mr. Small, who was then the Secretary to the Lancashire Miners' Association, appeared to be under the same mistake?—(*Mr. Robert Smillie*.) It was not a mistake.

27,016. *Mr. R. W. Cooper*: These are the concluding four questions and answers of Mr. Small's examination before the Mining Royalities Commission:

"(*Chairman*.) You base your argument that all minerals belong to the Crown in Scotland on the Act of 1592?—(A) That is so. (Q) Are you aware that that Act has been appealed to in recent times in Court?—(A) I am aware of that. (Q) Do you know the Court has decided that the Act although it does speak generally of all mines applies only to Mines Royal—that is gold and silver—"being controlled by earlier Statutes?—(A) I am perfectly aware of the position although in my opinion the Court did not give effect to the words of the Act or else it would be different. (Q) Therefore the Courts have decided in opposition to the view you entertain?—(A) Undoubtedly." I will deal with your own proof proper now?—I hope you are not going to take me on the law. I would rather you took me on mining.

27,017. I would rather not do that; I will leave that to Mr. Williams. I want to ask you some questions more particularly on section 1 of your proof. I put it in the most popular language I can employ. You refer to the fact that in this country the presumption of law is that a man who owns a piece of land owns everything contiguous to the land right down?—Unless it is expressly excluded.

27,018. That is the presumption which has to be displaced by evidence?—I start with that; that is an axiom.

27,019. You then point out, quite correctly, that when the ownership of the surface and the ownership of the minerals has been severed, then, of course, the minerals belong to the man in whose favour they were reserved by the severance?—Yes.

27,020. Then you speak of copyhold lands. There I venture to suggest a slight addition to your proof, as your proof is on the notes and I want it to be as accurate as possible?—Please correct it, if I am wrong.

27,021. At the bottom of column 2 on page 1, you say, "But neither the lord without the consent of the tenant nor the tenant without the consent of the lord may open and work new mines"?—That is so, is it not?

27,022. It is so, unless controlled by the custom of the country?—I have read up that case. Years ago, you remember, there was the celebrated copyhold case in Durham.

27,023. You mean Shaftoholekew Vaughan?—Yes, I think that was in your mind.

27,024. Partly?—I thought I might be asked with regard to it, so the other night I read it up.

27,025. I am afraid you rather misconceived it?—No, I have kept all the accounts from the Newcastle "Daily Chronicle" as they appeared and they are in my note books.

27,026. The Newcastle "Daily Chronicle" is not a legal authority. I have the shorthand notes of the case?—Then you would be right and I am wrong.

27,027. The Ecclesiastical Commissioners are far away the biggest?—What is the point, Mr. Cooper?

27,028. That in Durham the custom from time immemorial is that the lord of the manor and his lessee may work the coal without the consent of the copyholders so long as he does not let down the surface?—Yes, provided they can prove custom.

27,029. The point in that case which the Commissioners were trying to establish went one further than that. They were trying to establish there was a custom to let down the surface?—May I refer you to page 2, where I say that the copyholder cannot, unless there is a special custom to warrant it?

27,030. I am talking of the lord of the manor and not the copyholder?—The lord of the manor, if he can prove custom, has the right to let down the surface and work the coal, otherwise he cannot. It is a small correction.

27,031. It is an important correction with regard to the county of Durham. Again, on page 2 you refer to common land. I suppose you know that both in Durham and elsewhere very large areas of common land have been enclosed by Acts of Parliament?—Yes.

27,032. And under those Acts the minerals have been reserved in express terms to the Lords of the Manor?—Yes.

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.O.B.

[Continued.]

27,033. With full power to work?—Yes, an exception to the general rule.

27,034. They are reserved the full power to work?—Yes.

27,035. In some cases the Act has given power to let down the surface and in some not?—Yes.

27,036. It turns upon the terms of the Act of Parliament?—Yes.

27,037. I do not know what your object was in making the statement that where common lands are enclosed and if no special provision is made to the contrary the allotments are freehold. That does not bear on the question of mineral ownership at all?—You mean the words “the right of common is the right of taking a profit in the land.”

27,038. No, when common lands are enclosed and no provision is made to the contrary the allotments are freehold. What application has that to mineral ownership?—May I put this question to you? Who owns the minerals in common?

27,039. The Lord of the Manor?—And the Lord of the Manor can work them.

27,040. Yes?—That is quite right; I agree that is perhaps unnecessary, but it is illuminating.

27,041. Might I illuminate it a little further? As a matter of fact, lands that are allotted from a common, when the land is allotted to the original allottee, it partakes of the same title as the ancient land in respect of which the land was allotted?—Yes.

27,042. If you had a farm adjoining an old common, a freehold farm, and the common was enclosed and you had an allotment, your allotment is freehold; if your farm was copyhold, your allotment is copyhold and so on?—Yes. I have an opinion for nothing which is valuable. I live next door to a common and I am very interested.

27,043. I would not have troubled you if your proof had not been on the notes. The rest of your proof to an ordinary reader might convey the impression that tenants for life and tenants in tail and so on?—These are not ordinary readers.

27,044. Quite right—are really suffering from some particular disability in working coal. Have you forgotten the various Acts of Parliament which have been passed ending with the Settled Land Act giving these people full powers to lease coal to be worked?—Quite so. It is impossible to make a *précis* or proof a dissertation on law.

27,045. Then you speak about ecclesiastical persons, and there again the ordinary man might imagine that these persons were under a disability in dealing with coal. May I remind you that there are a series of Acts of Parliament called the Ecclesiastical Leasing Acts by which all these ecclesiastical persons may lease their coal for long terms of years with the assent of the Ecclesiastical Commissioners?—I am aware of that, and they do it, too.

27,046. Certainly?—I have worked it.

27,047. There are other persons in the country or corporations who own land. For example, in the neighbourhood of Newcastle the Newcastle Corporations owning coal?—Yes.

27,048. Then, again, there are charitable corporations owing coal?—Yes.

27,049. You probably have heard of Sherburn Hospital?—I have.

27,050. All these corporations have a power of leasing conferred upon them by Act of Parliament to enable the coal to be worked?—Quite.

27,051. Now a question or two about these cases of difficulty which have come under your notice. Do you remember the general drift of the Report of the Mining Royalties Commission was that whilst there were occasional cases of difficulty there was no such dreadful difficulty to justify any recommendation by the Commission?—I used to think so, but in a very short period covered by the control the number of cases that came before me was very surprising.

27,052. I do not want to ask you the names of individuals, of course. In what particular counties of England do these difficulties arise, or is it in Scotland or Wales?—Wales. Glamorgan, Monmouth, Yorkshire, Derbyshire, Notts, and Stafford. I have had cases there. If you like perhaps the shortest way would be to give you a little résumé which I have drawn up of these cases. It is as well to be very

well armed when under cross-examination, so I sort of put myself as far as I could in your shoes, and I thought of the questions I would ask myself, and so I answered them. Shall I give you these?

27,053. Yes. I gather the county to which you and I belong?—The county to which you and I belong is as near perfect as it can possibly be, and finally I say I was very surprised.

27,054. *Mr. Herbert Smith*: There are only you two saying that?—I agree to Yorkshire. I would like to say it once that with regard to one class of case I have given no examples, because their name is legion, and I did not think you would want any, and that is the case of coal which is prohibited by lease from being worked entirely.

27,055. *Mr. R. W. Cooper*: Prohibited by lease?—Prohibited in the lease from being worked entirely. That is the case largely of coal left under churches, manorial buildings, and so forth.

27,056. Have you found in those cases the leases have only provided that the coal must be left for the support of churches, schools, mission rooms and things of that sort?—Frequently. At the moment I am considering the coal left not so much for mission rooms, schools, and churches as the immense area of coal that is left under some of the old halls where there is as much as 20, 30, 40 or 50 acres.

27,057. Will you take the first case?—May I continue what I was saying? The reason I have not given those examples is because they are so numerous and because every mining engineer must at once recall a number to mind, so it did not seem to me necessary to mention cases of that sort. If you ask for specific cases I will give you several.

27,058. Take one class of building. I suppose you agree with me whoever should be the owner of the minerals in this country, there are certain buildings the stability of which must be provided for?—Yes, this is the point I wish to make there; it is really a point of substance, and it is this. Certainly all these buildings should be supported and the support could be ensured without leaving all the coal. If they allowed us to drive narrow places, or even wide places through that coal and work it in a method approved by all mining engineers, 45 per cent. of that coal could be recovered without any injury to the building. That is my point.

27,059. Your complaint is this. I am speaking of what I will call ecclesiastical buildings for the moment?—I am talking about the manor house or the castle.

27,060. Take a church or churchyard, chapel, mission room, and so on, as you probably know it is the practice of the Ecclesiastical Commissioners to provide that those buildings must be supported?—Yes, quite right.

27,061. I agree. Is your complaint then this, that the buildings might be adequately supported by leaving a certain portion of the subjacent and adjacent coal without leaving the whole?—I do not give that as I thought it would be so obvious.

27,062. Your case is this, that people leasing the coal, like the Ecclesiastical Commissioners, instead of requiring all the coal to be left might have met the case sufficiently by asking you for a certain percentage of the coal left?—And the excavation stowed up to make security doubly certain. These are the cases I propose to give to illustrate every point raised in my proof.

27,063. Come to what I may call a private building. I suppose you know that it has been in recent years, at any rate, the view of many mining engineers that you cannot take out 45 per cent. of coal without actually affecting the surface?—No, I am not aware of that.

27,064. Some mining engineers do take that view?—Yes, I know what experts are. It depends upon which side they are giving evidence.

27,065. You must be careful how you speak. There is a well-known place, probably known to the Chairman, in which there was a Judgment delivered by Lord Moulton, and he is a bit of an expert?—There was another Judge who said that witnesses could be

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

divided into four classes—liars, something liars, expert witnesses, and my brother Fred—Sir Frederick Bramwell.

27,066. Take the other class of case, a house. You think in that case the house might have been adequately protected without damage to the lessor?—Yes, I think any right-minded man would agree. Shall I read you these cases?

27,067. Yes?—As an illustration of the difficulty caused by the present system of law of ownership of minerals, one might cite the recent case of X. I will give you the name of the place, if you like.

27,068. What is the county?—It was the case of St. Catherine's College and the Norton Commissioners. I believe that is recorded.

27,069. It was in the Court of Appeal the other day?—The area involved is 600 or 700 acres and the seam at present being worked by the Askern Colliery in the neighbourhood is the Barnsley seam. In the first instance, the minerals under common were leased to the colliery company by the owners of the surface, that is the Commoners. Before the colliery company actually commenced working, the Lords of the Manor—St. Catherine's College—commenced an action claiming the minerals which had been leased by two of the Commoners. The Lords of the Manor won their case in the Court of Appeal, but without power to lower the surface, and the Commoners in question failing to give Notice of Appeal to the House of Lords are bound by this decision. Some time later the dispute was reopened by other Commoners, who carried the case to the House of Lords, the previous decision of the Court of Appeal being reversed. The present position, therefore, is that, whereas certain of the Commoners own both the surface and the minerals, the minerals under other portions of the Common, through a freak of the law, are vested in the Lords of the Manor, but without power to the Lord of the Manor to lower the surface, and he is not able to grant a lease of the minerals without the consent of the Commoners.

27,070. I am familiar with that case?—Then I need not weary you about it.

27,071. Not at all?—The main result is the coal is lost.

27,072. And for this reason, that having regard to the construction placed by the Courts on that old English Act it has held the persons entitled to work the minerals could not let down the surface?—Yes. The second case is this. This is only the case where an authorisation was given by the Board of Trade under D.O.R. Regulation 9 g.g.g. The area was divided up into hundreds of separate ownerships, and formed a part of the industrial district of ——. The area was only accessible to the —— colliery, the depth of the seam was over 400 yards, and the thickness 4 feet 6 inches to 5 feet. We satisfied ourselves that the proposed method of working involving the getting of 45 per cent. only of the coal could be carried out without risk of injury to the surface.

27,073. How many owners had you to deal with in that case?—Scores. Three hundred I am informed.

27,074. They must have been very small owners?—Some small, some large.

27,075. They were all lying intermixed?—Yes. I will take the next case, 23 acres of coal were involved in this case. The main roads of the colliery were stopped owing to the prohibitive price required. The owner, Mr. —— asked for £4,600. The colliery company offered £3,000, which was the valuation of the owner's mining engineer. The case was settled at £3,800 by our intervention.

27,076. Was that the case of a man who was complete owner of a piece of coal which he refused to allow to be worked?—Yes, 23 acres. The next company, it is a large colliery company in Staffordshire, had come to a mutual arrangement with seven large landowners for leasing minerals where a new colliery was contemplated. One owner, Mr. ——, whose estate was surrounded by those owners with whom arrangements had been made, refused to discuss the matter in any way. His reasons were sentimental,

and partly due to the fact that Charles I. had once slept in a house on the property. This action was holding up the promoters and causing delay. The pressure which the Department was able to bring to bear caused the lessor to enter into arrangements similar to those in the seven cases referred to.

27,077. Under the Regulations Parliament had power to authorise the destruction of the house, subject to compensation in money?—It was not so much the house, the whole property was sacred.

27,078. The whole thing?—Yes.

27,079. Assuming the minerals were transferred to the State, I suppose you agree that the State as the owner of the minerals would have to pay full compensation to the owner of the surface for damage caused to the surface?—Yes, presumably, and I should say justly.

27,080. Then with regard to buildings, would not the owners of buildings be entitled to have their buildings supported?—I take it, speaking broadly, the law of right of support would continue.

27,081. Who would pay the compensation, the Crown or the worker?—It depends who owned the colliery. If I were the State and you the colliery owner, I acquire the minerals in that colliery, and I let you the minerals for such and such a royalty.

27,082. And you put upon me the obligation to pay compensation for the damage I may cause to third parties and to indemnify you?—It is a matter of the terms of the lease. Another case is this. This was a case of joint ownership. The area involved only 2½ acres, but prevented the main headings of the colliery being extended and the dip coal being worked. It was a case of a small area holding up the development of the colliery. Four out of five owners were agreeable to the terms offered by the colliery company. The fifth refused to deal with the matter unless he could handle the money, and as the property was mortgaged this was impossible.

27,083. Omit the mortgage for the moment. Were they not advised, as was the case, that those four part-owners were entitled to work that coal without the consent of the fifth?—We were advised to the contrary by our lawyers. It is a case of lawyers differing. We naturally took the view of our own lawyers who were noted persons.

27,084. It was bad law I may tell you?—I am thankful to hear it.

27,085. Have you any more?—That is just a few. There was a case where the Colliery Company were desirous of extending their workings in certain seams into an area adjoining their present workings. This was in Lancashire. They have in lease to a small extent minerals from Lord —— who also owns a very large area to the dip of so and so workings, and now in lease to so and so colliery. Lord so and so originally leased his minerals to Messrs. so and so, and he stipulated in his lease for a rise barrier to be left, not only in his coal, but in that of other owners, and now refuses to allow this barrier to be pierced, thus effectually stopping Messrs. so and so's developments to the rise.

27,086. On the investigation of the facts of that case did you discover that rise barrier was *bonâ fide* required to keep back water from the rise to the dip?—My own opinion is it was not. I was borne out in that opinion by some very well-known mining engineers in Lancashire. I am bound to say the engineers acting on behalf of Lord so and so took the opposite view. A further company is now working minerals belonging to the Trustees of Lord ——, but on June 30th they have to surrender their lease—the whole of the property having been released to the adjoining —— colliery. It will be 20 or 30 years before —— colliery workings can get into the property, and in some cases there are areas of coal surrounded by goaf which are now accessible to the other colliery. There are two collieries, I do not want to give the names.

27,087. Did you get an explanation why it was the owner of the colliery who could work the coal refused to renew the lease of that colliery?—Colliery A, Colliery B.—Colliery B has its shaft sunk in its own property. Colliery A has two shafts sunk in property owned by Colliery A, and it is working an area belonging to, shall we say, C. Colliery B comes

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

along to C and says: "We will take that coal when the lease is ended." Colliery A is most willing, even on the same terms, to take it, but they are cut out by Colliery B, who has been too quick for them, and Colliery B cannot get into that coal for years, and Colliery A must stop working in C at the end of this present month, and a very considerable output is lost to the nation; half the colliery output.

27,088. Colliery B outbid Colliery A, and the owner of C lot the coal over the head of them to somebody else?—Yes, and the nation suffers. Then the next east is the case of a colliery company who agreed terms with a great number of small freeholders, but one owner demanded three times the royalty rent that has been agreed to in the other cases, and his action is preventing the colliery company from developing the minerals, the arrangement in question being more or less interlocked with the others.

27,089. You have given a sufficient number of illustrations?—I have a few more.

27,090. Unless you wish it, I need not trouble you.

27,091. *Mr. Herbert Smith*: Unless you are going to give us the names you have kept back?—In common fairness, I thought I should not mention them.

27,092. *Mr. R. W. Cooper*: Either through the means of your regulations which have now lapsed, or by means of some other statutory power, if some proper authority exists, the Mines Department or otherwise, having the necessary powers, all those difficulties could be got over?—Yes, but would there not be an interminable arbitration? You know what an arbitration is, and the time lost while some of these things are being arbitrated might be most detrimental to the progress of the colliery in question.

27,093. I only want to get out both views?—I thought very seriously over that, and it struck me it would be better to take one bite at a cherry than two.

27,094. I quite see your point. Now let me continue. On the question of barrier coal, what is your experience? Does it agree with mine that, generally speaking, barriers which may be 40, 50 or 60 yards wide are generally excepted under the lease?—You mean, may be worked.

27,095. You are leasing an area to me, you being the owner, and you stipulate for a barrier to be left; you would not only make me enter into covenants that I would leave the barrier, but you would exclude from the lease the 40 or 50 yards to constitute the barrier?—Yes.

27,096. You would still remain the absolute owner of the barrier?—Yes, true.

27,097. Therefore you could let the barrier to anybody you pleased?—Yes.

27,098. Either to myself or my next door neighbour, if you thought the barrier was unnecessary?—Yes, and that by mutual agreement between adjoining collieries has resulted in a barrier being worked sometimes.

27,099. You refer to the fact that you have known cases sometimes—we had better see the good side as well as the unfavourable side of the picture—where you say the colliery lessee has paid a good deal of money in the shape of dead royalties in anticipation of his right to work the coal afterwards?—Yes.

27,100. Then owing to his lease expiring he lost the right, obviously, of course, to work that quantity of coal which is represented by those over-payments?—Yes.

27,101. Have you ever known of cases of owners renewing their leases and allowing the lessees to work off the short workings which had accrued under the expired lease without asking anything for it?—Yes.

27,102. With regard to the working of coal generally under the present system of private ownership, do you agree with me, as a general rule the lessees or tenants of coal are placed under an obligation by the lease to work out all the coal which is fairly capable of being worked?—Yes, the lessor's mine agent is or should be insistent upon seeing that that is done, but I am quite prepared to say it is not always fulfilled.

27,103. Of course, at the present moment the Crown is lessor as well as a private individual?—Yes, true.

27,104. And they have an agent, too?—A very astute and insistent agent, too.

27,105. Now, with regard to the valuation on page 4. Your remarks apply entirely to what you call the freehold?—Yes.

27,106. I suppose by that you mean the rental value of the coal?—Quite.

27,107. Then you go on valuing the goodwill of the colliery, which you do not concern yourself about?—I just, perhaps, needlessly put in, as well as the one I was concerned with, two other forms of valuation. I am at the moment only concerned with the value of the minerals.

27,108. I am only going to suggest this, that what you call goodwill I should call a leasehold interest?—You give it a different term.

27,109. You mean that?—I mean that exactly.

27,110. Of course, you have heard from the Inland Revenue that, generally speaking, the method of valuation you have described is that which is adopted by the State in assessing the value of mineral property for death duty purposes?—That is so. That is why, when one has to earn one's own living by the making of valuations, one adopts the form which is most accepted or, in fact, only acceptable to the State, and that is the method laid down in King's "Theory Finance," 3rd Edition.

27,111. The only points, if I may venture to say so, which I want to give any consideration to at all on your suggested method of valuation is as to what should be the rate of interest for redeeming the capital?—One always learns something and I learned something from Mr. Sidney Webb, if he will allow me to say so. It passed through my mind the value of money had altered considerably, but I never applied it—perhaps because for the last 10 or 11 years I have not had to do with valuation—I have never applied it in theory to the valuation of property. One would redeem one's capital presumably at 4½ per cent. in preference to 3 per cent., which makes the present value somewhat less.

27,112. I am grateful to you for that. The next time I have to deal with the revenue I shall bear that point in mind?—I daresay you will. I doubt whether one would be quite justified in altering the return allowable to a purchaser, which I have always put at 8 per cent. (I put it somewhat higher, between 12 per cent. and 15 per cent. in valuing the colliery), and perhaps Mr. Sidney Webb would put it at 10 per cent. I am doubtful about that and I have been turning it over in my mind ever since. It seems a high rate to allow a purchaser of mineral property.

27,113. You think it ought to be 8 per cent.?—I have an open mind; until converted I stick to 8 per cent. Mr. Sidney Webb has convinced me on 4½ per cent.

27,114. That is a matter of dealing with capital?—Yes.

27,115. Now as regards the method of determining these values. You suggest further down in your *précis* on page 4 that perhaps the best way would be for a valuation by a board of experts to be set out?—It is such a technical matter. I happen to know that valuing is done in a very sloppy way in many directions. I have seen valuations that have passed that should not have passed. The theory of valuation is not, as I say, as well understood as it might be. There are in this country a number of very expert valuers known to you and known to me, very eminent men whose valuations could be relied upon, and I think if the State took over these mineral royalties they should be taken over at a fair valuation, but I would expressly exclude from the valuation certain properties which I mention. It seems to me that such a body of experts should be given a guiding line on which to go on that it could be said to them, "Now proceed and value."

27,116. You do think district by district they should investigate the actual merits of each property by

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

valuation, and not have any haphazard overhead valuation?—I think so.

27,117. Whatever the total amount of all these valuations amounted to would be the total. I mean to convey this. It would not be fair to adopt an arbitrary lump sum and then let that arbitrary lump sum be partitioned out amongst the various owners?—I do not know.

27,118. The owners must vary in their rates very much?—Yes.

27,119. One man may have a very short lease and one a very long one?—The end might be perhaps secured by each property being rigorously valued, absolutely correctly valued subject to a drastic exclusion. For instance, I would say every property that will not come into development within a period of 50 years should be excluded, and so on, and so on.

27,120. Because as a matter of arithmetic the mining area that does not come into operation for 50 years, as far as the present day value is concerned, is nothing?—I am very much impressed with the point of view which I think has been expressed here, that it would be as well for the State if it took over the properties to know where it was before it started to take them over, and it would lead to very great simplification if a lump sum could be set aside and the valuations made to come within that sum. I will tell you why. Otherwise it might result in an immense amount of litigation, trouble, worry, deferment in point of time, and so on. I am not decided in my mind at all. I cannot help seeing and being impressed by that side of the question.

27,121. Do not you think that there will be just as much contention in ascertaining the respective shares of all the numerous royalty owners in the lump sum?—The State would be outside it. It would be like the bun thrown to the bears. They would all be quarrelling about it for themselves, but the State would be happy.

27,122. How would you be sure that the lump sum was big enough?—That is why I say with a view to arriving at what the figure might be I put an outside figure. I suggest it should not exceed such and such a sum, but if the valuation of all the properties comes out at something less I would not give them all the money.

27,123. *Mr. R. H. Tawney*: How do you propose to arrive at that outside figure?—I have arrived at it.

27,124. *Mr. R. W. Cooper*: As described here?—Yes. £70,000,000 if you allow 8 per cent. If you allow 10 per cent. £55,000,000 odd.

27,125. £70,000,000 assumes the capital value?—Yes.

27,126. That was based on the revenue existing in 1893. You are quoting the amount set forth in the Mines Royalties Commission Report in 1893?—5½d. If anything, they have gone down since.

27,127. Having regard to the evidence from the Inland Revenue and Dr. Stamp, is that so?—He included wayleaves and other minerals as well. I was driven to go to the Royal Commission on Royalties in order to arrive at a figure.

27,128. You would agree if better information could be got for the purpose of estimating the assumed capital sum that better information ought to be resorted to?—Yes. You may take it it would not be more, but less, if anything.

27,129. *Mr. Sidney Webb*: The Inland Revenue know the amount of the royalties to a £, but they have not published it?—In that case the information is available.

27,130. *Mr. R. W. Cooper*: When you talk about a royalty being unproved, I want to see if you and I are in accord with regard to that. I appreciate what you said about the present value of a royalty which cannot be worked for 50 years. Supposing you had an area of coal that had never been touched by anybody, but was surrounded by other areas where the coal is in active course of working and therefore there was a moral certainty there would be the same coal seams existing in the area I am talking about, would you treat that as being for all practical purposes a proved

area?—So much so that I would not bore; I would sink.

27,131. You take the coal and work the adjacent royalties?—I think that is a proved property. In valuing such a property you have to take into consideration the main question—I know you know this as well as I do—you have to consider what is the likelihood in point of years of that property coming into operation; that is where local knowledge and mining knowledge comes into play.

Mr. Frank Hodges: What would be the situation if the enclosed area was filled up with disturbed strata?

27,132. *Mr. R. W. Cooper*: Suppose it is filled up with faults, and so on, you would then get the information you got from the adjacent strata?—It is a question to be determined by the local and engineering knowledge. With regard to the value, if there was a great dyke running through that property, or I can imagine it being so cut up by faults and washouts as to be valueless.

27,133. Is not the bedrock principle that you have to ascertain from the best knowledge and experience what the property you are dealing with will fetch if sold in the open market?—That is it with reservations.

27,134. What are they?—I might be a speculative person and say there may be coal here. I might be a bit of a geologist and say I do not know, but I will buy such an estate, and the man who sells it might be a bit of a geologist and say I think there may be coal here, and I may get or give £1,000 or £2,000 more for that property than I would if it were simply land. The Government comes along and puts down a bore hole and discovers coals. I do not think I ought to benefit by that.

27,135. You would not quarrel with me if I say the fair selling value is what it will fetch in the open market?—That is better.

27,136. Now, near the end of your *précis*, section I, you refer to what Mr. Gemmel said, and I quite appreciate your reasons for disapproving that suggestion. You do not think that if the minerals—what you and I call the royalties—were vested in the State, some provision should not be made for the protection of the present lessees and workers who, incidentally, probably have leases about to expire?—I do not know that I quite follow that point. It is my density.

27,137. May I make my meaning plainer? As you know, there are many different areas of coal leased in Great Britain, and certainly not a quarter passes, or a month passes, without some lease terminating by effluxion of time, and having to be renewed?—Yes.

27,138. And although there may or may not be a legal obligation to renew, yet the practice of renewal is so well established that it is tantamount to an equitable expectation?—Quite so.

27,139. Do you not think, if those minerals were vested in the State, there ought to be some full protection to the lessees in such circumstances as that?—Well, it is so much in the air.

Mr. R. H. Tawney: Can they sell that "equitable expectation"?

Mr. R. W. Cooper: Well, practically, they can. I put it to Sir Richard Redmayne whether that is not so?

27,140. *Mr. R. H. Tawney*: (*To the Witness.*) Do people sell equitable expectations when they have no legal title?—It is rather hard to answer that "yes" or "no." If I were valuing a colliery concern, composed of, say, two royalties—

27,141. *Mr. R. W. Cooper*: Would you take half-a-dozen?—Well, half-a-dozen, and one of those royalties was about to expire, as Mr. Cooper puts it, in three years' time, and that was a royalty, say, through which my main roads went, if I did not secure the renewal of the lease of that particular royalty, it might mean the closing of my colliery. No landlord, presumably, would fail to renew the lease, and I would certainly take that expectation of renewal into consideration, in valuing the colliery for sale.

27,142. *Mr. R. H. Tawney*: Do you mind my putting this, because you have not quite answered my question?—But one cannot quite answer your question.

6 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

27,143. I submit, for Mr. Cooper's point, it is rather relevant. Can you borrow money on the security of an equitable expectation? That is to say, a moral interest which is not a legal interest?—You could borrow money on the valuation of that colliery.

27,144. *Mr. R. W. Cooper*: That is the answer. If you value the colliery as one entire undertaking, there may be several leases, one of which might expire next year, but the person lending money would have regard to your valuation of the colliery as a whole?—Quite so.

27,145. Therefore, do you not think, if those mineral rights are vested in the State, that all the existing lessees ought to be protected by having the right of requiring to have their leases extended for a satisfactory term of years?—I see your point now. If the State took over the collieries, they should have the expectation of renewing the leases, certainly. The State would be the last person, presumably, not to do so.

27,146. I am not prepared to make that assumption?—I said "presumably."

27,147. I am glad to have your answer.

27,148. *Mr. R. H. Tawney*: To what period is that obligation to extend?—I should say the period normally running for leases, which is either 21 or 63 years.

27,149. Does that then create a new equitable expectation?—On the principle of that, we go on from day to day.

Mr. R. H. Tawney: Apparently so, on Mr. Cooper's argument.

Mr. R. W. Cooper: As a matter of fact, having regard to the rate of interest on which you capitalise the value of colliery property, when you get beyond a certain number of years, beyond that you do not count.

Witness: The collieries work out.

27,150. *Mr. R. H. Tawney*: Does that mean the equitable expectation extends to when the colliery works out?—That is about it.

Mr. R. H. Tawney: That is a novel theory. That is to say, the State never acquires the colliery because it is precluded by the equitable interest?

Mr. R. W. Cooper: The case I put is, if the State only pays the capitalised value of the rent, and the lease falls in next year, the State would acquire for the capitalised value of the rent something far more than the capital value of the rent?

Witness: Is not the whole thing met by this: if the collieries were taken over, they would be taken over on a fair valuation?

27,151. I am not talking of the colliery being taken over, but the royalties?—You are talking of the minerals being taken over and the collieries remaining as heretofore. Of course they should have a proper expectation of renewal.

Chairman: Gentleman, there is a witness who has come here to-day and we must call him in order to prevent him having to come again. I think so far as Sir Richard Redmayne is concerned, we had better adjourn his further cross-examination to next Friday, and we will ask Mr. Cooper to be good enough to resume his questions then.

27,152. *Sir Allan Smith*: Sir, before Sir Richard Redmayne leaves, I should like to ask him whether he would be anxious to revise a statement he has made. We have had a little bit of trouble about the use of phraseology, and for the Government Inspector to say it is required to take the "big stick" to the coal owners may give rise to two interpretations, one legitimate and the other absolutely the reverse. Does Sir Richard Redmayne think it is wise to leave that on the Notes? If so, it must be investigated; but if not, it must be taken out now.

Witness: The question put to me by Mr. Balfour was whether the collieries would combine voluntarily or whether compulsion would be needed. I will gladly substitute the word "compulsion" for "big stick."

Mr. R. H. Tawney: It is only in Scotland that this joke will be misunderstood.

Sir Allan Smith: I am not referring to that.

Witness: I am not suggesting the Government Inspector was going to wield the big stick over anyone.

Sir Allan Smith: But there are reasons, as you will see, from the interpretation and resentment which appear to have been accorded to the words "wasteful and extravagant," which might make an Inspector of your experience more careful in his language.

Witness: I meant "wasteful and extravagant."

27,153. But do you mean "big stick"?—Metaphorically I meant "big stick," but I will gladly substitute "compulsion."

Chairman: It does not quite follow the metaphor?

Witness: No.

Chairman: We quite follow your point, Sir Allan, and we are much obliged to you.

(The Witness withdrew.)

Mr ARTHUR PUGH, Sworn and Examined.

27,154. *Chairman*: I think you are Secretary of the Iron and Steel Trades Confederation?—Yes.

27,155. I must explain to you that I have not had the pleasure of having a *précis* from you, and therefore I want to understand the nature of your evidence. We have had here a number of gentlemen from different trades and associations to speak as to what their views of the nationalisation of coal mines and the coal industry are. We have had gentlemen representing Chambers of Commerce from Birmingham, Leeds, London and Glasgow, who have told us their views and what the views of their constituents are with regard to the nationalisation of coal mines. Now they represent the employers' views, and we thought it right to have the views of the men in different trades. For example, we have had Mr. Cramp, of the Railwaymen, here this morning, who expressed his views and the views of his constituents as to what nationalisation would mean for them. I understand you represent the Iron and Steel Workers. Will you kindly tell me about how many men there are in your Federation or Association?—95,000.

27,156. Are they spread all over the country in various places?—Yes, throughout Great Britain.

27,157. You are, I think, the General Secretary?—Yes.

27,158. How long have you been the General Secretary?—Throughout the existence of the organisation.

27,159. How long has this organisation been in existence?—I am rather afraid that that means an explanation. The Iron and Steel Trades' Confederation, as such, has only existed since the beginning of 1917. Previous to that it was split into a number of unions which formed the Confederation.

27,160. Are you in a position to tell me first of all the views which you think are entertained by your Federation on this matter, and if so, then will you kindly tell me your own view? First of all, what are the views of your Federation on the question of the nationalisation of mines?—Before replying to that, I would like to make one explanation, and it is this: Owing to the extremely short notice given to attend this Commission, I have not been able to get into touch with my Executive Council, and it has not been possible for them to do anything in the way of preparing a considered statement on the matter. I am therefore in somewhat of a difficulty here to-day with regard to speaking on behalf of the organisation, and in replying to any of your questions as to the view of the organisation or its members. Whilst I will endeavour, as far as I can, to state what I believe would generally represent their views, it must be understood that I have not been sent officially, but I am here on my own responsibility.

27,161. Quite right. Now will you continue?—You ask the opinion of the members of my organisation

6 June, 1919.]

MR. ARTHUR PUGH.

[Continued.]

with regard to the nationalisation of mines. I think certainly, so far as the principle of nationalisation is concerned, the great majority would be in favour.

27,162. Why are they in favour of it?—On the ground that with regard to so important an industry as coal mining, its importance to all industries and its importance to the community, the State should be the controlling factor, and that it should not be left entirely in the hands of private citizens, either few or great in number.

27,163. Will you tell me this: Have you formed any view of your own as to whether the nationalisation of mines would increase the price of coal, and whether, if it did increase the price of coal, it would have an adverse effect upon the workers in your industry?—I would hope that it would be possible under a centralised control, which might be carried out through the State, there would be such co-ordination and such arrangements as would make it possible to produce coal from the mine at the minimum of cost. If that were not done, of course, and the cost was increased, it would undoubtedly be a serious factor so far as iron and steel production is concerned. But I think my own view would be, and probably the view of the majority of my constituents would be, that under State control it should be possible to produce coal at a minimum of expenditure.

27,164. Now I understand your views, and I am going to ask Mr. Smillie on the one side, and Mr. Balfour, whom of course you know by reputation, upon the other, to ask you such questions as they think desirable.

27,165. *Mr. Robert Smillie: (To the Witness.)* I do not think I will keep you very long. Your Society is affiliated to the Trade Union Congress, is it not?—That is so.

27,166. I think you yourself have attended a considerable number of Trade Unions' Conferences?—Yes.

27,167. Have the members of the Iron and Steel Trades Confederation voted in favour of the resolution for nationalisation of mines which came before the Trade Unions' Conference?—It would have done.

27,168. Have you, as Secretary, received from Mr. Bowerman in advance the Agenda of the Congress so that you might send in amendments, if you cared to do so?—Yes.

27,169. Have you put the Agenda before your Executive or Conference so that your delegates might be instructed?—Yes.

27,170. Have they been instructed to vote in favour of the nationalisation of mines?—Yes, so far as I remember.

27,171. I believe you have never sent in any amendment?—No, that is so.

27,172. And your delegates never voted against it?—No.

27,173. *Mr. Frank Hodges:* Have you received, as secretary of your organisation, any communication from any official concern connected with the Miners' Federation soliciting your support in favour of nationalisation?—No, not so far as I am aware of.

27,174. Would all such communications be directed to you as secretary?—They should be.

27,175. *Mr. Arthur Balfour:* Your members, I take it, voted for the general principle of nationalisation? They had no definite scheme before them?—No definite scheme, but they would vote for the resolution as it stood.

27,176. Have you seen the proposed Nationalisation of Coal Mines Bill which has been handed to the Commission by the Miners' Federation?—I do not know that I have.

27,177. You agree, I think, that there would be a grave risk to the steel and iron industry of this country if nationalisation of coal mines should increase the cost of coal?—If the cost of coal were increased, it would undoubtedly affect the steel and iron industry.

27,178. Particularly in view of the very cheap coal which is being produced in America?—That would be a factor to be taken into account.

27,179. Do you agree it would be unwise to step suddenly from our present position into such a very big change as nationalisation without attempting in some way first to test the possibilities?—I think clearly one must look well ahead in whatever one does in regard to industry.

27,180. And move gradually?—Yes.

27,181. *Sir Allan Smith:* I should like to be clear on the point Mr. Smillie raised. When was it last that the Federation voted on the question of the nationalisation of mines?—I could not give you the date, because I do not know when the resolution last came before the Trades Union Congress.

27,182. Have you any idea what ballot the Federation polled on that question on the last vote?—At the Congress?

27,183. No; that the ballot of your Federation polled on that point?—We would not take a ballot on the resolution coming before the Trades Union Congress.

27,184. Does it follow your Federation has not taken a ballot on that point?—That is so.

27,185. Did the British Steel Smelters take a ballot on that point?—No.

27,186. Therefore the question of nationalisation has not been put before the members for voting either on the part of the Steel Smelters or the combination called the Federation?—It would be done through the delegates who would be appointed by the men in the districts.

27,187. But they have not balloted?—No.

Mr. Robert Smillie: It might be made clear that no one has balloted—not even the miners.

Sir Allan Smith: I am obliged to you, if that is on the Notes.

27,188. *Mr. R. H. Tawney:* I think Sir Allan Smith is under a misapprehension about the practice of the Trade Unions in instructing their delegates to vote on a subject. What is it?—The usual course is for the matter to come before the respective branches. They have their delegates who will probably be attending district or divisional committee meetings. There the delegates discuss it, and having regard to the views of the members of their branches, so they vote for and against. Then the next procedure may be that your districts or divisions in turn appoint their delegates to the annual conference or to the Congress itself, and so you get from the branches through delegations the views of the members so far as you can ascertain them to the final point where the vote of the organisation is recorded.

27,189. The ordinary practice is for all resolutions which are going to be submitted to the Trade Unions Congress to be discussed in the branches of the Trade Unions: Is not that so?—Yes, in the branches or in the districts.

27,190. And for the delegates to the Congress to vote in accordance with the instructions which are given them in the branches or the districts?—That is the general trade union practice.

27,191. That is to say, resolutions carried at the Trade Unions Congress do not simply represent the views of the persons who happen to be attending, but they represent the views of the rank and file?—Generally speaking, that is so.

27,192. *Sir Allan Smith:* It is a strong point. (*To the Witness.*) Do they represent the views of the rank and file?—So far as it is possible to obtain the views of the rank and file by the methods available. If you say in every question that a trade union has to decide it must have a referendum, and in respect of every conference which a trade union representative may have to attend, the representative must not attend until you have taken a referendum of the rank and file on the questions to be discussed, you are putting an entirely impracticable proposition.

Sir Allan Smith: I do not suggest that.

27,193. *Mr. Evan Williams:* Is there any representation of the views of the minority at the Trade Unions Congress? I take it your Federation would have more than one representative at the Trade Unions Congress?—Yes.

6 June, 1919.]

MR. ARTHUR PUGH.

[Continued.]

27,194. Assuming it was by a majority only that these views were held among your members, would all the representatives of the Trade Unions Congress give the vote of the majority, or would there be any representation of the vote of the minority?—So far as our organisation is concerned, we usually have a meeting of the delegates before the Congress. You will find on many important questions of principle a difference of opinion among the delegates and representing the difference of opinion in the different districts where they have come from. On questions of principle we usually ascertain the views of the delegates before the vote is taken, and if the majority are against it, then the vote would be against irrespective even of the general view of the Congress upon the matter. That is to say, we do not simply take a card containing so many votes and hold it up to be declared as a block vote until we know whether the majority of the delegates there are in favour of the proposition.

27,195. Supposing you had 100 lodges, and you found 40 were against a certain proposal, and 60 were in favour of it, and you sent 10 members to the Trade Union Congress, I take it the 10 would vote in favour of the proposal if there was a majority of the lodges in favour of it?—You see, the point is this, that the representatives appointed from the districts generally represent the majority view of their district.

27,196. But it comes back to this, supposing you have 10 representatives, those 10 represent the majority view, without any reflection at all of the minority.

Sir L. Chiozza Money: Sir, may I, in a moment, raise a point which I think of importance to raise before we meet again?

27,197. *Chairman*: (To the Witness.) First of all, do you want to say anything more?

Witness: No.

(The Witness withdrew.)

Chairman: Now I have a letter to read from Sir Lionel Phillips, who gave evidence yesterday. It is addressed to me, as Chairman, and he says: "May I supply an omission in my evidence of yesterday? Mr. Sidney Webb cited the work of boring oil in England as evidence of Government initiative and enterprise in industry. The facts do not sustain that view. Lord Cowdray, at the head of a great corporation, having oil interests in various parts of the world, took the initiative in securing certain areas which, owing to the study of his experienced advisers, were deemed to present favourable prospects. He was ready, and, in fact, obviously intended to bear the expense, and incur the risk, of boring, and, of course, would have done so in the hope of deriving profits from his enterprise. That the Government should, at a critical moment, have been ready to avail itself of the preliminary work done by specialists, is no evidence that, in normal times, permanent officials would have either the knowledge, or incentive, or be permitted to spend public monies in search of new fields for industrial activity." That is signed by Sir Lionel Phillips. Now, Sir Leo, what is the point you want to raise?

Sir L. Chiozza Money: The point I wish to raise is this. Evidence has been brought before us, and evidence has also come before each Commissioner, individually, I think, that an agitation is being worked up to cause certain bodies to pass certain resolutions in a certain direction. It is true we have only one more day to hear evidence. After all, the evidence which comes before us ought not to be prejudiced by such methods. Could you, in the small time that now remains at our disposal, call the Secretary of that Association?

Chairman: What is its name?

Sir L. Chiozza Money: It is the Coal Association.

Chairman: What is the name of the Secretary?

Sir L. Chiozza Money: Mr. Gee. I ask whether he could be called to explain to us the methods which have been used, and what money has been spent to cause these resolutions to be forwarded to members of this Association, and to cause, as it seems to me, an artificial presentation of views before this Commission—views which would not have been expressed spontaneously.

Sir Allan Smith: What does it matter? I suppose activities are going on at the instigation of the Trade Union bodies and others.

Sir L. Chiozza Money: We have the very reverse evidence to show that nothing of the kind has occurred.

Mr. R. W. Cooper: Do you think we should pay the least attention to these things? I certainly do not.

Sir L. Chiozza Money: The public is led to believe that certain resolutions are spontaneous when they are not spontaneous.

Sir Allan Smith: I think the best answer to that is this, while I did not wish to refer to it; if two gentlemen of the Commission wish to go into the witness box to give evidence, on oath, in favour of nationalisation, why should they blame outside persons for trying to work up an outside agitation?

Chairman: We are very much obliged to Sir Leo Money for raising this point, and to Sir Allan Smith for his remarks. We shall have an opportunity of discussing it privately in a few moments.

(Adjourned to Friday next.)

SECOND STAGE—TWENTY-SEVENTH DAY.

FRIDAY, 13TH JUNE, 1919.

PRESENT :

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. R. W. COOPER.

SIR ARTHUR DUCKHAM.

MR. FRANK HODGES.

SIR LEO CHIOZZA MONEY.

SIR ADAM NIMMO.

MR. ROBERT SMILLIE.

SIR ALLAN M. SMITH.

MR. HERBERT SMITH.

MR. R. H. TAWNEY.

MR. SIDNEY WEBB.

MR. EVAN WILLIAMS.

SIR ARTHUR LOWES DICKINSON, }
 SIR RICHARD A. S. REDMAYNE, } (*Assessors*).

MR. ARNOLD D. McNAIR (*Secretary*).MR. GILBERT STONE (*Assistant Secretary*).

Mr. Arthur Balfour: Sir, before you begin to take further evidence, may I make one remark with regard to this question of reduction of output, which seems to be of the very greatest importance not only to the miners and coalowners, but of even great importance to the consumers? I think it is a question which ought to be investigated, but whether this Commission, which is considering nationalisation, consists of the right people to investigate it, I have not quite made up my mind. If it is not, perhaps the Coal Controller could set up a Commission or Committee to investigate it. An any rate, I do not think it ought to be left where it is.

Chairman: No, I do not think it ought to be. I am very much obliged to Mr. Balfour for mentioning the point. He is quite right in saying that this question of the diminution of output is most important, and I suppose it has most importance for the consumers' class. Mr. Tawney has just drawn my attention to a letter from the Chamber of Commerce and Shipping at Great Grimsby dated 11th June last, which is addressed to him at the Coal Industry Commission, and it says: "Sir, I have the honour of enclosing herewith a resolution passed by a special meeting of the Council of this Chamber to-day: 'That the Great Grimsby Incorporated Chamber of Commerce and Shipping, having in mind the fact that the Coal Industry Commission has no representative of the consumers among its members, and representing, as this Chamber does, large and small consumers alike, views with alarm any suggestion of the nationalisation of coal mines, being

strongly of opinion that such nationalisation would be disastrous to the general commerce of the country and especially to the trade of Great Grimsby.'" I think that resolution contains a misapprehension so far as it states that the Coal Industry Commission has no representative of the consumer. We have had the invaluable assistance on this Commission of two very considerable consumers of coal, Mr. Arthur Balfour and Sir Arthur Duckham. If the Chamber of Commerce of Great Grimsby means the domestic consumer, I can understand it, but so far as consumers in general are concerned, it is an injustice to both the consumers I have mentioned to say that the Commission is not representative, because we have had most invaluable assistance (if they will allow me to say so) from two of the largest consumers to be found in the country. I quite agree with Mr. Balfour that this question of diminution of output is most important. However, I am glad to say that in the interval since our last sitting Mr. Herbert Smith has made very searching enquiries throughout Yorkshire. I understand that he has communicated with about 179 lodges and has had replies from 135. When Sir Richard Redmayne goes into the witness-box I will ask Mr. Herbert Smith to indicate the result of those enquiries. Whether this Commission will meet again for some time or at all after June 20th, of course, for the moment, I cannot say: but that some one ought to make an enquiry into this question I have no possible doubt, and having regard to the fact that we have had two very large consumers sitting upon this Commission, I think this body would be quite able to make those enquiries.

MR. JOHN JOSEPH PREST, Sworn and Examined.

27,198. *Chairman:* I think you are the manager of the Blackhall Colliery?—I am the General Manager and Chief Mining Engineer for the Horden Colliery Company, Limited.

27,199. I observe that Lord Gainford in his proof of the evidence which he gave before this Commission says this with regard to you, when talking about the Blackhall Colliery*: "The sinking and the electrical equipment of this colliery formed the subject of a paper read by Mr. Prest and Mr. Leggat before

the Institution of Mining Engineers on June 4th, 1914. Before leaving this part of the subject I must testify to the skill, endless resource and enormous energy shown by our manager, Mr. J. J. Prest, by whose indomitable perseverance and courage all difficulties were overcome." Therefore we know that you have had very large experience and have taken a very prominent part in the development of these collieries. The reason that we have asked you to be good enough to come here and give evidence is in consequence of a letter which you are said to have written to the miners belonging to some lodge of the Durham Miners' Association. If the Commissioners

* Shorthand Notes, Second Stage, Fifteenth Day, page 832, column 2

13 June, 1919.]

MR. JOHN JOSEPH PREST.

[Continued.]

will kindly look at the Shorthand Notes of 6th June (Second Stage, Twenty-Sixth Day), Question 26,982, they will see that Mr. Smillie read a correspondence which took place between you and a Mr. George Thompson. Mr. Smillie puts the question and he says: "I will read the letter, so that you may see the harmeny that is existing there." The letter is signed by Mr. George Thompson and is addressed, as I understand it, to you, and it says: "Dear Sir,—I am instructed to write to you on the most vexed question of larger houses for our big families. We have some outstanding large families that are living in houses that are not near large enough, and we are at a loss to treat them properly. If you could meet a deputation when you are at Shotton, when we could talk over the whole question of our big families and bigger houses, we would be much obliged. Our men ask me to state that for you to meet us would be the best course to adopt.—Yours faithfully, George Thompson." The reply apparently is written from Hardwick Hall, Castle Eden, to Mr. George Thompson, and is signed by you. It is as follows: "Dear Sir,—In reply to your letter of the 23rd instant, you can take it from me that we do not intend to build any more houses at any of our collieries, whether large or small, and for this decision you can thank Mr. Smillie and his friends." Now, when I heard that letter I said that you might have some explanation of it, and that it would not be fair in your absence to make any comment upon it, because we should like to hear what you have to say, if you desire to say anything. What I actually said was this: "(Chairman.) There may be some explanation of the letter. We had better ask him"—that is you, Mr. Prest—"to attend at the next meeting of the Commission on Friday next week. The address is the Horden Collieries, Limited. He ought to have an opportunity of explaining that letter." Now this is your opportunity: Do you desire to say anything?—I do not think the letter is very ambiguous. I think the letter is perfectly frank. What explanation do you require?

27,200. I do not require any, but I should have thought that perhaps you would like to clear the matter up. Is that your true sentiment?—There are two questions raised in this letter. The chief point is the question of the building of additional houses. I told Mr. Thompson that we did not intend to build additional houses.

27,201. *Sir L. Chiozza Money*: Who is "Thompson"?—A check weighman.

27,202. "Mr. George Thompson"?—Yes. He is check weighman of the Shotton Colliery. I informed Mr. George Thompson that we did not intend to build any additional houses at any of the three collieries, "and for this decision you can thank Mr. Smillie and his friends." The first part of the communication does not require any explanation. It is the second part, I take it, you want explained. With regard to the question of building houses, I may say frankly that prior to this Commission being appointed, I had in mind to build 600 additional houses. I have already built 2,300, and I was going to increase the quantity up to probably 3,000 to enable us to increase the output at the last new colliery, the Blackhall Colliery, referred to by Lord Gainford. This particular colliery, I may say, has cost up to date £734,000. Our present output from that colliery is at the rate of 320,000 tons a year, and it is only half developed. It will probably take another 500 additional houses to enable us to get our 700,000 tons of coal per annum. In other words, to get that 700,000 tons of coal per annum we should have to build houses that will cost us roughly £275,000. The total capital expenditure on that colliery will be then £1,000,000 sterling. We should be then in a position to obtain an output of 700,000 tons of coal a year. If that colliery is to be nationalised along with our other collieries on the terms set out by Mr. Straker, we should receive in compensation for a new colliery and one of the best equipped collieries in the United Kingdom about £165,000. Is it probable that, as a commercial man,

I should advise anyone to build additional houses at a place like that if my colliery is going to be taken away from me, and I should receive in compensation only a sum of £165,000? That argument applies elsewhere. If you take the whole of my concern prior to the war, our average output was about 1,350,000 tons of coal a year from two collieries. The third colliery did not commence to draw coal, although we had spent about half a million of money on it at that time. If you take Mr. Straker's method of nationalising collieries and his proposed system of purchase, on our pre-war output of 1,350,000 tons a year at the rate of 10s. or 12s. a ton, we should receive in compensation a sum of about £650,000 for the whole of our concern, and, as I have explained, I have spent at one colliery up to date £734,000. I have spent during the last 19 years over £2,000,000 sterling on new collieries equipped with the best plant money can purchase and laid out in the best manner my intelligence and experience can direct. Half our total expenditure is going to be lost to us. Is there any inducement for me or my Board of Directors at the present time to try and find sufficient money to build 600 houses, which are going to cost £270,000 or £280,000? What we should get the money at Heaven above only knows, but probably not less than 7 per cent. All the houses we have built range from four to seven-roomed houses, and a large number are fitted with bathrooms and a large number have electric light in every room. The streets are all made up and wide, just as they are in a provincial town, and we have spared neither money or anything else to make a good job of our town. The total expenditure is just about £2,034,000, and our output is at the rate of 1½ million tons of coal a year. If we are to be nationalised on our present rate of output we get £775,000. On pre-war output we get about £650,000. What inducement is there for me as general manager to go on building houses? I have another colliery I should like to open—I have two, as a matter of fact. Two or three years ago I had the plans completed for the re-opening of one colliery, and the total cost of that will be £600,000. Why should I commence spending £600,000 to get a probable output of 450,000 tons of coal a year when I may be nationalised and receive less than half the money I am going to spend?

27,203. *Chairman*: That is the reason for saying, "for this decision you can thank Mr. Smillie and his friends"?—Well, as a matter of fact, this pamphlet which I have here published by Mr. Smillie and Mr. Hodges gives the facts of the Coal Commission, and I take it that Mr. Straker is of the same opinion as Mr. Smillie and his friends, and if I am to be bought out on those terms I am going to keep what money I have in my pocket. I am spending no more, but if I get a fair square deal I am going ahead. I thought I would finish my career as a mining engineer by completing the last two collieries and equipping them and making them an example for other folk who wanted to develop collieries, and I would like to leave my mark as a mining engineer in the county of Durham.

27,204. *Mr. Robert Smillie*: I suppose you do not know Smillie, do you?—No, except by photographs. I take it you are Mr. Smillie. I have not had the pleasure of meeting you before.

27,205. Are you of opinion that Mr. Smillie has any friends at all in the country?—I should think a lot.

27,206. Who do you mean by Mr. Smillie's friends?—What I meant was the Executive of the Miners' Federation principally—those in favour of nationalisation.

27,207. Do you include everyone who is in favour of nationalisation as amongst my friends?—Yes, I should say so.

27,208. Supposing there is a majority of the people of this country in favour of nationalisation you would call them my friends?—Yes.

27,209. What do you mean by saying, "If you are nationalised"? Do you think they are going to nationalise you?—No, but my collieries are to be nationalised, and I have considerable financial interests in them.

13 June, 1919.]

MR. JOHN JOSEPH PREST.

[Continued.]

27,210. But you said, "If I am to be nationalised?"—You cannot nationalise me personally.

27,211. That is what you said. I wondered if you thought that?—You would have some trouble in doing that.

27,212. Now you have had very considerable experience in Durham, have you not?—Yes; 18 years as general manager of the Horden Collieries. I commenced them and built them up. I have had 8 years' experience as general manager of the Shelton Collieries and Ironstone Mines. I had 3 years' experience in North Yorkshire, and I have had experience in Kent.

27,213. Have you read Lord Joicey's evidence?—I have read Sir Hugh Bell's evidence.

27,214. You have read his evidence?—Yes.

27,215. Is he chairman of your company?—Yes, of my company.

27,216. It is partly his company, too, is it not?—He is a shareholder; that is all. It is not Bell Brothers or Dorman Long's, as you imagined, but it is a public company in which you or anyone can hold shares if you like.

27,217. Consequently it is not yours in the sense that you own it?—No, I am general manager of it and I have considerable financial interest in it.

27,218. But you have referred to it several times as your colliery and said that if your colliery is nationalised you are to be robbed?—Yes. They are my company's collieries.

27,219. And the company is not yours at all?—No, not at all.

27,220. I wanted to find out whether it is or not. I suppose you would refer to the men at Horden Colliery and Shotton Colliery as your men?—Yes, very often. It is a colloquial saying.

27,221. They are only your men in the sense that they are producing coal under your directions?—That is all. Most of them I have set on myself.

27,222. Are you aware that it has been said the best of relations exist between the workmen in Durham and the employers?—Yes, by Sir Hugh Bell.

27,223. And that just prior to the outbreak of war you were on the eve of being likely to be able to bring about a closer arrangement for the regulation of wages and other matters?—Yes, quite so. We had the matter discussed at several of our meetings on the question of letting the men see the working cost and so on, and we were in a fair way to get to an agreement on the subject.

27,224. I think Mr. George Thompson, in addition to being a check weighman, is secretary of the Shotton Lodge?—Yes.

27,225. It is not an uncommon thing for the members of any Lodge in Durham to approach the General Manager to ask him to meet them, is it?—No, quite common.

27,226. This was an ordinary application asking you to meet them?—Yes.

27,227. Did you think it would be your duty to your directors to write such a letter as this letter rather than meet the deputation?—Quite so; I thought it was hammering a dead horse to discuss a subject I did not intend under any circumstances whatever to proceed with.

27,228. Is a seven-roomed house the largest house any of your workmen have?—Yes.

27,229. I suppose you do not live in a seven-roomed house yourself?—I have not counted them.

27,230. Do you know how many rooms you have?—No.

27,231. Are they so many that you really do not know?—No.

27,232. Would you like to live in a four-roomed house yourself?—I have lived in a four-roomed house myself.

27,233. And got out of it as quickly as you could?—Yes, the same as you would do. I have lived for a number of years in a three-roomed house. I did not commence life as a general manager.

27,234. Are you going to treat me as you treated Mr. Thompson?—I shall treat you exactly as you treat me.

27,235. I will treat you as one man should treat another?—Right oh!

27,236. You would not like to live in a three-roomed house 'now, would you?—Certainly not. I worked hard enough during my 40 years of graft to be able to do without it.

27,237. To justify—?—To justify my existence.

27,238. To justify your having a better house than a three-roomed house?—Yes.

27,239. Is there any person who works harder than the coal miners of Shotton or elsewhere?—I have nothing whatever to say against our men. I have some of the finest hewers and workmen generally in the Kingdom, but when you are comparing one class of labour with another, coal hewing is a soft job compared with puddling. You get in front of a puddling furnace in midwinter with hell in front of you and snow behind you.

27,240. We should neither of us get in front of a puddling furnace if we could help it. We are dealing with collieries at the moment. Colliers work sufficiently hard to justify them in having a decent house to live in, do they not?—So far as the colliers are concerned, I have been associated with them for 40 years, and there is nobody who can say a bad word against them in my presence. I have lived with them and through them, and I am still as intimate with them as ever, and I have their best interests at heart. If you consult the agents of the Durham Miners' Association as to my character in that respect, you will find out how I stand with them.

27,241. I only know of it from this letter?—Well, that is not evidence alone.

27,242. But it is evidence. You do not deny what was said here, and you are trying to justify it?—Yes.

27,243. I put it to you that it is in the interest of any colliery company to have large families in which there are a number of workers?—Quite so.

27,244. And it ought to be in the interests, surely, of a colliery company to endeavour to house large families as well as it possibly can?—Certainly, and I have done that—we have done that.

27,245. Did you write this letter because the Company had made up its mind that they were not going to build additional houses?—Until we saw exactly where the question of nationalisation came in, and how it was settled, and what the Government proposed to do.

27,246. Had the Directors decided that and instructed you in that direction?—Yes, they had decided that.

27,247. Are you altogether correct when you say that under the Bill which Mr. Straker was speaking about with regard to the nationalisation of mines you would only get a fixed sum?—Yes, 10s. or 12s. a ton.

27,248. Is that the only thing the Bill says?—Yes.

27,249. Does it not make provision for arranging for what might be an increase of output in an undeveloped colliery?—Yes, but it all comes to 10s. or 12s. a ton.

27,250. But I think you were putting your case just now that the money you would get for your colliery would be small because your output was undeveloped?—Yes, it is half developed.

27,251. Does not this Bill make provision for taking into consideration what the developments may be of an undeveloped colliery, and to pay for them accordingly?—Yes, but if we have to spend for this Black-hall Colliery, say, £300,000 to build additional houses—we have spent £734,000 now—and if we have to make that up to £1,000,000 sterling to build additional houses, and the total quantity to be got from that colliery when fully developed is 700,000 tons of coal a year, we should then receive 10s. or 12s. a ton on the whole of the possible output according to Mr Straker's Bill.

27,252. That does not answer the question I put. Have you not given a misleading statement here this morning when you said that a certain sum only would be paid for that colliery, when you know this Bill provides for dealing with the colliery according to what its output may be when developed?—And I have given you an illustration of a colliery which when fully developed will mean confiscation and not payment.

13 June, 1919.]

Mr. JOHN JOSEPH PREST.

[Continued.]

27,253. Is it not the case that the clauses of this Bill, if acted up to, in the case of nationalisation provide that where the colliery is not fully developed a consideration would be given to that with a view to endeavouring to find out its output when developed?—I say you can put the output at anything you like but I lose two-thirds of my capital. That is the effect of it.

27,254. Then what you have stated you would get for such a colliery as you speak of is not the amount you would get under the Bill?—No, because I have not spent the additional sum referred to.

27,255. The price it proposes to pay for collieries is so much per ton on its output, or in the case of collieries not fully developed the facts should be taken into consideration in order to endeavour to pay a fair price if it were fully developed?—Yes, but you take the colliery, as I have pointed out, when it is not fully developed. If it were fully developed, what about it? I have told you I get about 350,000 tons from a colliery half developed, and to fully develop the colliery I shall have to spend practically £300,000.

27,256. Are you aware that in addition to paying for the collieries on the output, or on the output which it would come to if developed, it is proposed to buy the associated properties in addition to that?—No, I was not aware of that.

27,257. Would that to some extent change your view?—Absolutely.

27,258. Well, that is the proposal.

Mr. Sidney Webb: It is in the Bill.

Mr. Robert Smillie: We propose to buy the houses?—At what price?

27,259. At a price to be agreed upon.

Chairman: A valuation?

Mr. Robert Smillie: Yes, a valuation?—To-day's valuation, or the money I spent, £460,000, in building houses?

27,260. We propose to be more honest and to buy the houses at a fair valuation put upon them by valuers. Is there anything unfair about that?—No, not at all. Up to date I have spent £460,000 in building houses during the last 19 years. I have learned in 19 years a lot as to the building of houses, and I am still learning. I have installed the electric light in all the rooms in about 500 of the last houses I have built; and I had hoped to establish large public baths, wash houses, and laundry at each colliery, with the object of dispensing with the washing day at home. It was our intention also to build a central hospital for large collieries, with a permanent staff of nurses, to enable us to promptly deal with accidents occurring at our own collieries. I have progressed in 19 years, and I want to make a model property, but I cannot go on doing that in the face of the proposed nationalisation of the collieries. I am not going to waste £80,000 or £90,000 and more of my money until I see where it is going.

27,261. Mr. R. H. Tawney: Not if it is to be paid back?—You give me an undertaking to pay it back, and I will go ahead.

27,262. But it is in the Bill.—It may be, but the Bill has not passed the House of Commons.

Mr. Sidney Webb: The valuation is exclusive of the associated properties.

Mr. R. W. Cooper: But they are not associated properties as it is drawn in the Bill.

27,263. Mr. Robert Smillie: You may take it the miners are not so foolish as to think that they should buy two properties, one a colliery for which there were no workmen's houses, and another colliery for which there were 1,000 houses built, and to give the same price for the two collieries if the output were the same. You may take it they intend to treat the employers fairly in a matter of this kind.—I should hope you do.

27,264. I should like to thank you for all the good things you have done on behalf of your workmen in building good houses and the baths and the hospitals, and so on. You have not yet given them baths at the collieries, but I hope that will be the next thing.—I had all the plans completed, and I was going to start in 1914 when the war broke out. I was going

to spend £16,000 at Blackhall in building a model bath.

27,265. Do you think "Mr. Smillie and his friends" are out to rob you and your Company?—I do, according to Mr. Straker's Bill—I do not know that you were. I read the Bill and I said that I had worked 40 years of my life, and at a time when I was going to retire I am to go into the workhouse.

27,266. We did not propose to nationalise you at your age, but we propose in any event, even if we take the collieries over for nothing, that we would make sure that you and your family have decent living until the end.—What do you call decent living? It is a very elastic term.

27,267. People have different views.—If you let me name it, I am on it.

27,268. What people call a decent living for a miner would not be called decent living for you at all, I can assure you, in the ordinary sense of the term such as you and your Company would look at. However, when I said decent living, I meant to provide you with all that was necessary to make life worth living, with a decent house to live in. That is what I call decent living. That is what we are trying to get for the rest. Now I want to make this point. You are anxious to continue the good feeling between the employers, the managers, and the workmen?—Yes.

27,269. Do you think this is the way in which to encourage it—by writing such a letter as this?—I am a very blunt, straightforward person, and if a man wants to waste my time discussing a subject which is absolutely as dead as Julius Cæsar, I am not going to waste time.

27,270. Do you not think it would have been a fair and frank reply to make to Mr. Thompson, or to your miners through Mr. Thompson, that the Company had decided, under the existing circumstances, that it could not see its way to build further houses because nationalisation was coming along, without bringing "Mr. Smillie and his friends" into it?—I daresay you are right, but when you are up against such a proposition you make a blunt reply to it. A *propos* of these committees, I have brought a list of all our committees in the County of Durham. If every county had its committees like those in the County of Durham, you would work as peaceably, generally speaking, as you do in the County of Durham.

27,271. And if every general manager was writing letters like this, there would be no committees in a fortnight?—Would there not? If you want my character as a general manager and employer of labour, apply to the agents in the County of Durham. I happen to be the Honorary Treasurer of the Aged Miners' Homes Association, and I happen to be Treasurer of the Christmas Tree Fund, and I raise money every year and have done for 15 years. I look after the financing of these associations and their housing accommodation and all that sort of thing. I get a large sum out of the colliery owners to help keep these old people, and I have shown my sympathy to the class to which I belong by performing these honorary duties.

27,272. I have heard of you very often from your agents and the workmen, as I can assure you.

27,273. Chairman (to the Witness): Will you let me have that list of committees?—Yes. (Same handed.)

Mr. Frank Hodges: It is very desirable that this misapprehension under which this witness is labouring should be removed with regard to compensation, because I think if it is once removed from his mind he will not repeat that statement again. If he turns to paragraph 5 of the Bill, Section A, he will see half way down it says: "Whether in course of being made or driven for commencing or opening any such colliery or mine, or otherwise, and all associated properties (including vessels, lighters, railway rolling stock, and all works, including works for the manufacture of by-products, in the opinion of the Mining Council belonging to any mine undertaking or connected with any colliery or mine, and every house belonging to the owners of any such colliery or mine, which, in the opinion of the Mining Council, is usually occupied by workmen employed

13 June, 1919.]

MR. JOHN JOSEPH PREST.

[Continued.]

at such colliery or mine)." All those things are embraced in the term "associated properties."

Mr. R. W. Cooper: I do not agree with you.

27,274. *Mr. Frank Hodges:* That is the English of it?—It says: "all of which are herein included in the expression 'mine.'"

27,275. I quite agree. Then it is referred to on page 7, paragraph 9, and it states: "The purchase price of mines exclusive of associated properties." The associated properties which embraces the houses in which the miners live are excluded?—By-products, coke ovens, and what not.

27,276. They are excluded?—Particularly excluded.

27,277. They are subject to a separate valuation?—I spent a million on that sort of job.

27,278. *Mr. R. W. Cooper:* When this matter materialises you can always make the moaning clear

by suitable drafting. My submission is, as this Bill is drawn, the drafting does not convey the intention of Mr. Smillie and Mr. Hodges?—That is exactly how I take it. The "mixe" meant everything above the mine.

Mr. Sidney Webb: It is expressly stated to the contrary there.

27,279. *Mr. Herbert Smith:* It is true Mr. Slessor said, when a member put the same question to him, that clause ought to be redrawn?—It is a very important withdrawal, as far as I am concerned.

27,280. *Mr. Frank Hodges:* It is a question of understanding it?—I understood it, as I told you.

27,281. If the explanation given here satisfies you, then you agree you misunderstood it?—Yes.

(The Witness withdrew.)

Mr. PHILIP GEE, Sworn and Examined.

Chairman: I think Sir Leo Money wishes to ask you some questions.

27,282. *Sir L. Chiozza Money:* Do I understand you are the Director of the Coal Association?—I am the Director of the Coal Association.

27,283. When was that Association formed?—I think the date was about the third week of April—roughly that.

27,284. Did you send out an undated letter printed in type which looks like typewriting, but which I think is not?—(Handing letter to the Witness.) Yes, that is my letter.

27,285. To whom did you send this letter?—I am afraid I cannot tell you exactly to whom that particular letter was sent. We have circularised most public bodies and most public men, and we more or less stick to the same form; there may be variations.

27,286. A large number of copies of this letter have been sent out?—Very large.

27,287. To Chambers of Commerce?—Yes.

27,288. Chambers of Trade?—Yes, I think so.

27,289. And public men generally?—And public men generally.

27,290. The letter says: "Dear Sir, The Coal Commission. Without in any way attempting to give a forecast of the findings of the Coal Commission, we would venture to draw attention to certain broad aspects of the situation." That is the first paragraph. The second paragraph, which is underlined, says: "The consumer, who naturally desires a good supply of cheap coal, is not represented on the Commission." Is that the letter?—Yes.

27,291. Did you, at the end of the letter, remind the recipients of the same statement by saying: "While reminding you once more that the consumer—the very large majority of the nation—is not represented on the Coal Commission." Do you remember that?—I am afraid I cannot remember the text here. I am willing to adopt it.

27,292. Do you think those statements are true?—I do.

27,293. Have you acquainted yourself with the names and occupations of the members of the Coal Commission?—Those who have been responsible for the drawing up of that letter have. Generally speaking, we have as an organisation.

27,294. You signed it?—I am the responsible person who signs all these letters.

27,295. Did you acquaint yourself with the nature of the occupations and interests of the members of this Commission before you wrote this letter?—Not particularly. Most of them were, I think, in a general way known to me.

27,296. You were acquainted with them?—Yes, more or less.

27,297. You knew of Mr. Balfour before writing this letter?—I heard what Sir John Sankey said this morning.

27,298. Did you know when you wrote this letter Mr. Balfour had an important connection with certain not unimportant branches of the steel trade?—I am afraid I cannot tell you exactly what I know about Mr. Balfour.

27,299. You know he is in his own person an important coal consumer?—No doubt.

27,300. Have you heard of Sir Arthur Duckham before?—Yes.

27,301. Do you know that he is an important coal consumer?—No, I did not. I did not know he was a coal consumer.

Sir Arthur Duckham: Mr. Chairman, I should like to make a statement. I am not a coal consumer any more than anybody else round this table is a coal consumer. I was not appointed on this Commission as a representative of any consumers or any body of consumers. I have been put here as a Government representative, it may be, because I have some knowledge of the use of coal, and, it may be, for the work I have done for the Government. I am not a consumer. I do not control any works that consumes a large quantity of coal; I am not a consumer in that way at all.

27,302. *Sir L. Chiozza Money:* Are you aware you are using the word "consumer" in this letter in the ordinary sense by which we understand persons who use coal and are interested in coal from what one may call the public point of view?—Possibly.

27,303. Is not that the way you use the word in this letter?—I think so, yes.

27,304. Is it not clear that you are inaccurate in your letter if you mean by that word "consumer" the public interests are not represented on this Commission?—I adhere to that statement entirely that they are not represented.

27,305. The public interest is not represented here?—Or most inadequately represented.

Mr. Sidney Webb: That is different.

27,306. *Sir L. Chiozza Money:* You have heard what Sir Arthur Duckham says?—Yes.

27,307. You still think the public interest is not represented here?—I do.

27,308. Although its Chairman is a Judge of the High Court?—I do.

27,309. You adhere to that statement?—Yes, I do, of course; I said so.

27,310. You wish your evidence to be believed after making that statement?—I do not follow you.

Sir Adam Nimmo: Is that a fair suggestion to put to the witness?

27,311. *Sir L. Chiozza Money:* After going into the personnel of this Commission and after hearing what Sir Arthur Duckham says, are you justified in adhering to this letter in which you say the public interest is not represented on this Commission?—I do.

27,312. You do?—I do.

Sir L. Chiozza Money: Then I certainly shall not ask you any further questions.

27,313. *Mr. R. H. Tawney:* How do you think we were appointed?—I will tell you. I think it was simply a development of the political situation.

27,314. Who do you think appointed us?—I am afraid I do not know. I am not hardly in a position to know that.

27,315. Is it not rather relevant to know that, if you are going to make a general statement of this kind?

13 June, 1919.]

MR. PHILIP GEE.

[Continued.]

—I do not know that it is. I judge by the results; I look at the results here.

27,316. Do you think if the results are unsatisfactory to you you are justified in making reflections as to the constitution of this Commission? I am sure you do not mean that?—I am not quite sure of that.

27,317. Otherwise no Commission could be correctly appointed because the results would not please everybody?—In this particular case there are a great many people who think as I do.

27,318. I am not concerned to deny that. I want to know what you meant when you said that no representative of the public was here. Do you think they are nominated by bodies other than the Government?—I must stick to my general answer. I do not think this Commission is representative of the public.

27,319. What do you mean? Do you mean they were appointed by bodies other than the Government?—No, not necessarily. I am afraid I am not exactly acquainted with the details of the appointment.

27,320. Again, if you are making these general statements, is it not rather important to be acquainted with the details?—In all probability the writer of the letter whom I trust is fully acquainted with the details.

27,321. How do you think a Commission representing the public ought to be constituted?—It is a difficult matter to trim your balance quite right. My idea of a properly constituted Commission would be a Commission entirely different from this.

27,322. You have explained the weight to be attached to your letter admirably.

27,323. *Mr. Sidney Webb*: I do not want to trouble you any further about whether the Commission is properly representative or not. In the letter you signed you say: "The consumer, who naturally desires a good supply of cheap coal, is not represented on the Commission." At the end you say: "The consumer—the very large majority of the nation—is not represented on the Coal Commission." Those are statements of fact. Were you aware when you signed that letter and sent it out that out of the 13 members of the Commission there were seven who were not connected with the coal industry, and of those seven, four had no connection whatsoever with the coal industry except as domestic consumers? In the face of that, do you think it is correct to say that the domestic consumers were not represented, when four out of 13 members have no other connection with the coal industry than as domestic consumers? You say: "The consumer"—evidently meaning the domestic consumer—"is not represented on the Coal Commission." That is a matter of fact. Were you aware when you stated that fact that four out of the 13 members were nothing but domestic consumers?—In that way 13 members are domestic consumers. They all consume coal. I say there are 13, obviously, of such domestic consumers.

27,324. Were you aware of that?—I answer it in the way I wish to answer it.

27,325. Were you aware of that or not?—Will you go over your question again?

27,326. Did you know whether four out of the 13 members of the Commission had no connection with coal at all except as domestic consumers?—If you say that is so, I accept it. I am not aware that is so.

27,327. Were you aware of that fact?—I am not aware that is so.

27,328. I did not ask you whether you are aware of that. I ask you whether, when you stated the domestic consumer was not represented on the Coal Commission, you were aware that four of the members of the Commission had absolutely no connection with the coal trade except as domestic consumers?—I am not sure of that.

27,329. I do not ask whether you are, but whether you were at the moment you issued this letter?—I do not remember what I was aware of when I issued the letter.

27,330. On that fact, would it be correct to say you have made a false statement here?—Certainly not.

27,331. When you say the consumer is not represented?—No, nothing of the kind.

27,332. You have said the consumer is not represented?—What you are trying to put into my mouth I refuse to have put into my mouth.

27,333. I do not wish to put anything into your mouth. You say the consumer is not represented. That is what you said?—I say as a general statement that is, perfectly accurate—the consumer is not represented.

27,334. Measured by quantity, the majority of the consumers of coal are not domestic consumers but industrial consumers. You are aware of that? Are you aware when the Commission was first formed three of the 13 members of the Commission were representatives of the large industrial consumers?—I am not aware of that.

27,335. When you issued the statement that the consumer was not represented, had you made any inquiry?—I am not aware of that.

27,336. Has your attention been called to the fact that the Commission does include amongst its members representatives of some of the largest consuming industries?—You tell me so.

27,337. During this time you have not made any inquiry into that and you were spreading this statement broadcast that the consumer was not represented?—Personally, I take full responsibility for that letter.

27,338. You have signed it?—I have signed it.

27,339. You were spreading this broadcast during the time when you were not aware whether the consumers were represented or not?—You have not twisted me as you think you have, *Mr. Webb*.

27,340. I have not twisted you at all. You have been spreading this statement of fact broadcast. There is the statement underlined, that the consumer is not represented?—And I adhere to that.

27,341. I can only say you may adhere to the statement, but the literal fact is you have heard that of the thirteen members of the Commission four are nothing but domestic consumers, and, of the others, two at present, if not three, when you wrote this were representatives of the largest industrial consumers. What larger representation you would have wished I do not know?—I should wish it to be very much larger to make it apparent to me.

27,342. The Government, which is responsible as representing the consumer, has formed this Commission. Does that satisfy you?—No, not at all.

27,343. *Mr. Arthur Balfour*: Are you aware I was appointed as a Government member?—I believe that is so.

27,344. Are you aware I am a considerable consumer of coal?—Yes.

27,345. Is it your opinion *Mr. Sidney Webb* was appointed because he is a consumer of household coal?—Certainly not.

Mr. Sidney Webb: Would you mind making it clear that I was appointed by the Government in the same sense as you were?

27,346. *Mr. Arthur Balfour*: Was *Mr. Sidney Webb* appointed by the Government as a consumer of household coal?—I should not think so.

Chairman: We can all assure you of one thing. Whatever our shortcomings are, we are all anxious to be larger consumers this year than last year.

(The Witness withdrew.)

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B., Recalled and Further Examined.

Witness: Before Mr. Cooper examines me I should like to ask your permission to make a correction in the *précis* of my evidence. It is an obvious slip. It occurs about the middle of the first column on page 1186. The sentence reads, "Instead of redeeming capital at 3 per cent. one can and should substitute $4\frac{1}{2}$ to 5 per cent. The effect of this increase would be to reduce the amount of the purchase price." The word "reduce" should read "increase." For the effect of increasing the sinking fund accumulative interest rate the capital value is also increased. The effect of an increase in the remunerative interest rate is, of course, to decrease the capital value. I would suggest the sentence should read as follows: "Instead of redeeming capital at 3 per cent. one should substitute $4\frac{1}{2}$ to 5 per cent. The effect of this increase would be to increase the amount of the purchase price," and the next sentence should read, "I am doubtful, however, whether one should increase the percentage allowed to a purchaser much beyond 8 per cent. Any increase would, of course, reduce the amount of the purchase money."

27,347. *Chairman:* The word "reduce" should be "increase"?—The effect is different with the two rates.

27,348. *Mr. R. W. Cooper:* In your *précis* I omitted to notice some of your points of difficulty which you thought necessitated the proposed change of ownership. You refer, I think, to the ownership of coal under roads. You talk about coal being left under roads on page 2 under the heading of "Unknown Ownership of Minerals." You say there, "I have knowledge of the fact that considerable areas of coal are of unknown ownership—take as one instance the severance of properties caused by roads"?—"Canals and railways."

27,349. I will deal with roads first of all. What had you in mind when you thought there was a severance of the ownership of minerals caused by roads?—Might I refer you to one of the notes on that point that I did not read last time because you kindly intimated you had heard enough. This is the note I have on that. It is gathered from the evidence of Mr. H. S. Child, 25th November, 1902, before the Royal Commission on coal supply that certain portions of the Ayre and Calder Navigation —

27,350. I am talking about roads, not canals. Will you deal with roads first?—What is true of one is true of the other to some extent.

27,351. With all respect may I suggest that is wrong?—I know you know more about this than I do. If you say so I am quite prepared to take your opinion.

27,352. You may take it from me when a road divides two properties the ownership of the minerals to the middle of the road belongs to the owners of the property on each side of the road?—Is that in all roads?

27,353. Except perhaps where roads are set out under an Enclosure Act and the minerals belong to the Lord of the Manor?—In each respect up to the middle of the road.

27,354. Yes?—It is limited to certain roads.

27,355. Yes. There is no legal difficulty caused by roads?—Up to within what you say.

27,356. I suggest altogether. There is no legal difficulty caused by the ownership of minerals under roads?—The roads under the other properties alluded to by you are met by the other difficulty.

27,357. Tako canals. In the case of a canal, is it not perfectly clear that the coal under the canal must belong to the owner or the person who was the owner of the land on which the canal was constructed?—Mr. Child stated in his opinion that a considerable portion of this coal might have been worked but for a provision in the Canal Act that no injury shall be done to the works of the undertaker

27,358. Stop there for a moment. That is a different matter from any difficulty arising out of the

ownership of the coal. That is owing to the provisions of the Canal Act protecting the canal.—More coal is lost in many such cases than is absolutely necessary to protect the canal.

27,359. Is not that a matter depending upon the exercise of the judgment of the person on whom the responsibility of protecting the canal rests?—Entirely.

27,360. That is in no sense a difficulty caused by the existing state of the law of ownership?—No, not of ownership. There is considerable loss.

27,361. You were talking in your *précis* of the ownership?—Unknown ownership.

27,362. Ownership. I suggest the ownership is perfectly well known.—Is that so?

27,363. Tako railways?—There is a considerable quantity of coal that has been lost underneath canals the ownership of which, I take it, is not known.

27,364. With all respect I think there can be no doubt about it. The ownership of the land on which the canal rests was perfectly well known. Let me take you to railways.—Before you leave canals I am not satisfied about that. My proof goes on to say that subsequent sales and resales of adjoining properties have resulted in title to the mines under the severing strips being lost.

27,365. What is your authority for that? I have never heard of that. I have heard of cases coming into the Law Courts of disputes arising with regard to the construction of the plan attached to the deed. That is another matter altogether. What instances have you of that, I have not any?—I will try and give you a case. Here is the case of the Cossall Colliery Company, Limited.

27,366. Is that a case in the Law Courts?—No, it is a case that came before me. Here is a considerable area of coal under the Midland Railway in this case which is not claimed by them and the ownership of which is unknown. Would you like to see the case? (*Handing documents to Mr. Cooper.*)

27,367. Yes.—There is the whole correspondence concerning the case. It is applicable more particularly to canals. That is a case with regard to railways. The case arose through their asking for permission to work that coal, and we were unable to find the ownership.

27,368. Was not the ownership of the land immediately adjacent known?—Yes. That is the trouble. The ownership of that particular land under that particular railway is not known.

27,369. Could they not by the examination of the Midland Railway title deeds discover from whom they got the land?—No. The whole case is set out in the correspondence there.

27,370. I see the Colliery Company told you the ownership was unknown. No doubt unknown to them. That was no proof the owners could not have been ascertained?—The whole case is set out there. My mind is not quite clear on that.

27,371. Take railways generally. As you know all railways constructed since 1845 are controlled by the Railways Clauses Act?—That is under a railway.

27,372. Generally speaking, in fact, can there be any difficulty at all in discovering the owner of the land which the railway company bought for their railway?—We failed to discover it in that case.

27,373. Did you examine the Railway Company's title deeds?—We did not. The Railway Company said they did not own it.

27,374. Of course they would not own the coal. Under the Railway Clauses Act the coal is reserved. Did it not occur to you to examine the title deeds under which they got the land?—I was not seeking to work the coal. The colliery company was enquiring and they said they would have advice as they could not discover the ownership.

27,375. They must have been very supine?—We took them to be honourable people.

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

27,376. We do not doubt their honour at all?—If I acted as investigator for every colliery company it would be impossible. We must take their word as to the facts of the case.

27,377. It would involve a very drastic alteration of the law?—They put it to me they could not discover the ownership.

27,378. Take railways generally. Can it be suggested there is the slightest difficulty in ascertaining the owner of minerals under and adjacent to railways?—We were unable to determine it in this case.

27,379. That is one case?—Yes.

27,380. I suggest they ought to have been able?—That is another point; I cannot go into that.

27,381. I asked you about it on Friday and you gave me a certain number of illustrations. I forgot to ask you how many cases altogether have come under your notice which have suggested to you that the ownership of minerals ought to be altered?—I could not say off-hand.

27,382. You said you had chapter and verse for every case?—I will have it made out for you by tomorrow.

27,383. I should like to know the total number?—That shall be made out for you. I can give you a general sort of idea, but I would not like to bind myself to the exact figure.

27,384. I should like the exact number?—It is round about 100.

27,385. Can you give me any idea of the total acreage involved?—I can do that.

27,386. I should like to have that?—We will have that done.

27,387. Have you any idea of the total acreage of the British coalfield?—No, not off-hand.

27,388. Can you get that?—Yes, certainly. It would mean a memorandum. As you are quite well aware, the total acreage of the British coalfield is not known.

27,389. It is my faulty expression. I should have said the known and proved British coalfield?—We will endeavour to have that made.

27,390. Do not trouble about the area where coal is not proved. What I want is the proved British coalfield?—What do you mean by that?

27,391. The area in Great Britain where coal is?—Leased?

27,392. I will take it at that?—I will have that made out. It will be interesting, but it may take a few weeks.

27,393. That will be too late. Can you give me an approximate idea of what proportion of these cases that may bear to what may be popularly called the British coalfield? I do not tie you to 100 acres?—I would not be tied to 1,000 acres. It would mean my getting the plans of every colliery in this country.

27,394. May I take it that the number of cases that have come under your notice are only very small in proportion to the British coalfield?—I grant you that, certainly. The number of cases in which there has been difficulty in arriving at a settlement—

27,395. On which you have based an opinion that a change of the ownership of minerals ought to be brought about?—That is a totally different point. You include at once the whole of the barriers. Only, I think, two cases of barriers have come before me. At once I say the question of barriers alone is of sufficient importance to warrant a change in the ownership of the minerals. The leases of coal in the area amounts to tens of thousands of acres.

27,396. I want to have a word or two with you as to the position supposing the mineral rights were nationalised. First I can take it, generally speaking, coal is leased and worked by the leaseholders and not worked by the freeholders?—Usually it is leased.

27,397. If, therefore, any of these barriers are comprised in an existing lease the mere fact of the

ownership would not enable that barrier to be touched at all without the consent of the leaseholder?—As things are.

27,398. I say as things are?—Yes.

27,399. Therefore if you wanted to make your reform, as I would call it for the moment, effective, you would have to have some overriding authority created?—As they are.

27,400. Even if the ownership was vested in the State?—Well, supposing it is vested in the State.

27,401. You would still have to have some overriding authority created by the State to enable the barrier to be dealt with?—I presume the State if it owned the minerals would administer.

27,402. If the State holds the minerals subject to leases held by leaseholders the State would not acquire the rights of the leaseholders?—Let me put that in my own language.

27,403. Do you follow what I mean?—I am trying desperately hard to follow what you mean. I am the State for the moment and you are the colliery lessee. You are working the colliery and the collieries are not nationalised.

27,404. Yes?—You are the leaseholder. You own the lease for a period of years, and so long as that lease runs, until the termination of that lease, all the provisions of that lease hold good, I grant you that.

27,405. You agree with me?—I agree with what I understand you mean.

27,406. If you wanted to deal with a barrier in the case I put during the currency of that lease, which might be for many years, you would require some statutory power to enable the State, although the State might be the owner, to deal with the barrier?—It would have to proceed by legislation during the currency of that lease.

27,407. Of course, it follows the same thing would hold in numerous other cases which you and I might suggest. I will suggest another that will be somewhat familiar to you. Colliery A, a leaseholder, leases next to colliery B, a leaseholder, and a certain portion of A's area is cut off from A's pit by a big fault, but might be worked by colliery B; but without the consent of colliery A no power short of legislation could compel A to give up the coal on colliery B's side of the fault to be worked by colliery B?—The common practice in such cases is for colliery A to say to colliery B, or for colliery B to come to colliery A and say: "I can work that coal more conveniently than you can; I am willing to give you a bit here which you can work more conveniently and you give me a bit there," and an exchange takes place.

27,408. That is frequently done and no legislation is thought of?—That is frequently done.

27,409. With regard to support, as you said the other day minerals could only be vested in the State subject to the existing rights of support of the surface owners?—I think I said it would be only fair that the surface should be upheld.

27,410. I put it, it is much higher than fair. If it were otherwise you would by a piece of coal or mineral legislation be taking away rights of surface owners?—You would be injuring the surface without compensation.

27,411. Taking away part of their surface?—Yes.

27,412. Therefore a mere transfer of the ownership of the coal from the private individual to the State would not get rid of that right of support of the surface owner without legislation?—The right to support exists unless it is repealed.

27,413. It can only be taken away by legislation?—Unless it is repealed by legislation, as I understand it.

27,414. You are perfectly right. We talked a good deal last Friday about payment of compensation for example to surface owners. There is one aspect I forgot to mention. Supposing the State became the owner of the coal and entitled to work the coal, or to lease the coal to others to be worked, ought there not to be some very carefully thought out provision for

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

the protection of the surface owner? I mean supposing a man wanted to sink a new pit, or make a new railway, ought not the surface owner or occupier to have a voice in the determination of that new pit or railway?—You mean they might go and sink a pit right in front of my drawing-room window.

27,415. Or put a colliery wagon across your lawn?—I should not relish that.

27,416. There is by no means an uncommon stipulation now where private owners have granted leases to stipulate that the position of all surface works must be agreed upon by the surface owner or settled by a referee?—That can be carried too far. You doubtless are aware of cases where a man has objected to a colliery being sunk in any position that he can see it from his window.

27,417. I ask you whether it is not quite a usual thing for a colliery lease to contain a provision that the position of any surface works must be either agreed upon or in case of difference settled by some independent referee?—That is so.

27,418. Is that a reasonable provision?—Within limits. Take the case of Lumley Castle.

27,419. Which do you think is the more important section of the community, those who live on the surface or those who work underground?—Those that work under the surface live on the surface.

27,420. They are a part of those that live on the surface?—They are a part of those that live on the surface.

27,421. Do not you think the rights of the surface owners ought to be carefully considered as well as the rights of the mineral proprietors?—I am considering the British public. Anything that tends to prevent the proper working of the coal hits the British public—the nation. I am only concerned with the British public—the nation, on the present occasion. There are, on occasions, difficulties put in the way of opening out collieries by the owner of the minerals. I was about to instance the case you know and I know of Lumley Castle, where the colliery was required to be placed at a certain distance, and, in fact, at one time they would not have a colliery seen from any of the windows. That is frequently the case in the north of England. That, I think, is going too far.

27,422. Let us do Lord Scarborough justice. I know all about that case. Lord Scarborough assented to the construction of that new colliery so long as it was worked by electricity, and the colliery has been for some years in full operation?—Yes, I am going further back than that. There is a reason in everything. That there should be an absolute right in the State or anybody else to allow the sinking of a colliery to destroy the amenities of my property I think is wrong, but there must be reason in everything, and it is carried too far, as you and I are aware, as I say, in the case of many mineral owners.

27,423. Do not you think the point would be entirely met by the particular point being left to be decided by some independent referee?—It depends very much on the referee.

27,424. You cannot get beyond the independent referee, can you?—If it was left to a referee, one would like to know what is to be the character and condition of the referee. For instance, if the referee were a fox hunting squire the results might be disastrous.

27,425. Let me amplify my phrase by saying a competent and independent referee?—I accept your expression now.

27,426. With regard to these various difficulties that you have suggested, practically every one of them could be dealt with by an over-riding authority without changing the ownership of the property?—You put that point to me last time, and I said I would rather take one bite at a cherry than two. If there was an authority that had to deal with all these cases, it means an interminable series of arbitrations, or what amount to arbitrations, and Counsel on both sides would have to be heard and the case gone into in detail.

27,427. There is no necessity for Counsel or solicitors either?—It means all the cumbersome machinery of

an arbitration, even if Counsel and solicitors are not heard. That means time, and I think the answer I gave to you when you put that question last Friday was, I would rather take one bite than two bites at the cherry, as very often time was an important factor in the case.

27,428. Do not you think, having regard to the answers you have given this morning, even though your remedy of change of ownership was applied, you will still have to make another bite at the cherry by your over-riding authority; in other words, legislation?—I do not think so. I do not think that my answer implied that.

27,429. Let me put it again. You have told me of two or three cases, notwithstanding the change of ownership, things being as they are, and likely to be for many years to come, probably?—I qualify everything I said by this: if things are as they are, I grant you during the currency of the lease. Leases will expire; they are always expiring.

27,430. Many leases may run for 50 or 60 years?—Yes.

27,431. Which are now current?—Yes. Let us take the case of a lease that has 50 years to run, which is quite a good long time, and I am the State, and I became the owner of the minerals subject to the lease unless the law states otherwise.

27,432. Then do not you know if the law states otherwise you must expropriate the leaseholder?—Might I finish?

27,433. Yes?—Unless the law states otherwise, I take it it is within the realm of possibility that if and when acquiring the minerals the State will say we terminate all leases.

27,434. It could not possibly do that without confiscation or compensation?—Compensation.

27,435. That means again another legislative project?—That is the possibility. I say it is within the realm of possibility.

27,436. Without legislation?—Oh! no; but I grant short of that the lease would have to run, and during the currency of that lease, if there are difficulties in respect of that lease, barriers or what not, it would require some authority to deal with difficulties of that sort—some machinery.

27,437. The number of cases where colliery companies work their own freehold coal is comparatively small; still there are such cases of collieries working their own freehold coal; that is to say, collieries that have bought the coal out and out. Is it part of your suggestion that in those cases that coal should be transferred out and out to the State?—The State would become the owner of all coal, freehold or otherwise.

27,438. Let me give you two illustrations. You have two collieries side by side, and the coal fields attaching to one are held under lease. The State buys out the freehold interest subject to the lease and stands in the shoes of the original lessor. Do you follow me?—I do not.

27,439. Take the case where you and I first met of the Hetton Colliery. That was composed of a number of areas, and the colliery was held by the colliery company under lease. If the minerals of Hetton were transferred to the State, as suggested by you, they would be transferred subject to those leases?—Yes, when the leases ran out.

27,440. Subject to the leases as long as they are granted?—Yes, I presume so.

27,441. That is what I expected you intended. I do not know if you know the names of other collieries. I will give you the name of one, Garesfield. There the freehold coal belongs to the colliery company; there is no lease?—I have worked freehold coal myself.

27,442. What is to pass to the State under your suggestion?—The coal.

27,443. The entire colliery?—The coal.

27,444. That means the entire colliery?—Let me think about that for a moment.

27,445. Think it over; that is a striking instance?—I take it the colliery would have to pass to the State.

27,446. Do you intend it should pass under your suggestion?—I will put it this way. There are two means by which that could be arranged. The

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

State could say: "Inasmuch as we are taking over all the coal we will take over that particular coal and the colliery as such remains in our hands, that is to say, we become the lessor."

27,447. The State will say: "We will take over the colliery but will simultaneously grant you a lease on the customary terms for the customary period"—The freehold colliery would under existing conditions presumably charge itself with a rent which was similar to the rent current in the district, and the State would take over at a fair valuation the mineral property and become the lessor. Instead of the colliery company being its own lessor the State would be the lessor.

27,448. The State would pay the capitalised value of rent which the colliery had been accustomed to charge itself with and at the same time grant to the colliery company a lease for a long term of years?—I think that would be a fair way of approaching the matter; do not you?

27,449. I appreciate the practicability of it. After all, what you and I are discussing is the practicability of the proposition you put before us?—All these points would have to be faced.

27,450. With regard to the farm tenants of the surface, I assume you would intend that the State or the State's lessees should continue under the same obligations as colliery workers are now under to the farmers and others for crop damage?—I take it that was covered by your original question of support of the surface.

27,451. I do not propose to ask you any questions upon the rest of your *précis*, but my colleagues will do that?—I should be happier on purely mining points.

27,452. *Mr. Frank Hodges*: Have you during the sittings of the Commission, subsequent to the day on which you gave evidence, the 11th March, heard any additional evidence from other witnesses which would shake your conviction as expressed in these words on that date, "In my opinion the present system of individual ownership of collieries is extravagant and wasteful"?—No. I must say misconception seems to have existed in the minds of certain persons who have not been present during these sittings as to what is implied by that expression. I was comparing a collective system of production with the present system of individual and separate entities. If I remember I gave the reasons which in my opinion led me to state that the numerous separate entities were from the very nature of the fact—not condemning the management as managers—but simply condemning—I would not even use the word "condemning"—but pointing out directions in which the number of separate individual ownerships was wasteful and extravagant when compared with a system of collective production which would not be wasteful and extravagant. People who have not been present here have put the expression of words and ideas into one's mouth which one never gave expression to, and have stated that one has been blackening the character of the colliery owners and condemning the management, which is the last thing I had in mind and the last thing I did; far from it; I never used an expression derogatory at all to the management as managers.

27,453. I must confess that impression was never made on my mind?—Nor on any sensible man's mind either.

27,454. You, in a perfectly impartial way, I gather, set forth under the generalisation a series of economies which you thought could be effected under collective ownership?—Yes, and which I still think could be.

27,455. I take it from your *précis* that the thing that has given you the greatest concern since you made this statement on March 11th is not so much the criticism of your statement by people outside this Commission, but the falling output in the industry?—That gives me great concern.

27,456. Does that give you the greatest concern?—It gives me great concern.

27,457. I suppose your greatest concern is to find a remedy for it?—Yes.

27,458. After all, I take it, you judge the efficiency of the industry by its productivity?—Quite. Productivity with due regard to health and safety.

27,459. Always with those considerations. Needless to say, you are agreed we are all equally anxious about this?—I am sure of that.

27,460. Since the figures which were put in on behalf of the Coal Controller have appeared in the Press a great many explanations have been offered as to the cause of the declining output. I think it is true to say, is it not, there has been all through the years a falling output per man employed?—Through the years for a considerable period back.

27,461. I will take you back as far as 1890?—The point that troubles me most is that the fall has been so sudden and so marked from the period to the end of 1916.

27,462. Have you taken it in stages of 10 years to arrive at anything like a satisfactory conclusion by way of comparison?—If you take it even in decennial periods you will find if you take a curve right back say over a period of 30 years, I think I am right in saying you will see no such fall as has taken place from 1916 to date. I grant you there have been sudden falls and sudden rises. And the falls in output have been almost coincident with the rises in wages.

27,463. You have to go back, I think, a good many years to find the average output per man employed at 25 cwt. per day. What does your chart say?—The chart I have before me is a chart from 1913 to date.

27,464. Have you 25 cwt. in that period at all per man per day?—Per man per shift, no, I have not, and considerably below that.

27,465. Your chart does not go back beyond 1913?—No.

27,466. The figures are rather erratic, I think you agree, as afforded by the various authorities before that period. One cwt. per man means a considerable quantity over the year?—Yes.

27,467. If the output falls only by 1 cwt. per man it is a lot spread over the year?—It is very serious.

27,468. It is a very serious proposition?—That is so.

27,469. Would it surprise you to learn that since these figures have been produced in the Press, quite unsolicited, men have written from the collieries giving specific reasons why output has fallen, not by 1 cwt. per man per day, but by considerably more?—Really.

Mr. Frank Hodges: With regard to this I ask the Chairman's indulgence.

Chairman: It will be useful to follow that up.

27,470. *Mr. Frank Hodges*: I should like to bring Sir Richard's mind to a report which a check weigher submitted to his Committee, and which has come to me in an unsolicited way, I have not asked for it, with regard to the declining output at his colliery. I will give the name of the colliery if the Commission thinks it desirable?—I should be glad if you gave to me, if not to the Commission, the name of the colliery as I enquire into these cases as they occur.

27,471. This is the Pilkington Colliery, Ltd., Astley Green?—In Lancashire.

27,472. This is a report of the check weigher to his Committee: "For the first three months I have been continually bombarding the management for reasons as to the shortage of tubs, &c., which the men are constantly complaining about. During my investigation I found there have been stoppages of the main haulage roads through having day-work men working on the haulage getting the roof down and stopping gangs whilst the tubs were filled with dirt. On May 15th four men came out of the Trenerbone Mine as a protest for the manner in which they were being treated in regard to empty tubs. It was 12 o'clock noon when they got to the surface, and they had not had any empty tub from 11 o'clock of the previous day. Their tally number is 53. For the last few weeks the men in the Cranberry Mine have been having a bad time of it owing to the shortage of tubs. I am satisfied that more than nine-tenths of the men have been thrown on the minimum wage. Practically the whole of the

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

men have filled from 8 to 10 tubs each person with 9 cwt. to 9½ cwt. in each tub tonnage, 3 to 3½ per day, and with war bonus, war wage, and Sankey award added, that shows what would be lost to the community. One set of men, that is, 380 tally, have filled 9 tubs in 3 days. 316 tally, 312 tally and 311 tally were down the pit a whole day and did not fill any tubs. There are lots of other cases where men have gone to their work and not filled more than 4 or 5 tubs for 3 men in one day. All these cases could have, and would have, filled at least 8 tubs each person had they been supplied with the empty tubs. I have spoken to the firemen. They say they are ashamed to go among the men who have to get their time over the best way possible. These men were asking me what they must do in order to get the matter right, so I advised them to appoint three out of their number to interview the manager of the mine with me." I have similar cases from the Ashington colliery, the New Cumnoch, Scotland, from whom I have received a telegram. I had better put it in evidence.

Sir Arthur Duckham: This is not evidence.

Mr. Frank Hodges: I want it on the Notes.

Chairman: It will go on the Notes.

Sir Arthur Duckham: It is not sworn evidence?

Chairman: No.

Mr. Frank Hodges: I am sorry I called it evidence. I describe them as facts. They are facts that might be mentioned if the man was in the box.

Sir Arthur Duckham: If we are going to take this up I should like to have the witnesses.

Mr. Frank Hodges: The telegram is: "Miners here only getting from three to four days per week on average. The country is crying for coal. The men are willing to work, but cannot get work for want of wagons. 1,000 men are affected every day."

27,473. *Chairman:* What sort of a life does a tub have? Is it possible there has not been a renewal of tubs during the war?—The question of tubs is a very important question. It is a question that has received one's very close attention right through the war. The inquiry one was constantly addressing to collieries where there was a decrease in output was: "Are you short of tubs; are your tubs in a state of disrepair? If so, let us know and we will see how we can help you." That was the trouble throughout the war. Material was difficult to get. When the tubs are made of steel or iron, of course, it was peculiarly difficult to renew them. The position in respect to tubs is nothing like as acute as it was. There are not a great many cases now where there is a tub shortage. I should like to say, further, this question of shortage of tubs, what you might call underground clearance, has been from the earliest times a trouble underground with miners. In making one's round underground the question is addressed to the coal hewer: "How are you being kept with empty tubs?" "Very badly; and so-and-so, three stalls away, is getting an undue share," and so on. The curious point is this, that if, say, on a Monday or Tuesday morning after the week-end the full complement of the miners does not turn up, you frequently get just as good an output for a short time as you do when the full number of miners are there, or, anyway, the decrease of output is not commensurate with the decrease in the number of men, because the men who are at work get perfect clearance. One has had from time to time during the last few years, when one has been paying more attention to this particular question of economics of mining, one has frequently had complaints such as those that Mr. Hodges put before us. I had here the last time a number of cases, a hundred or more, which I had as instances pointing to the inquiries one institutes in these cases. All sorts of allegations are put forward from time to time, sometimes by the workmen, sometimes by others, and sometimes by the management as to the cause of the decrease of output. These are all inquiries into a frequent cause of complaint as shortage of supply of tubs.

Sometimes it is borne out in fact—in the majority or cases it is not borne out in fact—always provided that in no case is there, or has there ever been perfect clearance, because you cannot get it.

27,474. You think the position as to tubs has become accentuated since the war?—The position as to tubs is not as bad as it was, say, in the year 1917. It is very much better. Personally and honestly, I do not think that the insufficient supply of tubs is the cause of the decrease in output. I do think, if I might say here, this subject is so serious and the position is so serious with regard to the output that there is bound to be differences of opinion on all sides as to what is the cause of the decrease, and we should have it cleared up. The Coal Controller has had a meeting—I was not present because I was elsewhere—on Tuesday last, and my colleague, Sir Arthur Lowes Dickison, informs me the meeting took place, and the Controller is perfectly willing to do everything in his power to get at the bottom of the decrease in output. If I may venture to make a suggestion, I would say that the Coal Department be asked to set up machinery for going into this thing with the greatest possible care and detail, and put the information before this Commission.

Chairman: I should like the public to know the real reason for this.

27,475. *Mr. Frank Hodges:* You said that you thought the position was improved as compared with last year or 1917?—With regard to the quantity of tubs available?

27,476. What evidence have you of that?—This evidence; the complaints that one has received from the management as to the shortage of tubs are nothing as great—in fact, they are practically nil.

27,477. That is exactly my point?—And knowing the managers of collieries as I do, and believing them as I know them to be honourable men, I know they would not do other than ask for our assistance in the provision of tubs if they were short of them. Furthermore, the difficulty with regard to the supply of material is nothing like as great now; in fact, it is rather the other way about. There was considerable difficulty in providing the material. We had to proceed by way of priority during the war, but that difficulty does not exist now.

27,478. You depend for your conclusions upon the fact that your correspondence is not so heavy from colliery managers on the point?—And reports from my inspectors.

27,479. Have you any census of the number of trams turned out?—No.

27,480. Have you any census of the number of trams that have lived their life and are scrapped?—No.

27,481. Your conclusion in that regard would be without facts?—I say again, knowing the managers as I know them and believing them to be honourable men and knowing them to be capable men, and we can only get the information through the managers—short of going to each colliery myself and taking a tally of the tubs—and you must trust somebody. There is not such a shortage.

27,482. Does not that pre-suppose the owners of the colliery are as desirous to-day of putting you *au fait* with the position of the collieries as they were in 1917?—It does. I think they are just as anxious.

27,483. Is that pre-supposition a valid one?—I think so; I know of no reason to the contrary.

27,484. You do not think there is any possibility of the statement being true that there is a growing indifference at this moment on the part of the collieries to get a maximum output out of their undertaking?—I do not think so. I try not to think ill of anybody.

27,485. It is not a question of ethics, it is a question of fact?—I grant you it is a question of fact. I have no reason to doubt the integrity of the management of the collieries in this respect.

27,486. It has been stated that the workmen, because they are earning more money, at least, because of the increase of wages provided under the report

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

of this Commission in its first stage, are producing less coal per man?—I stated last Friday, in giving evidence, that I believed—it is only a belief, which may be wrong—that the majority of miners worked for a certain standard of comfort. If they could arrive at that standard of comfort in four days, whereas it took five days' work before, I believe they work for that standard of comfort. You are quite right and justified in saying to me, "Well, why say that when you are prepared to take the word of the management they are doing everything possible to provide clearance?" My reply would be, "I can only make deductions from facts, and it is a fact that in the past there has been a fall in output consequent upon a rise of wages, with one very notable exception," which exception I mentioned in my evidence last Friday, namely, the period when a special crusade was started by the Coal Mining Organisation Committee, and certain of the miners' leaders went amongst the men advocating they should put forward every effort to increase output to meet the exigencies of the nation at the time, and there was that remarkable rise of 4 per cent. in the output per man per shift over that period 1915-16, which is shown on this diagram and is very illuminating. That is my answer.

27,487. That period of 1915-16 is familiar to most of us and the reason why the output went up. It is sorry consolation to quote that, having made a bigger declaration that you believe the output per man is coming down because of the increase in wages?—In the *précis* of my evidence I consider the various reasons and I say the decrease is explainable in part by these various reasons, but mainly I think is the reason I have just given.

27,488. It is perfectly well known to you, the figures are available, to maintain that standard of comfort which a man enjoyed before the war he has to work much harder than he would have worked in 1914?—It is a question of the cost of living.

27,489. Exactly. If the cost of living has gone up 120 per cent. and his wages have gone up 115 per cent. he has to work harder in 1919 in order to get the same standard of comfort as he enjoyed in 1914?—Granted your premises.

27,490. The figures are before the Commission. Now I will return to the question of the shortage of material at the collieries. I am anxious, and I feel perfectly sure you are also, to get at the actual facts. Were not tubs released on priority certificates during the war from the Government?—The position with regard to tubs is this, some are made at the collieries, in which case we endeavoured to get priority for the material to make them and repair them. In some cases they were supplied by makers; in some cases we endeavoured to get high priority, and were successful in getting it for their supply to the collieries.

27,491. In the cases where firms had to buy their trams from steel makers they had to get priority certificates?—Yes, they are firms of tub makers.

27,492. Were the quantities permitted always in accordance with the demand at the particular collieries?—Yes.

27,493. Always?—As near as we could. We got the priority.

27,494. *Chairman*: Would you kindly tell me, because on this matter I hesitate to ask a question as it is a technical matter, and I am not like every other member of the Commission, because I do not understand these things, but is there any relation between the number of tubs in a colliery and the number of working places?—You have put your finger on a point that is of great importance in colliery management. The number of tubs should be, other things being equal, proportionate to the number of persons employed in coal getting, but there is one other governing factor, and that is the quality of the coal. In one case two men of equal ability and strength working in different seams will produce a different quantity of coal; one man may produce twice as much as the other because the coal is easier to get. In a colliery of that class it would still be proportionate to the number of persons employed, but it would be a higher proportion.

27,495. *Mr. Robert Smillie*: The distance from the bottom is surely the main factor?—Quite true; you must have ropes always manned, supplied with tubs.

27,496. You may have 500 tubs in a large colliery?—Quite so.

27,497. *Mr. Frank Hodges*: You are acquainted with Baldwin's collieries in South Wales?—Yes, I know them.

27,498. You are aware that Baldwin's collieries are associated with steel works under the same Company?—Yes.

27,499. Therefore, their supply of trams would be what you might describe at the maximum point?—Presumably they would supply what they wanted. I do not know the details of their steel works, whether they make that class of steel.

Mr. Evan Williams: They do not make that class

Mr. Frank Hodges: They make their own trams.

Mr. Evan Williams: But they buy the steel.

27,500. *Mr. Frank Hodges*: I am saying that they are supplying their collieries with trams they make themselves?—If they have to buy the steel plate they might not always be able to get it.

27,501. Of course, they may be subject to the market in that respect?—I was thinking of during the war when there was a difficulty in getting the plate, but now I suppose there is no difficulty in getting the plate.

27,502. Would it surprise you to learn that even in a colliery of that description the trams are so scarce that a man who has managed to fill his share by Friday afternoon of the week's supply does not present himself for work on a Saturday, because if he did there would be no tubs for him to fill. Are you aware of that?—No, I am not aware of that. I should have to inquire into the particulars.

27,503. Would you take it from me that that is a fact?—I would rather inquire into the details of the case.

27,504. Then you will not take it from me?

Mr. Evan Williams: Which are the collieries?

27,505. *Mr. Frank Hodges*: After that I will not press that question any further. I shall, I hope, treat Sir Richard Redmayne's evidence in a slightly more generous spirit than that. Has it ever occurred to you when you got a complaint of this kind that you should at once proceed to make a representation?—Yes.

27,506. Have you done it?—Yes.

27,507. How do you set up your representation board?—I do not have a board.

27,508. Whom do you appoint?—I have a man already.

27,509. Who is he?—Mr. Phillips.

27,510. What is he?—He is an inspector of mines under the Coal Control.

27,511. What district does he work?—South Wales.

27,512. Is that how he is described, inspector of mines?—Inspector of mines under the Coal Control. He has an assistant. He is not an inspector of mines at the Home Office.

27,513. I have had some experience of that gentleman at a colliery that I asked him to come and inspect with regard to the fall of output. It was no credit to your department that the output continued to fall at a much greater rate after his visit. What does he do? Does he consult the Workmen's Committee at the colliery?—He inspects the face.

27,514. When he goes to investigate a complaint how does he set about it?—I am explaining. He goes down the pit, goes round the face, talks to the workmen, asks the management for their reasons, and should, if he does not, ask the representative of the workmen for their complaints.

27,515. Do you know of any case where he has been to the workmen's committee and asked the workmen's committee to supplement their complaints?—Here is a case I have before me of Messrs. Partridge and Jones's works. This is his report. It will perhaps epitomise the points you had in mind, and if I may read it it will explain it exactly. The report is dated the 2nd of August, 1918.

27,516. I beg your pardon, that is not a report that has come to your notice since this great outcry with

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

regard to the falling output?—No, it is the 2nd of August, 1918.

27,517. You are dealing with a report as to gas found in the mine?—No, I am dealing with a question of development underground, fall in output, and so on. I thought that was what you were on.

27,518. I am dealing with the present position, but I should be glad to hear what the procedure was in 1918?—The procedure in 1918, and the procedure at the present time is precisely the same. We go into everything as far as we can and endeavour to arrive at the cause of a fall in output. This was a fall in output from 246,127 tons in 1913, and it had been steadily falling till, in 1918, it had fallen to 125,551 tons and I wanted to know the cause of this.

27,519. Chairman: That is 50 per cent.?—Yes, exactly: "I have visited the offices of this company and interviewed Mr. Smith, the managing director, and examined the plans and books and accounts generally, but more particularly of the Llanhilleth Colliery, and I can confidently say that there is no undue development of work taking place, but rather the reverse, as I do not think the company have pushed on the development during the control period with sufficient vigour to maintain their pre-war standard of output, and I find that there are now many collieries in the Llanhilleth pits doing repair and other work which would, if places were ready, be on the coal face. The books show that the output of coal per man is very low, averaging 12 to 14 per cwt. per shift, and that of the men employed only about 36 per cent. are coal getters. This for black working is very low. The number of men employed on the surface is extremely high as are the repairers underground these both being much the same numbers as were required for getting the far greater pre-war output." Then the report gives the outputs for the different years.

27,520. *Sir L. Chiozza Money*: Would you give us those because it is rather important?—1913, 246,127 tons; 1914, 216,986 tons; 1915, 118,923 tons; 1916, 160,724 tons; 1917, 139,873 tons; 1918, 125,551 tons.

27,521. That is up to when?—That is for the six months ending June the 20th in each year.

27,522. In each year?—Yes, in each year. "It will be noticed that a slump in output occurred in 1915 caused by the breakdown of the Cornish pumping plant in the shaft. No spares were installed, and before one could be set going all the west or dip side had drowned as well as the cross measure district, and in the old coal." Then it goes on at considerable length giving the various reasons.

27,523. *Mr. Frank Hodges*: Is there any reason there to prove that the individual workmen were restricting their output?—No, none in that case.

27,524. Therefore, you have no ground in that report for you to arrive at your belief?—No. This was on August the 2nd, 1918.

27,525. How many reports have you got to provide a foundation for your belief?—Would you like me to go through the reports.

27,526. I should like to have a summary of them to see whether you have any ground for your belief?—I will provide a summary.

27,527. Chairman: Can you select one now?—I will try and find one.

Sir L. Chiozza Money: I did not catch clearly the beginning of that report.

Chairman: Let Sir Leo have a look at it.

27,528. *Mr. Arthur Balfour*: Was the object of it to prove an undue amount spent on development?—Yes.

27,529. *Mr. Frank Hodges*: While you are looking for that report I should like to repeat my previous question as to whether any enquiry has been made during the last few weeks about a complaint made by workmen as to falling output?—I could not say because I have been sitting here all day, but I expect there have been.

27,530. You have a department, have you not? *Mr. Phillips* is one of the inspectors in that department?—Yes, and we have *Mr. Cook*.

27,531. His principal duty is settling disputes, not inquiring into output?—Yes, and inquiring into output too. He was at Beddlay last week.

27,532. *Mr. Robert Smillie*: He was there about disputes, not inquiring into output?—No, but incidentally he looks into other matters when he is inquiring about disputes.

27,533. *Mr. Frank Hodges*: I put it to you straight that you have not compiled any data which justifies you in coming to that conclusion?—I have given you the reasons.

27,534. They are speculations, are they not?—Entirely my belief. I grant you at once that, short of the fact that this wave of falling output follows the wave of advance in wages, I have no data.

27,535. I challenge your belief and ask you to be good enough if you would, to institute enquiries at once into these that I have here, and about 150 that *Mr. Smith* will bring to your notice in the course of a few moments?—Certainly, everyone of them shall be investigated.

27,536. A proper joint enquiry?—I should be very pleased to discuss with you or any representatives of the miners the method on which the enquiry should proceed.

27,537. And that is should be proceeded with immediately?—The sooner the better.

Sir L. Chiozza Money: Would you mind asking whether there are many more cases like this.

Mr. Frank Hodges: I feel so sure in my own mind that in that list of cases that *Sir Richard* has there he will find so few which will enable him to come to a conclusion that the fall in output is due to slackening on the part of the men due to increased wages that I will not trouble him to read them all through. I have no doubt if he did read them all through they would afford very interesting revelations to the Commission.

27,538. Chairman: Might we have the one you were going to find. We should be able to see the sort of thing then?—This is a case on August the 5th, 1915, at the West Hallam Colliery.

Mr. Frank Hodges: Could you not find a more modern one?

27,539. *Mr. Sidney Webb*: That is before the increase in wages?—The Chairman asked me to produce a case, but I will try to get a more convenient one.

27,540. Chairman: Yes, you might give us a more modern instance?—This is a case at South Griffin Colliery, No. 3 pit. This is a letter from *Mr. Cook* of the 11th of January, 1919, in which he says: "When I was in South Wales on Tuesday, *Sir Richard Redmayne* sent me a wire requesting me to visit the No. 3 Griffin Pit for the purpose of urging the workmen to secure a larger output of coal. This arose out of an interview which the owners had with *Sir Richard Redmayne* on the 7th instant in which it was stated that the workmen were practising restriction of output. It was impossible for me to do anything in the matter as I had to leave Cardiff for Halifax, and was, therefore, unable to go to see either *Mr. Williams*, the general manager, or yourself in connection with the matter. I am arranging, however, to meet *Mr. T. Jenkin Williams* on Thursday or Friday of next week, and shall be glad if at the same time I can arrange an interview with yourself. Please let me know at your earliest convenience which day is most convenient, and whether you think it will be necessary to hold a mass meeting of the men."

27,541. *Sir L. Chiozza Money*: It was not proved that the men had restricted the output?—I am trying to come on to the report.

27,542. *Mr. Frank Hodges*: Who received that letter?—*Mr. Manning*.

27,543. The miners' agent?—Yes. I am trying to find the outcome of all that. I am afraid the report is not attached to it.

27,544. *Mr. Sidney Webb*: Then at present there is no evidence?—In this case.

27,545. Is there any in any case?—Here is a report by *Mr. Cook* of the 9th of August, 1918: "Lancaster Steam Collieries, Blaina, South Griffin Collieries. Arising out of complaints made to the Comptroller as to the low amount of coal production from these collieries, and to the financial obligations involved thereby, I visited Blaina on the 2nd and 3rd of August for the purpose of inspection and general investigation. After meeting representatives of the

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

Company and the workmen, I made an inspection of a portion of the underground workings at the No. 3 Griffin Pit. The portion referred to, employing about 100 men and boys, was barred off owing to an excessive quantity of gas in the return air current; in fact the workmen had only been able to work 7 days out of the last 11, including the 2nd August, due to the same cause. The examination revealed a fluctuating quantity of gas varying from "not visible," and so on; I need not go into the question of gas. "From investigation, discussion and inspection, the chief causes of the present fluctuating and unsatisfactory condition of things appear to be (1) irregular and generally inadequate supply of empty trams to the coal-getters due to bad traffic arrangements and insufficient number of trams at colliery; (2) delays to coal haulage caused by insufficiency of shackles or tram couplings. This was partially put right on Saturday morning; (3) lack of effort and deliberate restriction of output by sections of workmen for the purpose of retaining certain allowances paid additional to the tonnage rates; (4) charges by workmen of inopitudo on the part of a number of under-officials, and that in some cases of officials (this is specially being gone into by Mr. T. Jenkin Williams, general manager); (5) hindrances to coal haulage caused by excessive quantity of rubbish causing congestion at the pit bottom and on the surface instead of being used to pack the waste in the workings; (6) the excessive number of minimum wage cases which result in minimum production instead of tonnage allowances where such are needed to induce maximum production; and (7) great disproportion in the number of "onecast men" as compared with the number of coal-getters, and limitation in the amount of work done by repairers and other grades of workmen. All these and other matters affecting production were fully discussed at a meeting of both sides held on Saturday, the 3rd instant, at Blaina office, and at the invitation of both sides (which fully believe substantial improvements can be effected). I have agreed to attend a mass meeting of South Griffin workmen which is being called to specially deal with these matters on Thursday, the 15th instant. I have also agreed to follow this matter by further underground inspection of alleged abnormal places."

27,546. *Chairman*: Were there many strikes at that colliery?—It runs in my mind that there have been quite a number.

27,547. *Mr. Frank Hodges*: You will remember that at that colliery there were strikes which were described as safety strikes?—Yes, it does not show a very high state of affairs.

27,548. The workmen complained that the colliery firemen failed to report the presence of gas, and the workmen asked for the dismissal of the colliery firemen?—Yes.

27,549. Is there anything else in that letter which would help you to the conclusion that, because of high wages, the men are restricting output?—No. You see I say it was a belief, and I have not based it on any definite enquiry. I have based it on the general principle, as I have told you on two occasions to-day, of the fall of output which is evidenced when there is a rise of wages over previous years. I may be wrong in my supposition, but that is a fact.

27,550. I put it to you that the basis of such a belief was badly founded in the light of the fact that, to maintain the same standard of comfort in 1919 as the men enjoyed in 1914, they must perforce work harder than in 1914?—I should like to work out the figures, and if that were so, that would be a distinct blow at my theory for accounting for the fall on the present occasion, naturally.

27,551. I have one request to make, and then I shall not put any further questions. I wish you would prepare a summarised statement from the documents that you have there giving the causes you have ascertained as resulting in declining output and the kind of investigation that you adopted in order to ascertain the cause?—Yes: I think that would be a very necessary preliminary to any enquiry.

Mr. Frank Hodges: I should think it is a necessary preliminary before you came to a belief or a conclusion. That is all I want to put.

27,552. *Mr. Evan Williams*: Have you had recently any allegations or complaints or representations made by workmen at any colliery that the owners are not doing what they should to get output?—No. I cannot call any to mind at the moment, but really one's correspondence is so big that when I am asked a question like that from either side it is difficult for me to give a direct answer without looking through my correspondence. After all, there are so many things to deal with that these do not photograph themselves on one's brain; but I cannot call to mind one at the moment.

27,553. That would be something that would fix itself on your mind?—In ordinary circumstances it would.

27,554. Have you found in the past that there has been reluctance on the part of workmen to make complaints to the Home Office or those who are in control?—No, I have not found any reluctance. I would like to say at the same time that I have constantly had complaints from workmen that they were not being provided with clearance, and that the management are not doing all they can to secure output. I have those constantly, some anonymous, some not. Every case, whether anonymous or not, is dealt with. That is what I wish to emphasise—no case, however insignificant, or even if it comes from an anonymous quarter, is failed to be dealt with, and dealt with quickly.

27,555. Is there any cause, that you know of, that would rather tend to make owners at the present time wish to restrict output?—No, I do not see why they should desire to decrease the output. Of course, I quite realise that it might be said it is arguable that, with the possibility of nationalisation hanging over their heads, they might not perhaps proceed with the same ardour in the management of their concerns; but I do not know that there is anything in that. I say it might be argued.

27,556. Do you not think that it is present to the minds of all of them that if the mines are nationalised, output would be one of the chief considerations in the price that they would get?—That entirely depends on the system of valuation and the time the output is reckoned from.

27,557. The only basis for the price is on the output?

Chairman: On the previous output.

Mr. Evan Williams: There is something that deals with future output.

Mr. Sidney Webb: Only undeveloped mines.

Chairman: Yes, quite right.

27,558. *Mr. Evan Williams*: What inducement there is in the direction of producing a greater output?—Presumably.

27,559. Take again the basis of financial control, as has been proposed under the Sankey Award that has been adopted by the Government, the retainable profit of the coalowner is in direct proportion to his output?—It is.

27,560. In fact one might say that output is the only consideration, so far as the remuneration of the owners is concerned, that comes into the calculation?—It is a very important factor.

27,561. So that the coalowner, from that point of view, would strive to get every ton he can out of the colliery?—Presumably.

27,562. He has not been generally accused of being reluctant to make a profit, or to increase his return?—No.

27,563. With regard to the Llanhilleth case that Mr. Cook investigated, was there in his report any statement as to the difficulty with the surface men? I think you say they had the same number of surface men employed when 125,000 tons were raised as when they raised 248,000 tons?—Yes.

27,564. Does he report there that the men threatened to strike if any of the men were dismissed?—No, it was not in that report that I read; it may be in the correspondence. It is very difficult for me at a moment's notice to give all the particulars of every one of those cases.

27,565-6. *Chairman*: Not only difficult, but impossible?—It is really impossible. If I had known you

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

were going to put these questions, I would have tried to make a synopsis of them, just as I am going to make for Mr. Hodges.

Mr. Evan Williams: I am asking you that, because

I know the men threatened to striko if the number of the surfaco men was reduced.

Mr. Herbert Smith: If you are making that statement, you had better go into the witness box.

(Adjourned for a short time.)

27,567. Mr. Evan Williams: Before I deal with Part II., there is a question I should like to ask you with regard to your suggestion as to the nationalisation of minerals. How would you deal with the land that is occupied by the surface works of the collieries if the minerals were nationalised?—Well, you cannot remove the buildings.

27,568. How would you deal with the land? Do you suggest that that should be purchased also?—One is only concerned with the minerals.

27,569. Yes, but the land at the present time is occupied in virtue of the powers in the lease?—Necessary adjustments would have to be made.

27,570. If the minerals were purchased by the State, the land would still remain in the hands of the private owner?—Yes.

27,571. And the colliery company would be without any right to the use of that land, except what they got under the lease?—Yes; the necessary adjustments would have to be made.

27,572. Do you suggest the land should be bought, or how would it be dealt with?—The land could be rented from the owner of the land, or could be purchased from the owner of the land. Let us take a concrete case, such as Mr. Cooper kindly put.

27,573. Let me give you a case?—May I take a case and then give my answer. I have, say, a colliery area of 1,000 acres, and both the minerals and the surface are owned by the same individual. The lease states that on payment of, say, 4d. a ton royalty and certain rent of so much, into which the royalty merges, I shall have possession of that for 60 years and a right to a certain amount of land for my buildings, and so forth. The State takes over the minerals at a fair valuation, but it only takes over the minerals at a fair valuation. The right, I take it, that would be given by the land-owner to me during the term of my lease would continue.

27,574. Take a case where a lease of that kind would expire, say, in five years?—Do you mean that the mineral lease expires in five years?

27,575. Yes. Suppose the minerals are acquired by the State, but the surface is not. At the end of that five years, the lease being at an end, the whole of the surface works at that colliery would revert to the owner of the land. Yes. That would have to be a matter to be dealt with in any Bill dealing with the taking over by the State of the minerals. They would have to safeguard the interests of the colliery owner.

27,576. You mean there would be powers to compel the owner?—Yes, I should say so. The point is rather a new one to me, and I should like to think it over.

27,577. It is an important point?—Yes; it is a point so important that it would have to receive the most serious consideration.

27,578. You have no suggestion to make now as to how that should be dealt with?—No, but I will give you a suggestion to-morrow when I have thought it over. I should think there would be many such details which would have to be dealt with by any Bill as to the taking over of the minerals.

27,579. It is a point which has not been drawn attention to, and that is why I mentioned it?—Yes, and it is an important point.

27,580. With regard to the introduction of machinery at the coal face, I suppose you would agree that the advantages would have to be mutual, both to the workmen and to the owner, before machinery could be successfully introduced?—How do you mean, mutually advantageous?

27,581. I mean unless the coal hower gets some advantage from the introduction he would naturally object to the introduction, and unless the owner gets some advantage from the introduction he will not agree to it?—In my proof of evidence I stated and

endeavoured to show that the introduction of labour-saving machinery was an advantage, inasmuch as it allowed of a reduction presumably in the working cost, and, therefore, gave a bigger margin for an increase of wages.

27,582. If the cutting price on the seam is not reduced on the introduction of machinery, it is possible that the introduction may not pay so far as the owner is concerned?—I would not put it, the cutting price; I would rather put it in this way: that the cost per ton is reduced by the introduction of the coal-cutter.

27,583. That may or may not be?—Yes, that may or may not be. If it is not, you do not put it in.

27,584. Have you ever estimated what it costs to run a coal-cutter?—Of course I have estimated what it costs to run a coal-cutter, but you can only estimate what it costs to run a coal-cutter, having regard to the conditions under which the coal-cutter is being run. It varies, of course, in different cases.

27,585. A point that is very often overlooked is that there is considerable cost in the upkeep of a coal-cutter?—Yes. You may remember that I mentioned that point in dealing with coal-cutters.

27,586. There is the capital outlay to begin with for the machine, and the cables, or the pipes?—I gave an example on page 6 of my *précis* from the North of England and the average saving effected thereby. I said, I think, that it is doubtful whether interest on capital has been taken into account.

27,587. That is just the point I want to bring you to, and take some concrete figures if we can get at them?—I say in my *précis*, "Judging by published statements, 6d. per ton is an average saving, but it is doubtful whether cost of motive power in driving the machines is fully considered in all the statements."

27,588. That is what I want to elaborate a little. There is the cost of the machines and the cost of the pipes or cables, according to whether they are worked by compressed air or electricity, and that would run to a very large sum?—Yes.

27,589. Now the machine is subject to great wear and tear, is it not?—Yes, and no machinery more so.

27,590. There is the upkeep of that and the wear and tear and all the repairs?—Yes, which are very heavy.

27,591. It would not be an exaggeration, would it, to say it costs over a pound a day between the depreciation and wear and tear to run a coal-cutter, apart from the labour?—I would not be surprised, but I would not like to bind myself to the figure.

27,592. You do not think it is too high an estimate, do you?—No, not at the moment.

27,593. Now the average out-turn per machine in the country is under 7,000 tons per annum, is it not?—Yes, 6,820.

27,594. Taking 280 working days you get 25 tons a day per machine?—Yes, taking one machine with another on the average.

27,595. So that the cost of upkeep of the machine would run to 10d. a ton on that calculation?—Yes, but I do not think that is quite the sort of calculation I would take if I were going to introduce a machine. That is, taking an average over the whole Kingdom, and there may be certain benefits which accrue from some of these machines that vitiate the total.

27,596. From some of the other machines?—Yes.

27,597. Of course, you may get machines above the average, and you may get machines below the average?—Yes, but you may put in a machine for a specific purpose.

27,598. What I want to bring out clearly is that there is a considerable expense per ton that is often ignored when putting in machinery at the face is talked about, and on the average of the country it

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

would amount to something like 10d. a ton?—I think the point is so important that I believe the time is very ripe now for a really thorough investigation into the whole question of the possibility of the wider application of coal-cutters to mines, and I stated that last Friday. The only public information upon which one can base any large-scale results is that of the North of England Institution of Mining Engineers, who enquired into the subject, but that is out of date now. 6d. a ton seemed to be an average saving, but I doubt whether the cost of motive power was taken into consideration. Then you have to consider interest on capital. Wear and tear was, I take it, taken into consideration in that case. I grant you that the position with regard to coal-cutters is a little indefinite, and it would certainly be a great advantage if a scientific body like the Institute of Mining Engineers were to set up a Committee of Inquiry as to the possibilities. I think, myself, the result would be a very much larger application of coal-cutters in this country than heretofore.

27,599. Until that is done, you will agree with me, I think, that there is a good deal of loose talk, based not on reliable information, as to the introduction of machinery doing all sorts of things with regard to increase of output, and so on?—Yes, but I have not exaggerated in it myself.

27,600. No; I do not accuse you of that, but I want you to confirm it, because, if I say it, it would not be evidence, but if you say so, it is?—That is why you say it?

27,601. Yes. It is the same with regard to conveyors, is it not?—Yes. The wear and tear of conveyors is very great. Judging from my own experience I think the sphere of application of conveyors in collieries is very much greater than that of coal-cutters even, because to apply a coal-cutter economically it is necessary almost always to apply a conveyor also, but you can apply a conveyor where you have not a coal-cutter.

27,602. You would agree that the cases where you can introduce a coal-cutter and conveyor together are not so frequent?—I should say they were frequent, but it all depends upon what you mean by "frequent." My opinion is that you can apply coal-cutters and conveyors in a number of cases where they are not at present applied.

27,603. *Mr. Robert Smillie*: Do you say it is general to have coal-cutters and conveyors at the same time?—No. What I said was that to apply the coal-cutter in the most economical way it is desirable and necessary, in fact, to apply it with a conveyor, and have the one working in conjunction with the other.

27,604. *Mr. Evan Williams*: Are cases frequent where the two work together at the present time?—No, but I say they could be much more frequently applied than they are.

27,605. That is your opinion?—Yes, that is my opinion for what it is worth.

27,606. Does it not require a particularly good roof?—Yes, but there are many good roofs.

27,607. And there are many bad ones, are there not?—Yes.

27,608. And it wants a particularly good roof to do that?—Yes, but it is the most economical way—to work both.

27,609. Conveyors do save a great deal of manual labour on the part of the workmen, do they not?—Yes.

27,610. Especially if the coal is carried from the face the whole length?—The effect of the introduction of all machinery is to save manual labour, and allow a larger application of manual labour. That seems contradictory, but it is not.

27,611. And that fact is not sufficiently realised by workmen at the present time?—I think it is at the present time. I think in the proof of my evidence I say that the advantages of the introduction of machinery have become realised by the miners and it does not meet with the objection it used to meet

with. The Coal Conservation Committee in its report gives utterance to the same sentiments, which I can read to you if you like.

27,612. I only wish that you were correct?—The Coal Conservation Committee Mining Report was a report drawn up by mining engineers in this country and they came to that conclusion.

27,613. That that objection on the part of the men had ceased?—I will just read it to you and give the names of the persons who formed the Committee, if I may. It is signed by Sir Adam Nimmo, Colonel Blackett, Mr. Forster Brown, Mr. Gemmill and Mr. Charles Rhodes—they are mining engineers—Mr. Smillie, myself and others.

27,614. What was the conclusion you wanted to draw particular attention to?—We considered the question of the wider introduction of machinery into mining and we dealt with the question of the opposition on the part of the miners to the introduction, and we dismissed it as not being a fact.

27,615. Did you take evidence on that?—No. You see we were all experts—Sir Adam Nimmo, Mr. Rhodes, Colonel Blackett, Mr. Forster Brown and myself, and we were all men of wide experience in mining.

27,616. You drew entirely on your own experience?—Yes; we thought we could not get better evidence. You would agree, would you not?

27,617. I will not dispute it?—This is the report: "Labour-saving appliances might with advantage be used to a greater extent in connection with colliery operations. The application of coal cutting machinery and face conveyors should be as largely adopted as possible. Much has been done in recent years in this direction, and but for the introduction of such appliances the cost of production would probably have been much higher, as they have materially assisted in counter-balancing the higher cost which has resulted from the working of thinner seams to a larger extent than formerly. There is, however, still room for considerable extension in the use of such plant. Reference is sometimes made to the hostility of labour to changes in methods of mining and more particularly to the use of mechanical appliances underground. We do not regard this impression as well founded. Labour does not appear to have an interest in objecting to anything that has for its object the affording of greater facilities for the bringing of its production to bank, or to anything that tends to make work less arduous. Investigation of particular cases where difficulties appear to have arisen rather suggests that in these cases the human factor has not been sufficiently considered in the changes introduced"—and so on.

27,618. How do you explain the steady decrease in the output per machine in this country and the increase in output per machine in the United States? Have you any explanation to offer for that, particularly in the last year?—I gave an explanation for that last Friday and I pointed out that in 1903 the output per machine in the United Kingdom was 8,158 tons. Then coming down to the last year before the war, the last pre-war year, it had risen to 8,412 tons. But in the war years it showed a steady decrease. Now I think that is due probably (it is only an expression of belief) to the fact that there has been great difficulty in getting plant and replacements. I know there has been great difficulty and I have had numerous complaints. For instance, I had a very strong complaint from Mr. Charles Rhodes that they were unable to get new machines to replace old ones, and they were unable to get plant and the requisites for the maintenance of these machines in a proper condition for working. I think that really is the probable cause.

27,619. You think that accounts for it?—Yes, I think so.

27,620. There has been a big increase in the number of machines during the late period, namely, an increase from 3,000 to 4,000?—Quite true.

27,621. And in the United States there has been a steady increase in the output per ton?—Quite true.

27,622. Take the last year—as between 1917 and 1918 there has been a very big increase in the United States, but a very big decrease in this country?—Yes, but you see America was not under the stress of war conditions that we were.

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

- 27,623. How does that affect the output per machine, which is what I am rather putting?—It is the inability to obtain the material to maintain the machines at the very highest possible level. I am trying to arrive at a possible explanation. Another reason which may be advanced as a possible explanation is that the class of labour which is required to work the machines, especially on introduction, is a very highly skilled class of labour, and that class of labour was largely recruited for the Army. I will not say I had complaints, but I had urgent appeals to endeavour to allow these men to be regarded as miners and not recruited in the early stages of the war. I think those two facts taken together are a very just and proper explanation.
- 27,624. Dealing with mechanical haulage, I see you say that it is a very good axiom that mechanical haulage should replace horse haulage?—Yes, that is the formula used by the late Mr. Nicholas Wood, and if it was true then, it is true now.
- 27,625. Would you say where the work can be done by five or six horses it does not pay to use mechanical haulage?—No.
- 27,626. How far would you go?—I should say five or six is about the point I would take.
- 27,627. If the work can be done by five horses, say, there is no advantage in putting in mechanical haulage?—I should like to have all the facts of the case before me, but as a generalisation I should say it would not.
- 27,628. So that there is not the scope for efficient replacement of horse haulage by mechanical haulage that is generally thought to exist?—I do not know what you mean by "generally thought"; it is no more than I generally think.
- 27,629. It has been said frequently at the sittings of this Commission that where horses are hauling coal it is almost in itself a wasteful thing?—Yes, but both are true. Take the case of a district, or section as it is called in Scotland, where perhaps seven or eight ponies are used. It is conceivable that you can arrange a system of mechanical haulage which would do away with the whole of those ponies. That would be a great saving, and it is that sort of floating idea, I think, which gives rise to the statement that a lot more could be done. There are collieries in which there are no ponies even, so perfect has been made the system of mechanical haulage.
- 27,630. It has to be a new colliery laid out for that purpose, has it not?—Yes, or a new district or a new seam in an old colliery.
- 27,631. And the conditions have to prevail?—As a rule.
- 27,632. You would not condemn the management of the colliery from the fact that it had three or four horses doing work in a certain place?—No.
- 27,633. *Mr. Robert Smillie*: Would not the condition with regard to the horses depend upon the length the horses had to haul?—There is a good deal of truth in that. Supposing I had one horse hauling coal a mile uphill and downhill, that would limit the output. I might by putting in a small engine not only relieve that horse of its work, but I might allow the work of 7 horses being performed. You see what I mean, *Mr. Evan Williams*.
- 27,634. *Mr. Evan Williams*: Yes?—It would not only meet the output of that colliery under the one-horse system, but it would allow of the increase of that colliery to a 7-horse system.
- 27,635. You would put in mechanical haulage not to reduce the cost of hauling but to get an increased output from that district, which is quite a different thing?—Yes.
- 27,636. Now coming to the figures which you gave of the consumption of coal at mines, you have taken 23 representative collieries, and you find that their consumption for colliery purposes amounts to 9.5 per cent. of the total production of those collieries. consumption for colliery purposes amounts to 9.5 per cent. of their output are representative collieries?—Those happen to be sizeable collieries, and they were representative in point of name, but the average of the United Kingdom is not that figure.
- 27,637. That is just what I was coming to, the average of the United Kingdom. Even taking the coal equivalent to the units of electricity or units of heat from coke ovens, it is only 6.77 on the average?—6.77 allowing for converting the heat into terms of coal. You are right. It is 6.2 of the actual coal consumed, and taking the equivalent coal in heat from coke ovens, blast furnaces, etc., that is equal to a percentage of 6.8.
- 27,638. 6.77 to be exact?—Yes. That is the average for the whole kingdom.
- 27,639. Does not that show that the 23 instances which you take are not a fair sample at all?—I should say they were distinctly of course, as the figures show, on the wasteful side.
- 27,640. And the economy that could be effected in them you would put at 23 per cent.?—Yes. I halved it, you see.
- 27,641. There is a possible economy, you say?—Yes, but I halved that in applying it to the United Kingdom.
- 27,642. But taking the whole of that and applying it to these collieries they would be still above the average consumption of the United Kingdom?—Yes.
- 27,643. If you take 23 per cent. of 9.5, that is 2.3. You still have 7.2 for these collieries after making them perfect?—Yes.
- 27,644. Is it a fair assumption therefore to say that you could get 12 per cent. decrease upon the 6.77 average when in that average is included the number of 23 collieries whose consumption is 9.5?—9.5 was the consumption there as against the average of the United Kingdom 6.2. Instead of taking the possible saving worked out of those collieries, 97,666 tons, and putting that into a percentage, I halved that.
- 27,645. What I am contending is that even halving that is not giving a fair deduction from your figures?—I am not quite certain about that.
- 27,646. You have taken 23 collieries which are either very, very wasteful, or where the conditions of pumping or something or other are very bad?—No, I have not; because taking the position in Scotland, it is 9.10.
- 27,647. And the whole district is below the 23 collieries which you take?—Yes.
- 27,648. 9.3 is higher than any district in the country?—It is higher than the average for any district.
- 27,649. I put it to you you have taken 23 collieries which are exceedingly wasteful, and although of course economy is possible in those 23 collieries, yet it is not a fair assumption to suggest even half that economy is possible in the others?—I do not know that that is a correct way to approach it, and I will tell you why. If I take every colliery, I might go to some other collieries with a lower percentage consumption than 9.5, and I might be able to show that I could save just as much coal as I have in these 23 and reduce the percentage to considerably below 6.2. For instance, I know of a colliery in Northumberland that reduced its coal consumption down to 2 per cent., and I will give you the name of the colliery if you like.
- 27,650. Reduced it from what?—On several percentages down to 2.
- 27,651. Was that by the introduction of something?—There was a paper written upon it.
- 27,652. It must have been a particularly wasteful colliery?—It is only 2 per cent. now.
- 27,653. The point I am on is not the actual consumption, but the amount of reduction in the consumption that is possible?—On your system of argument I should be perfectly justified in saying that that 6.2 per cent. is capable of being reduced to 2 per cent., but that would not be sound at all.
- 27,654. I do not think anything I have said justifies that. What I point out is that you cannot apply to the whole country even half the reduction that you show possible in this number of collieries?—Why not?
- 27,655. Because even after you make them perfect, they do not come down to the average of the country as a whole?—Would you like me to give you the collieries?
- 27,656. No, there would be no advantage?—You would be astonished if I did. Some are the most

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.O.B.

[Continued.]

notable collieries. I give that answer because you say these are very bad collieries.

27,657. They must be very bad cases?—I do not think you would say so when you hear the names of the collieries.

27,658. I do not think it is worth spending more time on it?—On your reasoning it is possible for me to take a colliery and say "It is the best I know, 2 per cent., and every colliery should be reduced down to that." I took those collieries. From inspection we determine at the Coal Control what savings are absolutely possible, and we give them, without electric plant, 10,000; by electrification, 78,000; or by installing other new plant, 8,600. But we might go to a colliery the consumption of which is lower even than these 23, and it might from an inspection be possible to determine from the character of the water and the position of the boilers and what not what economies could be effected.

27,659. It would not be difficult to find collieries with less consumption than those 23?—I grant the colliery consumption of those 23 is unusually high.

27,660. And that is why I contend the economy you have given is not a fair one as showing the possible reduction for the whole country?—Then I will tell you what I will do. I will take the best colliery and say the average might be brought down to the best.

27,661. Average consumption?—Yes.

27,662. The average consumption depends upon the conditions?—Exactly.

27,663. Take a colliery without any water to pump. That colliery might have a consumption of even 1 per cent.?—Exactly. Therefore you must take each colliery. I extracted something from a report I got the other day (we look into these matters) with regard to a Welsh colliery dated 14th May, and this is the report. I wish to point this out as showing that a great deal can be done in this direction. This is the report of the Inspector: "The coal consumption is appalling and should be dealt with by your expert as soon as possible as they have three boilers, 30 by 8, at 160 something to run this colliery and are using 32 per cent. of their production, a class of coal which is required elsewhere." It has been stated in evidence here that that class of coal which is saved would be of no value. That is so in some cases, but it is not the rule.

27,664. Is it not so in most cases?—No. I would say nearly all the coal is saleable, but in some cases the class of coal is not saleable. Here is a case where this particular class of coal would find a ready sale, and, not only a ready sale, but it is wanted elsewhere, because it is a highly bituminous coal.

27,665. That must be a colliery in an extraordinary position to use one-third of its output in order to keep going?—Well, it is employing 230 men.

27,666. Surely it ought to be closed?—Well, it has not ceased working.

27,667. No, I am certain it has not. With regard to what you call collective production, would you tell us exactly what it is you suggest should be done in this way and what is the extent of unification you recommend? What would be the size of the units and how should they be made up?—You are now referring to the evidence I gave?

27,668. Yes, to which you refer again here?—Yes. I am not finding fault with you for bringing the matter forward, but this was the object in view: I am instituting a comparison between a system of unification and a system of non-unification. The effect of unification would be to carry out certain economies of administration and so forth by reason of that unification. The one I had in mind was district by district.

27,669. The unification of a district as a whole?—Yes.

27,670. To make it one unit?—Yes.

27,671. And that is your view of what should be done?—That is what I had in mind.

27,672. Do you think such a unit is one that could be efficiently and economically managed?—If the districts were combined to form several units and

those units were again put under one umbrella for certain purposes?—

27,673. What purposes?—Controlling freights, for instance.

27,674. To set up a monopoly in the district?—No, for the purpose of general direction under the Supreme Council. The districts do lend themselves in the great majority of cases, owing to what is known as the *genus loci* and the geological conditions and customs, to combination more readily than the combination of, say, two districts. By "district" I mean coalfields.

27,675. In the South Wales coalfields you would unite that?—In the South Wales coalfield you have a condition of affairs which is something a little different. The method of working, selling and dealing with anthracite, as you know better than I, is different from that connected with steam coal. Probably South Wales would lend itself to the combination of either two or possibly three districts.

27,676. Do you suggest the anthracite district should be formed into one unit separately?—I think it probably would tend to efficiency.

27,677. Quite apart from the rest of the coalfield?—Not quite apart. The sort of idea one had in one's mind was these natural combinations and then an over-riding control over the whole country.

27,678. Do you suggest that you should have a veto upon the operation of the smaller units inside?—Yes, in certain directions.

27,679. Who would have the last word?—The Supreme Council.

27,680. How would you suggest that that Council should be constituted?—The sort of idea one had in one's mind was that it should be constituted by representatives from the districts.

27,681. Of the owners in the districts?—I would not limit it to the owners.

27,682. What would the constitution you suggest be?—If you went in for a system of Trust of that sort, you would have to safeguard the interests of the consumer, and the Government would want a say in the matter. On a Supreme Council of that sort I take it that beside that, applying the system of control of selling price based upon the application of the lighting laws, you would have a system whereby an increase of dividend is only payable after the men have received an advance and the consumer has received his quota in reduction of the selling price or by cash payment and the owners get their third. Besides those safeguards, I take it there should be some representation of the consumers on such a Supreme Council, and I think that the Government would seek to be represented thereon.

27,683. And you suggest that a Council so constituted should be the supreme authority over all the operations of the production of coal in the kingdom?—I am not suggesting anything at all, but simply stating what was in my mind at the time I gave utterance to that sentiment. That was the sort of idea which was in my head.

27,684. Is the idea still the same which you have now?—Mr. Hodges put a question to me on the last question, and the answer was that my mind was in a chaotic state.

27,685. Is it still so?—Yes, I think it is.

Mr. Herbert Smith: I do not intend to ask you many questions in detail, except on this damaging statement which has been issued from your office on restriction of output. I want to start with what Mr. Evan Williams put to you, and I would rather not miss that. We have had a lot of talk on this Commission with regard to the introduction of machines. Do you agree with Mr. Evan Williams that it costs £1 a day to keep a coal-cutting machine in repair?

Mr. Evan Williams: I did not say it cost that to repair the machine, but that it was the wear and tear, depreciation, renewals, and so on, interest on capital and the power taken to run it.

27,686. Mr. Herbert Smith: (To the Witness.) Do you agree?—I think I said to Mr. Evan Williams that I would like to go into the matter, but on the face

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

of it as a general statement it did not seem to me to be very much out of truth; but I cannot say until I have worked it out.

27,687. Let me put it in another way. We are told that workmen fought the introduction of machinery, and we have been told that many times. Is there any wonder if you agree with the statement of Mr. Evan Williams that it costs 10d. a ton and you want that out of the workman?—I say at once I do not think there is opposition to the introduction of machinery.

27,688. What I want to get at is this. Mr. Evan Williams says you are an expert and what you say notice will be taken of?—"Expert" is a term I do not care for.

27,689. You say they will take notice of an expert, but what he says they will not take notice of. I have taken notice of what he says, and I want to see what the position is. We get prices in Yorkshire called the 1888 basis. Do you understand that?—Yes.

27,690. Standards of 1s. 2d. a ton and percentage. Would you take 10d. out of the 1s. 2d. if you introduced machines?—No. If I introduce a coal-cutting machine into a face and am going to pay the men on the ton, I should devise, in collaboration with the men, such a figure on tonnage rates as would give them what they were getting before the machine was introduced and the possibility of getting something more.

27,691. What I am trying to get from you is this?—I have never bound myself to that 10d. a ton. I have reasons for not doing so.

27,692. I am trying to get you to admit they cannot always take 4d. off that 1s. 2d. If the position Mr. Williams took up, and that is his estimate as Chairman of the South Wales Coal Owners, is right that it ought to take 10d. off where you introduce a machine—

Mr. Evan Williams: I have never suggested there could be a reduction of 10d. a ton.

Mr. Herbert Smith: I put it to you you said it cost 10d. a ton?

Mr. Evan Williams: I think I rather underestimated it.

Mr. Herbert Smith: It has to come from somewhere.

Mr. Evan Williams: Yes.

27,693. Mr. Herbert Smith: It cuts rather deep. I seem to know more in practice than you do. Would you agree 7d. was a correct price to take?—It varies with machines and it varies according to the class of work the machine has to do. I could not fix an overriding figure applicable to all machines unless I knew what was the proper figure to allow on the cost of each machine. I make up the average and the conditions are so various that you have not the information.

27,694. Would you agree that men like Rhodes and Blackett know the value of machines?—I should say you have picked two of the men who are great authorities on coal-cutting. One, Mr. Rhodes, had been long instrumental in the introduction of coal cutting machinery in the country, and Mr. Blackett is the inventor of the Blackett conveyor.

27,695. We shall get to that later on. Would you be surprised to find one of these gentlemen said a fair reduction was about 4d.?—No.

27,696. We have left 10d. and got to 4d.?—I am not bound to 10d. or 4d.

27,697. If they got 4d. each to meet the cost of the machine for wear and tear and driving force and labour, that is all they were seeking?—I am interested to learn that.

Sir Adam Nimmo: How many years ago?

27,698. Mr. Herbert Smith: Pre-war. I am now dealing with pre-war; I take it Mr. Williams was. To take it now we should have to go higher?—I might put in a machine, as I said to Mr. Williams. I might put in an Ingersoll coal-cutter to drive a road at a positive loss because I wanted that road cut away quickly. There are so many factors entering into consideration that it is hard to speak in generalisations.

27,699. You might put in a machine that does not assist workmen at all between getting his coal bored on?—I should think the manager is very foolish that

put in a machine that did less work than the human factor.

27,700. There are foolish managers and miners' agents like foolish inspectors?—Are there?

27,701. They have been put in and proved to reduce tonnage?—That is very astounding.

27,702. The general thing is they have increased tonnage?—Yes. The average is somewhere about 8,000 tons per machine per annum as against, say, 250 tons per man.

27,703. Suppose I give you the colliery near Wakefield belonging to the Greaves. They have introduced machines, and if I tell you the average per man per week with a machine is 52 tons, and the average per man per week by hand got is only 9 tons 10, what do you say?—That is a capital result.

27,704. That was pre-war?—I should say it paid to introduce it hand over hand.

27,705. If I tell you they take 3½d., and they are quite satisfied, and the workman is somewhat satisfied with the machine, what then?—I am glad to hear it. You must consider each case on its merits.

27,706. It was going out to the world you agree?—I did not agree.

27,707. Or somewhat assented to the statement that 10d. a ton ought to be taken off for the cost of machine?—I do not say so. Mr. Williams said so.

27,708. Now coming to the conveyor, a different question altogether, would you argue it was good mining engineering to put a conveyor in a four feet seam?—It might be.

27,709. You would argue that?—It might be.

27,710. In a four feet seam?—It might be.

27,711. I must accept your answer though I do not agree?—I see you do not. I have known it profitable in a 3-ft. seam.

27,712. If I name another man I knew particularly well, John Hickson, when he lived—you know where the Waterloo Main is?—Yes.

27,713. That is over a 4-ft. seam?—Yes.

27,714. John Hickson put a machine in and said he never made a profit until he got this conveyor, and now he was going to make some. I suggested he might be examined by a doctor to find where he was travelling and within six months the conveyor was out?—I know cases like that.

27,715. It is a four foot seam or just over, and he put in a conveyor?—I knew a more remarkable case than that. I knew a case where they put in coal-cutters and worked them by electricity, and when put down they said they would not have them again as they would not pay, and they were taken out. Another man put them in in the same place and worked them by compressed air and made them pay.

27,716. Do not you know that workmen object to conveyors from a safety point of view?—I have heard they raise objections.

27,717. You admit when a conveyor is working on the face it is impossible for a man to hear whether his roof is weighting or not?—You mean from the noise?

27,718. From the noise of the conveyor.—He will not hear the roof unless it makes a considerable noise.

27,719. You know they put a gate in every 60 yards of the conveyor face, and there is only one gate out of three a man can get out of?—Yes.

27,720. Do you know men object to that?—Yes.

27,721. Do you think that men rightly object that timber should not be drawn when the conveyor is working, and timber should not be drawn out until all is still?—I would like to go into each individual case on its merits.

27,722. Take a broad view?—The worst of it is you cannot take a broad view.

27,723. You have not different Mines Acts?—You have regulations made to meet certain things.

27,724. In the best seams do you think timbering ought to be drawn while the conveyor is running?—I should say, subject to further consideration, as a generality—no. I think I have pretty well safeguarded myself.

27,725. I want you to do that. I always find inspectors do.—Thank you; we try to.

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.O.B.

[Continued.]

27,726. I am not going to put anything to jeopardise the introduction of safeguarding machinery and prices, though I agree in this inquiry Mr. Balfour asked you certain questions. I want to see if you agree with me. He asked you with regard to permanent relief funds at collieries whether employers encouraged them or not. I understood you to say yes?—I do not seem to remember that.

27,727. *Mr. Arthur Balfour*: Disablement fund and retirement fund. In some cases the employers establish them for the benefit of their workmen, was what I asked, and the witness said he believed so?—Yes.

27,728. *Mr. Herbert Smith*: Do you know why in 98 per cent. of the collieries in Yorkshire the employers refuse to stop anything from the men's wages for disablement?—I heard you mention that in the course of the inquiry. I do not know it, but my knowledge is not as great as yours. If you say so, it is no doubt correct.

27,729. I should not like to make a statement unless I can prove it.

Sir Adam Nimmo: Under no special circumstances?

27,730. *Mr. Herbert Smith*: It was very prevalent before the Workmen's Compensation Act came in to have miners' permanent relief funds at each colliery?—Yes.

27,731. Owners started an insurance of their own called the Mutual Indemnity Society?—Yes.

27,732. And said: "We are going to safeguard this one and we have to break up the Miners' Permanent Relief Fund because as long as a man gets any money he will not want to come back to work." That is the employers' side, and they said, "We will refuse to stop his permanent relief," and they are in the worst position of men we have to-day in the mining district. The worst class of men to-day is the man on compensation in any trade. He is simply starving with the pittance he gets, and the employers help to put him in that position. That is why they refuse to stop Permanent Relief Contribution in Yorkshire. In reply to a question put by Mr. Balfour, did I get it right that you said in your answer hevers must be paid by results, that is, contract work?—If I remember rightly, Mr. Balfour put the question of payment by piece work as against payment at a standard wage.

27,733. That is right?—I favour the former.

27,734. Why?—I think it is an incentive to produce more coal. I know if I was paid by the piece I think I should produce—perhaps in my case I would do equally well in both, but in the generality of cases payment by result conduces to a larger output, whether mental or physical. I know if I were writing a book and I was told that I would get a royalty of 1s. for every book I should be very much more inclined, honest man as I am, to write a book that would sell, whereas, if I was paid £1,000 down, I do not think I should be so desperately put to write a book that would sell.

27,735. For the benefit of the people then if you were paid by the Coal Controller by results you would get more coal out?—I do not think I would in that case.

27,736. You brought yourself in and that is why I put it to you?—That is quite a proper remark to make.

27,737. I suggest to you there would not be all that failure you anticipate, but what would happen would be there would be less accidents?—I do not know. I grant you that hurry is more conducive to accidents than an atmosphere in which there is no hurry.

27,738. You know that the Mines Act says that a workman must not work without he has sufficient timber?—Quite.

27,739. The Mines Act is good there?—It is good everywhere.

27,740. I am going to show where it is not. It does not say if the owner fails to find the man with timber he should pay him wages when he does not provide the timber if the man does not earn wages?—If he does not find the timber we prosecute him.

27,741. If the man does not earn his wages you do not fine the manager and force him to pay the man's wages?—Then the man should come down to the management.

27,742. You know a man is very often starved into submission to work with no timber?—He should not do so.

27,743. If I say there are about 3,000 shifts lost in Yorkshire through timber—what then?—I should like to enquire into it.

27,744. Your people are anxious to enquire now you have made a charge against us?—I have made no charge.

27,745. You have. I am going to show to the Commission it is not correct and I am going to demand an enquiry. Yorkshire and the Federation generally feel that they have been insulted in a way they do not merit?—I do not think it is an insult.

27,746. It is an insult to any man to be told the nation is dependent upon him and he is not doing his duty?—I have not said it.

27,747. Your statement to Mr. Hodges this morning said it?—I said again and again I do not think there is any deliberate organised reduction.

27,748. Now come to the state of the mines. You said in your evidence on Friday that you did not think the mines were backward in repair and that they were still kept up to the standard?—I said they were in a better state of repair, I think, than they were a year or two back.

27,749. That is during the war?—I said so.

27,750. They are not like the state of repair they were in pre-war?—I think I said that here. The mines are not in a more backward state of development or worse off for plant than a year ago.

27,751. I suggest they are a year older, a year worse in repair, than what they were 12 months ago?—I agree they are a year older. I do not think they are a year worse.

27,752. In 1918, only about 12 months ago, young men at the colliery were combed out to go to the war—A certain number of them.

27,753. *Sir Leo Chiozza Money*: 75,000?—Quite so.

27,754. *Mr. Herbert Smith*: Young men between 18 and 32 years of age?—Yes. Mr. Smillie took me on that point, and we agreed there had been a loss of a large proportion of what you might call the cream of the colliers.

27,755. You did not withdraw this charge of restriction?—I cannot withdraw what is true.

27,756. I put to you this, and I am not making the statements without going down the mines?—No more am I.

27,757. I mean during this last year. I have been down a large number of mines last year, and they are in a worse condition now than in 1917?—Then you have been unfortunate in the mines you visited.

27,758. I have not picked the mines particularly. I have been in some of the up-to-date mines and seen the conditions there with regard to tubs or trams. I understood you to say the outcry was not as bad as it was about 12 months ago?—About two years ago.

27,759. If I read out to you from over 90 firms representing over 300 pits that in 87 per cent. of the pits it is the scarcity of tubs which they cannot supply them with because they cannot get them and now they are not keeping up with the ordinary repair of breakdowns, what then?—Are these statements made by the management?

27,760. They are by the men and confirmed by some of the management; I will give you one—Mitchell Main. They asked for 1,200 new tubs; they have got about two hundred.

Sir Arthur Duckham: In what time?

Mr. Herbert Smith: From 1916 up to now.

Sir Adam Nimmo: To whom was the application made?

27,761. *Mr. Herbert Smith*: To the powers that be.—Made application to me?

27,762. I say the powers that be. They wrote to London for these tubs?—I do not supply tubs. I am not a tub maker.

27,763. I understood Sir Adam to say that you supplied them. I say the powers that be. I do not know who the powers that be are?—Presumably they applied to the firm. One's powers were restricted to moving the priority committee to grant priority and fighting for priority.

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

27,764. *Sir Adam Nimmo*: Had we not a running priority in the case of the supply of tubs?—Yes.

Sir L. Chiozza Money: What priority?

27,765. *Sir Arthur Duckham*: There was a priority for a certain quantity of steel in the year?—To put it in recognisable terms it was a priority just behind railways.

27,766. *Sir L. Chiozza Money*: And railways are as we know.—Above railways came the Admiralty.

27,767. *Sir Arthur Duckham*: There was a definite allocation of steel for the year for mining?—It was not big enough; it was far too small for us. We fought for it and got it increased; in fact there was a daily warfare.

27,768. Do you know Messrs. Briggs & Company's collieries?—Yes.

27,769. They have about seven pits. Would you believe they are about 600 tubs short and cannot get them?—I should be surprised to hear it.

27,770. They engage a tremendous lot of men?—Yes.

Mr. Herbert Smith: Mr. Chairman, I have got out a sheet, but unfortunately I have not got one for every member of the Commission. With your permission, I will hand it to you afterwards.

Chairman: Very well.

27,771. *Mr. Herbert Smith*: To follow this up, I have letters from branches and I have been to ten collieries to visit them myself?—I should like to read a letter from Charles Roberts & Company, Limited, Railway Wagon and Wheelworks, Wakefield. We have been pressing them on the question of tubs. They write under date the 28th May, 1919, so it is fairly up to date: "We are in receipt of your letter of the 27th inst. relative to the 200 pit tubs which we have on order for the Mitchell's Colliery near Barnsley, and as explained to their representative when at these works a few days ago we have done and shall do everything humanly possible to expedite delivery of these tubs. We fully recognise the urgency with which they are required. Unfortunately, however, the whole of our employees left work on Friday last without notice and at the moment we cannot say when they will return. Negotiations are, however, taking place between us and the various trade union officials. To show how we appreciate the critical position brought about by the shortage of pit tubs we have employed a large number of discharged soldiers, supplying them with tools and training them to make pit tubs." That letter is written to the Controller.

27,772. *Chairman*: It appears, therefore, on May 28th there were 200 tubs on order?—Yes.

27,773. When was the order given for those?—I have so many hundreds of letters that for the moment I cannot say. I will find track of that. I do not know if it is in this particular bundle of correspondence. My assistant will endeavour to trace it from the origin.

27,774. If they were ordered weeks before we can appreciate it. If they had been on order for months. Mr. Smith's point is a strong one. Perhaps Sir Richard's assistant can see if he can ascertain that for us?—We will trace the life history of these 200 tubs.

27,775. *Sir L. Chiozza Money*: You confirm Mr. Smith's information upon that?—I read that letter.

Mr. Herbert Smith: I will hand this sheet in later. I sent out a form on the 7th June, 1919, reading as follows, to our local officials. "Will you kindly supply us with the following information by first post on Thursday, 12th inst. As the owners are alleging the men have restricted themselves in giving output, the output per man per shift is reduced owing to the amount of the Sankey money, it is of vital importance I should know this to be able to see it before the Commission on Friday the 13th inst. The question is: 'Have your men been supplied with a sufficient number of tubs since January 1st.' If not state reason why." I have this form tabulated shewing the number of branches, the name of the branch, the number of men employed and the replies to the question.

Chairman: You might put some things to Sir Richard that will indicate the sort of case you desire to make.

Mr. Herbert Smith: With regard to pits being better off with regard to tubs there are 138 replies from 170 branches and 32 have not sent replies in. Eighty-five are not supplied with a sufficient number of tubs owing to shortage of tubs, etc., in collieries admitted by the employers and it has got worse since January. There are more men, but not more tubs to help the men to fill the coal.

Sir Adam Nimmo: How have the employers admitted these so-called facts? What is the admission made by the employers in each individual case?

Mr. Herbert Smith: The admission is in most of the cases to men in deputation. "We cannot give you more tubs because we cannot get tubs in place of broken tubs." In ten cases the admission is to me.

Sir Adam Nimmo: The mine owners have not authorised that statement to be made on their behalf. I submit this statement is valueless from the point of view of evidence.

Chairman: Mr. Smith says in certain cases there have been statements by the management to a deputation of the men. Sir Adam is quite right that that in one way is not evidence, because we shall have to ask the men and the management as to the circumstances. Mr. Smith goes on to say in ten cases the management admitted it to himself personally.

Mr. Herbert Smith: I do not object to give the managers' names.

Sir Adam Nimmo: I think it may give quite a wrong impression of what has taken place.

Mr. Herbert Smith: If you read some of these letters the managers have told the deputation it is impossible to get them and supply the men with them.

Chairman: Just indicate one or two.

27,776. *Sir L. Chiozza Money*: Sir Richard has a paper with him which confirms that statement of Mr. Smith with regard to the Mitchell Main. I wonder if he has any others?—My assistant has found this.

27,777. *Chairman*: When were the tubs ordered?—We wrote to Messrs. Charles Roberts and Co. on the 27th May as follows: "It has been reported to this Department by the Chief Inspector of Mines that Messrs. Mitchell Main Colliery, near Barnsley, are urgently requiring delivery of 200 tubs ordered from you on the 8th March. I shall be glad if you will be kind," and so on.

27,778. When you pass on an order like that is there a due date for delivery? Do they have to make them and deliver by the 8th May or deliver in a week?—It depends entirely.

27,779. When you order the tubs it is not like going to a shop to buy a pound of tea?—No. They say, "We shall let you have them as soon as we can," and so on.

27,780. I do not know what happened before?—This is their birthday, the 8th May. What happened before I do not know. With the best intention in the world I do not know the inward history of every colliery in Great Britain.

27,781. *Mr. Herbert Smith*: With regard to Messrs. Henry Briggs and Co. this is the letter from the secretary: "I beg to acknowledge receipt of your letter of the 7th inst. re restriction of output. In reply to your first question I say the men are waiting worse for tubs now than in the history of Briggs' pit. The men are not working five or six hours a shift owing to waiting for empty tubs. This has been brought forward time after time by deputation. The men are coming out of the pit three hours before the usual time, which means the usual day men do not get tubs next day before 9 or 10 o'clock. A man told me on Sunday they filled three tubs in two days when they ought to fill 40, and the whole sequence is shortage of tubs?"—Who is the letter from?

27,782. Our Secretary at Messrs. Briggs' colliery, Ben Bacon, the Branch Secretary, and it is stamped. That is one of the firms. I will go to Woolford. These are very big firms?—Is this a letter from one of your representatives?

27,783. From one of our secretaries. "Your letter to hand re restriction. We should only like

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

the opportunity of being supplied with more tubs," and so on. He says he has been ordering tubs for the last two or three years and he cannot get anything like the requirement, and he cannot do any more until more tubs are forthcoming. Then he says they can fill the tubs they are getting at this pit with a hundred men less than they had at present employed. The number employed is 1,120. At Whitwood they employed over 2,000. Do you know the Brierley colliery? The new colliery belonging to the Monckton colliery?—Yes.

27,784. Do you believe at that colliery there seems to be an understanding between the management and the officials that if they got 4 or 5 tubs per man per shift they have done all they need do and need not do any more?—I am not aware of that.

27,785. I will read you a letter the Secretary sent. It is rather interesting. It is a good thing this manager is not a Yorkshireman?—Are all your secretaries Yorkshiremen?

27,786. No. They do not use language like this as a rule. There are 1,070 members at Brierley in all. This is from the secretary: "Our members of the Brierley Branch are indignant at the charge made by Sir Richard Redmayne and other honourable gentlemen who are giving evidence at the Coal Enquiry that they have been deliberately curtailing the output. Clearly it is the management who have failed if there is any decrease in the output. We have men at our colliery continually coming back short of tubs. It is a very common thing for men to come out at half shift time. We have not had an empty tub there regularly, and it is caused by insufficient haulage and the management not having sufficient tubs to work the pit. We have also many men coming back for timber and there being water in working places and shortage of rails and on other accounts such as falls, &c." Then he makes a reply and says that he does not care if they all come back: it does not matter to him if the pit stops or not. That cannot be allowed to go on. That is another point. I can believe the manager said it although I did not hear him.

27,787. You know him?—Yes.

Sir Adam Nimmo: You have no assent from the manager in this case?

27,788. *Mr. Herbert Smith:* No. He knows there is a scarcity of tubs and does not care a d—whether the pit works or not. The Mitchell Main employs 1,750 men. I have a letter from a man who was appointed coal controller down the pit. I will read you this letter: "In reply to Mr. Smith's question of June 7th, we have all men working here. We are asking for a supply of tubs. New tubs are required and the management says they cannot get them. They had 150 ordered two years ago and our output is down for the above reason and also because they have a large number of by-workers which has reduced our output per man per shift. We have only a very low output of coal now but there used to be 300 tons per week, which means 54 tons per man each week, or 9 tons per man per shift. Our colliery only averaged 9 tons per man per shift and we have now 20 more by-workers each day than pre-war time. You can tell Percy Greaves that our men have been in the pits days together with hardly sufficient number of tubs and could have filled as many empties per week if they had been supplied with tubs to put coal in. Our members have been below the district day's work and some below the minimum on account of the shortage of tubs. We can prove this statement and our management cannot deny it. I say, who is to blame? I cannot say, but we have repeatedly endeavoured to ascertain the cause. We have gone to the extent of appointing a controller and paid half his wages from our check, and Mr. Edward J. Peace was appointed to that position and during the time he was down the mine organising the distribution of coal and everything, the output was a good deal better. If you want evidence from me you can have plenty." Men were rather anxious when they paid a man out of their own pockets to organise?—It certainly looks like it.

27,789. I have another letter. This is a statement the men sent on to the manager to meet a deputation. I will read it for what it is worth. This is from Maltby Main employing 1,640 men: "Have your men been supplied with a sufficient number of tubs?" "No." "If not, state the reason why?" "The roads are in bad condition; it is admitted by the management. If the men could be supplied regularly with empty tubs our present men could increase our output 25 per cent. regularly. Our men say they can increase the output by 33 and a third. Our men are not losing any more time by absenteeism than is general. The cause is we are short of tubs and we have got no remedy." Doncaaster puts it similarly. As a matter of fact, out of all these replies it amounts to this that out of 138 replies there are 94 complaining about the insufficient supply of tubs caused by not having tubs or by bad organisation. There are 12 collieries where there are no complaints; five collieries with increase of output and 27 collieries where the output is similar per man per shift now as it was before the war.

Mr. Arthur Balfour: It does emphasise the importance of having a Committee of Investigation.

27,790. *Mr. Herbert Smith:* I want to say here in my opinion the majority of cases are not through the wilful delay of the management. It is want of material. I want to see if Sir Richard agrees with this. As a matter of fact, since the mines were controlled, and I think his own figures prove it, the output from the day they were controlled started to decrease?—Yes, I think there is some justification for that. There is no doubt about it the output per man per shift began to decrease and steadily decrease since the end of the year 1916. The control commenced in 1917.

27,791. *Mr. Sidney Webb:* And the increase in wages?—The increase in wages commenced in 1915.

27,792. *Mr. Herbert Smith:* Did you ever make inquiry at Barmborough Main as to a decreased output?—I could not say. I made so many inquiries. I have a number of them here. It would take some sorting out. I should like notice of that question, as they say in another place. Inquiries are always going on in case after case. Mr. Perkin, who is here with me, thinks we did, and he is making a note of it, and he will let you know.

27,793. This was not a fully-developed pit when war started?—No.

27,794. Did you make any inquiry why it was? If we made an inquiry at all, we made an inquiry why?

27,795. Did you make an inquiry why their output fell down 87,000 tons in one year?—I have no doubt we did. I will look the matter up. If you could have told me yesterday evening that you were going to ask me these questions I would have had each case sorted out for you, but you quite realise that, sitting in this chair, I cannot do it.

27,796. If your people had told us that you were going to use damaging documents against the men like this, we should have got evidence to show that it is not true. Neither Mr. Hodges nor Mr. Snillie nor I agree with each other. All the papers are here for your gentlemen to examine. I will ask you, have not the workmen's side been kept in the dark about these things? All the inquiries you have made have been for the owners' side. Is it not fair as Britishers that the workmen should have an equal opportunity of defending their position?—Perfectly.

27,797. Has the Control carried that out?—I think so.

27,798. They have not, in my opinion. We have flashlights like this bounced on to us. This is done by your people with the general object of damaging our men. We court the fullest inquiry?—I welcome an inquiry.

27,799. I want to give you the case of Barmborough Main. The average number of tubs per man they could fill at this colliery, if they could get them, fell from 9 tubs per shift per man carrying from 10 to 12 cwt. per tub, and their average works out at about 5.5. I went to that pit myself to find out how it was that these men's wages had gone down, because Mr. Hodges put the real position to you this morning, and you know it as well as anybody round here that

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

the miner is not earning as much wage now as he did before the war, taking into consideration the increased cost of living. Taking Yorkshire, the hewers' wages have gone up 86 per cent., and the cost of living has gone up 120 per cent. These men have dropped from an average of 9 tubs per shift to 5.5.

Sir Adam Nimmo: My point was merely put in the interest of theory, to know whether there is an agreement between the parties.

Mr. Herbert Smith: When your people supplied these particulars you were not fair to us.

Sir Adam Nimmo: I have no sympathy with people supplying unfair details.

27,800. *Mr. Herbert Smith:* I am not charging you personally, but I say the Coal Control started unfairly at first. We are not the people to keep the poor people in this country without coal when we can supply them. I have not spent 25 years in the pit without knowing when they are telling the truth. There are some branches that I am going to give you that I am ashamed of their reply. I am not going to keep it back. They did not cause any inquiry when they dropped down 87,000 tons in one year?—I have taken a note of the case.

27,801. Has it not been put to you before now that one pit went down 87,000 tons, a new pit?—I am not trying to hide anything. You are absolutely welcome to get inside my mind, but when I do not know my own mind there is no good your getting inside it. We may have piles of these cases. I might have glibly answered, "Here is the pile; examine it yourself," and I wish to goodness you would examine it yourself; but as you will not do it I will examine it, and you are welcome to every bit of knowledge we have.

27,802. What we are anxious about is a public inquiry made by disinterested persons to see if the statement is correct or whether it is not. If it is not correct we will be honest enough to admit it?—And so will I.

27,803. All we want is a fair chance?—That is all we want.

27,804. *Mr. Robert Smillie:* Surely a loss of 87,000 tons a year is not a common thing?—I have just given you one case where the loss was greater.

27,805. *Sir L. Chiozza Money:* What was the reason for it?—Never mind the reason. I have given you a case where the loss was over 100,000 tons, and that had passed from my mind.

27,806. *Mr. Robert Smillie:* It is not a common thing, surely?—I should hope not.

27,807. I should have thought it was so uncommon that it would have remained in your mind?—I do not know whether you have a very retentive mind. I had until the Coal Control.

27,808. *Mr. Herbert Smith:* Will you believe that at that pit since January 9th there have been about 248 working shifts on an average per week lost by men being sent back from the pit?—Is that so?

27,809. They are all among these thousands who are employed?—You see in an impartial inquiry one would have to go into the case of every one of those returned shifts and see what was the underlying cause for the men coming back.

27,810. I am not making this statement against the manager, because in some of these cases there are justifiable reasons why men should come back, but they have gone down the pit and have probably worked half an hour, and been sent back again, and they have been put in the number of men working at that pit?—But that is mining, and that is always occurring.

27,811. Is not this an extraordinary thing in mining? There are 125 of these shifts as to which no manager can justify sending the men back. When you were a colliery manager and a man was working in his working place and a fall occurred, what would be the first thing you did?—I should say to the men, "If you clear this place out and get it ready for working again and do shift work, which is not usual by your work, I will give you your average."

27,812. Any sensible man would?—Precisely. I am a sensible man.

27,813. But 124 of these shifts have been lost because they said they got too much wage now?—If that is so, I should have thought it was false economy.

27,814. All these things are worth inquiring into?—Certainly; but I think it is more than one man's work; it is more than you or I could do.

27,815. Do you not think it is rather late now, as far as you are concerned, to talk about all these inquiries, when it has gone out to the Press that the miner is a bad man, is robbing poor people, not supplying the coal, when Chambers of Commerce are denouncing us, and coalowners are organising meetings to condemn us?—You are not going to put all those sins on my shoulders?

27,816. I am going to put 70 per cent. on the Coal Control, if anybody ought to hold an impartial position between you two gentlemen?—How can I do that when I am sitting here all day?

27,817. What I am objecting to is this statement that is made, which is not a fact, and the inference which is drawn from it?—You must not lay all the inferences that are going abroad to the doors of the Coal Controller. You would not be so unjust as that.

27,818. I will go further. The statement that you have made this morning goes to try to prove, so far as you are concerned, that because our men got 2s. a day advance they did 2s. less work, and put themselves in exactly the same position?—What statement have I made this morning?

27,819. To Mr. Hodges—that when men got more wages they did less work?—I have given the whole of the reasons for my belief in part 4 of my *précis* of the evidence, and I state that that is my explanation. It may be a wrong explanation, or it may be a right explanation.

27,820. It was made without inquiry, I submit to you?—I would not say without inquiry.

27,821. Without a fair inquiry?—I will put it like that?—I could not possibly inquire into every case.

27,822. You ought not to make a statement here that it applies to the majority of men, that the more money they get the less work they do?—I am perfectly certain you want to be fair, as I want to be fair. Why did you not, in examining Mr. Straker, accuse him of unfairness in making a statement as to his explanation without due inquiry as to the cause for the decrease in output?

27,823. I am prepared to give evidence, but you are giving evidence now?—I am asking a question.

27,824. I want to submit to you that you have no right to ask a question?—You have accused me of being unfair.

27,825. I do not object to answer it, but I object to your saying that what Mr. Straker said was unfair?—Mr. Straker gave reasons which were not the reasons which I gave. I mention his reasons in my evidence. You did not say to Mr. Straker, "Now why have you made that statement without inquiry?"

27,826. As to what?—As to the cause of the decrease in output.

27,827. He told us that it was because the men could not get the supply of trams, &c., at the pit?—I have made as many inquiries as Mr. Straker.

27,828. The same day as he was making the statement a paragraph appeared in the papers that men were being paid 5s. 9d. a day to stop at home. That was at a big pit in Northumberland employing 2,000 men?—Was it said who did that?

27,829. That the men did it, that they played off so many men each day?—I did not see that paragraph.

27,830. Do you know Rotherham Main Colliery, belonging to John Brown & Co.?—Yes.

27,831. I make the output of their colliery for the week ending January 15th 7,974 tons; the 22nd, 8,023; the 29th, broke the wheel, only worked one day owing to breakdown; February 5th, 8,108 tons, and they go on until they get down to 5,113 tons, and his reason is that the management do not care whether the output is kept up or not, and he gives two or three instances. They let the afternoon men down between 2 and 3 o'clock. There was a number of men in the afternoon shift, and because the lamps were not out at five minutes to two for three days in three weeks he sends 100 men and boys away. Is

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

not that worth enquiring into?—That is a statement from one of your representatives.

Sir Adam Nimmo: Surely, in a case of that sort, we should know what the management have to say.

27,832. *Mr. Herbert Smith:* All the management say is this: You ought to get the lamps out. The men say we got our lamps out by two o'clock; we do not start descending till two and we have a perfect right to go down. There is another colliery where they sent 200 men back. It was snowing and they had to ride by tram, and because they got down there at five minutes past six?—You ask me is not that a case worth enquiring into? I should say, yes; I am surprised they have not communicated the facts to me.

27,833. May I tell you that I have a letter saying that our people wrote to you last year from Mickfield?—That is another case.

27,834. Yes, and they simply get an acknowledgment, "They have your letter to hand and note contents?"—Did we send you that answer in that case?

27,835. Yes. I will read you the letter?—I should like to see the whole correspondence.

27,836. You have the letters in your office?—I have made a note of it, and I will enquire into the thing from beginning to end.

27,837. The Secretary writes: "In reply to yours of the 7th inst., re shortage of tubs and the allegation of the owners that the men are restricting themselves re output, etc., we at our branch thought the boot was on the other leg and that it was the owners who were restricting the output by not getting the men plenty of tubs?"—Might I ask you who accused you of restricting the output? Did the management accuse the men of restricting, writing to you or writing to us?

27,838. Do you not know that ever since this statement was issued, it has been the policy of some people to make these charges?—I see what you mean.

27,839. Do you not know that it was the owners who were restricting the output by not getting the men plenty of tubs. We estimate that from 25 to 30 per cent. of our men could fill more tubs if they could get hold of the tubs to put the coal in. Take my own case, for instance. Up to a few weeks ago we were averaging one pound a week having to be put in to make the day's wages. For the week ending April 29th, 1919, we had to put £2 4s. 11d. to make the day's wages, and only had 13 shifts in our own stall, and that for the week ending June 3rd we had 16 shifts in our own stall and £1 10s. was put in to make up a day's wages. We had 37 tubs out and could easily have filled 60 tubs in the same time. All this is due to the shortage of tubs and the managers not caring whether they get coal out or not. Then he says, "Some time ago you wrote the Coal Controller on this matter and then you wrote our manager and he promised to pay the men who did not get plenty of tubs the ordinary day wage, and that seems to satisfy him, but does not satisfy me, because between the day's wage and the contract wage is a difference of 3s. 6d. reduction to me," and he says this applies to our pits generally.

27,840. When you have all those complaints, do you not now wish there had been a fairer enquiry before you made that statement?—I adhere to my statement. Nothing I have heard has shifted me from the position I have taken up, but I quite agree, the more thorough the enquiry, the better.

27,841. If you adhere to your statement, you would not be a good independent man to be put in?—I should be delighted to be omitted.

27,842. I could read 250 letters?—You might give me 2,000 letters, all from one side. They might be quite true, or they might not be, but I want to hear both sides before I give a reply.

27,843. This morning you said to Mr. Hodges "I have no need to question the colliery manager, I can believe him." Is there not some truth that you might believe the workman's side?—I should like to hear both sides.

27,844. You say you would believe the colliery manager?—Apropos of the management of the mine.

27,845. *Mr. Frank Hodges:* You were talking about trams, that because the colliery manager had not sent in the usual requisition for tubs, you came to the conclusion, rightly so you said, that they had an ample supply?—Because they pressed me so considerably a considerable time before for trams and when a colliery manager tells me he is not short of trams, I take it for granted that he is not.

27,846. *Mr. Robert Smillie:* Can you depend any more on the employer's returns that the Coal Controller put before this Commission and which created such an impression in the country? Can you depend more on managers' returns than on our secretary's?—The manager has facilities for acquainting us with the drawings of a colliery which the men have not got and as to the output.

27,847. It has gone out in your statement and the Coal Controller's statement that the miners were deliberately restricting the output; that was a fortnight ago and we said it was not true, that the blame was on the management; and we asked you to make enquiry?—The Coal Controller has never said that the miners were deliberately restricting the output and I have never said it.

27,848. No, but it has gone out to the country; the newspapers have said so?—I cannot help what the newspapers have said.

27,849. It is made on figures presented by your department?—The figures were put in by the Coal Controller without comment. Such comment as has been made on the figures from the coal department has been made by myself.

27,850. Two of us here are on the Coal Controller's Advisory Board, and it would have been reported to us, so that we might have tried to get the facts before the country?—I do not disagree with you.

27,851. *Mr. Herbert Smith:* I am going to give you two more replies that we have received that I do not agree with. I want to be fair with you?—I am sure you do.

27,852. I do not agree with these, although I agree that the income tax ought to be put higher up than what it is. This is from Bruncliffe, where there are 420 men. The secretary says: "Mr. Smith. Dear Sir,—The cost of restricting output in my opinion is absenteeism owing to income tax. Raise the amount to £250 and an increased output will be made, and this is common knowledge."

Mr. Robert Smillie: You might explain the meaning of that. I think it means that men are laying off rather than make money that is liable to income tax.

Mr. Herbert Smith: That is what it means. The limit was £160 before the war, and they altered it to £130. Of course, £130 is not worth £65 now in the market as it was before the war, but I do not justify an answer like this.

Chairman: You very fairly said that you would read some letters that you do not now agree with.

27,852A. *Mr. Herbert Smith:* Now here is a letter from the Leeds Central branch employing 400 men: "Your letter of the 7th instant to hand respecting restriction of output. I may say that, so far as our colliery"—that is the Osman Thorpe Colliery—"is concerned, there is very little difference from that previous to the Sankey Award, as nearly as possible half a hundredweight per man per shift, and this can be accounted for in various ways, such as more money, working on the Saturday, and playing long day; and another is, lads not doing their work as they ought to; but we have a high percentage of absenteeism owing deliberately to the income tax, as is the case with some of our men who never broke a day before the income tax was put on. The Sankey Award gives £6 16s. per quarter, and 17s. 6d. goes in taxes, so that the position is that the men say they might as well play as pay it; but let them raise it to £250, and then it will encourage the men to work more regularly." These are two reports that I cannot agree with. I agree the tax is wrong, but this is a wrong way to put it right. I ask you now, in face of all that evidence, if you do not think you have rather misjudged the men as to restricting themselves because they are earning more wages, because as a matter of fact they are earning less when you take into consideration the cost of living. If I tell you that I am

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

worse off now than I was before, would you believe it?—Yes, and if you said the same of me it would be right.

27,853. If I tell you that I am worse off, I know the men are worse off than I am. There is just one other question and then I am done. You have heard Dr. Shufflebottom give his evidence with regard to the temperature in pits?—Yes, I heard him give his evidence, but I do not remember every word of it, if you would refresh my memory.

27,854. It is at page 767?—"That provision be made for reducing the temperature of hot seams in the coal mines, and that a temperature of not greater than 77 degrees Fahr. (wet bulb) be regarded as injurious to the health of the worker. (This is the standard adopted in France.)"

27,855. Do you agree with that?—77 degrees Fahr. (wet bulb) is a trying temperature, and I think, speaking from memory—I am fairly conversant with the French law—that Dr. Shufflebottom is right in his statement when he says that 77 degrees Fahr. (wet bulb) might be regarded as injurious.

27,856. Do you think that there ought to be legislation on that question as early as possible? We are suffering from it particularly in some districts?—Yes. I think the question of temperature is an important question. I am glad to say that the face temperature of seams in this country at the great majority of collieries is not 77 degrees Fahr. (wet bulb). I know that from having personally taken a great number of observations.

27,857. But you will admit that there is a fair number in certain districts where it is so?—At certain pits that you and I know of it will be 77 degrees Fahr. (wet bulb).

27,858. You think that ought to be dealt with as speedily as possible?—I think it is a subject for regulation. I should like here to remove a slight misconception that exists on a reply that I gave to Mr. Frank Hodges this morning. I am sure he would be the last person to believe that I wished to be discourteous to him, and I can assure him that it was not in my mind to be so. I happen to know that he took my answer to a certain question in a wrong way. I certainly did not mean it in the way in which I admit he was perfectly justified in taking it. He asked me if I would take a certain thing from him, and I said no. I did not mean to say that I would not take anything that Mr. Hodges stated to be a fact, but what I wanted to convey was that I would not take the inference that he drew from the facts as my inference. I certainly did not wish to be discourteous.

Mr. Frank Hodges: I misunderstood what was meant.

27,859. Sir Adam Nimmo: Just one question on the point of tubs. Assuming that there has been a shortage of tubs, have we not to concentrate upon this point as to when that shortage really matured in a reducing output?—Certainly.

27,860. Is that not really what we have to direct our attention specially to?—That would be a point we should have to direct our attention specially to in its relation to the decrease in output, but, of course, I should like to concentrate on removing that cause if it is a cause. From the point of view that you have mentioned I answer certainly.

27,861. It is the main point in endeavouring to discover what effect the shortage of tubs has had upon the output?—True.

27,862. And particularly what effect it has had upon output recently?—Yes.

27,863. I take it that we are agreed—what we want to discover is the cause of the recent reduction in output?—Yes.

27,864. Would you agree that it was specially pertinent to discover whether the shortage of tubs had matured particularly immediately after the Sankey Award had been given?—There or thereabouts.

27,865. Do you agree that you could only deal with this problem by going into each individual case?—Yes.

27,866. It cannot be a problem for this Commission?—Whatever is the nature of the enquiry, and I think an enquiry is most desirable, not only

with a view to discovering the cause and to satisfy one's mental curiosity, and with a view to remedying it, whatever the cause may be, but in the interests of the public, because after all the decrease in the output is so serious as to be more than serious: it is alarming. But I think it is most necessary that it should all be done in the light of day, and that it should be public.

27,867. And that all these allegations, whether on the one side or the other, should be carefully sifted?—Most certainly.

27,868. And that we should find out what the cause really is?—Certainly; it would be a great relief to me personally.

27,869. Just on a point that was referred to by Mr. Evan Williams. Is it not the case that so far as owners are concerned at this particular time, their whole financial interest appears to depend on getting output?—*Qua* control coal, yes. I mean if they do not get it they do not get their guarantee.

27,870. So that as far as the coalowner is concerned, can you imagine him doing anything else than bring all the pressure he can bring to bear to get output at the present time?—I should suppose so.

27,871. That may not get us any further than this, that there is a presumption in favour of the coalowner being desirous of securing output?—I should have thought there was that presumption.

27,872. Therefore, it does seem to make it all the more necessary to investigate the cause of the reduction in output to the very bottom?—I think that is most necessary.

27,873. Of course, there is no good shutting one's eyes to this fact—it is best to be perfectly frank—but it has been stated (I think you will agree with me) that the owners or rather some owners are desirous of killing the idea of nationalisation, and that if it can be shown that under the Coal Control there has been this lamentable decrease in output, it is *prima facie* evidence that control on the part of the Government is bad?—Well, personally I do not believe that. My beliefs are not evidence, but I do not believe it. I only mention that as you are dealing, not with what I may call facts, but with presumptions.

27,874. But if there were such owners as you speak of, and they thought by reducing the output that they would kill nationalisation, would not the result be likely to be the very opposite?—Personally, I should have thought so, but that may not be everybody's view. I do not like dealing with presumptions, because they are dangerous. I have been making a presumption, and the result has been two hours' cross-examination by Mr. Herbert Smith.

27,875. Chairman: In your view is not the proper thing for everybody to do to suspend their judgment on this question?—I think so.

27,876. Sir Adam Nimmo: Now coming on to the question of the nationalisation of minerals. You were a distinguished member of the Coal Conservation Committee?—And you were another.

27,877. On that Committee we both recognised, I think, that there was a problem that had to be disposed of in respect of waste of coal and coal that was held up contrary to the national interest?—All our recognitions are in print.

27,878. When was that report issued?—It was in 1918.

27,879. When that Committee came to report upon the means of solving the problem that was before them in respect of waste of coal and loss of coal they did not think it necessary to nationalise the minerals?—No; I do not think that problem was before them.

27,880. You signed that report. I do not want to suggest that in the view which you have now expressed you are contradicting the position that was taken up then, because you may have some quite good reason for it?—I have progressed.

27,881. But what I want to know is this: In your view is the problem that has to be dealt with in that respect any more acute to-day than it was in 1918?—I think the problem is the same.

27,882. Just the same?—Yes,

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

27,883. I think in the course of your evidence to-day that you laid special emphasis upon barriers?—Yes.

27,884. I take it that the problem of barriers is just the same to-day as it was in 1918?—I say the position is the same.

27,885. You agree that that Committee did not think it was necessary to nationalise the minerals, to deal with that problem?—I do not think it discussed the question.

27,886. Did it not supply a solution by putting powers in the hands of the Minister of Mines without dealing with the nationalisation of the minerals at all?—This is what it says: "While we consider it necessary that the proposed Minister of Mines and Minerals should have adequate power of intervening to prevent permanent and avoidable loss of coal, we think the end in view might to a large extent be attained voluntarily, and as the natural result of co-operation among the colliery proprietors of each district. If the interests of all the collieries in the district were consolidated, the intervention of the proposed Minister of Mines and Minerals for the purpose of preventing loss of coal would in many cases not be necessary. Not only would combined drainage schemes be introduced where required, but unnecessary barriers worked out, and the best method of working the mines in the district would be ascertained and generally adopted."

27,887. We need not go into details. I take it that the view of the Committee was that so long as we put sufficient powers into the hands of a recognised Authority or Department we would be able to solve the problem that we had before us without the necessity of nationalising the minerals, and I take it that you agreed to that view?—Yes. I think it was since this report was drafted that we found it necessary to get the regulation known as 9 G.G.G. in order to apply compulsion.

27,888. I think we are agreed that it would be necessary in certain instances to apply compulsion?—I do not think the question of nationalisation or buying out the mineral owners ever came before us.

27,889. Was it not rather this, that we did not think it necessary to consider the problem from the point of view of the nationalisation of the minerals, believing that we had supplied a sufficient solution by suggesting that power should be put into the hands of the Minister of Mines?—I think some of us might have regarded the nationalisation of minerals as a very short cut if we had ever discussed it, but we never discussed it; and if you had asked me a few years back whether I thought the nationalisation of minerals was a desirable thing I should have said No; but I think one develops in all these cases, and when one is brought face to face with difficulties as they arise imperceptibly your mind changes and you grow to adopt an attitude for a belief which was repugnant to you a few years before.

27,890. But I take it you agree that the difficulties are not any greater to-day than they were before?—No; I think some of us have a better realisation of the difficulties now than we had before.

27,891. I want to put the point to you in this way, looking at it from the point of view of this Commission, do you think we ought to consider the solution of this kind of problem from the point of view of nationalising the minerals if we find that we can deal with that problem in some other way?—There are many ways of dealing with a problem, but some ways are better than others, and some ways are quicker than others; and I personally have grown in all truth to believe—the belief has been forced upon me—that the most satisfactory way, the line of least resistance, would be to buy out the mineral owners, and for all minerals to be under one control, namely, State control.

27,892. Would you not say, looking at it from the national point of view, that we ought not to commit the nation to this financial obligation, unless we find that we cannot solve these problems in any other way—ought not that to be our view?—I am not suggesting that the State should be committed to any financial obligation short of getting a return on that financial obligation.

27,893. You are accepting a financial obligation of very considerable magnitude?—It is getting a *quid pro quo*. It is getting the minerals.

27,894. Ought we really to assail private ownership in any respect in the national interest unless we find that we cannot get the national interest properly served unless we do that?—It is all covered by the words "properly served."

27,895. Is it your view that the proposals which have been submitted by the Land Acquisition Committee do not go sufficiently far to solve the problem?—I have thought very long over that because that seems to me to be the whole case, whether the proposals enunciated there are not sufficient to meet the situation, and the belief has been forced upon me that they do not go far enough. My chief reason is that the process would be slow and cumbersome. There will be considerable irritation, the erection of these courts of enquiry, and so on, would be slow and cumbersome, and the result would be better and more quickly obtained by proceeding to nationalisation.

27,896. Take the past history for a minute. Has it not been the case that under private enterprise an enormous number of these kinds of cases have been disposed of?—True.

27,897. Do you not think that if it were known that compulsion could be brought to bear upon an unwilling owner to agree in particular circumstances, it would have a great tendency to make an unreasonable man reasonable?—It would make mere unreasonable men reasonable I grant you.

27,898. But would you not admit that it might go a long way towards the solution of the problem we have before us?—It would go some way.

27,899. And, therefore, there might not need to be so many arbitrations as evidently you have in your mind?—There might not.

27,900. I think you conceded this to Mr Cooper: that whether you nationalised the minerals or not, you would require to have a large number of arbitrations so long as the present leases held?—Did I concede that?

27,901. I think you did?—Not quite.

27,902. I think you agreed that a central authority of some kind would require to be set up?—There would have to be an authority to determine the position with regard to the surface in certain cases.

27,903. And that would involve a large number of arbitrations?—I do not think I said that. Mr. Cooper will bear me out that I did not go that length.

27,904. Take the point that you do not think the proposals of the Land Acquisition Committee go far enough. In what respect do you think they do not go far enough?—If the State owned the minerals the question of barriers would be very much more efficiently dealt with. For instance, in dealing with all new areas of coal, it could specify how the barriers were to be left, an enormous amount of coal would be saved in that respect, and furthermore if they owned the minerals, the difficulty of arranging a central pump, and so on, would also be very largely simplified.

27,905. Would not the sanctioning authority under the proposals of that Committee be able to deal with those matters in precisely the same way. They would act, would they not, like local experts?—I think it would be very slow, cumbersome and costly.

27,906. Would it be any slower than the Government action to carry out the readjustment of one area belonging to A and giving it to coalowner B?—The Government being the mineral owners, it would be very much more simplified because the ownership and the sanctioning authority would be one and the same.

27,907. But not during the lifetime of the present leases? There would still have to be a considerable period in which a large number of inquiries would have to be held?—I do not know about that.

27,908. I merely want to get your views upon it?—After carefully considering that and reading that report very carefully, and portions of it several times again and again, and in view of the enormous amount of work the sanctioning authority would have to

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

undertake, much of the work would disappear if the minerals were vested in the State. I have come to the honest opinion, not that I altogether like it, but in the interests of the community and in the interests of the industry, that the simplest and best way would be for the nation to own the minerals.

27,909. Now coming particularly to part 3 of your *précis*, I want to get some information from you. I take it that your view there is this, that efficiency is unnecessarily lowered by operating the 3,000 odd mines which are now being carried on in the United Kingdom?—Yes, 3,129.

27,910. How many companies are represented by these 3,129 mines?—I think it is round about 1,500 separate concerns.

27,911. I suppose you agree that there is a considerable amount of what you call collective production going on just now, that is to say, by large companies?—There is a good deal of cut-throat competition.

27,912. We may come to it?—We have come to it.

27,913. Is there not a very considerable amount of unification just now by the presence in the British these 3,129 mines?—I think it is round about 1,500 separate concerns.

27,914. But some of them are very large?—And some of them are very small.

27,915. Do you agree that in the case of the large ones there is relatively a very high efficiency existing?—I think so.

27,916. Why do you suggest enlarging many of these companies and so taking the risk of lowering the efficiency which already exists?—It would not lower it.

27,917. Would you not lower it by combining it with smaller undertakings?—No, I think you would not approve that, and you would approve the other. You see the cost of administration would be so very much lessened. The question of pumping would be so very much lessened; all matters of buying and selling would be so much simplified when the forces are combined instead of being antagonistic.

27,918. What I want to get at now is the question of the size of the unit that you are dealing with, the necessity for collective production over some considerable areas?—I see what you mean.

27,919. I take it that what you have in your mind is that the extension would be on the basis of contiguity. Let us go to Scotland, for instance, to get an illustration for you. If you were to link up certain units would you link them up in relation to the collieries in a particular area?—Take Northumberland.

27,920. I would rather you take the Scottish position, because I should like to know in concrete what is in your mind from the point of view of collective production in Scotland. You know how the Scottish coalfield is broken up: You have Fifeshire, the Lothians, Lanarkshire, Ayrshire, and Stirlingshire?—Yes.

27,921. We put these into four units?—Yes.

27,922. Am I to understand that under your collective production scheme you propose to take Scotland as a whole?—I put forward no scheme.

27,923. Very much would depend on the details of what you suggest. I want to see how you work it out?—Now may I speak for a little bit? This is the sort of idea that I had in my head: If you can eliminate destructive competition, a great end is served. If the collieries can be combined, administration would be greatly reduced. They would be able to secure the best possible prices for the export coal. I am only taking a few instances which I have no doubt you will come back to presently. Instead of the foreigner being able to exploit one owner against the other—take, for instance, the whole of the exporting collieries on the east coast of Scotland combined into one concern—on the question of export alone, they would be able to secure,

on the average, a higher rate than they would if they were competing for the trade.

27,924. I am going to ask you about that later?—That brings me down to the unit—contiguity, similarity of trade, similarity of geological conditions, similarity of custom would constitute, I should say, logically the conditions of the combination. That is why I was going to take the case of Northumberland. There the trade is the same, the customs are the same, the people are the same, the geological conditions are the same, and they all come in competition. Northumberland would form a very valuable unit. The same reasoning would apply to every other coalfield. You could combine in those sorts of ways, allowing for the play of those governing principles.

27,925. Is there any real connection between Fifeshire and Lanarkshire or the Lothians and Ayrshire or Fifeshire and Ayrshire?—Fifeshire is rather like Northumberland: it is a distinct field apart, but it has a competitor to some extent in the export trade.

27,926. Would you not say that the Lothian coalfield was quite an independent coalfield?—It is largely so.

27,927. When you come to Lanarkshire, would not that be a unit that would certainly be separated from the other?—Speaking without the book, I should say that Scotland was divisible properly into, perhaps, three divisions.

27,928. What three have you in your mind?—I would take the Lothian area, the Western area, and the Fifeshire area.

27,929. In the Western area do you mean to group Lanarkshire and Ayrshire together?—Yes.

27,930. Is their trade really the same?—No, not quite, but I think the probability is that it lends itself to combination.

27,931. Along with Lanarkshire?—I think so; I am a little doubtful on that point.

27,932. Would it not be much too big a unit to effectively control?—I do not think so. I contemplate the whole kingdom.

27,933. You may be on safer ground when you take a unit like the Lothians or Fifeshire, but when you combine it with, say, Ayrshire, are you not getting into a problem that is very complex?—I do not think so. When Mr. Evan Williams was examining me on the point, I suggested the whole of South Wales being divisible into two.

27,934. I merely wanted to get at the kind of size of unit that you have in your mind?—I would not put it in point of tons or in point of number of persons. I think the governing principles should be those I have just adumbrated.

27,935. Would you agree that you would not want your unit of collective production so large that you cannot get concentration of effort?—Certainly.

27,936. And effective control?—Certainly.

27,937. Really individual control?—What do you mean by individual control?

27,938. You put your special man or men over a particular unit and you do not make that unit so big that he is not able effectively to handle it?—Sir Douglas Haig was Commander-in-Chief of one of the largest armies the world has ever seen, and I should say his control was effective. He had not control over every man in the army, but he had control over generals of armies and generals of divisions and so on, down to the sergeant.

27,939. I suppose you would agree that, with regard to the handling of collieries, it is not desirable to throw too much responsibility on to other people?—Without stretching the simile too far, I think the control of a great enterprise like the coal-mining industry is like the control of a great army.

27,940. You need the directing will at the top?—Yes, you get the individual control through your respective colliery managers.

27,941. I do not want to be too critical of your *précis*, but are you quite sure that the simile that you adopt of a railway station is really an appropriate simile in the circumstances?—All similes are dangerous, but I think that is rather a good one. I can say that because it is not mine.

13 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

27,942. Is a railway station in any sense a self-contained unit? Is it not merely a stopping place on a through journey?—What is a colliery? A man goes down and up again. True, he stops there for a time.

27,943. How do you propose to carry out the scheme of collective production, because I am very interested in that? Do you mean to take power to force certain collieries to combine?—As Sir Allan Smith is not here, I can, perhaps, use an expression which he took exception to. Mr. Balfour asked me that very question or something similar. He said: Taking it for granted you advocate a combination of units, how would you bring it about, supposing they are willing to combine? Judging from the opposition that the idea met with, I should presume—I should be delighted to hear if I am wrong—that they would not willingly combine.

27,944. Would you give them the chance of willingly combining?—If the owners would come and have a deathbed repentance—

27,945. Not necessarily a deathbed repentance?—You will lead me into these somewhat jocose expressions. If at a late hour the coalowners propose to combine, I should think it would be a very good thing.

27,946. Let me rather put it in this way—that certain principles having been enunciated—let us say one of collective production—would it not be reasonable to leave it to the districts themselves, for a certain period to be fixed, to see whether they could come to a suitable arrangement or not before compulsory powers were applied? What is your view on that point?—I think something must be done soon.

27,947. In any case, it would require a considerable time within which to do it?—Yes.

27,948. I suppose if it could be done voluntarily you would agree that an effort should be made to do it on that principle?—We have been sitting here for a considerable time, and no coalowner that I have listened to, or no representative of that side, if I may use the term, that I could recall has advocated a process of combination such as one would like to see carried into effect.

27,949. I am taking your view?—That is a great compliment to me.

27,950. I am asking you questions upon your own evidence, and your suggestion is that there should be collective production, and we are trying to get information about it. I say, assume that your views in principle were accepted, would it not be advisable to allow the districts to endeavour to amalgamate

themselves?—If the owners came here and said, "We accept this principle, which we were averse to before, and are now proposing to combine," I would like to know a little further before I answer your question in what respect are you going to combine and what sort of combination are you going to have; and then, having grasped all the details of the scheme, I should say, "My blessings on you—proceed to carry it into effect. How long will you require to carry it into effect?" If you said, "A year," I should say, "A year does not seem out of the way. Have a year to carry this arrangement into effect which you have expressed your intention of doing." But I have not, as yet, seen any intention expressed.

27,951. You agree that after that voluntary period compulsory powers should be applied, so as to bring them within your scheme of collective production?—I take it that compulsion would not be necessary, because they would come here as honourable men and say, "This is our scheme."

27,952. I am assuming that they are not willing to carry it out?—I prefaced it by saying you put the details of the scheme before me, saying, "This is my scheme," and being satisfied with the scheme I say, "Proceed with it."

27,953. It is very important that we should know what you mean by collective production and how you propose to carry it out and what the size of the unit is that you have in your mind, because there is nothing more serious that we have to consider in relation to your evidence than that, because you lay a great deal of stress on it?—I have given you my mind.

27,954. I understand your view, for example, as regards Scotland, but I take it that generally speaking you would apply the same principles to other districts of the country?—Yes. Then I would ask you not to lose sight of the fact, as was extracted from me in examination by Mr. Evan Williams, as to the combination of the combinations.

27,955. Yes, I quite understand that. Now let us take the question of distribution for a minute. You say prior to the war the distribution of coal was regulated mainly by the need for getting a market. Would you not say by the need for getting the best market?—In the circumstances, yes; but there is a lot in that.

Chairman: I am sorry to interrupt, but I am also sorry to say it is getting quite late, and I am afraid we cannot finish your cross-examination to-night. It would be convenient here to interpose one witness, and then we will resume Sir Richard Redmayne's cross-examination to-morrow morning at half-past ten.

(The Witness withdrew.)

Mr. HENRY BIRTLES, Sworn and Examined.

Chairman: I must explain to the Commission why I am now calling Mr. Birtles. It is in pursuance of a promise that we made. Mr. Frederick Parker Rhodes on the 22nd May, 1919, at pages 869-870 of the Minutes of Evidence, at Question 20,965, was asked this question by Mr. Cooper: "From your general knowledge of South Yorkshire companies, do you think that, taking the South Yorkshire companies as a whole, the shares are held by a large or small number of shareholders?—By a considerable number and I may say, with regard to that, that I cannot understand one figure that has been put before this Commission. There has been a figure repeatedly mentioned of 37,000 as being the total number of shareholders in collieries. I do not believe it is correct. I asked that some steps might be taken to try to check it, because, looking at my own knowledge of what they are in South Yorkshire, I thought there was an inaccuracy, and at the present moment, with returns only from three-fourths of the output they have arrived at over 200,000 names. Some of those, of course, would be duplicates no doubt, but it satisfies me that that suggestion that the total number of shareholders is limited to 37,000 requires consideration and careful examination at any rate,

if it is accepted as a figure which has any material bearing on the labours of the Commission." I said then we will have that gentleman examined. What happened on that was that a return was asked for, a return was sent from Somerset House and circulated, but after what Mr. Rhodes had said, I said I will have the witness here and will ask him questions. Mr. Wallace Thorneycroft, who was called next, said very much the same thing in his evidence with regard to the number of shareholders, and he followed that up by this letter of the 13th June addressed to the Secretary: "Dear Sir,—Number of investors in coal industry. I hereby enclose letter from Sir William Peat, and share his regret that we are not yet in a position to put in the precise number as proposed by me on 22nd May, Question 21,355, page 835. I should like to either hand in the letter formally or that the Chairman should read the letter, so that there is some record of the facts in the evidence." Mr. Thorneycroft was under a promise to send the letter, and this is the letter from Sir William Peat: "Wallace Thorneycroft, Esq. 13th June. Dear Sir,—I regret that the labour involved in preparing a correct card index of the investors in companies engaged in working coal is

13 June, 1919.]

MR. HENRY BIRTLES.

[Continued.]

much greater than I anticipated, and the work is not yet complete. There are, of course, investors interested in more than one undertaking, and it is the elimination of the duplicates that takes so much time. I am fairly safe in estimating the total number of individual investors at something like 200,000. When the work of numbering the individual investors is completed, I shall let you know the result, but there is no doubt that the numbers greatly exceed 37,000, which is the figure frequently quoted in the *videuo*." In accordance with my promise I have called this gentleman whose name is Mr. Birtles.

27,956. Where are you engaged?—At the Registry of Joint Stock Companies.

27,957. Would you kindly tell me what your position is there?—I am the Registrar.

27,958. You have heard what I have read out. You have heard first of all how in the first part of our inquiry we had that return showing 37,000, and you heard the evidence of Mr. Parker Rhodes, in which he says 200,000, and you have heard the letter from Sir William Peat. Will you tell us your views on the subject?—I should like at once to say that the figure of 37,000 is not quite complete. In my return I give also a figure of 94,000. The 37,000 relates to shareholders in coal-mining companies only carrying on the business of coal mining, but there are also 94,000 shareholders in companies which not only carry on coal mining but also carry on what we call the allied industries of iron and steel. That at once disposes of the question as regards the 37,000. It should be 132,000.

27,959. I will just read that. It is on page 326 of the proceedings of the 14th March. Mr. McNair has kindly found it for me: "Now I propose next, in order that it may get on the Notes, to read a Memorandum from the Registry of Joint Stock Companies, Somerset House, dated 12th March, and signed by Mr. Birtles, one of the officials there. 'I have obtained from the Inland Revenue Authorities lists of all the Companies engaged in coal mining in the United Kingdom, and have ascertained from the files, the number of shareholders in each Company registered here as shown in the last Annual Return. I have also ascertained from the Registrar of Companies at Edinburgh the number of shareholders in the Companies engaged in coal mining in Scotland and registered there, and from the Assistant Registrar at Dublin the number of shareholders in the one Irish coal mining company. I append the results for each of the six coal mining areas of the Home Office classification.'" That gives for companies engaged in coal mining only 37,316 shareholders, for companies engaged in coal mining and allied industries, 94,723 shareholders. If you add those two together it comes to 132,039.

Sir L. Chiozza Money: That includes all the duplicates and triplicates.

27,960. *Chairman*: Then the official goes on to say: "I should point out that where the same person holds shares in more than one company no has been counted more than once in the above totals, and in the case of shareholdings in the names of more than one person the joint holding has for the purpose of this return been reckoned as one. The above return, as it purports, relates to the number of shareholders, and does not, of course, include debenture holders, as to the number of which there is no information available in this Office." I am afraid I interrupted you, but it was to get that put on the Notes. Now will you kindly continue?—I do not know that really I have very much to say about it, except as to the manner in which this return was compiled. It is really based on a list of companies given to me by the Inland Revenue Authorities. I, as Registrar, have no information as to the companies engaged in coalmining, or any other industry, but this list of companies was supplied to me by the Inland Revenue Authorities. Then we went through the file; every company is bound to render a return every year to me showing the names of its shareholders. I put my staff on all these files, and they simply counted up the names in the returns, and the figures I have given here are simply an aggregate of the returns.

27,961. *Sir Adam Nimmo*: Would it cover the private companies?—It includes the private companies.

27,962. *Mr. Sidney Webb*: You say it includes all the shareholders, but many companies have preference shares and ordinary shares, and perhaps other varieties of shares. Does it include in any particular company separately the preference shareholders and the ordinary shareholders, and therefore if a man has ordinary shares and also preference shares, they would be counted twice?—In some few cases it might possibly happen that a shareholder might be counted twice.

27,963. By inadvertence, do you mean?—Not by inadvertence, but simply by the way the companies render their returns.

27,964. Therefore, we may assume that in these cases where a single person has preference and ordinary shares in the same company, he would normally be reckoned as two or three, according to the different kinds of shares?—I do not agree with the word "normally," because I think that ordinarily the preference and ordinary shares would be shown against the same name on the same line, so you would not get the name of the shareholder twice.

27,965. You have not separate lists?—No, it is a common list.

27,966. Therefore, putting it the other way, normally the man would be only counted once if he had only preference shares and ordinary shares?—That is quite correct.

27,967. Errors might occur, but leaving those out, the account you have purported to give us, and attempted to give us, is the number of separate individual shareholders in a given company counting each man once within that company?—As far as we could ascertain.

27,968. Therefore, surveying what you have done, you are quite satisfied that 37,000 and 94,000 is as near the total as you can get?—I have no reason to doubt its substantial accuracy.

27,969. Could you help us? Have you any explanation of the apparent divergence, because Mr. Parker Rhodes was not the only case. We have had various exclamations of surprise at the smallness of the number?—I am afraid I cannot. My attention was called to this only this afternoon. I cannot understand it at all. The difference is too great. There must be something basically wrong. I do not think it is in our methods.

27,970. *Sir L. Chiozza Money*: Do you mean that your surprise is because there are 37,000 in coal only?—No; I am speaking of this figure of 200,000 given by Mr. Rhodes.

27,971. *Mr. Sidney Webb*: Sir William Peat's letter points out that the number of duplicates is very large. Probably you would not be surprised to hear that the number of duplicates is large?—No; the same shareholder holds shares in different companies, you mean.

27,972. Yes?—I have not any information on that point.

27,973. At any rate your return would normally include duplicates?—Undoubtedly. There is a point the other way, of course. There is the case where shares are held, say, by a company. In that case we should call that one, although the number of shareholders in that company might be thousands. It is only fair to put the other side.

27,974. Would not that company appear in the Inland Revenue Return as a coal owning company?—No, I take it not. It is simply an investing company. The case I may mention is the well known one, for instance, the Cambrian Consolidated. They hold shares in a good many companies. In each of those cases the holding of the Cambrian Consolidated has been taken as one only.

27,975. In your list of companies would not the Cambrian Consolidated appear?—It is a shareholder company. Perhaps they own coal mines as well; I do not know.

27,976. *Mr. Evan Williams*: I think you are quite right. They hold shares in other companies?—Yes, I think that is so. It is simply an investing company, and then there are the trust companies and banks.

13 June, 1919.]

MR. HENRY BIRTLES.

[Continued.]

27,977. *Sir L. Chiozza Money*: Am I right in supposing that the 94,000 mainly refer to iron and steel companies which own collieries?—I should say that is correct.

27,978. Can you give us any help whatever as to the number of large shareholders in these companies; that is to say, have you had prepared a return showing the number of persons owning coal shares only who owned,

say, more than £250 worth of capital?—No, I am afraid we could not give you that.

27,979. Would it be much trouble to do that? Would it not be a simple thing to run down the list?—I am afraid it would give a great deal of trouble.

Chairman: We are very much obliged to you for your evidence.

(Adjourned to to-morrow at half-past 10.)

SECOND STAGE—TWENTY-EIGHTH DAY.

SATURDAY, JUNE 14TH, 1919.

PRESENT:

THE HON. MR. JUSTICE SANKEY (*in the Chair*).

MR. ARTHUR BALFOUR.

MR. ROBERT SMILLIE.

MR. R. W. COOPER.

SIR ALLAN M. SMITH.

SIR ARTHUR DUCKHAM.

MR. HERBERT SMITH.

MR. FRANK HODGES.

MR. R. H. TAWNEY.

SIR LEO CHIOZZA MONEY.

MR. SIDNEY WEBB.

SIR ADAM NIMMO.

MR. EVAN WILLIAMS.

SIR ARTHUR LOWES DICKINSON, }
SIR RICHARD A. S. REDMAYNE, } (*Assessors.*)

MR. ARNOLD D. MCNAIR (*Secretary*).

MR. GILBERT STONE (*Assistant Secretary*).

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, recalled and further examined.

27,980. *Sir Adam Nimmo (to the witness)*: Last night we were dealing with section 3 of your *précis*, and had come to the question of distribution, and I referred to the first few words of your statement under that heading where you say, "Prior to the war the distribution of coal was regulated mainly by the need for getting a market," and I asked you whether the producer was not interested in getting the best market from the point of view of price, and I think you agreed?—No, I do not think I did.

27,981. Then what is your view with regard to that?—My view on that is this: that the great object of the coalowner was to get as large an output as possible, with a view to keeping down cost as far as possible. He had to sell his coal, and he had consequently to enter into competition with everyone else who wanted to sell their coal, and naturally there was a scramble for the foreign market and the best price was not realised.

27,982. We are not dealing here, I think, necessarily with the foreign market. When the coalowner puts his coal into the market, does not his whole interest lie in getting the best price he can for his commodity?—I thought you were speaking about export.

27,983. No. You deal with export later in your *précis*?—I agree with you that it is to the interest of the coalowner to get the best market possible in the circumstances for his coal. It is the circumstances that I am up against.

27,984. I suppose the price is only depressed provided there is a larger supply of coal in the market

than there is a demand for at the time being?—The whole thing is governed by supply and demand, of course.

27,985. Is not the consumer interested on his side in getting the best suitable quality at the best price he can?—Naturally.

27,986. And would you not agree that in the main there has been a sound economic reason for the inland flow of the coal?—No, I would not.

27,987. Does not the consumer try to look after his interests in respect of quality?—He does.

27,988. Is he not constantly analysing the qualities of coal that he receives?—He should do, but I do not think many of them do so.

27,989. Is it not a common practice in the big works to analyse the coal?—It is becoming more common than it used to be, but it is extraordinary even now at the present day to what a small degree science is brought to bear upon the consumption of fuel.

27,990. Is not the analysing of fuel an increasing practice?—It is an increasing practice, but it is a long way from perfection.

27,991. Do not large consumers regard it as a very vital question to them?—I should say the majority of the very large consumers do, but science is not brought to bear on the consumption of coal to anything like the extent it should be, and we are extraordinarily ignorant as a nation as to the quality of coal that exists in the country. We have actually to go Sweden in order to find the best work on the

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

quality of British coals. I have found during the time I have been on the Coal Exports Committee that the foreigner has a better knowledge of the qualities of British coal than the ordinary British consumer.

27,992. Does not that amount to this, that it is the consumer in this country who requires to be stirred up more than the coalowner?—I think they both want stirring up.

27,993. Do you not agree from the evidence we have had before us and from your own personal knowledge, that the consumer in this country is longing for freedom of action now with regard to selection of coal and fixing of price?—No. I have heard a good deal of talk in this room about the iniquities of the Coal Control in supplying wrong qualities of coal and so on, but I discount it very largely. I will give you an instance to show what I mean. When I was sitting on the Coal Exports Committee, one consumer said that he could not do with a class of coal that he was getting for his production of Mond gas. It struck me as very extraordinary. He wanted a more bituminous coal than we were allowing him to have. I got hold of the Mond gas people in another part of the country, and asked them what kind of coal they were actually using. They said: "We could not do with any but this class of coal." I said: "This is diametrically opposed to the class of coal this man says he must have." There you are! I had enough scientific training to know in the first case the man was not burning coal to the best advantage, and I had sufficient knowledge to know that in the second case they were burning coal to the best advantage. Therefore I discount very largely a good deal of what I have heard here in the way of evidence as to the improper supply of coal. What really is at the bottom of the whole case is this: during the period of war, for reasons which are as well known to you as to me, the coal has not been kept as clean or anything like as clean as it was before the war. In fact they told me in Paris when I was over there a year ago last May that the dirt in the coal had increased to the extent of 100 per cent., and the evidence they adduced was absolute confirmation of that statement. It was not that I required evidence, because one knew it. That is what has caused dissatisfaction with the fuel in this country.

27,994. Whose fault is that?—It is not the fault of one section of the community, but it is the fault—if you can call it a fault—of a number. There was a very heavy recruiting of the ablest coal hewers, and their places were largely taken by men who had been outside the mines for some period. There was a great demand for coal, and when there is a great demand for coal and coal is more readily sold, that care is not exercised that might be exercised, and is exercised when you have to fight for your markets.

27,995. Do you not think the Coal Control has something to do with influencing the situation?—No. I am absolutely clear as to that. The Coal Control *qua* control has nothing to do with the dirt.

27,996. Has it not an influence on the minds of the men?—I am sure of that; in fact, the control has exercised rather the reverse influence. I will give you a case of the Harton Colliery or the Boldoan Colliery—I forget which it was. The Gas Companies complained that the coal from several of the collieries was very dirty. I sent down an inspector to examine the position, and the management confessed that the care was not being exercised that should be exercised. They put the blame on the men. We inspected the cleaning belts and so on, and we found that it was a case of six of one and half-a-dozen of the other. The result of our visit and inspection and action generally resulted in a very marked improvement in the class of coal from that colliery. We have that in writing from the Gas Company, and we had an acknowledgment from the management of the colliery saying that our influence had been most wholesome. We have every now and again to repeat our efforts, but, generally, the result is of good for the time being.

27,996A. Have you found any consumer who has not been up against the transport scheme under Control?

—I have never had a colliery, in my capacity as manager or in the capacity of director, but what there were everlastingly complaints as to the quality of coal supplied. Now, instead of having to go for 1,500 collieries, to their joy they find there is one individual they can beat, and they beat him unmercifully, and that is the Coal Controller.

27,997. Does the consumer say he has been forced to take quite unsuitable qualities of coal and thereby incur loss?—He has always said that and always will.

27,998. Has he not said it enormously more since the transportation scheme came into force?—I do not think the cry has been greater, but it is more evident because it is launched against the Coal Control which is a Government concern. If all the complaints made before the war received the same publicity which they receive now, the British public would think the end of the coal trade had come. There is more justification as to the bad quality of the coal, inasmuch as it is dirtier than it was, for the reasons I have given.

27,999. Does our experience of the past carry us further in the direction of scientific distribution?—I think there is a great deal of what is very good and valuable in the distribution scheme that was put forward by the Coal Control.

28,000. It is not suggested by those who know it in detail, but I am prepared to put it to you?—I am answering for myself and not for anyone else. I think it is axiomatic that, the nearer you consume coal to the point at which it is obtained the better there must of necessity be cases of exception where there is a particular class of coal. We know the best coking coals in the world are in West Durham, the Victoria Garesfield, and all about there. There are certain high-class steels and so forth which must be in their manufacture the highest class of coke, and exceptions have to be made in cases of that sort.

28,001. Special qualities have to be provided for those special cases?—Yes, but that is an exception to the general rule.

28,002. Could you put the case higher than that at the present juncture the whole field of distribution requires to be explored and we have no past experience to go on to suggest that a serious change ought to be brought about?—I think the experience of the last few years in the coal control is most valuable experience.

28,003. I do not think the consumer agrees that he has been well served by it.—Well, I gave you my views of the consumer and his complaints. He is like the poor—ho is always with us. But he leaves me quite cold. I have known the consumer in the old days. Generally speaking, when there is over-production the voice of the consumer is heard loud in the land: when the production is short of the demand the consumer is only too glad to get anything he can, and he is not so much in evidence. But he is always there. I grant you that the coal is not as good as it was, inasmuch as it is dirtier for the reasons I advanced.

28,004. Would you not admit that this defect which you allege, in the light of all the facts, is really a matter of conjecture as yet?—Which?

28,005. As to the improvements which can be brought about by scientific distribution.—But I think they have been.

28,006. I do not think that the consumers agree, however?—I am only speaking for myself. I cannot say other than I do say.

28,007. We will leave it at that and come to the question of wagons. I do not think we need trouble very much about that, seeing under what is known as the Transportation Bill it is proposed to take private wagons over.—That is a good thing.

28,008. But I think there is a good deal of misunderstanding with regard to the place filled by private wagons belonging to the colliery owners. May I ask you to look at it for the moment from the point of view purely of the colliery owner: can it be said that the possession of private wagons by the colliery owner has been a defect in the industry?—Do you mean the provision of wagons?

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

28,009. I mean from the point of view of the coal industry considered by itself?—Yes, I think it is a defect and I will tell you why—it is in one way, but not another. It is one of those questions which requires rather a lengthy answer. I think that the owners who provided themselves with wagons did a very wise and proper thing because they looked in advance; they took time by the forelock and said to themselves: "Seeing that we must have a regular and systematic supply of wagons and that we are not likely to get that from the railway companies, we will do it ourselves." But if you ask me whether that is a good thing looked at Nationally, I say, No, and for this reason: that the time lost in sorting and shunting those wagons is so very great. As you know, we went into this thing together at considerable length in the old days of the Coal Organisation Committee and we came to the conclusion, did we not, that a great deal of time was lost at the collieries through inability to serve them with wagons, and our transport in this country was in a very rub-and-go position. We were short of wagons and the time lost in shunting these privately owned wagons led to very considerable loss of time at the collieries. I am looking at it entirely from the colliery point of view. The collieries were not served with wagons to the extent they might be because of the time taken in shunting and sorting private wagons.

28,010. Was it not due to the insufficiency of wagon supply?—Yes.

28,011. An all-over supply of wagons?—Yes, but the time lost in shunting and moving about and sorting out private wagons is so great as to militate against the proper clearance of the collieries.

28,012. I think we are agreed on this: that colliery owners do not put down wagons to secure a profit *qua* wagons, but what they do, as you have agreed, is to secure regularity of supplies?—That is the primary thing.

28,013. There is also another reason, is there not, that they desire to have their wagons for the purposes of storage as against, say, shipping contingencies?—Yes, to some extent.

28,014. If you were a colliery owner and not a railway man, would you not want to have private wagons of your own?—If I were not adequately served by the railway companies and I was a colliery owner, I would get myself wagons in order to serve myself.

28,015. Is not that the only reason why the colliery owner really purchases wagons?—I granted that at the beginning, but I say the system is bad for the nation. I have tried to answer your question in the broad sense. I would certainly take that precaution. I am not blaming—far from it—the forethought of the colliery that provided itself with wagons, but looked at from the national point of view, it would be very much better if there was community of interest in respect of the wagons.

28,016. If the railway companies had had an abundance of wagons in the past, the colliery companies would not have provided wagons for themselves?—No; I grant all that and I commend them highly for their forethought, but I say it is bad from the point of view of national output.

28,017. I suggest to you that you cannot get sufficiently far to say it is a defect. You will remember you are setting forth in this part of your *présis* certain defects?—Yes, certainly it is a defect.

28,018. Has it not saved an enormous amount of colliery output to the owner and therefore to the nation?—You are looking at from the point of view of the past. I am looking at it from the point of view of the present and the future.

28,019. Does it not follow that if the railway companies supply a sufficient number of wagons, the colliery companies interests in providing wagons will be withdrawn?—If there is community of interest in the wagons it makes for increased output.

28,020. I see with regard to the question of distribution that you desire to eliminate the middleman. Who is it that keeps the middleman going?—The middleman.

28,021. Who keeps the middleman going?—The middleman.

28,022. No, is it not the consumer?—If you take the outcry against the middleman I generally find it is the consumer who cries out most against the middleman.

28,023. I suggest the coal-owner is always doing his best to do without the middleman?—If the owners would only combine, they could overcome the middleman. You remember the Marquess of Londonderry had a very great fight and he said "I do not care what happens! I will have my own staithe and wharves in London."

28,024. *Mr. R. W. Cooper*: Did not he give it up as a failure?—Well, he fought a fight and I think he still has his wharf.

28,025. I think if you make enquiry you will find it has been given up?—Then the middleman was too much for him. If the owners combined, the middleman would not be too much for them; they would be too much for the middleman and the consumer would benefit.

Sir Adam Nimmo: Does not the consumer think that the services of the middleman have been of value to him?

Mr. Sidney Webb: Certainly he does not.

Sir Adam Nimmo: Pardon me, he does.

Witness: May I answer your question. I agree the middleman exists because he fulfils a function. If the consumer could do without him, I should think he would gladly do without him. No middleman can exist simply because he wants to exist. One must look about and see how one can do without the middleman. What is the cause of his existence? The cause of his existence is that the coal-owner as at present constituted cannot see his way to dealing more directly with the public and the public being uninitiated go to the nearest person who has coals to sell, and that is the middleman. I do that myself. But if the owners could combine and establish their own agents, the profit of the middleman could be divided between the public and the owners.

28,026. If the coal-owner appointed his own agents, he would have the expense incurred thereby?—Yes, he would have the expense incurred thereby, but one agent could deal to a very much larger extent than the middleman and the profit would go into the pockets of the consumer and the owner.

28,027. Is not the real reason that the consumer stands by the middleman because he has a better reliance upon supplies through the middleman? Assuming there is a break-down at a particular colliery on a particular date, the middleman having a connection with a number of collieries is able to provide the consumer with the coal he needs at short notice?—Quite right.

28,028. And the consumer believes he receives valuable services from the middleman in that respect?—He goes to the man who has coal to give him, but all that can be done by the owners combining to the elimination of the middleman.

28,029. Is not that very much a matter of conjecture?—Oh dear, no. The late Mr. Hamilton Greg told me a few months before he died—I suppose he knew more about the coal supply of the South of England than any man living, perhaps—that the whole thing could be run by one firm, and he was prepared to do it.

28,030. That is to say, what would be created would be a considerable monopoly?—Yes, a considerable monopoly.

28,031. With all its evils?—With all its evils. Therefore, I suggest that the considerable monopoly could be carried out without the aid of a middleman at all.

28,032. And possibly by tying up the whole industry in a knot?—No, I do not say that.

28,033. By elaborate machinery?—No, I do not say that.

28,034. And a great many regulations?—No, I do not say that. I think it would make for great simplicity and cheapness and effectiveness and regularity of supply.

28,035. You do not seem to have the consumer on your side in making that statement.—Yes, I think I have—the disinterested consumer.

28,036. Do you suggest that those who have come before this Commission have not been disinterested?—

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

The disinterested consumer is the British public, and I think it is becoming thoroughly alive to the fact.

28,037. Let us take the question of export prices. Do you feel that you can speak from experience in regard to the working of the export trade?—Yes. I have exported coal myself and had a rare fight over it. My fight was with Lancashire.

28,038. Have you found any expert in the export trade who has come here and said that he thought the export trade could do the work through a Committee?—Who are the exporters who have come here?

28,039. Sir D. M. Stovenson?—Yes, he lives by it.

28,040. Well, he is an expert?—Yes, I know he is an expert.

28,041. And he is interested in the maintenance of the British export trade?—He is interested in making his living.

28,042. Is there any other person who has had similar experience of the trade who has said it could be done by a committee?—Do they not all make their living by it?

28,043. Yes, but they understand the business?—Yes, and they make a living by it.

28,044. And they want to continue the trade?—Yes, to continue making their living.

28,045. And in doing that they are looking after the best interests of British trade?—It may or may not be.

28,046. They are always looking out for new markets?—They are endeavouring to sell their coal to the best advantage, and also endeavouring to buy it as cheaply as possible.

28,047. If there has been one bit of evidence given more emphatically than another in connection with the export trade, is it not this: that you require great mobility in connection with that branch of the trade?—Do you want my opinion on the evidence of other people?

28,048. No. Is it not essential that in the working of the export trade, we should have free mobility?—What do you mean by "mobility"?

28,049. Mobility in price, and mobility in rapid decision where competition has to be met?—I should like to know what you mean by "mobility of decision"?

28,050. Freedom of action.—I would rather put it in this way: that you must have machinery which will allow of the coal produced for export working as easily as possible.

28,051. And as rapidly as possible?—Yes, as rapidly as possible.

28,052. That is to say, that the man who is selling British coal abroad must have a free hand?—Yes, and I am quite prepared to agree with you that it is very difficult indeed, and one of the greatest difficulties in the way—shall we say?—of nationalisation to dispose of coal for export to the best advantage. It is very difficult, and I have been giving that a great deal of thought, as no doubt we all have. But it does not seem to me that it is impossible. Of course, any change brings difficulties in its way; but, after all, what is required in the export of coal? It requires that the people that export should have a great knowledge of the foreign markets, of the requirements, of the variations in price, and that they should act, and act quickly. As you ask me what is the sort of resultant opinion that one has formed from the evidence one has heard from the exporters who so thoroughly know the export trade, I should say it is the knowledge of the foreign markets, the almost daily variations and the possibility of quick decided action. If that is so, I do not see why that could not be done by a process of agents and agencies; that is to say, if the owners were to combine into one large combination for the purposes of dealing with their product (coal), they could have their paid agents or agents working on commission just as the exporter has his agents, and that rapidity in point of decision—what you call mobility of action or freedom of action—could be carried out in the same way with this overriding advantage, that there would not be competition as between owner and owner, and there would be an elimination of the cut-throat policy.

28,053. I am going to come to that. Do you suggest that we should run the risk of a change of

system which has wonderfully developed the export trade simply because it may be possible to devise some other method, the results of which we cannot foresee?—I do not advise any sudden change in that respect.

28,054. But you suggest the setting up of a committee?—Please let me answer the question. I do not advise any sudden change in that respect, but I think that it would naturally and automatically follow a combination of owners. They would see that it was to their advantage to establish their own agencies in the way of export, and the middleman would be gradually if not rapidly eliminated.

28,055. Would not your position in that respect depend very largely, if not entirely, on the fact as to whether you had a monopoly in the trade or not, and can you suggest that we have a monopoly in the export trade?—No, but we would have very much greater power to deal with our coal if all the 1,500 units were acting in harmony instead of trying to get the trade from each other.

28,056. Do you think you can really work the position, as we know it, through a committee composed of three different interests such as you suggest in your *précis*—the coalowners, the miners and the Government. Will not the inevitable result be to tie the whole position up?—No, I think not; I do not see why it should.

28,057. I do not think that position is supported by those who know the trade thoroughly?—I am only speaking for myself and not anyone else.

28,058. Let us come to the question of competition. Is there any real evidence to show that the competition between one district and another breaks down the prices? There is a good deal of conjecture on the subject, but is there any real evidence that that takes place?—Yes. Again and again in the history of the coal trade the owners have endeavoured to combine to maintain prices, and the reason their combinations have always broken down is because there has not been loyalty.

28,059. Is it not rather this, that you referred in your evidence yesterday, I think it was, to the operation of the law of supply and demand, and I think you agreed that you did not desire to interfere with the operation of that law. Now, so long as you have a larger quantity of coal in the market than the market can absorb, you must do one of two things, surely: either reduce your price and try to expand your market, or withdraw the coal altogether?—Yes.

28,060. What has happened in the past has been this, has it not, that when the supply has been in excess of the demand, the economic condition has righted itself by the price falling?—It does naturally, but if the coal trade is worked on scientific lines, I do not see that the necessity arises for producing more coal than there is a demand for.

28,061. Does that not simply mean that you withdraw labour from the mines in order to reduce the output?—Labour flows to and from the mines as the demand for labour increases or wanes.

28,062. Is there not always a period of reaction? That is to say, there is always a period, is there not, when you cannot withdraw the coal suddenly from the market?—Now, Sir Adam Nimmo, you deliver yourself into my hands: Why are there those periods of reaction? Those periods of reaction have been due to greed; they have been due to intense over-production. In such a combination as I have in mind, that would be obviated, and there would not be those fluctuations. That is the main idea of the late Sir George Elliott's scheme; those sudden fluctuations would be done away with.

28,063. Would you arbitrarily control production?—No, my point is quite clear. Take the "seventies," to establish an historic parallel. After the Franco-German war there was great demand for coal. There is always, of course, the hiatus of depression which we are passing through now, which will be succeeded very shortly, I hope, by a great burst of trade. Well, that happened. In the chemical trade as in the coal trade, but prominently in the coal trade, development went forward at a tremendous rate. People

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

were attracted into the trade, immense dividends being paid; wages rushed up to a high figure, they developed collieries to a great extent; there was over-supply, and down came the price. Then that was followed by years of depression. That is a most unscientific procedure.

28,064. Would you have prevented expansion on the rising market?—I would not have expanded it to anything like that extent.

28,065. Would not that be putting the cold hand on enterprise altogether?—Not at all; I would expand to meet the legitimate requirements, but I would not expand to deluge the market with coal.

28,066. Looking the facts in the face, do not cycles of trade up and down rest really upon a broad world position in respect of the demand for coal?—That is one of the mistakes that political economists make.

28,067. *Mr. R. H. Tawney*: That was exploded long ago?—That is one of the mistakes the political economists make, and ten years afterwards withdraw and say it is wrong, like the Manchester school. That is one of the mistakes they made, and are in the process of withdrawing.

28,068. But that was all given up twenty years ago?—Then you and I, Sir Adam Nimmo, are twenty years behind the times: I was not aware they had changed.

28,069. *Sir Adam Nimmo*: Now, let us take the question of competition again. I have no doubt you have observed the prices of competing districts on the East Coast and the West Coast: is it not wonderful how close these prices approximate to one another?—When I was in Northumberland, and Fifeshire went on strike, we did a roaring trade. When we and Fifeshire were working together we had the same markets, and were competing against each other, and cutting each other's throats.

28,070. Let us take normal conditions?—Those are normal conditions. When the conditions were normal, we cut each other's throats and made a bare existence; but when the conditions were abnormal and there was a strike in Fifeshire, we did really well.

28,071. Is it not, after all, the foreign coal that we are in competition with that determines the price of coal for export?—To some extent, but I think equally, and possibly to a greater extent, it is the competition at home.

28,072. Is not this what happens: in fixing British trade in coal abroad at a particular time, the best coals are absorbed first of all, and determine the price?—To some extent.

28,073. The standard coals, I think you will agree, are always picked up first of all?—No, I do not think that is altogether true. I know that is often put forward, but you find buyers in the market who buy a special class of coal, and they do not want to buy the best coal. Take, for instance, large electricity works: they will not go abroad and buy the best gas coal; they will buy duff, they will buy steam small, and they will buy a cheap class of coal.

28,074. Is not that only when they find they cannot get the best coal at a price which they think a satisfactory price?—I do not think they go into the market to buy the best class of coal; they go into the market to buy the class of coal that they want.

28,075. Is not that contrary to experience?—I know that is what is stated, but I do not think it is the whole truth.

28,076. What I suggest is this, that when these standardised coals are purchased, first of all the other coals fall into relative line. It is not competition amongst themselves that really determines the price, but the foreign coal meeting these standard coals?—You and I know that they would go down 1d. or 2d. a ton in order to get the trade from somebody else. That is well known.

28,077. I suggest to you that, looking broadly out on the export trade, that is not what happens. It has not a material effect on the situation?—I think it has a very material effect, the most material effect.

28,078. Now dealing with the question of central purchasing of materials for collieries, I do not wish to say very much about that. I think we would agree that, provided a combination is not too large, a large company can buy cheaper than a small company, on

the whole?—I think you and I agree more than appears on the surface.

28,079. Do you think that applies, if you had really large combinations?—Would you get anyone to agree with you if you said, by making your combination very large you will be able to purchase cheaper coal than a private undertaking of some size?—I think so.

28,080. I suggest to you that it is contrary to the experience of those who know?—You know that an ounce of fact is worth a ton of theory. Let us take the case of the London and North-Western Railway Company. That case made a great effect on me. The London and North-Western Railway Company were buying, so I am informed by one of their chief officials, sectionally, and when they improved their system and bought centrally, the result has been the saving of tens of thousands per annum. Now the London and North-Western Railway Company is a very large combination; it is a very large system, a very large unit.

28,081. Yes, but I put this to you, that if you take the experience of Railway Companies generally in the matter of coal, when they come into the market at one particular time to buy the very large quantity of coal they generally get, the market is put up against them. I have had a good deal of experience of this kind of problem, and I have seen that invariably applied?—I think it stands to reason that, just as you get a better price in selling if you sell centrally, so you buy your material cheaper if you buy centrally, instead of playing unit against unit.

28,082. But is not the tendency, human nature being as it is, that if there is only one buyer comes into the market, a very large buyer, the suppliers put their heads together to get as high a price as they can?—Form a ring?

28,083. Against the buyer?—Not more than they have done already.

28,084. Is there not a tendency to do it, the larger the purchasing combination?—I do not think there is any more tendency to do it in that case than there is at present.

28,085. I suggest that in a matter of this kind there is a great deal of conjecture as to what may happen?—There is a great deal of conjecture in everything in life.

28,086. There is one matter of detail in passing: I notice you use an illustration from explosives and pit wood?—Yes.

28,087. What you say may be true with regard to explosives, particularly now where you have an overriding combination; but are your remarks true in the case of timber before the war? Was there not really quite a free market in foreign timber before the war?—It was in the hands of very few people.

28,088. But a sufficient number of people to give quite a free market?—I do not think so.

28,089. That is my experience?—I do not think so. As you say, of course, certainly not since the war.

28,090. We cannot judge at all by what has happened during the war?—I quite agree with you. We must take pre-war conditions. The pitwood trade was a trade in the hands of very few people—I have been astonished to find how few.

28,091. The experience of coalowners on that point is simply this: that they get quite a free market?—Take the North of England; how many substantial timber merchants would you say there were in the North of England?

28,092. I cannot speak, of course, from an intimate knowledge of the North of England?—I should say three, and Mr. Cooper will enlighten you, no doubt, as to their names.

28,093. *Mr. R. W. Cooper*: What do you mean by the North of England?—Northumberland and Durham.

28,094. Only three?—Three substantial timber merchants.

28,095. I should be happy to find you a list with more names than that.—Yes, but substantial; and those three have two-thirds of the timber trade, and one of them more than half

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

- 28,096. What are their names?—Pyman and Bell. I should say they have more than half the timber trade of Durham.
- 28,097. Then let me give you some names: there is Osbeck, Pyman and Bell—.—I mentioned them.
- 28,098. Atkinson Brothers, and there are three or four more in Newcastle alone. What about Hartlepool?—Hartlepool is dealing with a good deal more than Northumberland and Durham.
- 28,099. *Sir Adam Nimmo*: I know the Scottish position pretty intimately.—They are a ring.
- 28,100. There is quite a large number of suppliers of timber.—They are a ring.
- 28,101. We are dealing now with the position before the war. Before the war in Scotland, I think, the Scottish coal owner would say that he had relatively a free market in pit timber.—Is he going to after the war?
- 28,102. We can only judge of this in the light of pre-war conditions.—I think that ring is going to continue.
- 28,103. *Sir L. Chiozza Money*: Do you say there is a ring?—There was in Scotland.
- 28,104. *Sir Adam Nimmo*: Was there a ring before the war?—The war has brought the ring into being, and it is continuing.
- 28,105. I have no doubt if the coal owner is left as he was before the war he would break down the ring as he did it in the past?—He will break it down more effectively if he combines.
- 28,106. I do not think you are really on good ground when you refer to the pit timber under this heading.—I think I am on good ground, but inasmuch as the substantial trade is in the hands of a very few people—not in respect of the explosives, of course, which is an absolute ring—I think you will find this—I am not quite so certain that there is not an understanding among the timber people.
- 28,107. There is generally an understanding, of course, in most industries to carry it as far as they can.—Take South Wales, Mr. Evan Williams will bear me out that there are three main importers of timber.
- 28,108. *Mr. Evan Williams*: Pit wood?—Yes.
- 28,109. There are, I should think, 30 to 40 importers.—There are three main importers from the Government point of view.
- 28,110. Because, by arrangement, all the small ones put their business into the hands of the others for war purposes only at the request of the Government during the war?—What they will do in the green tree they will do in the dry tree.
- 28,111. *Mr. Evan Williams*: No, the competition is already beginning.
- 28,112. *Sir Adam Nimmo*: We do not want to labour this position. We only want to get it fixed as to whether you are correct in saying that this was a tied-up position before the war, and I suggest it was not.—Well, we do not agree. You see I say in my proof, that as to pit wood the commodity is fairly normally an imported article—that you would agree—and in the hands of comparatively few traders. That is the position. I cannot retire from that.
- 28,113. Taking the question of the displacement of vested interests, what elimination would you really hope to secure. I take it, that you wish to employ in the industry in future, all those who can be of real use to the industry?—Certainly.
- 28,114. Let us take the case of managing directors. I suppose you would agree that most of these men are of very great use to the industry?—If you combine all the collieries into one concern you could do away with a great number of managing directors.
- 28,115. Would you not try to find a place for them if they were really men of ability and brains?—I would be quite cold-blooded. I would not weight the industry with any more managing directors or managers or any other managerial staff than is necessary to conduct the industry.
- 28,116. Take the general managers that you refer to: are not these men the most valuable men in the industry?—If I had two collieries and there were two general managers, great men both of them, and I combined the two collieries—I am not now regarding State combination—but the two collieries agreed to combine, they would not retain two general managers.
- 28,117. What do you estimate to be the present cost of administration to the coalowners?—I have not made the calculation.
- 28,118. It is not a great deal per ton?—I have not made the calculation.
- 28,119. If I put it to you that it was a very small amount per ton, would you hope to secure any great saving?—What do you call a small amount per ton?
- 28,120. Let us put it at 2d. a ton?—2d. a ton on 270 million tons: I could live on that.
- 28,121. My colleagues suggest that it may be a great deal less?—2d. a ton on 270 million tons is what it is—it is neither more nor less.
- 28,122. Let us take what is happening in connection with control as a guide to this matter. You are aware what the estimated charges are in connection with the administration of coal. The sum is put down at £552,395, I believe, with a great many unpaid officials at that?—I do not think the two are comparable. Let us compare like with like.
- 28,123. I rather suggest that when you begin with your policy of collective production, and then go on to your policy of control of distribution, control of home prices, control of export prices, you have built up a huge system of control that would require a great staff to manage?—The staff is less and less as you combine more and more in proportion, and that has been the experience of all trusts and combinations.
- 28,124. When you take the Control Department?—I say you are not comparing like with like. It is like comparing a piece of chalk with a piece of cheese. They are totally different things.
- 28,125. I suggest that by the time you have finished with your scheme you will have an enormous scale of charges that will have to be met?—I disagree with you entirely. The control is a system—an evil, if you like—which was the outcome of the war to meet special circumstances. The combination that I have in view is something quite different and you must compare like with like. If you want to compare like with like, take any combination of collieries in the past, either in this country or other countries, and compare it with the projected combination.
- 28,126. Would not your suggested scheme, if thoroughly comprehensive, get dangerously near the scope of the present control?—No, not at all.
- 28,127. I understand you propose to deal effectively with the whole problem of distribution?—Yes.
- 28,128. Within your collective production?—Yes.
- 28,129. That might apply to very large areas?—Yes.
- 28,130. These might require to be co-ordinated?—Yes.
- 28,131. The same thing would apply with regard to prices?—It would automatically come out of the combination.
- 28,132. Would it not apply in the same way with regard to prices?—What—the control?
- 28,133. The setting up of a complicated machine for dealing with the whole of that?—No, not complicated at all. The effect of combination always tends towards simplification.
- 28,134. It does seem to be suggested that when you get a big combination under control?—What could be more complicated and more efficient from one point of view than the present system, whereby each of the 1,500 companies have 1,500 different systems? I would have one company with one system.
- 28,135. That would not deal with the problem at all that you are dealing with—the disposition of prices between the export trade and the home trade?—It would be far simpler if instead of having 1,500 collieries you had one.
- 28,136. I suggest before you have done you would run to enormous expense?—I suggest that you would not. I suggest you would have saving in cost both to the coalowners and that it would be in the national interest.
- 28,137. I suggest there would be an enormous expense in connection with it. I suggest that it points the way to a very large expenditure if you carry out your scheme?—I say you must compare like with like.
- 28,138. Now take the question of the saving in freights; do you mean shipping freights?—Yes.

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.O.B.

[Continued.]

28,139. How can you possibly control shipping freights by any combination of coalowners?—Is it not self-evident.

28,140. No, I do not think so. I think it is very far from being self-evident?—That is where you and I differ. There is competition for chartering vessels at present, is there not?

28,141. Yes?—There would not be.

28,142. But surely a ship is the most mobile thing in the world. It goes where it can get the best market?—Quite so.

28,143. How is it going to be brought to our shores? Is it not by the freight offered?—Exactly.

28,144. How could a combination of coal interests bring boats more readily and at a cheaper cost to this country?—For the very reason that I have just stated. Instead of having 1,500 competitors or thereabouts or instead of having numerous competitors there would be no competitors.

28,145. Is not all this body of competitors really a competing source to bring the boat to secure the freight that is required? If the shipowner is not satisfied with the freight offered he goes into the world's markets, and he takes his boat where he gets the best freights?—I maintain that national combination could control freights to an extent which would be impossible for an individual colliery owner.

28,146. It is not a competition between the shippers; is it not the world's market in freights that controls freights?—No, it is both.

28,147. The shipowner goes to any part of the world where he can get the best freight?—He goes where he can get the best price like everybody else.

28,148. How are you going to bring him to a port here?—Suppose the vessel is here and you go on Chango and you say I will give you so much—another man says he will give a bit more: the man who gives a bit more gets it.

28,149. If he finds he can get the freight by shifting his boat he shifts it in ballast?—Yes.

28,150. I suggest to you there is no possibility of securing a saving in that respect?—I say there would be considerable saving.

28,151. I should be surprised if any shipowner would agree with you?—I should be surprised, if he spoke the truth, if he disagreed with me.

28,152. With regard to central pumping, is not that a problem that has to be gone into in detail?—It is a problem that is on us now. We have lost a large part of a coalfield through it.

28,153. Is it not conjecture?—We have lost a whole coalfield through want of combination on the part of the owners.

28,154. *Mr. R. H. Tawney*: May I ask where is that?—In South Staffordshire. I should say not the whole coalfield, but part of it; and it is lost entirely through disagreement among the coalowners. One coalowner, who is due to pump the water says he will not be drowned out for five years and therefore only should he pay the same contribution as the man who will be 'drowned out immediately; and for the last three years I have been fighting this battle, and I am sick of it. We cannot get combination, and they ask the nation to finance them.

28,155. *Sir Adam Nimmo*: You raise a question here which is of general application?—An ounce of fact is worth a ton of conjecture.

28,156. Can anyone say what can be done in connection with central pumping?—I know that this trouble is likely to arise in South Yorkshire.

28,157. I think the evidence of *Mr. C. E. Rhodes* was to the contrary?—I have had correspondence with him in which he was asking me to try and get something done.

28,158. Was not his evidence contrary to that?—I only know what I know.

28,159. I suppose, assuming even that something could be done in this direction, that each case would require to be separately investigated?—There is no assumption about it.

28,160. One minute. Will not each individual case require to be closely investigated by itself?—Every case requires investigation.

28,161. Would it not mean an enormous amount of underground mine driving to bring about what you want?—No, none.

28,162. Take the case of the coalfield as a whole, can any men sitting here just now say what can or what cannot be done in the way of central pumping?—Yes, I am sitting here, and I can say what could be done. Instead of having 100 different pumping plants you can have one.

28,163. What cases have you in your mind?—They are very important cases, and what is true of one field may be true of another field in a few years since this question of central pumping is a very serious point.

28,164. Of course, all these cases could be dealt with quite well under the proposals of the Land Acquisition Committee?—I do not think so, but they could if the minerals were nationalised—very considerably.

28,165. Take the case of working together good and inferior coal seams: what precisely have you in your mind in that connection?—Precisely what I say. I will read it to you:—

“Generally, under a system of collective production artificial factors which impede mining would be removed. Owing to the extinction of the competition prevalent in normal times between rival coal owners coal, good and inferior, could be worked together instead of bringing up only that which is necessary to allow of one owner competing with another. It might be argued that the consumer would suffer in that he would on the average be provided with a poorer class of coal than heretofore, but this does not necessarily follow, and the fact of there being a lower grade of coal on the market would lead consumers to make use of it on the score of cheapness and adopt more scientific means of burning it than at present, with advantage to everybody.”

There is a good deal of coal being left at present in the mines unworked, and I suggest that that coal could be worked, and though the average of the coal would be lowered there would be purchasers for that coal at a price.

28,166. But I suggest to you that every coalowner in the country is going to the very fullest limit possible in working inferior coal along with these good quality coals?—I know collieries in which 40 per cent. of the seam is being left underground unworked, and that is coal that I would gladly give in Surrey 30s. a ton for.

28,167. Would your view be this, that the private owner cannot go further than a certain point in forcing the coal on the consumer?—That is because he is a private owner.

28,168. That is to say, we are to force the consumer to take the coal whether he wants it or not?—I say I would pay 30s. a ton to-morrow gladly for that coal.

28,169. Would it make for efficiency from the consumer's point of view if he had to take coal that he regarded as inefficient?—It would give me the warmth that I require, and cook the dinner that I require quite effectively.

28,170. I suggest to you, from a considerable experience of a question of this sort, that every coalowner does his best to work all the seams available?—Every coalowner does his best to sell his coal and he cannot produce that poor class of coal because he says he cannot sell it in the market. If he tried to, Messrs. So-and-so over the way would capture my trade by giving better coal.

28,171. What do you think the consumer would say if you compelled him to take an inferior quality of coal?—I would not compel him. I say the consumer, if he wants to pay the high price, will get the high class of coal, and if he wants to pay the lower price he would get the lower class of coal and make the thing profitable.

28,172. I suppose you would do your best to force upon the consumer the quality of coal that you thought he should take?—Not altogether.

28,173. Does it not amount to that?—No.

28,174. Is not that what the consumer is objecting to?—The consumer would come along and say: “That is a poor class of coal; it is worth 8s. a ton less. Yes, I will take it.”

28,175. Is he not being persuaded to do that now on every hand?—He is being persuaded to take some things that he will benefit by hereafter.

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

28,176. I am taking the pre-war position. Was not there every effort made in the pre-war days to induce the consumer to take an inferior quality of coal if he would take it?—In the pre-war days the coalowner was a wandering sheep. He would not be controlled, but now he is being controlled to some extent and he has to some extent to take what he can get.

28,177. Did not the coalowners' interests lie in exhausting the coalfield to the greatest extent possible?—Yes, subject to the possibility of his selling what he produced.

28,178. That is to say, if he had a marketable seam from the mining point of view he did his best to extract the coal and to find a market for it?—In several South Yorkshire collieries he has been leaving 40 per cent. pre-war.

28,179. One would require to look into the individual case to know what the coal is?—In one of my annual reports I deal with the question. It a great deal concerned the late Mr. Pickering and myself.

28,180. I take it the position is that you are going to force the consumer to take it whether he wants it or not?—No.

Sir L. Chiozza Money: You ought not to put such a question.

Sir Adam Nimmo: If Sir Richard does not want to reply to the question he can say so.

Mr. Sidney Webb: He has replied in the negative. It is definitely on record that Sir Richard replied in the negative.

Sir L. Chiozza Money: You want him to say something else.

Sir Adam Nimmo: We need not carry it any further.

Mr. Sidney Webb: I hope not.

28,181. *Sir Adam Nimmo*: I think you and I agree?—We agree far more than the public suppose.

28,182. I think you and I agree that the miners' leaders in the question of output have an enormous influence over the men.—Yes.

28,183. And that they could do a great deal?—Yes, I said so.

28,184. They have an influence to assist in the increase in output if they set themselves to do it?—I feel so.

28,185. I want to ask you this: Do you know whether any prominent miners' leader has in recent months gone to a district and strongly urged the men to produce more coal in the national interests?—I do not know; they are there; they will tell you. I cannot speak for the miners' leaders.

28,186. It is not within your knowledge?—It is not.

28,187. *Mr. R. H. Tawney*: Would it be within your knowledge had it happened?—I do not know that it would have been, unless it appeared in the newspapers. Sometimes I read the newspapers; sometimes I have not time.

28,188. *Sir Adam Nimmo*: We have had various statements which have been submitted by Mr. Herbert Smith and others as to the cause of the reduction of output which has recently taken place?—Yes.

28,189. In the line of the questions that I have just asked you, would you be surprised if you had evidence submitted to you that at any rate one prominent miners' leader has been telling the men in a public meeting not to put out too much coal?—I would be surprised.

28,190. Would you say that if a case of that sort was known publicly that it ought to be investigated along with the other factors which may be reducing the output of coal?—I will go this far and say that all factors should be investigated.

28,191. I hold in my hand a letter which I have received. Mr. Herbert Smith and Mr. Frank Hodges have indicated that they have received letters as to the cause of the reduction of output. Now, I hold in my hand a letter which says that a prominent leader in a mining district, at a public meeting which was held on the 1st June, urged the men not to do too much work at the present time?—I am very surprised to hear it.

28,192. Do you agree that that is a factor that ought to be investigated along with the other factors?—Every factor ought to be.

Sir L. Chiozza Money: Who was the letter from?

Mr. Herbert Smith: I gave you the names of the senders of my letters.

Sir Adam Nimmo: I will read the letter. "At a meeting addressed by Mr. Duncan Graham, M.P."

Chairman: Who is that letter from?

Sir Adam Nimmo: From Mr. Arnot, general manager of the United Collieries.

Sir L. Chiozza Money: Is Mr. Graham a miners' leader?

Mr. Herbert Smith: Who is the sender of the letter?

Chairman: I will read this letter. This is a letter from the United Collieries, Ltd., of 109, Hope Street, Glasgow, 11th June, 1919. Then it sets out their telephone address, and telegrams are to be sent to "Combino, Glasgow." "Dear Sir Adam, At a meeting addressed by Mr. Duncan Graham, M.P. for Hamilton Division of Willbough Larkall, on Sunday 1st June, Mr. Graham advised his hearers not to exert themselves, and to do as little as possible, and to see that they got as much money as possible for it. He stated that he did not care if a representative of the Press were present and published his views, his reason for giving these views being that there was no need for labour to be honest when the other side were so dishonest. This statement is vouched for by Mr. McDowall, the manager at Quarter, and Mr. Wilson, the under-manager. I cross-questioned them on the subject, and they both agreed that the statement I have given is an accurate report of what was said. I do not know if you will attempt to make any use of the statement, but Mr. McLean thought that it ought to be known in view of the present restriction of output, that such advice was being given by those who were thought to be responsible leaders. I hope you are keeping well and able to keep your temper in face of so much provocation.—Yours faithfully, THOMAS ARNOT."

28,193. *Sir Adam Nimmo*: All I want to say is this: that I expressed surprise that such a condition of things should be reported. I want to know whether you agree that when an investigation takes place into the causes of reduced output such a thing as this should be investigated?—Everything should be.

28,194. *Mr. Robert Smillie*: I should point out that Thomas Arnot is the manager of the colliery. Although Sir Richard says he has the fullest faith in colliery managers, we are not disposed to take that?—I have the fullest faith in everybody, but we were dealing with the question of tubs when I said that, and not accusations made against one another.

28,195. Mr. Duncan Graham is a member of Parliament?—I know him, and, therefore, am the more surprised.

28,196. I think he ought to be heard on a matter of this kind before it can be taken as evidence. You cannot say that this statement was made?—Certainly not.

28,197. *Sir Adam Nimmo*: I am merely making the statement as a subject for investigation.

The Witness: I said if an investigation should be carried out all parties concerned should be heard.

28,198. *Mr. Herbert Smith*: They ought all to be tried together?—Quite so; there should be no individualism in the trying. On that question of diminishing output, which concerns us all so greatly, I do think a very great deal could be done to mitigate the effects if there was a wider acceptance of the principle of double shifts. I go so far as to say this: that double shifting districts give more than double the quantity that the single shifting do.

28,199. *Chairman*: I daresay you will be very glad to see what took place in South Wales on that. Perhaps you have seen the Welsh papers?—No, I have not. I was brought up under the system of double shifting, and I am a great believer in it.

28,200. *Mr. Sidney Webb*: I have just one point to put to you, and that is with regard to the statistics of expense. The Home Office has published statistics as to the fatal accidents, and it is assumed that those statistics are very satisfactory, but the Home Office does not now publish statistics as to the non-fatal

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

accidents. Can you tell us anything about it?—You very kindly mentioned that fact to me yesterday, so when I went home I looked up the matter just to see how it stood. Taking the report of the divisional statistics for the year 1914, we issued then tables showing the separate non-fatal accidents, the number of them, also a table showing the persons injured. Unfortunately, I have not been in the Home Office for the last 2½ years, so I am a little bit rusty as to what goes on there in respect to this matter, but I can hand you this table so that you can see that the number of separate accidents for the year 1914 was 150,000 odd, and the number of persons injured was 158,000 odd, and a comparison is instituted with the preceding year.

28,201. I have those figures, but what I wanted to know was, since 1914 what was the proportion of accidents?—Since the war, with the object of economy, these tables have been vastly cut down.

28,202. As a matter of fact, have they not been omitted, not cut down?—Probably omitted.

28,203. That is not cut down?—A great number of tables have been omitted.

28,204. Apparently all statistics with regard to the number of non-fatal accidents are not now published by the Home Office?—No.

28,205. Could you give us any information as to that. Have you a table?—I have. I will circulate it. You very kindly mentioned the fact to me, and I had tables made out.

28,206. Will you refer to them in order that they may be put on record on the notes?—Yes, I will mention it to get it on the notes. These are 3 tables.* One is a table of the non-fatal accidents reported to inspectors, average accident rates per million tons of minerals raised in groups of 5 years at mines, under the Coal Mines Acts from 1895 to 1918. The accidents per million tons are given in groups of years. For instance, the first group is 1895 to 1899 inclusive 21.0 accidents per million tons of minerals raised. Then skipping a few years and coming down to the last group 1917 and 1918 17.2.

28,207. May I ask you on that whether those figures are strictly comparable? Was there not a considerable difference in the requirements in 1907?—As the Note states, in the year 1907 there was a large increase in the number of non-fatal accidents reported owing to the operation of the more definite requirements laid down in section 2 of the Notice of Accidents Act, 1906, a break in the groups of 5 years has, therefore, been made. For the quinquennium 1900 to 1904 it stands at 15.5; in the last 2 years 17.2, but that increase is not strictly comparable. Then the second table is non-fatal accidents disabling persons injured for more than 7 days, accident rates per million tons of minerals raised at mines under the Coal Mines Acts during the years 1908 to 1914 inclusive. The figures later than 1914 are not available: for 1908 513.8 accidents per million tons of minerals raised; 1914 568.1.

28,208. Now that shows a rather remarkable increase in the proportion of serious accidents, in proportion to tonnage?—Accidents disabling for more than 7 days—it shows a rise.

28,209. That is only down to 1914?—The rise is very variable; you see it varies up and down.

28,210. But at any rate it is a somewhat significant fact that there is no decrease, and there are no figures later than 1914?—That is so.

28,211. Could not those figures be got? When you say there are no figures available, do you merely mean that the Home Office has not published them?—The Home Office has not published them. I am not aware that the return has not been continued, but I should not like to speak definitely thereon owing to my having been absent for the last 2½ years.

28,212. The accidents continue to be reported?—Presumably.

28,213. And if they have been reported, surely the Home Office is looking after the matter?—If they

have been reported the only question is the question of tabulation.

28,214. I think it is unfortunate that we cannot get them, because it has been reported that the accidents are decreasing, and here we have certain significant figures showing that the accidents have been increasing?—Certain classes.

28,215. These are the serious classes of accidents?—Disabling for more than 7 days.

28,216. The others have been satisfactorily decreasing, but the 150,000 accidents have been if anything increasing?—I would not like to say that because in the year 1913 it was considerably higher than in the year 1914.

28,217. Yes, but taking the series of years?—And the year 1911 was higher than 1912.

28,218. 1908 was very much lower?—Exactly.

28,219. Taking the series of years the table would show an upward tendency. Take the later figures which you have, and then take the fact that the two biggest causes of accidents, as you will agree, are falls of ground and roof and run-over underground?—Yes, those are prior to those reports that I have given to you.

28,220. Take the figure for 1917, where we have only the fatal accidents it is true, but the number of deaths during 1917 due to falls of ground was 733, whereas the average in the preceding five years was only 645, showing a rise in fatal accidents of 88, or something like 16 per cent. That is rather grave, is it not?—That is not very pleasant.

28,221. Now take the biggest class of accidents, the run-over underground, the number of deaths in 1917 was 271, the average for the preceding five years was 218; there again you have a very large rise. Now, have we the figures for 1918?—We come to the third table, and that gives the year, the number of deaths from accidents, the number of non-fatal accidents reported to inspectors, the number of non-fatal accidents disabling for more than seven days, and the number of offences in respect of which prosecutions were instituted. You will see the non-fatal accidents disabling for more than seven days end at 1914.

28,222. The Home Office have not given us the later ones?—No, I should like to see the later ones.

28,223. Surely as there is a certain indication at any rate that the figure is rising very seriously, I should think the Home Office was very much concerned?—Yes; you see the number has gone down for 1914. It is 158,000.

28,224. You cannot take one year.—The curve is very slight.

28,225. There have only been two years in the seven when it was more than 1914, and four years in the seven which are less than 1914?—Yes.

28,226. Consequently if you take the average of the six previous years to 1914 it considerably exceeds it?—Yes.

28,227. And we have some indication that it is worse still?—In order to institute a comparison that would be of real use, one would like to see the number of non-fatal accidents where men have been disabled for more than seven days classed according to the nature of the accidents.

28,228. I am a little surprised that we have not got it.—We have all been so tremendously employed during the war.

28,229. Considering the number of clerks out of work, I should have thought it could have been done. Now take the question of the causes of these accidents. Take this very serious question of accidents from falls of side and roof. It has been alleged that I have only been able to cite one case in all Great Britain in which the employers have been in default with regard to the prevention of those accidents. Do you think there has been only one case in your experience?—Where the owners have been to blame?

28,230. Yes, where the owners have been to blame for accidents owing to falls of roof.—It would be what Sir Adam Nimmo calls conjecture on my part, but I would be surprised if there was only one case.

28,231. Is it quite confined to conjecture? For instance, might you not turn to the Home Office

* See Appendix 77.

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

Report for 1917, and would you not find under that cases of contravention of the provisions about timber—52 prosecutions and 52 convictions?—If that is so, then it ceases to be conjecture.

28,232. That is why I wanted to bring these facts before you?—When I have the facts before me, it ceases to be conjecture.

28,233. Then it is hardly correct to say that there is only one case where the owners have been in default on account of this very large number of accidents when it turns out that there have been 52 convictions?—Yes.

28,234. Then with regard to the very large number of accidents which are serious owing to being run over. There are altogether 271 deaths and, as far as I remember, something like 60,000 accidents. I see there were prosecutions to the extent of, at any rate, 9 convictions with regard to travelling roads and haulage. I do not know whether that has any bearing on the 60,000 accidents, the being run over by trams?—Yes.

28,235. It has a bearing?—Yes.

28,236. Then there are cases where there have been contraventions?—Are those prosecutions of the staff?

28,237. Yes. Now with regard to that very serious amount of accidents from casualties in the mines last year being more than all those which happened at Gallipoli. I have stated that fact, and I have been accused of exaggeration. Do you think that is exaggeration?—Would you repeat that more slowly?

28,238. That there were more casualties in the mines in Great Britain last year than happened in the Gallipoli Expedition, not fatalities, but accidents?—Yes; but a Gallipoli casualty on the average, I should say, was a more serious matter than a coal mining casualty.

28,239. That is perfectly true. I have always gone on to state the number of fatal cases?—Take the case of a man who has his thumb badly cut; he cannot possibly work for perhaps a fortnight or three weeks. That is a casualty. But take the case of shell shock; a man may be injured for life. You must compare like with like. I know it is startling when you put it in that way.

28,240. I want it to look startling?—It looks dramatic.

28,241. I want it to look dramatic. It is dramatic. There are 160,000 cases where the men are injured so that they cannot work for a period of seven days or more. We need not take the deaths—but why are there 160,000 cases of men injured? Is it not possible to do something to prevent that?—It is not a safe calling.

28,242. Do you not think that it can be made far more safe?—I have been devoting the last 11 years to endeavouring to make it more safe.

28,243. Have you had a free hand? Have you had all the Inspectors that you asked for?—I would rather put it in this way: Could I do with more Inspectors? Yes, I could.

28,244. If there were more Inspectors, is it not likely that the regulations would be more strictly observed?—I believe that the decrease in fatalities being so marked in the mines has been due not only to scientific development but largely due to the regulations.

28,245. Would you consider that decrease in fatalities, in proportion to tonnage, for the moment? There has been no decrease in fatalities due to falls of side and roof?—No, there has not been.

28,246. There has been no decrease in fatalities, has there, with regard to men run over by trams and tubs underground?—No; there are two reasons for that.

28,247. There has been a great and satisfactory decrease in the number of fatalities from explosions?—Yes.

28,248. But leaving aside the explosions, has there been any decrease in accidents at all?—Do you mean decrease in the number of persons killed?

28,249. No. Take both cases; decrease in the number of persons killed—it seems to me there has been none, except with regard to explosions; and certainly there has been no decrease with regard to persons injured seriously?—If you have gone through the

figures and satisfied yourself that that is so, I will accept it.

28,250. The figures are not absolutely clear, but that is my general inference?—I grant you at once that there has been little or no decrease in respect of falls of ground—so much so that in Annual Report after Report one has drawn attention to the fact; and one did hope that the introduction of systematic timbering a few years before the war would have resulted in that, but it does not seem to me to have done so.

28,251. Has systematic timbering been applied?—Systematic timbering is in force throughout the whole of the coalfields of Great Britain.

28,252. It is supposed to be?—It is a penal offence not to carry it out.

28,253. There were 52 convictions in that respect?—Exactly.

28,254. How many more might there have been?—I do not know.

28,255. You very much want, I am sure, to get further precautions taken against accidents?—I can assure you I do.

28,256. Do you not think it would be a good thing if this Commission included in its Report something very emphatic about the need for reducing this tremendous total of serious accidents every year?—I should like to see first what you are going to say in the Report.

28,257. *Mr. R. H. Tawney*: With regard to this question of accidents, you are quoted as having said that it is simply a question of the progress of scientific knowledge. It was Mr. Leslie Scott who said that?—Does he say where I said that?

28,258. The context makes it evident that it is meant to be only a question of that. You did not mean that?—No. I must look that up afterwards.

28,259. You must. As a matter of fact, was it not dependent on science and also on the application of science?—Of course.

28,260. And the application of science depends on the stringency of State regulations?—Quite so.

28,261. With regard to this question of fluctuations, your replies seem to astonish Sir Adam Nimmo?—They did not astonish him so much.

28,262. I gathered that. Your point is this, I take it, that in good times more capital is invested in the industry than is needed to supply the normal demands?—Quite so.

28,263. The result is when normal times occur part of this capital stands idle and the men are unemployed?—Yes.

28,264. Your remedy is to prevent the reckless supply of capital?—That puts it very nicely.

28,265. Have you read the accounts of the Rhenish Westphalian Coal Mining Association?—Yes.

28,266. You remember that was one of their objects? Yes.

28,267. And you remember that was one of the results for which success was claimed?—Yes.

28,268. You were asked certain questions the last time about the way it would be proper to treat a colliery that was approaching the end of its lease but had its lease renewed in the past and might have a reasonable expectation of its being renewed again?—Yes; Mr. Cooper asked me those questions or something similar.

Mr. R. W. Cooper: I did.

28,269. *Mr. R. H. Tawney*: What I want to know about your answer is this: did you mean that the expectation of renewal was a saleable asset, so to speak, with a market value, or did you merely mean that the State ought to take that expectation into account and give a compassionate allowance or consideration?—You may remember that when Mr. Cooper put the question to me I said: "Let us take the case of two royalties," and he very rightly, if I may say so, and very properly said: "Let us take half a dozen." Now that makes all the difference. Supposing I took the case of one royalty, and I worked that royalty, and towards the end of the 60 years I was asked to value that colliery, I would value it on the value of the plant—that would be one item—and the annuity derivable from that colliery for the term of its lease, but that would be the valuation of present value; but if it were a case of

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

a number of royalties and one of those royalties was on the eve of terminating, the case would be quite different. There would be every reason to suppose that the lessor would grant a renewal of the lease, and I would take that into consideration in valuing the colliery.

28,270. Do you think that expectation is the kind of security a Bank would advance money upon if you go to it and say: I expect to have my lease renewed, but there is no contract to that effect?—The Bank would probably not advance money in the first case, but would in the second case on the strength of the valuation.

28,271. Do you say that if you have a lease expiring and no guarantee that that lease will be renewed the Bank would advance money upon that?—The Bank would advance money on the valuation.

28,272. That valuation is assuming the whole question. The valuation depends upon whether the lease is going to be renewed or not?—No, not altogether, because it is one out of six.

28,273. Your point is when there is a group of royalties or leases and five are going to be renewed but one is not yet certain, the five covers the one—is that the point?—Not that altogether. The point is this: The expectation is so great as to amount to a certainty because the leaseholder could not work the colliery himself nor could anybody else, and because of the surrounding royalties it amounts to a certainty.

28,274. If the expectation amounts to a certainty why have you not a definite agreement?—Probably there is.

28,275. We are putting the case where there is not?—Then I regard it as equal to a promise.

28,275A. I do not think you will find anybody going to lend his money would agree with you upon that?—The banks drive a very close bargain—they would.

28,276. If they say this expectation is as good as a certainty what hinders the proof of the certainty?—Let us put it to Lloyds Bank.

28,277. Can you tell us anything about the Coal Controller's Office? Very unpleasant things have been said about it?—They will continue to say them.

28,278. It has been said it employs hosts of officials?—It employed me and Sir Adam Nimmo.

28,279. It was said it persistently refused to raise salaries to a reasonable figure. Can you tell us about that?—It did raise salaries, but we have to take precautions just as any other concern would have to take precautions. I can assure you there was a case where a manager increased his salary (the profits of his colliery being guaranteed) from £500 to £1,500. The secretary increased his salary by 100 per cent. or 150 per cent., I forget which, and the surveyor by 100 per cent., and these three were shareholders and had a directing capacity in the concern. You will agree with me it was rather necessary to take precautions. We took precautions, but in one case we agreed to a substantial advance to the colliery manager or under-manager in Scotland. We desired to make that a permanent advance, but the coal owners took a different view.

28,280. Really. Then the refusal to advance salaries so far as it took place was pressed upon you by the coal owners who have been saying your salaries were too low?—I thought it would have been rather nice on the part of the coal owners here if they had made that explanation instead of leaving it to me.

28,281. It is kind to use the word "nice." I do not know what the proper word to describe the failure to make that explanation is?—Our backs are broad and we can bear it. I should like to say, too, and I say this not in any defence at all, but I say it from the feeling that I have towards the late Coal Controller, my friend, Sir Guy Calthrop, and I heard it stated here, and very rightly and properly said, and I am not finding fault with it at all, by the representative of the Colliery Managers' Association that the Coal Controller declined to meet them. I was approached by the Colliery Managers' Association. We have always met them at the Home Office on all questions affecting them and affecting the mines, whenever they desired to see the Secretary of State or to see myself

or anybody else. They did approach the Coal Controller. I advised the Coal Controller to meet them. The Coal Controller was willing to meet them, but the owners' side of the Advisory Board objected.

28,282. Dear me. There are two cases apparently in which you have been blamed by the owners for not advancing salaries?—I mention that fact because of Sir Guy Calthrop.

28,283. You have been blamed by the owners for not meeting the managers, when it was themselves who put pressure upon you not to meet them?—I am not condemning the owners. I simply say I think it would have been rather nice if we had heard in this room an explanation of that fact instead of leaving it to me to make it.

28,284. *Mr. R. W. Cooper*: Do you mean the owners' side of the Advisory Board?—I said the owners' side of the Advisory Board. There is one owner here present that hold just as strong an opinion as I did on the matter; that is Mr. Evan Williams.

28,285. In favour of raising the salaries?—In favour of the Coal Controller meeting the Colliery Managers' Association.

28,286. *Mr. R. H. Tawney*: Now with regard to wayleaves. You talk of wayleaves being compensated for when you destroy the amenities of the estate?—They might, you know.

28,287. What is the position now? A wayleave is charged when the transit of coal does not affect the amenity of the estate?—Oh, yes. If I have a royalty and you have a royalty, and your coal in order to come to the shaft has to pass through my property underground, where I never see it, I probably charge you ¼d. a ton for all coal that passes through my estate underground.

28,288. Should you propose that such wayleaves should continue?—I say not.

28,289. Do you propose to pay compensation for wayleaves of that kind?—No.

28,290. You do not propose to pay compensation for wayleaves which do not damage the amenities of the estate?—That is so.

28,291. *Mr. R. W. Cooper*: I understand that your remarks apply to surface wayleaves?

28,292. *Mr. R. H. Tawney*: There is a further discrimination still. It does not apply even to all surface wayleaves?—Not all.

28,293. *Mr. Sidney Webb*: Sir Richard is saying he would not pay compensation for surface wayleaves as such, but only for such surface wayleaves as interfered with the amenity of the estate?—That is right.

28,294. *Mr. R. W. Cooper*: What do you mean by "amenity"?—I took for instance the case of a colliery being sunk in front of my drawing room window, and so on.

28,295. Do you mean residential amenity?—I would compensate the man who has a railway run across his park.

28,296. Or across his farm?—Or across his farm. I mean the saleable value of my land would be depreciated.

28,297. Obviously?

28,298. *Mr. Evan Williams*: The occupation of the land you would pay for, and that is now paid for in the form of wayleaves sometimes.—Yes, that is a matter of bargain.

28,299. With regard to the question of output. You have given us some figures and some tentative explanations. I understand those opinions are merely tentative and provisional as to the explanation of the facts?—I have given what I believe and it is a belief.

28,300. You have not given us the facts on which the belief is based?—No, I have endeavoured to be quite frank and open.

28,301. Would it be true to say that the matter is still sub judice as to the causes?—I think so.

28,302. Expressions are sometimes made in the Press as to the reduction of output being entirely the fault of the miners. Those are, at any rate, premature? Yes, and the whole cause is one which, you say, is sub judice.

28,303. Would it be right to say that the output depends on two factors; first the management on one side, and, secondly, the increase on the other?—Yes,

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

and, of course, a third, the changing character of the seam, which is a physical factor.

28,304. Is it accurate to say it is conceivable the management may have less interest in getting the largest output than it had in the past, in normal times?—No. Sir Adam Nimmo took me on that point, and I agree with him very largely.

28,305. I will take the address of Mr. Arthur Pease, Chairman of Directors of Pease & Partners. I cannot put the present position better than by quoting from the "Times" what one of the Directors says. He quotes from one of his managers: "The fact at the moment of the uncertainty as to the future is disastrous in every way; neither the men nor the officials can settle down to work." I suggest to you that that may reasonably be interpreted not as casting any blame on the management, but as suggesting that at the present moment they are not able to apply their best energies; they are not able to settle down to work. Is that correct?—What he says he evidently thinks.

28,306. He is a person of some experience?—Pease & Partners' managers are all men of experience.

28,307. Apparently they are believed to be persons of some experience by coal owners?—They are good men.

28,308. That is a factor you have to consider; that is to say, the uncertainty of the future of the industry?—Yes, that is a factor in the situation, I grant you.

28,309. If that is so, it is surely quite unfair to talk as though the reduction in output was entirely or mainly the fault of the men. There is the evidence of a coal owner himself to the effect as far as the managers are concerned they cannot do their best?—The whole question wants thoroughly going into.

28,310. I suggest that is another reason for suspending judgment, at any rate. With regard to the question of wages and output, what did you mean by the relation between wages and output? You said something which was interpreted to mean that the higher the wage the lower the output. Do you offer that as an explanation in the general fall of the coal per man that has taken place for the last 25 or 30 years?—Oh, no, I did not mean that. What I meant, was there are a succession of waves. Those waves may be, are in fact, on the down grade. The average down grade over a period of years is not accounted for by the wave theory. That opens out a large field, which would require a good deal of explanation; but, of course, a very important factor is undoubtedly this: that we are working now seams of a different character and quality to what we were, say, 50, 60, 70, 80, 90 or 100 years ago.

28,311. The general movement is due to causes that have nothing to do with wages or with the output of the mine?—To a great extent it has been due to physical causes.

28,312. It is rather important to remember that. This particular *obiter dictum* of yours—I hardly think it was much more—was taken and commented upon in the Press, and the other factors that are far more important are ignored?—My remarks apply to a succession of waves. It can be shown in diagrammatic form that, with every advance—every wave of advance in wages—there follows a wave of decreasing output.

28,313. There is a further question. When you talk of wages, what do you mean? Do you mean coin or real wages?—What a man earns.

28,314. Earns in the shape of—£.s.d.

28,315. Or in the shape of purchasing power?—That brings you back to Mr. Hodges' point. Mr. Hodges said if he could show that the value—I will put it at once—it presupposes the purchasing power of money is the same.

28,316. It presupposes the purchasing power of money remains the same. Would it surprise you to know that between 1903 and 1914, so far from the purchasing power of money remaining the same, it fell largely?—It would not surprise me, because I know it. What I said in answer to Mr. Hodges I say in answer to you. I would like, to sit down, as I shall do, and work out the relative value of wages now as compared with some time back and the proportion of wages that

goes to maintain a certain standard of comfort. It is rather an involving calculation.

28,317. I assume the explanation of the fall in output can hardly be the rise in real wages. As a matter of fact, real wages have not risen?—In my explanation I said that to some extent it is due to the fact—it is only a belief—that so many men are now working on the minimum instead of working on piecework, due to the fact that the minimum, the Sankey wage and the war wage, make up, for want of a better word, a respectable figure.

28,318. That, again, is quite another point?—I mention it in my proof.

28,319. I admit it is extremely relevant to consider. It is a different problem from the problem of wages and output. Your statement was misinterpreted. When you come to examine the facts, you cannot find the fall in output was due to a rise in wages. It is one of the plausible statements put forward. You were under pressure perhaps when you made it?—All the pressure in the world will not make me say what I do not want to.

28,320. You were in a hurry perhaps?—We might talk it over one day, Mr. Tawney.

28,321. Your opinion is that the matter is still *sub judice*?—It is a matter for enquiry.

28,322. *Sir L. Chiozza Money*: Have you had a chance of seeing the speech of Mr. Leslie Scott, K.C., M.P. to the Commission?—No.

28,323. *Mr. R. W. Cooper*: Is it right to cross-examine on this speech?—I have seen it, but not read it.

Sir L. Chiozza Money: May I read this part? It is not addressed to the Commission.

Mr. Pawsey: I object. Sir Leo Money says it is not addressed to the Commission. It is.

Sir L. Chiozza Money: Mr. Pawsey has no *locus standi* here, and he must sit down.

Chairman: I suppose if we were to go more or less by precedent it would be this. Now the position would be that Sir Richard Redmayne would leave the box, and then Mr. Leslie Scott would make his speech, and at the end of his speech there would be no opportunity of cross-examining the witness on the hypothesis, he would have been finished with. You can put one or two hypothetical questions, but you cannot put that speech to him because it is not meant to be read to the witness in the box.

Sir L. Chiozza Money: Rather a curious course has been followed. This has been printed.

Mr. R. W. Cooper: Supposing for the sake of argument that had been submitted an hour or two ago, and kept back until Sir Richard was out of the box, no questions could have been asked upon it.

Sir L. Chiozza Money: If this had been respectfully submitted as an address, that would have been a different thing.

Mr. R. W. Cooper: If Mr. Leslie Scott had made a speech at the end of the proceedings, the witness could not have been asked questions upon it. We ought to presume the document was delivered at the end of the proceedings, not before.

Sir Alan Smith: I must object to any question that is going to be addressed to any witness on this report. I claim the right, if any questions are to be put, to read this report and put any question I please.

28,324. *Sir L. Chiozza Money*: I do not want to fall foul of Sir Allan Smith in this matter. I will ask Sir Richard this question. Is it true that Civil Servants do not get positions of responsibility until they are 50?—No, I do not think that is true for a moment.

28,325. Is it not the very reverse of the truth?—I was quite old, I did not enter the civil service until I was 43, and I occupy the same position now as I did then.

28,326. Do you know Sir John Anderson, K.C.B.?—Not personally.

28,327. You know he was in the thirties?—He was quite young.

28,328. As a very young man he became the civil head of the National Health Insurance Commissioners?—Did he? I will take it from you that he did.

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

28,329. If you take the case of the Ministry of Shipping, there were 4 or 5 young men civil servants, holding the most important positions?—That is quite true.

28,330. If the statement was made anywhere that in the civil service the men never had a chance until they were 50, that statement is not in accordance with the facts?—I do not think it is.

28,331. With regard to the question of output. I want to deal first with the special question of the fall in output recently, the war falls in output. Have you formed any estimate from your general knowledge of our mines as to their, what I may call, backwardation?—I have.

28,332. What would you put it down to?—Their backwardation?

28,333. I mean the time required to put them into a pre-war condition?—The time required to put them into a pre-war condition with regard to development. I should think I would not be far wrong if I said the average over the whole country would certainly be three years.

28,334. That is in point of time?—I would not like to bind myself to a month or two. I think the general average mine is backward in point of development for very good reasons.

28,335. Could you help us by putting it in the form of a percentage? Would you say in your opinion they were 10 per cent. or 20 per cent. down in point of efficiency, not through the fault of the miners, but through the result of the war?—I put it in point of development. That is the only way I can put it.

28,336. We are expecting something different?—I think so. A properly managed mine should always have in sight so much coal.

28,337. Forgive me if we do not pursue this. I do not want to waste your time?—The plant is in a backward state to some extent. To what extent I cannot say. In some collieries it is not in a backward state; it is in others. It would be only generalising, and my opinion would not be of much value.

28,338. That is the real point. The railways had a superior priority with regard to material as compared with material for tubs?—The wear and tear on railways is terrific.

28,339. They have superior priority in getting material over mines in some respects?—Yes.

28,340. Would it not be reasonable to suppose the mines have a considerable backwardation?—A mine is not quite comparable to a railway. A railway wears down very much more than a mine would wear down.

28,341. Are there not particular points in which a man, for instance, took the retreat of the face from the underneath rails. That has occurred during the war?—No doubt there is a loss in not being able to keep the roads and haulage in the position it should be. At the same time as against that the output has been falling, which has to be put against that.

28,342. Take the case of the tubs. Is it not perfectly clear there is not enough material, even if the mineowners placed their orders in full time, to make them in sufficient quantities?—No doubt the collieries in respect of tubs suffered perhaps more than in any other direction.

28,343. Is it not the fact that the competing claims for a limited amount of material was so great between our claims and those of France and Italy and all the other users of metal, and so forth, that it was a continual struggle for the little bit of material that was available?—That is so. The way we managed in the mines was we cut down the development, the sinking of new pits to the utmost point.

28,344. Is it not the fact it was not really possible to make the tubs the colliery managers desired to order?—We were unable to supply the collieries to the extent they required.

28,345. Does it not therefore follow in the name of commonsense, and is there not very strong support in reason and from facts which we know, quite apart from the evidence produced by Mr. Herbert Smith,

that the probability is there is a very great shortage of tubs and trams?—I think in some collieries—a great many collieries make their own—there is at the present moment a shortage. I cannot put it more than that.

28,346. Did you notice the letter published in one of the London daily papers, the "Daily Mail," on June 10th. It is signed by a miner. It is not signed by his name, but there is no doubt it is an authentic letter, as the editor vouches for it in a leading article. It says: "Sir, in a letter published in Saturday's "Daily Mail" (that was the 7th, although the date is not given) "I pointed out that in the Notta coalfields we had worked in that week one full day (Monday) and two half-days (Tuesday and Wednesday). Since then we have completed the following working week:—Monday: full day, also afternoon shift; Tuesday: half-day, no afternoon shift; Wednesday: half-day, no afternoon shift; Thursday: three-fourths day, no afternoon shift; Friday: three-fourths day, no afternoon shift." Then he goes on, "This has been the general time worked throughout the Notts coalfield, which supplies London with coal. I understand conditions are similar in the South Yorkshire coalfield"—which appears to be amply confirmed by what Mr. Smith says—"Even when we work we are unable to get the number of trams we could fill. These are shared among the men. On Friday we were confronted with a notice informing us that the pit would close down until Wednesday next." That is June 11th, this Wednesday just gone?—Whitsuntide holiday I suppose.

28,347. Apart from the Whitsuntide holiday we get a bad week?—I would want to know the reason of all that.

28,348. He goes on, "This state of affairs did not exist till the Sankey awards were given, and we miners look upon it as an expected development. A reduction in output makes a good weapon to fight the reduction of hours award, but I consider this a mean and unjust method of reducing it, as the blame falls on the miner and the fruits of such scheming on the general public. Given the trams to do it with, the output could be increased anything up to 50 per cent. I should like to hear the Coal Controller's views on the matter?"—I should like to know all the details of the case. One sees these letters by the score. There may be the whole truth, part truth, or no truth. I grant you there is a shortage of tubs.

28,349. May I make a practical suggestion? Mr. Smith made an enquiry in his district?—But not so great as it was in this shortage of tubs.

28,350. Mr. Smith made enquiries in his district. Would it be possible for the Coal Controllers' office to make enquiries of a similar character, addressing the question to both sides and getting a report from both sides, not because it would give a complete enquiry, but it would give a superficial account of what is going on from every pit. Could not that be done within 10 days?—No. Supposing I got one explanation from the management and another from the men?

28,351. That is what we want?—Which is right?

28,352. In some cases you would get agreement. You would say that is on the face of it veracious. In other cases where you get disagreement you would make further enquiries?—You would get innumerable cases. It is not a question of time. Not only the question of tubs, but all sorts of questions would be raised. One would have to visit these places. I quite agree it is very desirable that a very thorough enquiry should take place, but it should be a thorough enquiry.

28,353. I do not suggest it should be the end of the enquiry?—A preliminary enquiry. One is always chary of a preliminary enquiry. It seems to me the time has come for some more drastic enquiry.

28,354. There does not seem to have been an enquiry made in the way that was done by Mr. Smith. There has been no special enquiry made by the Coal Controller?—There is an enquiry into each case that shows a decrease in output, not by questions, but by sending somebody down and by investigation.

28,355. Out of the 3,100 mines, how many have shown a decrease in output?—A marked decrease of output?

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued.]

28,356. Any decrease?—We do not enquire into any decrease. There might be a decrease to-day and an increase to-morrow.

28,357. A preliminary canter of the kind suggested might be useful and could be done rapidly, and would point to what you should do further in the way of enquiry?—I agree it could be done. I am afraid the result would be so unsatisfactory as to make one wish that instead of taking two bites at the cherry one had taken one—I would go in for the enquiry right off.

28,358. This is a rapid bite?—I do not think you would get very much to swallow.

28,359. If you are going to conduct an enquiry that is going to occupy months, during that time you lose a large amount of coal. If you put out a thing like this it wakes every body up?—I think the Press has wakened them up now. It is worthy of consideration. I am willing to do anything that is likely to result in an increased output.

28,360. Apart from this particular fall in output, on the question of general efficiency, Professor Knox, of the Cardiff School of Mines, has told me that, in his opinion, he thinks with regard to the surface plant of our mines throughout the country, not more than 2 per cent., in his estimate, is thoroughly efficient. Do you think that is an exaggerated statement?—I think it is, very.

28,361. Would you say that a large proportion of the surface engineering work is not up to date?—I would not like to say the larger proportion. I should say there is a large quantity of surface plant at collieries which is out of date. I am not blaming the coal owner for that.

28,362. I am?—So many of the collieries are old and have not the wherewithal to get the new plant. That is one of the advantages to be secured by combination.

28,363. I asked Mr. Mottram, one of your divisional inspectors what he thought in his district was the percentage of collieries that were up to date generally, taking them as a whole, having regard to the size of their shafts, whether using machines and so forth, and he gave his opinion as about one-third were up to date. Would you give your opinion from your knowledge of the country as a whole?—That answer of his—I do not remember it—I should imagine was capable of a very important interpretation.

28,364. He interpreted it himself?—Might we have it?

28,365. The interpretation was, as you reminded us some of the mines were started at a period more or less remote?—I mean something more than that. I mean one-third of the mines for instance, in point of number, it might be two-thirds in point of output. All modern mines are so much larger than old mines, and draw such very large quantities of coal. I happen to know that in South Yorkshire, which is a growing field, some of the large collieries are drawing enormous outputs. The record in respect of the quantity of coal drawn up one shaft is bigger than any coal mine in the world, over 4,000 tons a day up one shaft.

28,366. Are there not a very considerable number of cases of mines in this country that are not using the upcast shaft where it might be used with advantage?—That is one of those very difficult questions to which you cannot answer "yes" or "no." Subject to certain developments underground there are cases where the upcast shaft could be used, but for the developments necessitated thereby more capital would be required, which these collieries could not get.

28,367. That is another point?—That is one of the advantages of combination.

28,367A. I am not talking of whether capital is available. The question is could it be done with advantage apart from the question of capital?—It could be done with advantage, but not with advantage as things are.

28,368. Do you agree there is a continual field for the application of more capital in the mining industry to produce more efficiency?—Yes.

28,369. It is a continual and considerable field?—Yes.

28,370. It is a real serious economic fact?—Yes.

28,371. You have expressed that very clearly with regard to pumping?—It applies right through.

28,372. And it applies equally to machinery and conveyors, and so forth?—Yes.

28,373. What is the present development in this country of the manufacture of such machinery as coal cutting machines. Has it developed as regards that to any extent?—Yes, it has; it is a very interesting point. To a large extent, I believe I am correct in saying this, we are resorting to American made coal cutting machines; even though the American coal cutting machines are being sold at a higher price than the English machines. You may take an American machine at £675 as against probably £625 for an English machine.

28,374. Could you tell me from your own knowledge is there any restriction on the importation of American machines now? It is rather interesting. Has the Board of Trade removed all restrictions on the importations of mining machinery and plant?—I have just written a strong minute upon it.

28,375. They have not yet?—I would say, I have reasons to understand, but I have not got it definitely in writing, that the Department which deals with that at any rate are not going to impose any restrictions on the introduction of coal cutting plant from America.

28,376. You mean they are going to remove the restrictions that exist?—No; not going to impose them. There are certain quarters outside Government seeking to have them imposed.

28,377. You mean asking for a duty?—Not a duty.

28,378. A prohibition?—From certain quarters there was a desire—nothing to do with the coal trade—that this machinery—I will put it this way—the plea put forward was there was sufficient production of coal cutting machinery in this country.

28,379. It is the same as paper?—I think you may take it from me—

28,380. That the danger will be avoided?—The danger will not arise.

28,381. It would be in your opinion a serious danger to the coal industry?—I think it would be a very great mistake to impose restrictions on the introduction of any machinery into this country.

28,382. With regard to the question of the efficiency of mine managers. Do not you think it would very greatly help in connection with what we all desire, a desirable sort of competition of emulation among mine managers if they felt they were part of a system where it was possible to rise to a seat on the Central Council of Mining Industry of this country, for example?—Sir Adam would call that conjecture.

28,383. Under a system of collective ownership and State control would not a mine manager have a wider field for ambition than now?—I cannot put it higher nor lower than this: I do not know what would happen to a colliery manager's mind. I can only say what would happen or what would take place in my mind. I am not aware since I entered the Government service, though it has not been very fruitful to me on the point of £ s. d., there has been any waning in my endeavour to do the best I can for the nation.

28,384. In the first evidence you gave in connection with the former part of this inquiry, you very clearly endorsed an opinion that the present system of individual ownership would have to go or ought to go?—I did not say that exactly. I like to stick as nearly as I can to what I have said. The words I used were, I think, that in comparison with a collective system it was wasteful and extravagant. I have heard nothing, read nothing and seen nothing to change me in that opinion.

28,385. Your position is, in brief, while you do not desire to give any opinion on the question of Nationalisation, at the same time you do still contend for some form of collective ownership?—My position is precisely that in words.

28,386. Mr. Robert Smillie: There are a considerable number of communications from the collieries, either signed or anonymous?—Yes.

28,387. Complaints?—Yes.

14 June, 1919.]

SIR RICHARD AUGUSTINE STUDDERT REDMAYNE, K.C.B.

[Continued]

28,388. Do they all come to headquarters or do some go to the Divisional Inspectors?—It depends upon whether they are addressed to headquarters or to the Divisional Inspector.

28,389. I suppose there are some that go to the Divisional Inspectors?—They receive them.

28,390. And some come to headquarters?—Yes.

28,391. You made a remarkable statement. You said that all communications, even anonymous communications, are replied to and attended to?—Yes.

28,392. Is not that a sweeping statement?—No.

28,393. How do you know?—That I received.

28,394. You did not say that you received. I am dealing with anonymous communications received by a Divisional Inspector?—I cannot speak for him. His instructions are to deal with everything. I can only speak of those which I see and every complaint, whether anonymous or signed, receives my attention.

28,395. That comes to you?—Or the attention of my staff.

28,396. Before the Royal Commission on Mines a statement of that kind was made by a very important witness that all complaints, anonymous or otherwise, were attended to. He had to admit he did not know whether anonymous complaints were attended to or not. Are you in a position to know whether your anonymous complaints are attended to by your Divisional Inspectors?—I hope so.

28,397. You are not in a position to say whether they are or not?—I can only speak of those complaints I receive and the instructions I give to the Inspectors in respect of those. I cannot speak of what any man does if I am not there.

28,398. I will take that from you. Many of them, I daresay, would be privileged?—In talking this matter over with the Inspectors they have assured me from time to time they deal with all these.

28,399. All of your Inspectors assure you that?—All those I have talked to. I am not speaking of the Coal Controller now at the moment, but of the Inspectors at the Home Office.

28,400. You answered some question put to you by Mr. Sidney Webb with regard to roofing and timber. Do you admit, in view of the fact that the vast majority of accidents, fatal and non-fatal, which take place in the case of timber that it is important that the timbering should be attended to and all the methods of timbering should be improved?—Yes.

28,401. Do the large majority of accidents, fatal and non-fatal, from falls take place at the working face?—Yes.

28,402. Are we using at the moment the most scientific system of timbering at the working face? Cast your mind over to France for a moment?—I have been, as you have been, through the French mines, and I have studied and written on that system of timbering. That system of timbering, I am rather inclined to think, is capable, and I think I have said so publicly, of application to the roof of certain collieries that I have seen in parts of South Wales and elsewhere, but the roofs I saw were what they call friable roofs. There are not many roofs in this country quite similar to that. Some of the results of the adoption of that lattice work timbering have been very remarkable, not so much in saving fatalities, but in saving innumerable accidents.

28,403. I think that France, after they adopted the lattice system of timbering at the face, reduced their accidents considerably?—Enormously.

28,404. Are you aware, in addition to the latticing with timber, they use steel?—There I am absolutely with you. I think a great deal more could be done in driving forward those thin steel bars, and I am very glad to see in a colliery in Nottingham that it has been adopted by Mr. Fowler, and admirably adopted; it is a species of foretimbering.

28,405. Mr. Fowler, as you know, has always been in the lead where safety was concerned?—He carried out remarkable improvements in old collieries.

28,406. Do you think the more question of cost should stand in the way if human life and limb is to be saved within reasonable bounds?—You can get coal at too cheap a price. I grant you the greatest quantity of coal ought to be obtained with the greatest degree of safety and health to those getting it.

28,407. When you speak of scientific timbering, according to your rules, you mean there shall be no portion of the exposed roof more than a certain distance from a prop or other support?—Systematic timbering.

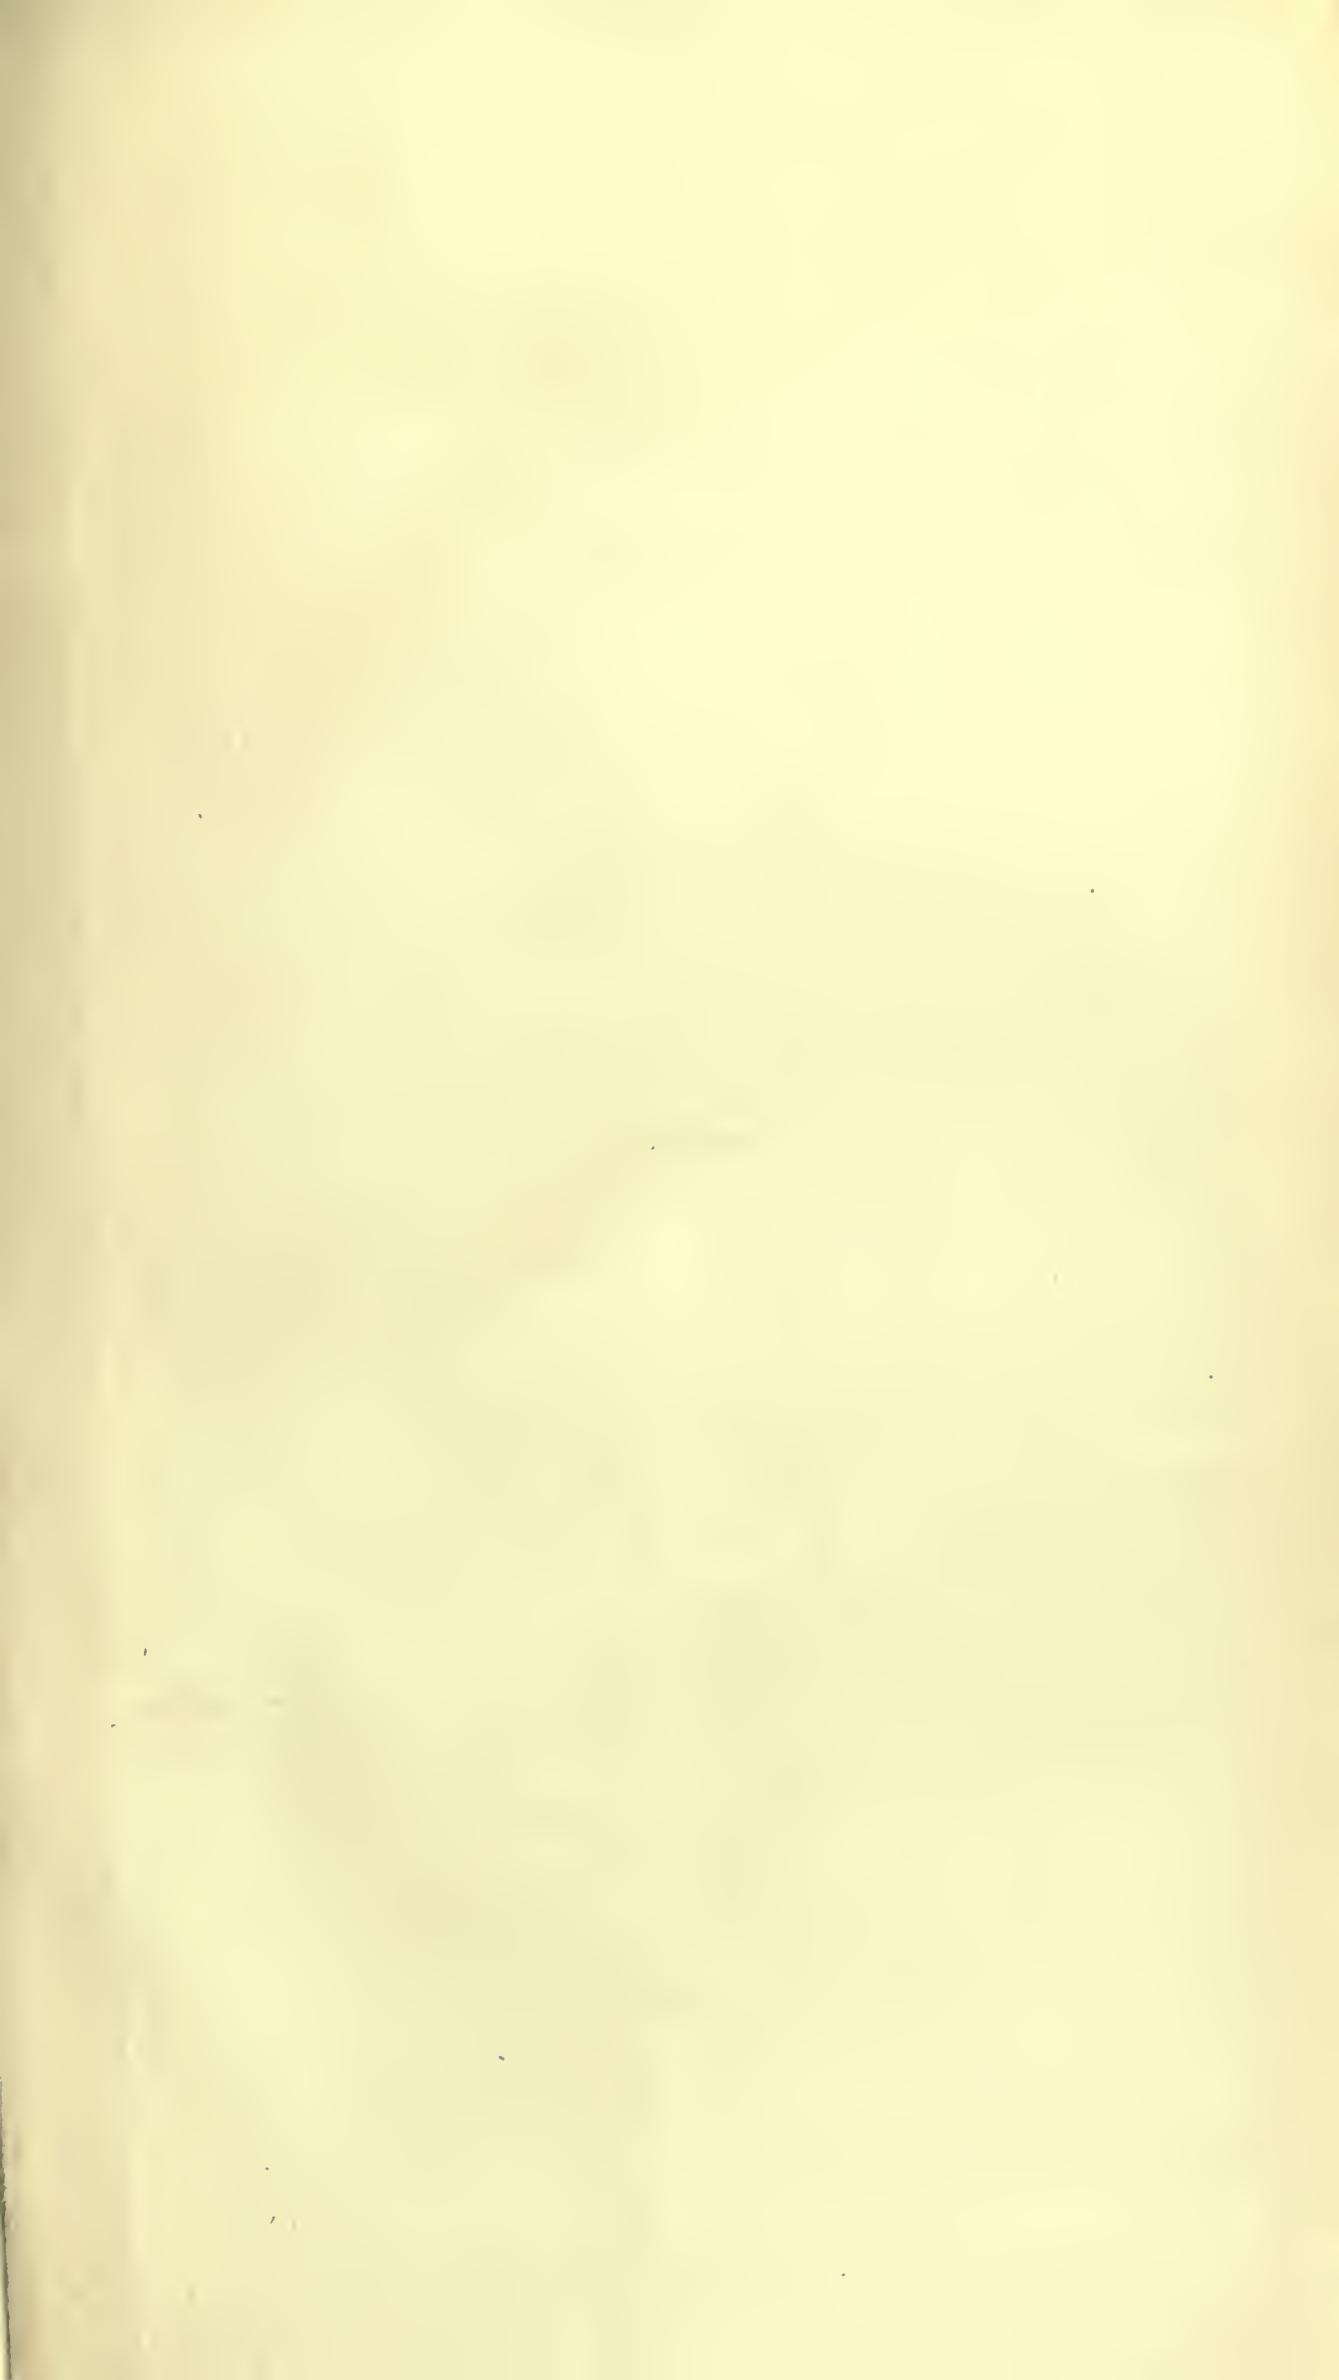

28,408. We have not, as far as you know, attempted to put in force the French lattice system of timbering? No, we have not.

Chairman: We are very much obliged to you, Sir Richard, for the great assistance you have rendered to the Commission both at the last stage and the present stage of this enquiry.

(The Witness withdrew.)

Chairman: There are one or two announcements I have to make. In Hansard of the 29th May, 1919, a question was asked by Major Nall in the House of Commons to the following effect: "Major Nall asked the Minister of Labour what are the usual subsistence allowances given to members of a Royal Commission; and, in the case of members now sitting on the Coal Commission, is that amount a sum equal to £1,500 a year?" Mr. Baldwin, I presume, on behalf of the Government, answers, "Members of Royal Commissions are entitled to an allowance of one guinea for each night (covering a period of 24 hours), on which they may be necessarily absent from home on duties connected with the Commission. This rate is applicable to the Coal Industry Commission." I desire to say publicly that no member of this Commission has claimed or received that allowance. We have now concluded this part of the Inquiry. I observe from the shorthand notes over 28,000 questions have

been asked. I have already announced the number of witnesses and the class of witnesses which have been called, altogether 116. I should like, if I may, to thank the shorthand writer for the very excellent way in which he has let us have so promptly the notes from time to time. I should further like to thank, if I may be allowed to do so, the gentlemen of the Press for the very accurate reports they have put in the daily papers from day to day, I think they have been forgotten very often. I have read most of the reports, and I have hardly discovered one single mistake in them; they are much to the point, and the members of the public who cannot be here ought to be indebted for the very lucid account they have received from time to time. The Commission will now have a private sitting, and I hope that the report will be in the hands of the Government quite early on Friday morning the 20th inst.
